But as for such wood as is in Mountains and Woods scituated far off from mens dwellings, and which are not frequented, that is not of any use at all, they are Dens and lurking places for cruel Beasts, as Bears and Wolves; which said wild beasts do annoy and hinder other profitable ones, as Staggs, Does, Boars, Hoggs, Sheep, *&c.* from feeding on the wild Fruits of such places. But who is there will amend it, and bring such places to a due or good use? What! should such vast Woods, which are the receptacle of those cruel wild Beasts be cut down and lie a rotting, or be consumed by Fire, so to destroy those wild beasts? Surely no body will attempt it, as fearing the toilsomness requisite hereunto: And besides, forasmuch as no other profit is to be thereby expected, save an extirpation of those wild beasts, there's no body will take that Task upon him. Nor is it a thing so behoveful to Fire, and burn down such huge Woods, as we read in History, that some have heretofore done, *viz.* most great Woods have been burnt, meerly to destroy Insects and other hurtful, wild, and ravenous beasts. There is an hazard run in so doing, for such a Fire may spread wider, and do a great deal of mischief.

There are such Examples which may be produced, which witness how that Fire being put to Heaths, have (by burning thereof) crept into the bordering Woods and destroyed them, and mightily injured the neighbouring Inhabitants: And therefore 'tis not so advised a Work to consume Woods by Fire; and to cut them down, that so they may lie and rot, and be thereby rooted out, cannot be done, because of the great costs thereto requisite.

So that such places must of necessity even remain the Receptacles of hurtful Beasts and Thieves; for albeit that sometimes the Glass-makers do in suchlike places build their Furnaces or Glass-houses, yet they fall far short of consuming so much Wood by their making of glasses, for those Woods are scarce the thinner or lesser for that: Tho' they spend daily in every such Glass-house twenty loads, yet such a vast quantity as that is, will not decrease. Besides, the Glass-men do not use all the wood without making any difference, but make choice of the streightest and smoothest wood, such as they may best and easiest cleave: As for shrubs and knotty *Oaks* and *Beach*, those they touch not. So then the best Trees only are used about their Glass Works, and the bushy woods, as *Briars*, *Thorns*, *&c.* and which are the most commodious hiding places for the wild Beasts, are unmeddled withal, as being unprofitable for the Glass-makers: Nay, they let most curious arms or branches of *Beach* lie a rotting, and make use only of the body of the Trees. Moreover, in such Woods as are far off, the Glass-makers build no Houses, but do erect them as near as possible they can, to such places as are inhabited, because they must of necessity have commerce with men.

Farther, 'tis not a little wood that is spent in the Mines about Metals, especially in such Mines where Iron is molten; but what we said but now touching the Glassmen, the same is to be observed here; for such metal-melting Houses are never erected on the high Mountains, or are built in far remote Woods, because they must have the assistance of Men, and water to drive their bellows-mills, and besides the place must be such, as that all Necessaries may be brought them in Waggons, and their Iron transported into the Cities or Towns. Nor do the Metal-melters indifferently use any wood they meet with; nor make they their Charcoals of every kind of wood, but leave the shrubs and bushy woods as unfit for coaling. And therefore those great and vast woods, tho' there be Glass-houses and Metal-melting-shops in many places, do remain untouch'd, because no body knows the use of them.

But now, forasmuch as I have all my life-time most accurately search'd by a diligent observation into the wonders of God, and have not spared any labour or costs about the secret wonders of Nature, and have learned from Nature her self, my instructing Mistriss, that God being a true and just Lord over his Family, did neither do, make, or create ought without certain and just causes, which notwithstanding is not regarded by the most part of us men, who imitate the irrational beasts, and alwaies live without the knowledge of God and of His Works. Verily, we have no colour of Reason at all for it, not considering that men were created and appointed by God for another-guise end, than the brute beasts, which are void of all Reason; and we regard not the Truth of that old Saying, *God and Nature never make any thing in vain.*

So then, whereas this is a Truth (as assuredly it is) certainly we may see that these huge Woods were not in vain made, but that they have some benefit (for so they have) *viz.* a most great Treasure for such who know it, and know how to use it. Which I will therefore shew, as clear as the Noon-day Sun, and will so set it afore the eyes of the blind and darksom world, that the Deriders and Contemners of natural Philosophy, such as is to be Learned only by the fire, and not out of *Aristotle*, may be even enforced, will they, nill they, to confess and grant that the Fire is the true Teacher and Master of natural Arts, and so will be; for whosoever they be that are Ignorant as to the Fire, and that know not its wonderful efficacy, tho' they may be most skilful Proficients in foreign Tongues or Languages (which in the more-secret Philosophy makes not at all to any purpose), yet nevertheless they will not be able to accomplish any the least matter in things of so great a moment: I do therefore say, that such men as are skilled in natural things, are not of right to be contemned, or secretly back-bitten by those who say, Believe not such a man that hath not attained the empty vain Title of a Doctor in the Universities. I confess ingeniously, that I never frequented the Universities, nor ever had a mind so to do; for should I have so done, haply I should never have arrived to that knowledge of Nature, which I mention without boasting, as I now possess; neither doth it ever repent me, that I have put my hands to the Coals, and have by the help of them penetrated into the knowledge of the Secrets of Nature; I do not desire to disturb any one in this way, or to thrust any out of their places; I never was willing to live on the costs of great men, but have with my own hands gotten me my Food and Raiment, alwaies advisedly thinking on that most known Verse; —*Alterius*

——*Alterius non ſit qui ſuus eſſe poteſt.*
Let not him anothers be,
Who can of himſelf live free.

But to return to my concentration of Wood, I can with truth affirm, and will experimentally demonſtrate it, that the greateſt Treaſure of the World; yea, as great or greater than is in Wine or Corn, lies hidden in Wood. VVine and Corn do require the Labour of Man for its growth out of the Earth; but Leaves, Graſs, Briars or Buſhes, Shrubs, Twigs, all ſorts of Trees great and ſmall, do come forth out of their ſeeds and ſprouts and grow up and encreaſe infinitely without any help of man at all.

Therefore I ſay that more profit may be reaped of VVood than of Corn and VVine, were the Art of extracting thencefrom ſo great a benefit but known to any.

So then, foraſmuch as this little Book (as being the firſt part of the Treatiſe of concentration of things) treats of the emendation of Vegetables only; and that of VVine and Corn is already finiſhed; I will now in the name of God ſet about VVood, Leaves, and Graſs, and lay open thoſe moſt great and hitherto hidden Treaſures and Riches, and ſet them forth before the Eyes of the whole VVorld. And I pray God, the Omnipotent, VViſe, Unſearchable and Merciful Lord and Father of all Creatures in Heaven, in the Earth, VVater and Air, that he would ſo govern and guide my hand that I may here write and teach nothing ſave only ſuch things as ſerve for the Glory of his Divine name and the health of all Mankind. *Amen.*

VVe have ſhewn in the two foregoing Chapters how VVine and Corn are to be condenſed into their Juices, that ſo they may be commodiouſly ſent into thoſe places, in which profit may be gotten.

Here now falls in this queſtion, How the Juices are to be ſqueezed out of Herbs, Twigs, Shrubs and great Trees, and being preſſed out what good they ſerve for, ſeeing they are not of uſe for meat and drink like thoſe which are extracted out of Corn and VVine.

To this queſtion I make this reply, that indeed there is not any food to be prepared from them, but that yet other things are thence preparable, and ſuch as men cannot be without, *viz.* VVholeſome Medicines, and likewiſe Gold and Silver wherewith a man may alſo buy, beſides VVine and Corn, other neceſſaries as Garments and other appurtenances which men ſtand in need of, beſides meat and drink.

But to begin the work it ſelf, we ſhould in the firſt place teach the way how Juices may be ſqueezed out of Leaves, Graſs, Shrubs, and then afterwards ſhew their uſe. But foraſmuch as none is of ſo weak a judgment as to lay out Moneys or things valuable, and to beſtow his labour and ſweat on ſuch a thing whoſe uſe and profit he is ignorant of; 'tis therefore neceſſary, that (before we come to teach the way of ſqueezing out the Juices) we firſt ſhew, what benefit and profit ariſeth from that kind of work; that ſo a Man's labour may not be ſpent in vain: To give ſatisfaction herein, I affirm, that the greateſt and beſt virtues of all Vegetables are hidden in a certain Salt which the Phyſicians and Philoſophers call the Eſſential Salt. Of this Salt all Vegetables are full, but yet, one fuller than another as experience teſtifies. Such Herbs as have not much taſte, as Lettuce, Coleworts, Rapes and ſuch like have a leſs portion thereof, and are therefore eaſily putrefied. But ſuch as are ſharp and bite the Tongue, as *Water-robbin*, *Arſmart*, *Laurel*, *Pepper-wort*, *Scurvy-graſs*, all the kinds of *Creſſes*, all the ſorts of *Radiſhes*, *Leeks*, *Onions*, *Garlick*, *Muſtard*, and ſuch like; alſo all bitter Herbs, as *Carduus benedictus*, *Wormwood*, *Fumitory*, *Eſula*, *&c.* all ſuch as theſe are full of it. Beſides, all ſuch Vegetable plants as are naturally ſour, yield much of that Salt; amongſt which, may be reckoned, unripe *Grapes*, ſour *Apples*, ſour *Cherries*, Wild *Plums*, rough (or wild) *Grapes*, the unripe *Mulberries* or *Black-berries*,) the unripe *Barberies*, *&c.* But yet ſome of them yield more, others leſs Salt; which inequality and changableneſs is accidental, for they are as to their natural foundation like each other.

NB. Some Herbs and chiefly thoſe which have a notable bitterneſs, as *Cardunsbenedictus*, *Wormwood*, *Fumitory*, do (after their being ſqueezed, and when their Juice is depurated, and the Phlegm draw off, and the remaining Juice concreted or condenſed in the cold,) yield natural Nitre, and ſuch as being put upon a burning Coal will preſently burn up in a flame, like the common Salt-petre which is uſually extracted out of the Earth digged in Stables, and ſo concreted, or cryſtallized): As for other Herbs and Fruits which are not bitter, but have a piercing ſharpneſs, as all the *Creſſes*, they (after their expreſſion or ſqueezing) yield a volatile Salt, which does not burn like that which is drawn out of bitter Herbs: Such as have an acidity in them, as *Sorrel*, *Barberries*, *Ribes*, curled *Grapes*, wild *Apples* and Orchard ones, and other unripe Fruits, do yield another Salt, *viz.* a Salt taſting like the acid taſte of Wine, and reſembling Tartar of Wine, in taſte, virtue, efficacy & propriety.

And now albeit that theſe three kinds of Salts are unlike in taſte, yet nowithſtanding the one is moſt eaſily tranſmuted into the other, inſomuch that Tartar may be made Salt-petre, and Salt-petre Tartar. The third ſort which is more volatile than the others, and which proceeds from the *Creſſes*, *Muſtard*, *Aron*, *Pepper-wort*, *&c.* will eaſily be turned into either of the former.

But as concerning this laſt, it is virtuous in Medicine, as I have hinted to you in ſeveral places in my other Writings, but (ſet aſide its Medicinal uſe) and it is of but little benefit. The two latter, *viz.* The Nitrous, and Tartarous are of various uſe. The Dyers uſe Tartar in Dying their Cloths, and Salt-petre is uſed to make Gun-powder withal, and for the Tranſmutation of Metals, and other ſuch like Arts, as I have clearly proved in my Explication of my *Miraculum Mundi*. Foraſmuch therefore as both ſorts of Salt are uſed in great quantity throughout the whole World, and that there can ſcarcely be had ſo much as ſerves for neceſſary uſe, and upon that account are always good Commodities, and that Salt-petre is twice the value of Tartar, therefore 'tis but fitting, and well worth while to extract Salt-petre out of the Juices of Herbs and Trees, it being of more value, and better price than other Salts. But if it ſhould ſo be, that there ſhould be ſo much Salt-petre as that it ſhould be of a poor price, then may the Juices be turned into Tartar. But foraſmuch as it will not eaſily ſo happen, that there ſhould be ſuch a glut of Salt-petre, it will be the beſt way, to improve thoſe Juices on the making of it; and ſpecially becauſe it may at all times ſerve for the profitable bettering of Metals; nor can ever ſo great a quantity be produced, but that it will ſometime ſell off. 'Tis more profitable, and better to uſe it for the bettering of the meaner Minerals than to make Gun-powder with it; and were not that moſt pernicious Art already too well known, it were better to be without it, than to make it, ſo far ſhould it be (from any one) to deſcribe the manner of making Gun-powder. But

But forasmuch as neither my desire nor will tends to be any occasioner of hurting my Neighbour by the help of Salt-petre, but inclines rather to benefit him thereby; and to this end I have already clearly enough discloſed many most profitable Arts which proceed therefrom, *viz.* in my *Miraculum Mundi*, and in the Explication of the same, and moreover shall do in the following third and fourth part of this Book, about the bettering and concentrating of Metals: I am, verily, confident, that none will interpret it in the worst part, if I shew the way of making Salt-petre out of Wood and other things; that so, our Country may by the benefit of (such) Herbs, Grass, and Wood, which otherwise, ly a rotting, and are of no profit, be enriched (if it be only sold) with abundance of Treasure, and may afterwards be spent on most profitable Arts, as may be seen in the *Miraculum Mundi*, and in the Concentration of Minerals and Metals. So that he that would not make it into Gun-powder, has no need so to do.

Besides these Virtues of Salt-petre which we have reckoned up, there do daily more and more new and admirable ones spring up out of the dark, all which, were they here to be summed up they would even draw the whole World into an admiration of them. But we will forbear to multiply more words concerning things of such moment; for it may easily be perceived from what has been hitherto demonstrated, and from those Publications I have made (by my Writings) that many more, and greater things lie hidden in this Subject, which neither I, nor others know of. Deservedly therefore may Salt-petre, or Nitre, be termed an Universal Subject, and Wonder of the World, notwithstanding many rude and unskilful Fellows, will upon this saying, shrink up their Noses, and audaciously contradict me (and say) that Nitre is not the true and Universal Dissolvent.

But if Nitre be not that Universal Subject, then let those that prate against this Judgment or Opinion of mine, produce another and better Subject; which, yet, in my Opinion they will never be able to do. If it were not an Universal Subject, how comes it to be so plentifully found to be in all things. Is it not found in all Vegetables? Is it not in all living Creatures that live either under the Earth, or in the Waters, or in the Air, or on the Earth? Is it not met with (or found) in the inmost Bowels of the Mountains, and even in the most hard Stones? I will demonstrate it in this small Treatise by most clear Arguments, and will most evidently evince it.

In the first place, that all Vegetables have it, is already clearly demonstrated and proved, for I my self (and I am the first, as I know of) made trial and turned their Juices into natural Salt-petre. But I will now so evidently shew the truth of this thing, that even those blind Back-biters and Detracters shall feel it with their hands.

In the first place therefore, I demand, whence the common Nitre is gotten? Is it not out of the Earth, which is digg'd out of the Stables where Beasts stand? For it has insinuated it self into (or joined it self with) this (Earth) passing out of the Excrements of the Beasts in length of time, and hath coagulated it self therein, out of which it is at length drawn by pouring on of water, and then is boiled up into Salt-petre. Who can deny this? I think no body can. So then if this be granted, that Nitre is found in the Stables where Cattle stand, the Question is, By what means, and way it came into the Stables? It is by the help of the Urine and Excrements which the Beasts have there cast forth. Then again, I ask whether or no those Beasts have those Excrements from their Meat and Drink, or from elsewhere? They cannot arise from water, forasmuch as they drink nothing but Water: So that they must necessarily have their rise from the food they eat, and that consists of the Vegetables, Grass, and Herbs. Therefore we affirm, that the Salt-petre was of necessity in these Herbs, and Grass, afore the Beasts feeding on them. For if it had not been there it could never have been made in the Beasts Bodies that which it was not afore. For their Stomachs contribute nothing to this Operation, save a bare putrefaction. And besides, the Countreymen do even the same thing, for they gather up Stubble, the Leaves that fall from the Trees, the Grass, and such like things, and put a great quantity of them into a Pit together, and there leave them so long, till by the help of Putrefaction they are all turned into Dung, and therewith do they afterwards Dung their Ground (in such wise) as is wont to be done with the Excrements of Beasts. Therefore, forasmuch as that putrefied Grass and Stubble doth dung the ground and render it fruitful, (as well) as the Excrements of Beasts, it must needs be granted, that they have likewise Salt-petre in them. For it is not the Dung, but the Nitre in the Dung, that is, the Author of that Dunging Impregnation and Fertility, as I have already confirmed by Arguments in my *Miraculum Mundi*, and which will be sufficiently convincing proofs here in this place.

I would therefore fain see that Man that dares be so bold and heady as to deny this thing, that the Essential Salt neither is, nor can be made, Nitre.

And now we come to treat of the Beasts in the Fields, of the Fish in the Waters, and of the Birds in the Air, that so by a thorough examination of all these sorts we may see, whether or no they are enriched with Salt-petre, and whether or no their Essential Salt be like the Essential Salt of the Vegetables, and can by the same means pass into Nitre.

In the first place, and above all, this is here to be considered, as a main principle, (*viz.*) That all those things which dung the Fields and Lands, and fatten them, most necessarily contain in them Salt-petre. For from this only, and alone, comes all the fertility throughout the whole Earth, which Axiome cannot be gainsayed. But now, that the Animals, or Beasts, Birds, and Fishes are Partakers of the same Virtues, I firmly gather from hence.

First of all, it is not unusual for the Gardiners to put the Horns, Hoofs, and Bones of Beasts, to the Roots of Trees, and so cover them over with Earth, and that on this account, because they make them exceeding fruitful. This now is every where used: Likewise the Gardiners do every where buy up Hens Feathers, Hens, and Pidgeons Dung; as also from the Tanners and Curriers the Offals or Shavings of the Beasts Skins, and their Hairs, and use them to enrich their Gardens. The Vine-dressers also buy up the shavings of Horns of the Comb-makers in many places where they can get them, by which, they fatten their Vines, far better than with Dung, and that lasts for nine or ten years. The Gardiners do likewise buy up from the Tailors, bits, or pieces of Woollen and Linen to dung their Gardens when they plant Colworts. If they did not find any Nitre, or Fertility in them, to what end would they lay out their Money on so base a Matter? To the Ignorant and

Unskilful, these things may seem wonderful and incredible, because such a kind of dunging Land is not every where in use. He that is incredulous, let him go to *Colen* on the *Rhine*, and there he'll find that I have spoken nothing but the truth. All these things do the Gardiners make use of according to their ancient custom, for from their Predecessors learned they these Secrets. Nor know they what other reason to alledge for their doing this, but only tell you, that they serve exceeding well to enrich their Fields and Vineyards.

But I do assuredly affirm, that 'tis the Nitre that is hidden in these things, performs this effect: There is therefore far more abundance of Salt-petre in the Superfluities (as Nails, Horns, Hair, *&c.*) than in their Excrements, or Dung. And I thus prove it.

First, Because they will give you for one Sack full of the Shavings of Horns, half an Imperial, which is as much as will buy four or five such sacks full of Cow, or Sheeps dung.

Secondly, They will give the Tanners, or Curriers, above an Imperial for one Cart-load of the Shavings of the Hides, whereas with the same Money they may buy three or four Load of dung. Rags are sold for a quarter of an Imperial. Were they not virtuous or effectual, why should they be so dear? This here spoken, we have proved so to be, by the customary practice of the common men only, as Husbandmen and Gardiners. Were it lawful for me to reveal somewhat to the purpose, I could teach how to extract out of every hundred weight of Bones, in Beasts, Birds, and Fishes, ten pound of Salt-petre. But this is not to be divulged.

Now it remains in the next place, to confirm, that Nitre does not only lie hidden most plenteously in the Vegetable and Animal Subjects, but that it may be digged, or gotten out, and prepar'd of Stones, Rocks, Cliffs, Hollows of Mountains, and out of the plain Field in a very many other places; and this is undeniable, for 'tis evidently known, and if need were, I could, for witness sake, make mention of many such Testimonies. He that is desirous of knowing more, as touching this salt of the Earth, let him peruse the ancient Philosophers. But forasmuch, as every one hath not those Books at hand, and that many Men cannot understand them, I will for Amplifications sake add yet one demonstration, to shew whence that Nitre ariseth, which sticks on to, or swells out of those moist and old Walls of Houses. Comes it not from the Mortar, with which the Bricks are joined together? Not only all *Stones* are fit for making Calx, or Lime of, but also all kinds of Stones, which break, or grow in the Waters, like Drops, or Pebbles: Likewise, those stony things which grow in the Sea, as Coral, the Pearl shells, or Mother of Pearl, and Shell-fish of all sorts, which being burnt, moulder in the Air, have in them plenty of Nitre, and will easily yield it forth to those who have the way of extracting it disclosed unto them. But this is not the place to mention it in, because I have determined to treat here, of only expressing the Juices of the Vegetables, concentrating them, and making them gainful or profitable.

Forasmuch as we have hitherto understood (or shewn) that Nitre or Salt-petre may be had from all things, *viz.* from Herbs, Wood, fourfooted Beasts and creeping Things, from Birds in the Air, and Fishes in the Water, yea from the very Elements themselves, as Earth, Water, Air, and Fire; It must needs follow that it is that so much spoken of Universal Spirit without which nothing can either be or live: It is the begetter and destroyer of all things; in which all things are, as I have demonstrated in my *Miraculum Mundi*, out of the most ancient Philosopher *Hermes*. I therefore hope, that no body will any more doubt thereof or oppose himself with a perverse stubbornness against a truth so manifestly known. Were not the shortness of time an impediment unto me I could most easily produce more arguments and those too more pregnant. If any one is minded firmly to cleave to his own stubborn perverseness, even *Hermes* himself should he arise from the dead, would lose his Labour in teaching him; and therefore let them keep their contumacy to themselves.

We have sufficiently confirmed and that by arguments enough, that Salt-petre is an universal Subject, and every where to be found. Hence it may be easily believed that it may also be met with in woods, and that more strong, more powerful, more corporal, palpable, and visible than in any other Subject: Upon this account therefore is it to be also sought for, and drawn forth out of them too. But forasmuch as such an Extraction cannot be made afore that the Juices are prest out of the Wood, out of which Juices the Nitre is to be drawn forth, the whole Art consists in squeezing out these Juices, but yet by another kind of way than is done with Herbs. Therefore the due Presses being fitted ready, I shall be able to shew him who requesteth it at my hands (so as he does not endamage me) the way of squeezing them. For to prostrate a work of such great moment to every ones view, whereby those that are unworthy, should partake of such great Secrets, and by which a thing of so much value should be obnoxious to a common Abuse, is not verily, either necessary, profitable, or laudable. Let not any one therefore take it amiss, that I have so careful a regard of things so considerable. Let it suffice, that I have detected the thing, wherein such great Treasures have hidden themselves, which hitherto are profitable to no body, but are easily acquirable, or to be had. Do but look a little upon those most vast Woods of *Germany*, which are stored with such mighty abundance of Trees, that wood is of no account. There hath been none as yet that has converted them unto their use, save a few, who in some places make Pot-ashes of the wood they burn; and yet they have but small gains therefrom, because they can't have vent sufficient for as much as they could make by their burning the wood, nor do any use them, but Soap-boilers, and Dyers.

Besides, I never as yet saw the Man that duly attempted that Artifice, and so administred it as to get therefrom a greater gain. For sometimes they gather scarce an hundred weight of Pot-ashes out of the burning of ten or twenty great Trees, and they can hardly have above five or six Imperials for it. And now consider but the great Labour and Sweat in burning so much Wood into Ashes, and of boiling the Ashes into a black Salt, and then of making this Salt red hot in peculiar Furnaces, that it may become white, green, or blueish; all this consider'd, 'twould make a Man admire what 'tis that could stir up those that follow this work, or order it to be done, to suffer such a quantity of Trees to be burnt up, for so very little profit. But what need many words? They have the wood for nothing, and (as the Proverb runs) *The half White of the Egg, is better than the empty shell.* Haply if they knew how to make any thing better, or more profitable out of their Wood, they would not omit so to do.

How many hundred weight of wood, are they to burn

burn afore they have one hundred of Pot-ashes? But now if the Juices that are squeez'd out of them were boiled into Salt-petre, they would get ten times the profit with far less trouble.

Let us compute the case, and suppose that out of an hundred pounds of Wood, there are squeezed forth twenty pounds of Juice, and that from these twenty pounds of Juice, you have some 4 or 5 pounds of Nitre, and that a midling Oak or Beach will load, when cleft, some ten Carts, and each load hold twenty hundred weight. Now then, one hundred yielding five pound of Nitre, a load of twenty hundred, yields an hundred pound of Nitre; the Tree that is about ten load, yields a thousand weight.

Now we'll put case that a hundred weight of Nitre yields twenty Imperials, which being ten times multiplyed, makes two hundred Imperials for ten loads, or for that one Tree divided into ten loads.

But to wave so accurate a computation, and not to extend it too far, we will suppose a hundred of Wood to hold only three pound of Nitre, and a load to be about twenty hundred of Wood; this load will yield Sixty pounds of Niter, and the Tree ten loads, so there will be Six hundred pounds of Niter. If now one hundred (of Nitre) will cost ten Imperials, that Tree will yield sixty Imperials for the six hundred pounds of Nitre. The smallness of the cost (in making it) makes the labour the more profitable; nay, if by this invention of mine, the price of Nitre should fall down, even to ten Imperials (which notwithstanding, will not so easily come to pass) yet would the gain thereby be great, yea ten times more than that which comes from the Pot-ashes. But he that knows how to use this Nitre, for the concentrating of Metals, (concerning which the three following parts of this Book shall treat) will not have any cause of fear, that this Nitre will lie on his hands and yield him no profit.

By what hath been said, the well-minded Reader will easily perceive what vast treasures are oft-times before his eyes, and through ignorance lie as yet unknown, and not used to advantage. What man knows God's end, in producing to light such great Mysteries and Secrets of Nature, in this most filthy Dregs of the World? To give thereof a Reason, we will not tire our understanding, but give most humble thanks to God for such great mysteries that he hath revealed for the comfort of many men, and will pray unto him graciously to bestow on us his fatherly blessing, to the end that we may well use such great gifts so freely bestowed.

But now if any should be of the mind that it is wholly unnecessary, that this Art should be made publickly known, because that Gun-powder is made of Salt-petre, and that by Gun-powder many Cities and most strong holds are overthrown, and nothing is to be expected thencefrom, but Slaughters and Destruction: To such, I answer, That it was not for this end that I disclosed this most great and most profitable Art, that by its base abuse I might help on these horrid Calamities; but my aims have been chiefly at this, if haply any new Foreign Enemies should invade our most dear Country (which is a danger we seem not far off from) we might be able to receive them with like Arms or VVeapons, and by a just defence drive away such a Calamity.

And withal, that those most thick and vast VVoods being despoiled of their thickness, may not for the time to come be a shelter fot Thieves and Robbers, as likewise for wild beasts, all which oftentimes do much mischief.

And farther, That many thousands of Men may get their Food and Rayment more Commodiously and more easily, and may make good Gold and Silver from the unprofitable VVood. For by means of this Art, thousands of moneys may be gotten in our *German* Countries, without any hurt to our Neighbour. Nor is it needful to cut down any great Tree, for the superfluous Branches or Loppings, and the shrubby briary Underwood which is all about the Trees, and doth chiefly afford a passage to the Stags, and hiding places to other hurtful Creatures, will be sufficient for this kind of use or imployment.

The other Trees that grow up aloft may be preserved to build Houses withal, which may be employed about Hunting: And besides, when the Trees are freed from that thickness, and have thereby a free access of Air, they will the more easily dilate their Boughs, and grow up taller. And then too, those wild Beasts that are profitable, will (when such vast deal of underwood or shrubbiness is taken away) meet with fatter pasture, and with more plenty of Grass, and escape by having a freer Course from the pursuing VVoolves, which now they are letted from by those most thick Shrubs and Bushes. But yet if so be that in such places in which is such a deal of VVood, and to no man useful; a good part even of the great Trees should likewise be cut down, and used about this Artifice of ours; yet notwithstanding there would not arise to the Possessors thereof any loss, but much Profit; and when all's done, there would be yet remaining a huge multitude of Trees. Consider I pray those most spacious VVoods the *Arduenne*, *Ottonick*, *Semane*, and *Bohemian* VVoods, and many others which the Countries in *Germany* are cloathed (or environed) with.

Can it be imagined, that they can at all be lessened by the Glass Furnaces, or the melting of Minerals and Metals.

These places that are one year bared by cutting down the Trees, you shall see in few years covered over again, by the benefit of nature, with new Trees; so that it cannot possibly be, that though even a very great many Presses should be used to press the Juices out; such a vast immensness of Woods should be exhausted, and make any sensible diminution of the Wood.

But now, if any one shall believe these writings of mine, and shall, after the afore-mentioned way, set about the Concentration of Wine, or Corn, or Wood; I do faithfully affirm unto him, that I have in this Book openly proposed the very naked Truth, without any dissimulation, and have not omitted any thing save the revealing of the Presses, which for certain causes I conceal.

And therefore I certifie every one, that I will not as yet divulge this most wonderful secret, of thus-boiling Nitre out of the Juices of Wood, or else I would have described the Press too. Besides, though a man should even see the Press, and know how to make it, and were ignorant of the purification and concentration of the Juices, he would not bring the Art to effect; so that, without my instruction, the work cannot so easily be made publickly known. And though this seems to be a thing so mean, yet this squeezing out of the Juices of Wood, is far beyond (or richer) than the operations on VVine or Corn. But I doubt not but that many, well considering of this unheard of, and very gainful Artifice, will begin to think whether or no good Nitre may not likewise be gotten out of other Subjects easie to come by. Now then I must methinks needs instruct these. The

The common Fossile Salt, and Sea Salt may by the benefit of this Art, be also turned into Natural Nitre; but I judge it needless to speak more of this, for as much as that which I have already mentioned concering the Wood seems abundantly enough. Breifly, God doth in all places set before our eyes His Omnipotency, where he gives not VVood, there vouchsafes He Stones and Bones, out of which Nitre may as well be extracted, by those that are skill'd in this Art, as it may out of other things. And where Fire is wanting, there is VVater however. But I know that it is certain, and past all doubt, that by the certain experience of Art, plenty of good Nitre may be made out of Sea Water.

Now if any shall object and say; Thou affirmest that Nitre is to be found in all places of the VVorld, but especially in Wood and Stones; but yet, that there are many places which have neither VVood or Stones, & have only a Marshy Moorish Soil, which brings forth Grass only: By what means can Nitre be there, or in what things, or what places should it be sought for, thinkest thou there?

I answer; I have already, in what hath been said afore, confirmed, that Nitre may be drawn in large quantity even out of Grass; but verily there's no such need here of so doing, to rob the beasts of their food, and to use the Grass about Nitre-making: For the Cheese and Butter that come from the Grass, will easily yield more than the Nitre that's made thereof, would; God deals not so unjustly or unwisely with the Creatures as to give his blessings with a liberal hand to one, and take the same away from another: No, no; The Treasure of his Riches is inexhaustible, and he gives his Creatures largely to partake of them; nor doth that axiome (or maxime) which is so very usual in this perverse World, prevail at all with him, *viz.* The fall of one is the rise of another; but his will is, that all should have their necessaries abundantly supplyed, that every one should have enough, and that every thing should come to perfection. Therefore it is not at all necessary, that Nitre should be extracted out of the Food which the Beasts live on, because it may easily be extracted out of other Subjects which which bring not any profit to Man or Beast, and this in great quantity too. For in such plain low Countries and moist watery grounds, where you shall not meet with either Mountains or Vallies, or Stones, or Wood: The most gracious God hath, like a provident and wise housholder provided for the inhabitants, giving them a certain kind of earth inlaid with many Roots and Fibers that grow therein, which the *Dutch* call Torf, we *Turfs*, the which they use instead of Woods, to boil with, and about other necessary uses; so that they may easily be without the wood, which is yearly brought them in such vast quantity out of other Countries. Now these same Turfs contain in them the like Essential Salt as Wood does which Nitre is extracted out of.

As concerning Stones, they do not in those places shew themselves to sight (as lying deep) if you except such as are burnt (or Bricks) and which are brought hither to build houses withal, yet God hath bestowed on them a matter sufficiently apt to make Lime withal, so that they may be without, even Stones themselves. The Shell-fishes of all Sorts (serve to this work), and sometimes the raging of the Sea, drives the Fishes shells ashore by heaps, and like little hills, the which being carryed by the Inhabitants into the Cities and Villages, they put them in the Lime-Kilns, and reduce them by a strong fire into good Lime, and that by means of the Turfy fireing we mentioned but now; so that I do not see any reason why, in these Countries that are destitute of Wood and Stones, there should be found less Salt-petre than in others, in which huge quantities both of Wood and Stone are found. Nay, rather I affirm, that there is more there, than is in almost any Country of *Europe*; for do but compare the price of Turf and Wood, the Wood is dearer, the other cheaper; besides the Wood is harder to press out, and this yields its juice more easily.

So then, from all the foregoing demonstrations I absolutely conclude, that there is not any place in the whole World, wherein great quantities of Salt-petre may not be made.

And if I should say, that there is not to be found in the whole world any places in which Nitre may be easier and plentifullier made than in the low Countries of *Germany*, as *Brabant*, *Holland*, *Zealand*, *Flanders*, *Friesland*, the *Groningen Fields*, the County of *Emdane*, and all those Countries which run as far as the *German* and *Baltick* Sea, in this their moorish kind of ground; verily I should not speak untruth, but if need were, I could witness it of a certainty.

But lest my Writings should remain too obscure and unknown to such as are unskilled, and that such may not overmuch torment their Brains by unnecessary Pleadings how this may be effected, I judge it altogether necessary openly to confess the Truth before every one, and say, That Nitre or Salt-petre, were but its true use known, is justly and worthily to be accounted of as the greatest Treasure of the whole world, as being a thing by the help of which, good Health, Honours, and Riches may be purchased; and this we shall confirm in the three following parts. If then that this be granted, then this also will be yielded too, that the Subject-matter out of which it is extracted, is not to be despised, but to be highly valued; and therefore ought Wood and Turf to have their due Honour given them, concerning which, I have by many Arguments affirmed, that the one of them is every where in the upper *Germany* in great plenty, and the other in the low Countries of *Germany*, (nor doth these at all come short of the others) and that both may and ought to yield Nitre. Besides, not only the bare Turf is hereto useful, but likewise the hitherto thrown-away ashes, which are every where cast out as unprofitable.

NB. They are not useful in washing, as wood-ashes, with which the Laundresses make Lyes, and being they are not, they are thrown away as good for nought. But yet there is in them a great quantity of a certain salt, which being inverted by Art, passeth into Nitre; therefore through meer ignorance is there cast away, together with those Turfy ashes, a vast quantity of unripe Salt-petre, from whence a mighty profit might redound to those Countries, but being improvidently thrown away, is meerly lost. But yet I would not have any imagine, that the Salt which is made of the Lee of Turf-ashes, is presently Salt-petre; no, for 'tis needful that the subtilty of Art be first thereto used, afore such a Salt be brought to that pass, as to burn like Salt-petre: But yet care is to be taken, that that Art become not common, for then so Noble a thing, and so profitable to our Countries, will be known by Enemies as well as Friends; which to prevent, it must be warily handled, and the principal work here requisite is this, *viz.* That it may not be published so imprudently, as to render the ungrateful and unworthy partakers of the same, as well as the thankful and worthy ones.

By these things here spoken may every one see and gather, that God is no respecter of Kingdoms and Principalities, and provides for some better than for other some; all Men are His Creatures and Heirs of all His

Goods

Goods, if so be they be but willing, and do not stubbornly oppose and slight the Divine Grace, and do not wantonly cast it away and neglect it: Concerning which we shall speak more in the following part, touching the Concentration of Minerals.

This we must yet farther add, *viz.* That common Salt-Nitre is in all Coasts, in all Tracts or Continents, and in all Countries; yea, even in all those places in which there's neither Wood, nor Stones, nor Leaves, nor Grass, nor Earth, nor any bottom of Earth: As for example; Near *Greenland*, where the Sea is said to have no bottom, where the Whales are caught, and which do greatly inrich the Merchants with their fat or oil: Did they but know, that the remaining Flesh and Bones were even yet of great use, and knew they but how to turn them into Salt-petre, they would preferr it far before their Fat, for the sake of which, so much labour and trouble is undertaken; for in the flesh of one Whale only (which as it is, is not at all profitable to any man) I dare say, that there may be found 20, 30, 40, 50, yea, sometimes 100 Centenaries, or hundreds weight of Salt-petre. And so likewise the Intrails of the dried Stock-fish that are caught in *Island* and *Norway*, should I affirm, that they would even almost excel the Fish it self in value, I should not be deceived. I find no difficulty that might hinder me from affirming this to be agreeable to the Truth.

Do not the Salt-petre-men preferr the Nitrous Earth that's found in old burying places (if they can have it) far beyond other Nitrous Earths? And this among others, that most excellent Examiner of Metals, *Lazarus Ercker*, in his Book of examining of Metals, affirms, and gives this Earth the chiefest place. Nor is it to be wondered at, that of late in *Poland*, towards *Muscovy*, where formerly great Battels have been, and many thousands of men slain, and by reason of the multitude of them, have (after the Battel) been thrown into deep Caverns of Mountains for the easier burying them) there hath been a great quantity of Salt-petre extracted out of the Earth. Were there not gain and profit to be gotten, those men that are imployed in the extracting and boiling it, would not lay out so much Money on unprofitable Ashes of Carcases.

But to pass this by, let any one make but this Experiment: Fill some Vessel with Bulls or Ox-blood, and put it in a warm place till it putrefie and be turned as it were into Earth; then extract a Lye out of this Earth, and boil it so long, till a little skin appear on the top, then lay it by in a cold place, to shoot into Crystals, or little Stones, and these will be true Nitre.

NB. There is another and more compendious way of extracting Salt-petre out of the blood of Animals, which belongs not to this place to treat of; let us but compute the account a little. If there are yearly kill'd in some great City some ten thousand Oxen, besides Calves, Hogs, Sheep, and Goats, and the blood be cast away as unprofitable, [*now an hundred weight of blood yields some* 5, 6, 7, *or* 8 *pound, or more, of Nitre.*] the question is, How many Hundreds of Salt petre is lost? That this may be the more clearly evidenced, *viz.* That there is much Salt-petre in all Beasts, Fishes, and Birds, take another Experiment: Let a Beast, Bird, or Fish be laid in some warm place, where no Rain comes, to putrefie, out of the Carcass there will come Worms; of these Worms or Maggots take about one pound, more or less, put them in a Glass with a narrow neck, stop the glass with Paper only, and set it at the Sun, but not too hot, and in a few daies the worms or maggots will be turned into water; then pour out this water into a Copper Vessel tinn'd over, clarify it with the whites of Eggs, as Vegetable juices are wont to be clarified; then evaporate the clarified Juice, by little and little, by decoction, till it be covered over with a skin; as we have taught you in the Vegetable Juices; then set it by in a cold Cellar, and there will shoot good and natural Nitre, but especially if that Liquor shall have stood a while afore in the air.

The self-same Experiment may any one make with other Vermin that arise from Flesh or Cheese, and he shall find that even living Creatures have Salt-petre in them: so then there is nothing to be found, wherein that Universal salt of the World is not seen to be; but in some the salt doth sooner put on a *Salt-petre* nature, and in others it is already made *Salt-petre* by Nature.

Let this serve as an example, *viz.* The Essential or Universal salt of Vegetables, Animals, & Minerals, is indeed in its own nature nitrous, but it does not conceive any flame afore it has attracted life and flame from the Air. Further, one salt attracts that Life sooner and willinglier than another does, according as it is by Nature framed. By how much the more volatile and urinous the salts are, so much the sooner do they change themselves into Nitre; and by how much the more biting and more corrosive, so much the more difficultly and slowly do they put on the nature of *Salt-petre*. But because Nitre is a salt that partakes of both natures, *viz.* of a Urinous and Corrosive Nature, and is compounded as it were of both a Urinous and a Corrosive Salt, therefore by the help thereof one skill'd in Nature may easily help the salts, and make of them whatsoever he pleaseth. Nor is there in the nature of things any salt, but may by the help of Art be turned into Nitre; but especially those salts which are sublimed by fire, and are elevated by the force thereof; as likewise those that are in the Urine and Excrements of all Animals; yea more, Animals, Vegetables, and Minerals themselves do easily assume the nature of Nitre: This now is the first degree of salts. Another degree of salts are those that are somewhat fixer, (as the Sons of Art call them) and are such as are left in the fire, from Vegetables, Animals, and Minerals: These do more hardly pass into the nature of Nitre; but the hardest of all, are those salts which are in the third degree, as common salt, Sea-salt, Mountain or Fossile salt, Alume and Vitriol; for by Art are even these brought to that state, as to pass into true Nitre, but harder than the former, for they need a longer time for transmutation, than the abovenamed flying, volatile, and urinous salts. And therefore I would not have any of you to opinionate, that when I say in my Writings, that this or that salt may be converted into *Salt-petre*, assoon as ever it is extracted out of the *Lixivium*, or by barely calcining with fire, that (I say) it should presently be true burning *Salt-petre*; no, there is a yet farther time thereto required, whereto it may attract its life and soul out of the Air, and become burning or inflamable.

Every common *Barber* and mean-pated fellow, knows that the most *Salt-petre* hitherto made, hath been boiled out of a Lee, drawn out of the Earth taken out of old stables, wherein Sheep and other beasts have stood. And why, I pray, out of the old standing places of Sheep, Oxen, and the like Cattel, and not likewise out of the new? It is on this account, because old Stables do not only in *long* Process of time imbibe more salt out of the Excrements and Urine, and consequently yield more Salt-petre; but also those very salts (that come from the Excrements of the beasts) and which is the main thing, have in long process of time received their soul or life from the air, which new salts have not as yet attained unto: For

let any one boil, and try his concluſions on the freſh Dung and Urine of Animals, as much as he liſt, they will never become Nitre, unleſs they draw their Life out of the Air. Let any one take ſome good Salt-petre, and mix it with Earth, and deſtil off the Spirit in a Retort, there will come over into the Receiver ſuch a ſharp and corroding water, as will diſſolve Metals, Stones, and all other even the hardeſt Mercurial Bodies, and yet the Salt-petre was not corroſive before, but it hath gotten that degree of corroſivity from the fire's operation. Contrariwiſe, let ſome good Salt Nitre be taken, and be calcined in a Crucible, with burning Coals or ſuch-like other matters as will burn or calcine it: By this operation it will be changed into a very fiery and fixt Salt, but not ſo corroſive, and thus it will diſſolve all Fat, Oils, Greaſes, and ſulphureous Bodies, which thing the former corroſive Spirit will not do; for ſuch bodies as are diſſolveable by this fixt and urinous Salt, the former acid Spirit leaves them untouch'd; and on the other hand, it will diſſolve thoſe bodies which cannot be diſſolved by the fixt Salt, and yet are they both extracted out of one and the ſame Subject, by the help of the fire. Hence may it eaſily be conjectured, that this is an Hermaphroditical Salt, and partakes of both natures, ſeeing it puts on both (or either) of them; for the Philoſophical Maxim witneſſeth, that every thing hath its Original out of that into which it can be changed and reſolved.

Now when I pour the acid Spirit that deſtilled over into the Receiver on that fixt Salt again, they are both of them diveſted of their nature and property; the Spirit loſeth his ſharpneſs and acidity, and the fixt ſalt puts off its fiery nature, and ſo they both become again an Hermaphroditical Salt, but yet not preſently, but 'tis neceſſary to allow them ſome time of ſtanding together in the Air, whereby they may receive that life and that burning nature which the Fire hath deprived them of. But yet notwithſtanding, this comes ſooner to paſs in this, than in other contrary ſubjects, becauſe theſe two Contraries have heretofore already been one Salt-petre; for ſuch as never have been Nitre, but are hereafter to be ſo, require a longer abode in the Air. Theſe inſtructions we give to thoſe that might haply think that Salts may be animated without the help of the Air.

And now, that I may perfectly demonſtrate that Salts do get their life out of the air, without any encreaſing in weight thereby, and not from elſewhere, I will give you this following example. Take 1 *l.* of Honey or Sugar, and let it be diſſolved in ten pounds of Water, and let this Water be ſet for ſome weeks in a warm air, the Honey or Sugar will be as a magnet to this Water, and will by attracting a life out of the air turn it into ſharp Vinegar, and that without any thing at all encreaſing the weight of the ſame. By this means Water, by the addition of Honey, Sugar, Malt, or any other Vegetable Juice, will, by the operation of the hidden and attracting eſſential Salt, paſs together with it into excellent Vinegar. But now ſome or other may imagine that the Honey, or the juice of the Fruit and Corn, have in them an hidden acidity, which by the help of the warm encompaſſing air, hath revealed it ſelf, and ſo did not attract its birth out of the air: But I will ſhew you the contrary, as follows: Take a pound of Honey, Sugar, or ſome other Vegetable Juice, and force it over in a Retort into a Receiver, and you will find that there will deſtil over 10 or 12 lots (or half ounces) of inſipid Water, and ſo many of acid water; the remainder is a dead aſhes, and have nothing in them; the Vinegar and Phlegm that aſcended, will not yield one pound of Liquor, and the Vinegar it ſelf, with its acidity, will ſcarce be ſo ſtrong in taſte as thoſe ten pounds of water that are turned into Vinegar by the air.

This now demonſtrates, that there was not in the Honey any more acidity than what was thence drawn out by the help of deſtillation, for the remaining aſhes have not any taſte at all. But put caſe that the acidity which is driven out of the Retort into the Receiver by the force of Fire, ſhould be as ſharp as *Aq. fortis*, (when as tho' it is ſcarce as ſowre as Vinegar) yet would it hardly make ten pounds of Water ſo acid as to be compared with the other which is made by the eſſential Salt and the Air; ſo that it is evident that the acidity (as being a life) is drawn by the Magnetick Virtue of the Honey out of the air.

But as touching this Eſſential Salt of Vegetables, its being a Magnet, to extract an acetous ſpirit out of the air, and communicate it to the dead water. You are here well to obſerve, that the univerſal ſpirit or ſoul of the World may be drawn out of the Air many and ſundry waies. In the aforementioned Example of Vinegar is a ſpirit extracted, which is fit for the converting of Vegetable Liquors into Vinegar. In Hermaphroditical ſalts, the Univerſal Nitrous ſpirit becomes burning, as in Wine, Ale, and Metheglin. All theſe are ſo made by the means of air, without which no Wine or Ale can ferment, and without fermentation it is impoſſible for a burning ſpirit to be generated; which ſaid ſpirit is eaſily afterwards turned into Vinegar, and this Vinegar into Nitre, and this Nitre again into a burning Spirit or Vinegar; for every Life is of one and the ſame original, and may by the benefit of Art be changed out of one nature or property into another.

So likewiſe the ſame is to be underſtood in the generation of Salt-petre, all Salts of Animals, Vegetables, and Minerals are dead, afore they get themſelves a life after a magnetical manner out of the Air, and be made into Salt-petre; for amongſt all ſalts, none deſerve to be called a *Live Salt*, but that one of *Salt-petre*, which by the Philoſophers is called the *Watchful Dragon*, which likewiſe at the beginning was dead, but hath got himſelf a Life out of the air. By all which it is moſt clearly manifeſt, that the life of all things ariſeth out of the air, and that thoſe Creatures which come not into the air want Life, and that ſuch things as already have life, are choak'd and die if the air be taken from them. Hence comes the death of all things, by a ſuppreſſing or taking away of air, (in which air the Life of all things conſiſts) what way ſoever it be done by, as the aforeſaid example of the Vinegar teacheth; for if Honey or Sugar were not made thin with Water, there would never have hapned that changing into Vinegar. So likewiſe *Grapes*, *Apples*, *Pears*, *Barley*, *Oats*, *Wheat*, were they not moiſtened with water, but remained dry, they never would get the nature and property of Vinegar, and that for this reaſon, becauſe the air could never infuſe its life into a dry and ſhut-up body.

This they well know who are imployed in making a quantity of Vinegar; and upon this account do they in Summer time ſet their Veſſels open to the Sun, and in the Winter, they keep them in warm ſtoves near the fire, and both afore and behind, and at the bottom do they make holes to give the Air entrance, that ſo they might the ſpeedilier promote the changing of the Wine, Ale and Metheglin into Vinegar.

They likewiſe know this too, that even ſtrong Vinegar

negar if it be a long time shut and kept from Air, corrupts and dies. The which thing, seeing it is to be as well understood of other Subjects, as of these here, *viz.* Salt-petre and Vinegar, we may affirm thus much, That by how much the more of warm Air comes to the Wine or Ale, so much the sooner will they pass into Vinegar. And by how much the more of warm Air the Salts draw, so much the speedier will they draw a Life thereout-of, and put on themselves the nature and property of Salt-petre. This is the reason why the Salt-petre boilers do sometimes turn or dig up the Earth from whence they have had Salt-petre, and moisten it with water, that so the Air may the more commodiously penetrate that Earth by its operation, and infuse Nitre thereinto. But yet this business goes slowly on, and may be compared with that where a man presseth out Grapes or Apples a little, and then exposeth those Reliques of the press'd Grapes or Apples to the Air, or else grinds Malt somewhat grosly and moistens it with water and so sets it by that it may be endued with the nature and virtues of Vinegar: It would indeed come to pass, but yet much slower than if Wine, Ale, or other Drinks were set by so, without the huskiness or bran: The same is to be observed in the making of Salt-petre. By how much the more, the Air toucheth the Salts, so much the speedier will it reduce them into living Nitre. This may be seen in old walls that are built in moist places, you see how the Lime sprouts out and is converted into Salt-petre. We see not the same thing done in the inside of the wall, where the Air can cannot penetrate into it. Hence know I of a truth, that it is not the husks of the Grapes, nor the husks or bran of the Corn grows sour, but it is the thin Juice or Liquor that is either pressed out of them, or extracted with water. And I likewise see that 'tis not the Ashes, nor Calx vive, nor the like calcined things that becomes Nitre, but only the Salt that is hidden in them. Therefore seeing that all calcined things being moistned with water and for a long time exposed to the warm Air do extract a Life and become Salt-petre, and that the Ashes and Calx are like a dead Earth and never yield Salt-petre, but remain a dead Earth. Likewise, forasmuch as such Earth doth not at all conferr ought to the generation and making of Salt-petre, but is rather every where an hindrance thereunto, whereby the Air cannot associate it self to the Salt; therefore do I separate the earth, body, shell, and useless garment, and keep the Salt, and I introvert it by the Air and turn it into Salt-nitre, but yet not without the addition of Water, in which the Salt is dissolved and rendred more fit for extracting a Life out of the Air; for otherwise should the Salt remain dry this transmutation would be a tedious while a bringing to the desired end.

If therefore the Salts that are prepared by the fire are dissolved in water, and the water be together with it kept by peculiar Instruments in perpetual motion, and some heat be also thereto adjoined, so that there be not the least Atoms of the Salts to be found which have not the unceasant penetration of the warm air, and which are not animated, (because the warm air and motion do in all places touch and vivify the Salts): Such an operation as this does more in four Weeks, than if the Salt lay in the heaped up Earth and open to the air (far longer) wherein it would not in a whole years time attain to so great a change. But this perpetual agitation and heating consisteth in a certain wooden Instrument which may of its own accord by an unceasing motion heat the Salt-water, so as that every Week a growing alteration may be evidently seen and perceived. It is not of any great charge, and one may get ready as many Vessels to be filled with Salt-water to make Salt-petre with (as he pleaseth) for one Man can manage an hundred of them or more and conserve them in continual heat and motion, so that a Man may keep such an Art secret as long as he pleaseth. And as concerning the ordering the salt by the help of the fire and getting it a magnetick and attractive faculty afore it be dissolved in water to be put into the Vessels; and also how the Vessels are to be prepared, this cannot be conveniently declared in writing, but it is expedient that as well the manual operations requisite for the endowing of salt with a magnetick faculty, as the Instruments necessary for the turning it into Salt-petre be also well lookt into, with all the appurtenances thereto belonging. Any one will easily comprehend them all, and be able to imitate them; yea far easier than any gross or great work, and it may be improved in any subject whatever. It is not any sordid kind of operation, but pure and clean, it needs not any making of Lixiviums, nor any decoction, nor any evaporation, but perfecteth it self without impediment or retarding the work, and coagulates the Salt into Nitre. Verily it is a most delicate and most profitable invention, from which many others may have a beginning and flow.

Thus have we declared and proved that the soul of the World vivifying dead salts, and turning them into Salt-petre, adds not unto them either weight or encrease, and yet nevertheless it is of such abundant efficacy and power as to reduce them all to Life, which Life is no other thing but the little Bird of *Hermes*, and easily admits of being esteemed for the most noble amongst all the Creatures GOD hath made, set aside but the soul of Man, and may by the help of Art be again extracted out of the Salt-petre. But that I may mention the thing more openly and more clearly; I say, that the salts must (by the help of Fire and Art) first get a magnetick and attractive power and faculty afore they can draw a Life out of the air. Now then, after that the universal Life of the World is caught and fettered as it were by the salts, and hath turned the dead salts into living nitre, yet that life lies hidden in that Salt-petre invisibly, and can but a little or scarce any thing at all shew out or dispay its virtues by reason of the Grois body of the salt.

NB. If so be that any one shall but know how to draw out this Life again out of the Nitre, and bring it into a body, and make it visible, he shall have a thing so admirable that he'll scarce find the like (as I believe) in all natural things. For there is such a sweet and red Liquor, as to sight, thence had, that one only small drop will tinge a thousand parts of water with a Golden colour: which (said Liquor) I have not as yet brought to a constant or fixed Medicine, but do make use of it in Medicine (as it is) and I find in it things wonderful. But this little Bird (as far as I know) cannot be again extracted out of the Nitre by any other subject than with a net artificially prepared of Sheeps-skins.

Such a worthy thing as this is, do I rank in the number of great secrets and mysteries, and I suppose it to be that work which the knowledge-desiring *Jason*, being holpen by *Medea* who was most skilful in the Chymical Art, took away from the Dragon, and called it the Golden Fleece: But I would not have any one perswade himself that I speak here of such a Tincture as is extracted out of fixt Nitre (and likewise the same is extractable out of Salt of Tartar) by Spi-

rit

rit of VVine. No, that is no true Tincture, but the Spirit of Wine is somewhat altered and tinged by the fixt salt. But that Liquor of mine is the true, occult, and inmost Tincture, Virtue, and Life of the Nitre, and is of a golden Nature, but plainly flying and volatile, one drop whereof doth so gild an whole Imperial, as if it were gilt over with Ducket Gold. This Tincture cannot be changed or altered by any contrary Menstruum, be it Corrosive or Urinous, no nor by *Aqua-fortis*, or Liquor of Salt of Tartar; the like of which is scarce to be found in all nature.

For if there be a most delicate colour drawn out of the Vegetables, as Cochenele, Saffron, and such like, by the help of the Spirit of Wine, and there be dropt therein but one only drop of *Aqua-fortis*, the colour will presently turn pale, and if you add more, it will vanish for altogether. Or else if a drop of the Liquor of Salt of Tartar should be put therein, it would presently change colour and become duskyish. But now, this true Tincture of Nitre, or Soul of the World suffers not any change from either of the contraries. And should one have even a metallick Tincture, or extract even from Gold it self, yet would it not stand in this tryal, but would be precipitated either by the acid or the fixt salt, and separate from the Menstruums. But ours doth constantly abide in every trial, and resists both the contraries.

I do therefore repeat what I have often said, that there is more lies hidden in Nitre than many thousands of Men can perswade themselves of. But because it is so vile and abject a thing, no body thinks that there lies hidden any thing of good therein. But do but read the chiefest of the Philosophers, and you shall therein find that they do enigmatically point at Nitre, and do call it the Dragon which is to be slain by its Brother or Sister afore it parts with its Treasure; But enough of this.

The things hitherto mentioned, have I produced for this end, that my Neighbour may be the better certified concerning them. All the Philosophers Books are full of this thing, amongst whom, *Hermes*, and *Basil Valentine* excel, who have written most clearly. *Paracelsus* saith openly, Alchimy hath found it in Nitre. The late Philosopher *Nuisment*, hath published a Treatise of the Salt and Spirit of the World, and is verily most worthy the reading, which (said Book) I commend to the Reader that studies these things. Therefore do I here again repeat what I have so oft reiterated, *viz.* That Salt-petre is the most admirable, the most excellent, and the most powerful Subject of the whole World, whose wonderful properties cannot be enough search'd into. But because it hath its rise from dung and putrid rotten things the greatest company of foolish ones do despise it, but the small company of Philosophers and Wise-men (who are those that know what admirable virtues it has) do most highly esteem it, and set thereon a great value. The well disposed Reader will clearly find more as to its virtue and efficacy, in the three following parts.

O thou the original of all good things, and Treasure of all Treasures, vouchsafe that we may well and rightly improve this earthly and fading Treasure, and may so search after, and use it unto the end, that we lose not the chiefest good, but may rather find and keep thee for ever.

An Admonition, adjoined as an Over-plus.

IN the first Chapter of this first part of the concentration of things, have I plenarily manifested, by what means, new Wines and Musts are (by the help of an Artificial condensation) to be brought into a narrow compass, that so they might be carried into far remote places wherein there are no Wines, and may there be sold to great profit. But yet I forgot to shew, by what means the savour which the winy Juices contracted in their concentration, is wholly to be taken away in the fermentation when they are again dissolved in water, that so the Wines made of those Juices may not have any untoward and unpleasant taste. 'Tis an Artifice without which no man can easily, quit himself in this Art of making Wine. But that I may certify every one hereabouts, the Medium (or Basis) necessary about the precipitation in this work is no other thing but common *Sulphur* excellently well purified, a little portion whereof (according to the nature and property or disposition of the Juices) is to be hereto added, which must boil up (or ferment) with the Wine, that so it may draw to it self all the filths, and all the strange odour, and savour or taste in the fermentation, and by precipitation cast them down to the bottom, which being done the Wines become sweet, clear, and get a good savour. Furthermore it is to be known by what means (seeing that there are many fæces and defilements that will separate themselves out of those kinds of Wines as well as out of others, and settle to the bottom) even they are to be put to some use, that so there may not be any loss, but that the gain may be by so much the greater. Divers ways are there of making profit from them; as for instance, The remaining Wines may by pressed out in bags, or else they may be turned into Vinegar, or a spirit may be thence destilled, and the remaining gross matter be boiled in water, and the Tartar therein dissolved, and prest out in bags, that it may so shoot into Tartar. But as touching this expression I have taken care to have a peculiar Book published at *Norimberg*, (viz. *The Treatise of the Lees of Wine.*) So that it is wholly needless to make any mention of the same, in this place. The Courteous Reader may use it to his occasions, as being such a Book, in which he will find the said pressing out the Wine and Tartar, and also the making of Vinegar, clearly described, with all the circumstances thereabouts, and without all question if he rightly understands me, and sets about the work, he will do himself a great deal of good.

NB. But if so be that any shall know the Art of turning the Tartar of those Fæces into Salt-petre, (and such a thing may be done and that in a very short time) he will get twice the profit, that is to be gotten by making Tartar of them; forasmuch as he need not put himself to the inconveniency of pressing them.

In the second Chapter of this first part where mention is made of the concentration of Corn, there it has been alleadged that the remaining husks or branny parts which remain after the extraction of the Juices, may be made to yield as much yea more Moneys than will pay the costs about the Corn. But it is well known, that those reliques that are left in your boiling up of Ale, are improved to fatten Beasts with. If now a *Medimnus* (a measure of about some 6 bushels) of Corn doth cost half, nay even a whole Imperial, those reliques (that are left of it in working) can scarce cost less than one eighth part of that Imperial. And now out of such a *Medimnus* or measure of such re-

liques,

liques, they would very hardly when turned in the Beasts, into nutriment, have made in them two pounds growth of flesh, the price of which (said two pounds) would not amount to the eighth part of the said Imperial: Whereas now, if those reliques were handled after the afore-mentioned way of reducing Wood into Juices, they would easily yield as much, or more Salt-petre than the price of the Corn was at the beginning. So that here's an enriching Treasure offers it self to the pious and diligent Housholder, whereby he may do good to those in need.

In the third Chapter of the first part, is mention made only of the Concentration of Wood, of the pressing the Juices out of the Wood, and of the making Nitre; But because there is not every where such great quantity of Wood, as to imploy it to the making of Salt-petre without omitting the more necessary use of it, yet notwithstanding the case may be so ordered as that a great quantity of Salt-nitre may be made of the Leaves of the Trees and the Grass that grows under the Trees, and there's no need to cut down the Trees, if a Man has no mind so to do. Besides too, in such places where there's but little Wood and much Corn, even the very stubble or straw (of the Corn) is fit enough to be made into Salt-petre. So that there is no place where there is not matter found for the making of Salt-petre.

And therefore I cannot forbear but must needs teach all pious Housholders (whether they have their Houses in Cities or in Villages) a certain easie Artifice, by the help of which they may gather a Treasure for their Children, without any labour and costs, and such a one as Thieves can never rob them of.

And now, seeing I have revealed in this small Book, for the benefit both of Rich and Poor, high and low, three Artifices or Workmanships by which, Wine, Corn, and Wood may be made more profitable; but yet have not brought any assisting help to such as want both Wine, Corn, and Wood, I have judged it worth the while (that so even they who have nothing, and yet nevertheless desire to provide for their Wives and Children in some honest way) to bestow on them a secret Art, whereby they may seek their advantage or profit. And I hope the thing will redound to the Honour of God, and to all our Healths.

Besides, I will shew away to such as have no inheritance left them from their Parents, nor have any thing come to them by Marriage, by what means they may without labour and trouble get a Treasure for their Children.

First of all, Let such a one take care to have some shade or hovel made, to join to that side of his dwelling that lies in the middle 'twixt the North and the East part of Heaven, or some other more convenient place, so as to admit the Sun and Air to it, but to keep off the Rain. Under this Pent-house or Hovel, let him dig a large Pit, and with the Earth he digs out let him make banks round the Pits-mouth that so it may keep the Rain off of every side. This done, let him each day in every year, or whensoever he can conveniently carry and throw into that Pit these following matters, so long till his necessity forceth him to dig all out again, and to see how much Treasure he hath gotten, even whilest he slept. Now these matters are, All sharp and bitter Herbs, growing in by places, amongst bushes, and in the way sides, and such as the Beasts feed not on, as *Esula*, *Cicuta* or Hemlock, Henbane, Fumitory, the thick stalks of Tabaco that are thrown away in those places where it is planted, the hard stalks of Colwort, which the Beasts eat not of, and likewise all those things they leave in their Troughs; likewise Firr tops or Apples if you have them at hand; also the Leaves that fall from the Trees in Autumn are to be gathered; also Pigeons-dung, and Hens-dung, Birds and Hens Feathers; all the Ashes which VVomen usually make their Lees with, and other Ashes that are not fit for that use, as also such out of which the Lixivium or Lee is already extracted; the soot of Chimneys, Hogs hairs, the horns of Oxen and Cows, and the bones which the Dogs eat not of. All these matters may he throw into his Pit, and that he may the sooner fill it, he may gather as much as ever he can from the bordering places, and throw it therein, that so in one or two years time he may with all those things fill up his Pit. Mean while he must pour into the Pit the piss gathered in his House, and that he may have enough he must also get as much as he can from his Neighbours, so as to keep the things thrown in the Pit in a continual moisture, whereby they may the sooner putrefy. In want of Urine, common Water may be taken; if Sea-water or other Salt-water can be had, it will be the better. Also the Brine of Fishes-pickle, and the salting or salt-water that Flesh is macerated (or pickled) in are of good use in this business; likewise the Blood of Oxen, Cows, Calves, Sheep, which you may easily have at the Butchers; all these things putrefying together do put on the nature and property of Salt-petre.

If now, all those matters in your full pit shall have well putrefied, then cease from pouring on any more moisture, and all the things are to be left so long till they are dried. And then if you need Money, let a Salt-petre maker be sought for, and bargain with him about the price of drawing out your Salt-petre by water, of making it, and selling it. This done, cast the remaining Earth again into the Pit, together with the remaining Lixivium that shot not into Nitre, and there leave it for a year or two, and moisten it sometimes with Urine, or if you have not this, with common Water. This Earth will again yield Salt-nitre. but not above half so much as at first.

NB. If you stand not in need of Money, let the matter lie, and as oft as it dries, so often moisten it again with the aforesaid moisture, that so the Nitre may more and more grow and increase. By this means shall such a one gather a secret Treasure, & shall not know almost how he came by it. If he needs it not himself, his Children will find it. Thieves & Souldiers will not steal it away. If one Pit be full then another may be made, that so nothing at all of those matters, which otherwise are most base, (but in this case most suitable) may be lost. Now if there were but only one in every Village that were appointed to exercise this Labour, there would be found out as it were in a small Country many thousand hundreds of Salt-petre, and so these matters still serving for the same use, there would never be any scarcity of Salt-petre. And now, Nitre being present, Gold and Silver are not far off. Let every one observe this, and esteem it. Men will sometime or other at last, become thrifty and wise, and will see what blindness they have been possessed with.

Give GOD the thanks, and be helpful to thy Neighbour. GOD hath bestowed on me, I bestow on thee, do thou likewise bestow somewhat upon thy Neighbour, and it will be well with us all.

THE SECOND PART OF The Prosperity of Germany.

Wherein is shewn,

By what means Minerals may be Concentrated by Nitre, and turned into Metalick, and better Bodies.

For the benefit of my Country, and of all such as affectionately and industriously follow after Metalick Affairs.

Friendly Reader,

I *Have taught in the first part of this Book, by what way the Vegetables, as Wine, and Ale, are to be concentrated, whereby they may yield more profit than hitherto they have done, and also, how Wood is to be reduced into Salt-petre. In this present Second part, shall be taught, how the Salt-petre is to be used, and how, by it Minerals may be Concentrated, and wrought into Metalick Bodies. And as to this Concentration, thus stands the case; that is to say, forasmuch as a good part of Minerals are of very little use, and lie neglected as things of no worth, and prove not profitable to any one, (whereas if there were Men that understood but the Art of it, there might redound a great benefit to the Lands where they are. It hath seemed to me worth while to declare it to my Country, nor doubt I but that there will arise some diligent ingenuities, who will lay the thing to heart, and take care thereabouts, and will even set their hands to the work it self, and thence get much profit; which to me would be very pleasing and acceptable. Therefore (in the Name of God) will I set about the manifestation of the Gifts of God (which lie every where unknown, and wholly disesteemed, and which yield no Man any fruit) and lay them open before the Eyes of the whole World, that so they may be better known hereafter, and be of more benefit to the Country. And I beseech the most Wealthy, and the most Ancient Housholder, our most merciful Father, to bestow a Blessing, and good success on this my endeavour, that it may tend to the Honour of his most Holy Name, and the health of all our Souls.* Amen.

Of the difference of Minerals, and what is understood by the Name of Minerals.

AS concerning the word *Mineral*, why all Fossile and Metalick Mines are so called afore they have been wrought upon, and brought by the fire into Malleable Metals, I judge it but of small moment to make any tedious Comment thereupon; besides, others have long ago throughly treated of that, and yet it makes but little to the thing it self. But my purpose is (at present) to teach, what means such little esteemed Minerals may be made useful, and profitable by; but afore I begin this work, I will recite, and shew the many sorts of Minerals that there be; then next that, I will shew how, by the benefit of fire, and the hands of the Artificer, they may be converted into better bodies, and become useful, and profitable for Mankind.

Under the Name of Minerals are comprehended, or reckoned these following, *viz. Antimony*, *Auripigment*, White, Yellow, and Red *Arsenick*, *Cobolt*, *Lapis Calaminaris*, *Zink*, *Bismute*, or the *Silvery Marchasite*, likewise the *Golden Marchasite*, *Pyrites*, or *Copperas* stones, *Vitriol* of various kinds; as also, its kindred, may be added to the number of Minerals. And albeit, that some do also referr Alume, Salt-petre, Sal-Armoniack, Sal-Gem, and others of that kind to the rank of Minerals, yet cannot I acknowledge them for such, or reckon them up amongst the number of the above mentioned, seeing there is nothing Metalline to be found in them: Such only therefore do I call Minerals, that have in them a Metalline nature, and which do admit of being joined with other Metals, and of being molten together with them in the fire, and out of which the known Malleable Metals, may be extracted. These are they which I intend to treat of, and will see, what good is thence-from extractable.

And first of all we'll speak of *Antimony*.

Antimony is the noblest Mineral of all, not only because it doth for the most part contain Gold in it, but upon this account too, because more eminent Medicines may be thencefrom prepared for the use of Mankind. In the Mine-pits it has its peculiar Veins; that which is found in *Transilvania*, hath some little bigger portion of Gold in it, and is accompted of as the best in all *Europe*, next that is the *Hungarian* ♁, which likewise doth sometimes contain no contemptible portion of Gold; next is the *Fechtenbergick*, which is found at a small Town call'd, in the *German* Tongue, *Gold-Gronack*; the *Polonian* sort, and that which is found in most places of *Germany*, contains but little Gold, or none at all; but there is some which has much Silver in it, and (for the most part) is neither wont to be used, nor desired, or sought for, save by the Letter Founders, and these use it to make their Matters flow. Also many do use it (*viz.* ♁) in Medicine, and do much good therewith, but it hath certain Enemies who are none of the wisest, and so is hated, and rejected. But yet there lies in it more hidden good, than all its Enemies are able to conceive of, witness my *Panacea*, which is mentioned in the second part of my *Pharmacopœia Spagyrica*.

And

And *Basil Valentine*, certainly an excellent Philosopher, writ the Triumphant Chariot in its Honour, which is an exquisite Book and profitable to read.

But as concerning the way of making a Regulus out of Antimony, and as to the uses it serves for, that I have described in the fourth part of my Furnaces. Moreover, as to the manner of depurating Gold thereby, and cleansing it from all Heterogeneous mixtures, and as to the graduating of silver, thereby, that it may become Golden, all this have I spoken of in the Explication of my *Miraculum Mundi*; and as to what other effects may profitably be done, therewith in Metalick Operations, shall be shown, partly in this Treatise, partly in the third and fourth ensuing parts. As concerning the way of separating it in quantity out of the Ore, *per descensum*, is to be seen in *George Agricola*'s Book, that he wrote of the Metalick Art, and in others; nor indeed belongs it to this place to speak thereof.

Of Arsenick.

Arsenick likewise is a good Fossile, or profitable Mineral, and is put to many Uses. It also hath its singular, or distinct Veins in the Earth, whence it is taken; it is forced out of the Ore by Ascension, and Descension, and is purified for use: It is found white, yellow, and red. Also some silvery Minerals or Ores do in their solution, or melting; yield much Arsenick, which the Melters of the Ores do catch in Chimneys or Funnels made for that purpose, and keep it for use; concerning which, you may read in *George Agricola*'s Writings. So likewise, *Cobolt* yields Arsenick, and so do some Golden Minerals, or Ore; that which is separated from a Minera of Gold, *per descensum*, is very red, and auriferous; and this, those that deal with Metals, have experience of; which, if they separate not from the Gold Ore afore they melt it, it carrys away a great part of the Gold, and hides it in its Belly in the melting, so that they would not have so much Gold as there is in the Ore. For indeed, such a kind of Arsenick, is an unripe Gold, as shall be hereafter proved: So then, there lies more hidden in that Contemptible, and Venomous Arsenick, than any one will easily perswade himself to believe. There are also Medicines prepared out of it, but such, as serve only to be externally applied, in inveterate, and virulent Evils, as the Cancer, and Fistula. It is also used in Colouring and Dying Cloaths, concerning which, you may peruse my other Writings.

Of Auripigment.

This Mineral is in a manner of the same Essence that Arsenick is of; but this does not come forth of Minera's, or Metalline Ores, but hath peculiar Veins of its own, in which it is generated; it is an unripe Mineral, and doth for the most part also contain Gold. It is exceedingly Poisonous and Volatile, and therefore it is but little used, save only by Painters. It can be fixed by Nitre, and it makes Copper white, and brittle, as Arsenick doth: And it suffers it self to be sublimed out of its yellowness, into Transparent Rubies, which are used for Ornaments sake.

Of Cobolt.

Amongst all the Minerals that are to be found *Cobolt* is the most poisonous; it's an unripe silver, and it ofttimes yields in melting good silver, yet one sort more than other; some also there is which hath not any Silver at all, and is used about the sky-colour'd Smalt, to help make it, with an addition of Fusile Sand, and Potters Ashes. But when they meet with that which has Silver in it, they separate it thence from by Fusion; besides, it may be so fixt by the help of Salt-petre as to yield permanent Silver, as shall anon be spoken of.

Of the Silvery Marchasite.

The silver Marchasite, or Wismuth, is a known Mineral; it's every where found to and again in the silver Mine-pits, as well as Cobolt is, but yet it is much more fixt than Cobolt; neither is it of so poisonous a Nature. It is gotten out of its Ore, or Minera, most easily by a small flame of wood fire, and is used by the Pewterers to make their Pewter hard, sounding, and fluxile. Likewise, out of its scoria or drossy parts, is the blue Smalt also prepared, which the Potters use to glaze their Pots, and the Glass-men to make sky-colour'd Glasses. It doth very frequently abound with much silver, and 'tis rare to find any that is wholly void of silver: And if it holds so much silver, as is of more value than the Marchasite can be sold for (as 'tis barely *Bismute*) they separate it, if not, they leave it in it. For if an hundred weight doth not contain 20 or 30 Lots, or half Ounces they do not separate it, because the Marchasite will yield so much. But now, the Silver may be gotten out of the Marchasite, by Salt-petre, so as that the remaining Marchasite shall lose nothing of its goodness nor be at all spoiled, as I have shewed in the Explication of my *Miraculum Mundi*.

Of the Golden Marchasite.

The name of *Marchasite* is proper to every unripe Metallick matter (and is) of as many sorts as there are Metals; hereupon the matter which has Gold in it, is called the Golden Marchasite; that which has Copper, the Coppery; that which has Iron, the Irony, and so that which abounds with Sulphur, is called the Sulphureous Marchasite. But now there is Sulphur in all the Marchasites, and sometimes Arsenick too, but (the Golden ones) have more of Gold than the other Marchasites have; Besides, out of all kinds of Marchasites proceeds (for the most part) a Vitriol, which shews the nature of that Metal, which the Marchasite contains; one while Copper, sometimes Iron; 'tis rare to find a Marchasite that hath no Metal at all in it; if it hath nothing of Gold, Silver, or Copper, yet has it Iron, and gives out of it self a Vitriol useful for Dyers, and which such as prepare *Aqua-fortis* cannot be without.

Of Zink.

Zink is a Volatile Mineral, or a half ripe Metal when it is drawn out of its Ore. It is much clearer and brighter than Tin, yet not so malleable and fluxile as Tin is, and it is usually put to Tin to make it brighter and harder. We have it not much growing in *Germany*, but great quantity of it is every year brought us by the Merchants out of the *East-Indies*. The way how to prepare it for Medicinal uses, have I described in the first part of the Philosophical Furnaces. It is a golden but an unripe Mineral, it gives Red Copper a Yellow Colour and turns it into Brass, as *Lapis Calaminaris* doth; and indeed that same Stone is nothing else but unmeltable *Zink*, and this *Zink* may properly be called a fusile Lapis Calaminaris; for as much as both of them partake of one nature. But with *Zink*, there is most an end conjoined Lead too, and then it is not fit to make Brass of, unless the Lead be first taken thereoutof; so it is at *Goslaria*, where together with the Minera or Ore of *Zink* is Lead also digg'd out mixt amongst it, and is called a Lead Ore, though there be contained in that Ore, four times more of Zink than there is of Lead, and yet they burn up the Zink for to have the Lead, which Lead hath some Silver in it. In the melting it flies away in fume, and it is a volatile and combustible Mineral, and sublimes it self up into the holes of the Furnace,

Furnace, whereupon the Melters or Founders are constrained to knock it off frequently, leaſt it ſhould too much leſſen the Furnace; this matter they knock off, they call Calmei (which is Lapis Calaminaris) and which turns red Copper into Braſs, with encreaſe (of its weight); and ſo verily by means of the not-knowing or being skill'd in this Ore, a great quantity is yearly burnt up and loſt. Sometimes the founders do gather ſomewhat of the Zink, which is moſt excellently excellent; but that Ore might be melted with far greater profit, if they did not ſo burn up the Zink, and force it into fume; but ſeeing men are hardly drawn back from an old cuſtom, it muſt be born with.

But yet (I ſay again) if that Ore were handled in a due manner, there would redound far greater profit thencefrom than now doth. Such a kind of Mineral as this is doth Weſtphalia alſo yield, which the founders there accompt for a Leaden Ore, becauſe it has ſome load mixed with it, but when it comes to be freed or molten it goes (all) away in fume, and therefore they ſay, it is alſo a Calmei or Calaminaris Ore, and ſo it lies unuſed.

Of Calmei *or* Lapis Calaminaris.

Calmei Ore is digged out in many places in *Germany*, but there is none of ſuch note as that which is found at *Aquiſgrane*, for that is wholly void of all kind of Leadyneſs, and much different from that of *Goſlaria*, or *Weſtphalia*; and therefore it is alſo very fit to make Braſs of, which is there made in plenty, and farther, this has Gold in it, though not ſo much as to quit the Coſts of ſeparating it. But there is no Mineral richer with Gold than this, and could it but be ripened (and I doubt not at all of the poſſibility of ſo doing) a good deal of Gold might be drawn out from thence.

As concerning what elſe may be performed with that Mineral, I have formerly told you in my Firſt and Second Part of Furnaces, nor is it needful to treat of the ſame thing more at large in this place.

Of Common Sulphur.

Sulphur or *Brimſtone* is the moſt known, moſt uſed, and moſt combuſtible Mineral of all. As touching its uſes in Medicine, and in Alchimy, about the ſeparation of Metals; may you find ſomething mentioned by my ſelf, in the writings I formerly publiſhed, and in the writings of others too.

But at preſent we will only mind you of this, *viz.* That it is the very Foundation and Root of all the Metals; for tis rare to find any mine wherein *Sulphur* does not ſhew it ſelf. Very many places in the World, is *Sulphur* both made and digged out of the Earth, in very great quantity, & that chiefly in *Iſland*, and in *Italy*, nigh to thoſe always burning Mountains, *Heckla* and *Veſuvius*; it is alſo drawn out of Marchaſites *per Deſcenſum* in many places of *Germany*, ſo that enough of it may every where he had for a little money.

Theſe are the chiefeſt Minerals that I ever knew of, and theſe are they which are commonly ſought after, and applied to uſe. But now, beſides theſe, there are ſo many various kinds of Foſſiles and Minerals to be met withal, that one cannot reckon them all up, or give them peculiar Names. One contains Sulphur, and Arſenick, another, Cobolt and Sulphur; another Antimony, and Arſenick, and of that kind are there very many more. But yet thoſe that we have reckoned up, are the moſt known, and moſt in uſe, and therefore ſhall at preſent be ſufficient for us to ſpeak of.

Having now taught what Minerals are, and which of them are moſt known & uſed; I will now teach, in the next place, by what means they may (by the help of Salt-petre, & of other Subjects) be fixed, concentrated, imbodied, or brought into Metals, ſo as to be rendred profitable for the uſe of Mankind, and which otherwiſe lie every where to and again neglected and, are wont to be of no eſteem.

And as to the Concentration of Minerals, thus ſtands the Caſe with them; they are either to be fixed & ſubdued, as 'twere by the help of Salt-petre, that ſo they may not ſo ſuddenly fly away in fume in the fire, and be burnt up, but may abide the fire and ſuffer themſelves to be molten; or they are to be reduced into bodies by the help of Metals, that ſo they may come in uſe, and that by augmenting the Metals, as Lapis Calaminaris does, or they are to be purifyed, ſeparated, and made better, as ſhall be mentioned of *Sulphur*, *Antimony*, and the others, that ſo thoſe kind of Minerals of which there lies to and again, at preſent, great quantities, wholly neglected, and profitable to no body, may hereafter be of uſe and benefit.

And firſt of all, as to the fixation of the Minerals, the way of proceeding is thus, *viz.* The Mineral is to be powdered, and to be mixt with equal weight of burning Salt-petre, and ſo to be fired, that the combuſtible and volatile part of the *Sulphur* may be forc'd away, and the Mineral may afterwards brook the fire the better, and be molten and forced downwards (*per deſcenſum*); which operation I have treated of in the explication of my *Miraculum Mundi*, and therefore think it needleſs to repeat the ſame thing again here. By this mean therefore may *Arſenick*, *Auripigment*, *Cobolt*, *Zink*, *Biſmute*, and other Volatile Minerals be in ſome ſort fixt by the inflaming and burning up with Salt-petre, ſo as afterwards to endure the fire, and to yield forth the good they have in them. There's alſo another way of imbodying Volatile Minerals, *viz.* by the benefit of Metals; if the Metals and Minerals are joined together in a due meaſure, and be likewiſe united together by the virtue of a Cementing fire; then doth the volatile Mineral penetrate it ſelf into the Metal, and becomes Metalline, and doth alſo encreaſe the Metal, as is evident in Calmei or Lapis Calaminaris, which being joined with red Copper and cemented, enters into it, augments and encreaſeth it, and turneth it into Braſs; whereas there cannot be any Metal educed out of the Calmei by the uſual way of melting. In like manner may all Arſenical minerals be (by cementation) introduced into Copper, & made corporeal; and theſe do not colour the Copper yellow as Calmei doth, but make it white, nor is the Copper rendred maleable thereby but britle, but yet 'tis not without profit; for if that white Copper be handled after a convenient manner of taming or over-maſtering it, then the Gold and Silver that was in the Arſenick, betakes its ſelf into Regulus's, which are to be depurated in a Teſt or Cupel, or elſe by the help of Salt-petre; but there cannot any metalline body be made out of Arſenick, Auripigment, or Cobolt, by bare melting. The way of proceeding with it is thus; The Copper is to be cut into ſmall bits, and to be moiſtned over with *Linſeed* Oil, and the Arſenick, Auripigment, Cobolt or any other Realgar is to be powdered and ſtrewed thereupon, and ſo a bed of Copper, and a bed of Arſenick to be put one a top of another in a melting Pot; then the Pot is to be well covered and fenced with Lute, and placed in a circulatory fire, and the fire is to be put nearer and nearer to it, until the Pot is through red hot, then let it cool, and you ſhall find that the Arſenick hath gotten ingreſs into the Copper, and makes it black and brittle. The Copper thus burnt, may be reduced into powder, and burnt with good Salt-petre, whereby the Volatile Gold and Silver which was contained in the Arſenick, is made corporeal, and abides as conſtant upon

upon the Test as other fixt Metals do; so that by this means permanent and good Gold and Silver may be gotten out of every sort of Arsenick, Auripigment, Cobolt, and the other volatile, venomous and base minerals.

NB. This kind of operation is very dangerous to those that are unskilful, and who being unversed in the Chymick Art, have not learned to take heed to themselves. And therefore it behoves every one to beware of doing ought rashly or heedlesly. He that knows not how to carry himself (or his business) warily, let him forbear to meddle at all with this labour or process: But as for one who is better versed, and pretty well experienc'd, he may set about this work safely and will gain by it: Because there is oftentimes found Arsenick and Auripigment that hath in it much hidden volatile Gold and Silver, and which cannot be retained in the common way of melting by Fire, but will totally fly away: But now if it be imprinted in the Copper by Cementation, and fixt in the same by Saltpetre, and then precipitated by means of Lead or Iron into Regulus's, it will render all that fixt which afore was unfixt and flying. But as concerning such a Cementation and Fixation to be done by Nitre, will be manifested by the following process.

NB. But you are carefully to observe, that one mineral must help another in the separation of their Gold and Silver (if you would undertake this Labour for profit): For so each will produce what it has in more abundance, and thou wilt have a greater reward for thy pains and costs. For example, I prove and try Auripigment or Arsenick, and find that it is auriferous, and I have a mind to perfect it and turn it unto my use; hereupon do I look for such Copper as is likewise auriferous, (and indeed there's plenty enough of such every where): Into this Copper do I introduce my auriferous Arsenick by Cementation, and that I may not need to cupellate (or blow off) the same upon a Test (for the very Labour of so doing will cost more than the gains will be of that separation) I do precipitate the Gold that is therein into a Regulus, which Regulus being purified, I obtain the Gold that was contained in that Arsenick and Copper, neither is there any need of cupellating all the Copper. But that the precipitation of the Regulus may be the more commodiously done, I proceed on this wise. I find out some Antimony of a good sort, and which is of a Golden nature; likewise such Iron as hath Gold in it, both which, *viz.* the Iron and the Antimony, may easily be gotten, and then I set on the separation which I thus institute.

First of all I implant the auriferous Arsenick into the auriferous Copper (if such may be had) then reduce I these into powder, and fire them with an equal admixt weight of burning Salt-petre; by this means the Arsenick is made a little more fixt, and suffers it self to be the better dealt withal in the fire; but if you are well skilled in this kind of labour you may spare your Salt-petre and may melt down your Copper (burnt with the Arsenick and powdered) with an equal weight of Antimony. And if of its own accord it lets fall a Regulus out of it self, then there needs no precipitation, the Regulus may be laid by, and that which remains may be likewise precipitated into a Regulus with common Iron; and this (last Regulus) is also of use, as shall hereafter follow: But if not (that no Regulus falls) then that Mass may again be put into a Crucible, be molten, and a little Iron filings be cast in to make it settle; the which must be stirr'd about with a red hot Iron rod, and when it's well molten, 'tis to be poured out into an Iron Cone; which being cool, the Regulus may be knockt off, in which Regulus will you have the Gold that was in the Arsenick, Copper, Antimony and Iron. This Regulus must be cupellated either by Salt-petre in a Crucible, or with Lead upon a Test; which done, you will have the Gold that lay hid, and shut up in the afore-mentioned Minerals.

But now, if one hath a mind to make that separation yet more compendious, and to have greater benefit thereby, he may add to that Copper burnt by the Arsenick, some Silver burnt with Brimstone, and so melt it with the Antimony, and by the means of *Mars* precipitate them into a Regulus; then the Silver will so much the better draw to it self the Gold out of the Arsenick and Antimony, and yield (in the separation) greater benefit.

NB. If so be a man be not skilful in this operation, let him forbear his Silver a little, and add some Silver to the Regulus by melting them, and then afterwards purifie the Regulus by Salt-petre; for so the Gold that is in the Regulus associates its self to the adjoined Silver, and inricheth it with no little increase, *viz.* according as the Minerals have had more or less Silver, in the making their separation.

And this is such a work as seems sufficiently able commodiously to sustain life; but it requires an experienced Artist, not a giddy headed fellow. Neither have I written this process for those who are not as yet well versed in Pyrotechny, but for such who are well skill'd and dexterous; and although this kind of operation needs no great store of Art, yet notwithstanding, every one will not rightly perfect it, and therefore do I warn such as are not well skill'd in Pyrotechny to desist from this labour, and betake themselves to some other, and set themselves about doing such things in which haply they are better skill'd, and not to lay the blame on me, when they are frustrated of their expectation, as if I had not dealt faithfully and sincerely in my writing, but let them rather impute it to their own prepostrous rashness and unskilfulness; and what loss soever they bring upon themselves, let them impute it only to their own (misconceptions).

To deal plainly with you, that labour is conjoyned with some difficulty; but yet if any one be diligent and well exercised in the Pyrotechnical Art, the operation will succeed in such an ones hands very pleasantly; nor will he want a worthy profit, especially if he takes such Minerals as are richest, and use them about this separation. But some perhaps will say, Whence shall I have those so good Minerals? Who demonstrates to me, which are auriferous, and which are not auriferous, which are good, and which are to be rejected, that so least being deluded in this, I should lose all my labour? I would have such a one know, that if he has not gotten so much skill and experience as to prove a Mineral, whether it be auriferous, or not, he is not at all fit to take upon him this Labour of separation, and he were far better advised, if he wholly abstained from setting about it. But yet that I may not omit ought which may seem to be desired from me, I will over and above add here in this place, what way Minerals may be proved by, whether they be auriferous or not, and 'tis on this wise to be done; all Realgars, as Arsenick, Auripigment, Cobolt, and others of that kind, are first of all to be implanted into Copper by cementation, then are they to be molten, or throughly purged and subdued with Lead (like as you do with a crude Mineral); after this, there

comes out a certain little ſilvery Pellet, and this you are to prove as you would for Gold. Now according to the moreneſs or leſſneſs of the ſame, ſo is the buſineſs to be ordered, and compute to be made, whether or no the ſaid Mineral is worth the pains of ſeparation as aforeſaid. Likewiſe the Copper it ſelf may be cupellated with Lead alone, and then the remaining ſilver Pellet be proved for the Gold, with Aqua-Fortis; but as for the Antimony, and Iron, they may be well melted jointly together in a Teſt under a Cover or Muffel, or in a clean Crucible in a Wind Furnace, with this obſervation, that there be uſed twice as much Antimony as Iron, and ſo a Regulus will ſettle, which is to be purged or tried with Lead in a Teſt, and kept flowing till all the fugacious parts are evaporated, which done, there is found a ſilver Pellet, which is to be proved with Aqua-fortis, how much Gold it has.

NB. This probation, or trial is to be accounted of as a certain and lawful trial, but ſuch though as you may eaſily err in the doing of, and ſo may have nothing, though it had in it a good part of Gold; for the Antimony will not eaſily ſuffer it ſelf to be vanquiſhed, or go off, but it will break the Teſt, or Cupel, and the little Pellet which is the probatory Globulus betakes it ſelf (by reaſon of the fierceneſs, or eating penetrativeneſs into the Teſt) ſo that the Proba or trial it ſelf, may moſt eaſily become fallacious, and yield no certain diſcovery. Which to remedy, the buſineſs is to be thus managed, after that your two parts of Antimony ſhall have been well melted in the Crucible, with your one part of Iron, there muſt be put thereinto a little dried Salt-petre powder, and the Pot, or Crucible muſt again be covered over, and care taken to make them melt well together; then are they to be poured out into an Iron Cone firſt ſmeared over with Wax, and when 'tis cold, the Regulus is to be knockt off from the Scoria, to which muſt be added twice or thrice the weight thereof of Lead, and the Regulus of the Antimony doth in the melting-pot ſeparate it ſelf by Salt-petre from the Lead, and the Lead is to be afterwards cupellated, and ſo that goes all off, and the true weight is had. But albeit, that this deſcription be clearly enough delivered, yet certain I am, that one in ten will not underſtand it aright, and therefore it is behoveful, more fully to inform, and clearly to ſhew the Reduction of that Regulus into ſcoria by Salt-petre. To make this trial or proof 'tis not needful to take a huge vaſt pot to fill with Iron, 'tis ſufficient to take of Iron 100 *l.* of the ſmaller probatory weight, and 200 *l.* of Antimony, both which are to be molten together, and to be precipitated with a little Salt-petre, for ſo the Regulus doth the better ſeparate it ſelf from the ſcoria's, the which is then to be waſht and purified by Lead and Salt-petre. This Regulus that comes from the Antimony and Iron, put with three times its weight of Lead in a clean Crucible, and make them well to flow in a wind Furnace, but cover your pot cloſe that no Coals fall in, and ſo hinder the work, then take off the cover and throw in a little powdered Salt-petre, and again cover the Crucible, and above all things have a care that there fall not in any Coals, and let them lie and operate a little upon each other, then the Salt-petre imbibes all the Antimony, Iron, and Lead, and thereby becomes hard. This being done, ſome more Salt-petre is to be again caſt in, and you muſt make them flow together, and ſo all the whole parcel of Antimony, Iron, and Lead, betake themſelves into the Salt-petre, and paſs into ſcoria, but part of the Lead remains whole or free, and is not ſcorified, and therein will the Gold be, which the Antimony and Iron had immixed in them, which if it be blown off on a probatory Cupel, or Teſt, under a Muffel, there will then remain the true weight.

NB. But it is expedient, that there be a juſt proportion obſerved in this kind of Work, that you take not overmuch Salt-petre to this ablution, or converting it into ſcoria, and ſo bring all the Lead into ſcoria, but the buſineſs is ſo to be managed, that there be left remaining one third part at leaſt, of thoſe three parts of Lead you took, which is not reduced into ſcoria with the Antimony; then may it be poured out into a Cone, and when 'tis cool, the Regulus is to be knockt off from the ſcoria, and Cupellated.

NB. He that is minded to waſh Metals after this manner by the help of Salt-petre, and to reduce them into ſcoria, muſt have an eſpecial care that not a Coal falls into the Crucible, for they will much hurt, and will again precipitate them, which the Salt-petre hath already imbibed, and ſo render the operation invalid. Beſides, it is worth the while to admoniſh, and tell you that all Arſenick, and Antimony is auriferous, but yet ſo, as that one ſort is richer than another, and that abundance of Copper and Iron hath likewiſe in it Gold, which no body finds out, nor can it be ſeparated by that old beaten way of Cupellating it with Lead. But ſome, or other might here ſay, Where ſhall I find Arſenick, Antimony, Copper, and Iron, which have Gold in them? Had they any thing of worth in them, others would doubtleſly have extracted it, and not have ſuffered it to come to my hands whole and ſound? To ſatisfie ſuch an one, I anſwer thus, tho' thoſe that work on the Metals, do for the moſt part know, that there is in Arſenick and Antimony, a Volatile Gold, yet know they not how to extract it thencefrom with profit, for the ſeparating way they take would coſt more than the Gold they ſhould have would yield, becauſe (according to their uſual way and cuſtom of working) all of it would vaniſh away with fume. And this is to be underſtood of Arſenick, Auripigment, Cobolt, and Antimony, all which may (by the way we have here mentioned) be tamed and introduced into Copper, and be made permanent and fixt.

But now, that there ſhould ſometimes be Gold implanted, naturally in Copper, and ſhould there alſo be left remaining untoucht, is ſo done on this account, becauſe there is not in it ſo much as to pay the Coſts of the ſeparating it by Lead (for verily the Cupellating it with Lead on a Teſt, requires great expences.) This is the reaſon why Gold lies immixed in the Copper oftentimes, and cannot be thence extracted with profit.

The ſame is to be underſtood of Iron, for a Vein of Iron doth oftentimes offer it ſelf, which is very much impregnated with the more precious Metals, and yet no body either knows, or obſerves it. For the Ore of Iron is for the moſt part wont to be forced out by unskilful Men who have no care at all of the Gold, but only of ſuch an Ore as contains a good portion of good and malleable Iron; and ſuppoſe they did certainly know, that there were in 100 *l.* of Iron, ſome Lots of Gold, by what means (I pray) would they extract it thencefrom? For Iron cannot be dealt withal by Cupellation on the Teſt, much leſs can it be ſeparated (as Copper is) by the means of Lead; ſo that there's no reaſon for any one to wonder

der that there are so few to be found, that promise themselves, or seek after much good out of Iron, seeing it is not so apt a Subject to be separated, and subdued as Copper is. But by the help of Arsenick, Auripigment, or Antimony, 'tis no difficult matter to tame, and bring it under, so as to make it yield forth what it has: And 'tis thus. This Iron, which is auriferous, may first be cemented with Arsenick, as we have afore taught of doing so with Copper, then is it to be precipitated into Regulus's by means of Antimony, which Reguli being imbued, or mixed with Lead, and reduced by Salt-petre into scoria, and cupellated, the Gold doth at last offer it self (which was hidden in the Minera's, or Ores, and so despised) and that with no contemptible profit. But now if any hath a mind to have the business yet more perfect, he may instead of Lead, add some Gold, and then reduce the Regulus into scoria's, by Salt-petre, and abstract it from the Gold; for so the Gold you put thereto doth the better hold that other Gold which it has attracted out of the Regulus, and there is made a much more plentiful encrease, than if the Regulus had been scorified upon Lead. Nor are the scoria to be thrown away, but they may be precipitated by throwing in live Coals, whereby the Salt-petre doth again let fall the Regulus which it hath swallowed up, and which Regulus you may separate from the dross when 'tis cold. This Regulus may be afterwards commodiously used in other Metalick Operations, that so it may yield anew out of it self the Gold; concerning which business there will a place fall in to speak of by and by. And besides, those drossy Offals (which for the greatest part are fixt Salt-petre) are also of good worth, which may be reserved for the subsequent Metallick Operation, which may be stiled a perpetual Metallick-working artifice; so that there is nothing at all wasted, but all things are of use. And this way of the separation of Metals is so very profitable, as that any one may get himself sufficient gain for to supply the necessities of Life. But if you have no fansie to meddle with Arsenick, or Auripigment and would willingly shun them by reason of their poisonous nature, they may even be omitted, and you may cement that auriferous Iron, with the Golden Marchasite, melt it with Antimony, and precipitate it into Regulus's. For even by this means too, the Gold that was in the Marchasite, is brought in use, and yields an increase to that Gold which is extracted out of the Iron and Antimony. But if so be there be no Golden Marchasite to be gotten, that separation may be ordered, even with Iron and Antimony, and if the Iron be but auriferous, the Labour will not be without profit.

This kind of separation or eduction of Gold out of the volatile Minerals, and baser Metals will be an egregious aid or benefit to such as have learned rightly to operate in the Fire, and whom (otherwise) a grievous want of things and small estate afflicts; for there is enough of the aforesaid Minerals, every where obvious, but they cannot be well handled, or wrought upon by reason of their unfixedness and immaturity, and therefore do they lie neglected and as it were wholly useless, and are not made beneficial to any. I know that some do well understand the way of fixing Cobolt, and Bismuth by Salt-petre, and do thence get an abundance of Silver; and likewise there are some that know how to tame and subdue Arsenical Realgars by the help of Salt-petre, so that they suffer themselves to be molten, and yield forth their hidden Gold and Silver. But he that shall so manage the business as to adjoin thereto the auriferous imperfect Metals, such an one will make a more successful work thereof; especially if he gets himself some auriferous Iron, the which he may get for a small matter: And besides, if he makes his Salt-petre himself, then all that whole operation of fixing or separating the volatile Minerals would be done with very little costs, and yield much gain.

NB. But now if any one would yet get more profit by this separatory operation, then he must contrive the doing it not in Crucibles or Pots, but in hearths (or furnaces) where a great heap of the volatile Mineral may by fixing Nitre melt together, and be precipitated into Regulus: then the Regulus may be separated from the Scoria, and be depurated by Nitre in other Furnaces, and be fitted for use; and so by this means may there be so much gain gotten, the like whereof, the great heaps of Ores which Men are necessitated to dig out of the bowels of the Earth with so much expence and charges, will scarce afford.

Likewise all Minerals may by the help of Salt-petre be fixed by the moist way, so as to yield permanent Gold and Silver; whereby (without doubt) full as much, if not more, is obtained, as is by the dry way. The way of operating is this. Dissolve a volatile Mineral, be it Cobolt, or Zink, Wismuth, Calmei, Arsenick, Auripigment, or any other the like mineral, in a strong *Aqua-fortis*; the solution being made, separate the *Aqua-fortis* again; then shall you have remaining a white Calx, which is fixed by the virtue of the *Aqua-fortis*: So that now it will admit of being molten with Lead, of being separated from the Scoria, and of being cupellated. But he that knows how to melt that Calx with Antimony and to precipitate it with auriferous Copper and Iron, gets more Gold than by that operation with Lead. But haply, every one can't perform that separation; for the excoction or melting, the reduction into Scoria, and Cupellating upon the Test, are operations more known and easier to be done.

Moreover, there are also some Minerals, which may be fixed with the moist fire, that is, with a most strong *Aq. fortis*, so as to yield their Gold and Silver in the *Scoria*, but especially Tin, Quick-silver, and Lead: If a vehemently-strong *Aq. fortis* be but once abstracted from Tin, it makes it so fixt, as that it will not fly away in the greatest Fire, but will melt into a white Glass. But now, if you would have it to yield forth its Gold, you must melt other Metals with it, into which the Gold may insinuate it self, and be made corporeal, such as are Silver and Lead. Lead, if it be dissolved in *Aq. fortis*, and precipitated by Urine, it gets such a hardness, that it will scarce melt in a Crucible; if you precipitate it with a Lixivium, it becomes glassy; if with Salt-water, it is rendered exceedingly volatile; for common Salt makes all Metals volatile, and on the other hand, Nitre fixeth them both by the moist and by the dry way, binds them, and constrains them to abide in the Fire; and this you are to know aforehand. Now, for the better confirmation of this thing, see how easily the common Mercury is made to abide the fire, if *Aq. fortis* shall have been several times drawn off therefrom, insomuch that it will suffer it self to be made wholly red-hot. But now, if the same be sublimed with Spirit of Salt, it becomes more and more volatile, so amongst all Salts there's not one that fixeth Minerals, save this most noble Nitre, and this hath a natural aptness to do it both by the moist and dry way, as hath been even now demonstrated.

And verily, this way of fixing the imperfect Metals (which

(which is done by the help of Nitre, by either the moiſt or dry way) is to be preferred far before that which is done only with a Fire of Wood; not barely on this account, becauſe it is ſooner and ſpeedilier performed, but for this reaſon too, becauſe it fixeth better and more durably: For if any one ſhall endeavour to make *Arſenick*, *Cobolt*, or other volatile Minerals, permanent or fixt, by the bare force of common fire, How much time, I pray, muſt he allow it? Haply it will require ſome months for this kind of Work, if not a whole year, yet at leaſt half a year 'twill need; whereas by the means of Nitre it may be done in one or two daies: For if a volatile Mineral be mixed with Nitre, do fulminate, and be edulcorated, and that fulmination be repeated 3 or 4 times, it will afterwards endure a ſufficiently-vehement melting Fire. Or if a Mineral be only diſſolved in *Aq. fort.* and that *Aq. fort.* again drawn off therefrom, it will even by this means be rendered fixt and conſtant in the Fire; ſo great is the force and virtue that lies hid in Salt-petre: And this the ancient Philoſophers well knew, and therefore ſaid that the moſt vehement Fire of all was to be uſed to the fixation of volatile Minerals; and this Fire is hid only in Nitre, and is no where elſe to be found; for the Central Fire hath too ſoon withdrawn it ſelf from the volatile Minerals and baſer Metals, and left them unripe, and they can be advanced to a maturity, both by our common Wood-fire, and by the fire of Salt-petre, and be fixed. And now I ſuppoſe that I have more than ſufficiently proved, by what I have ſaid, That Salt-petre fixeth Minerals and Metals, both by the dry and moiſt way; nor can any one reaſonably deny the ſame. Moreover, I judge it not fit to paſs this too over in ſilence, *viz.* That Salt-petre doth likewiſe make volatile, not only the unripe Minerals, but alſo the fixt Metals themſelves; ſo as that they ſuffer themſelves to be ſublimed and deſtilled wholly (like common Sulphur or Mercury) ſave the fæces, which are ſomewhat blackiſh and ſtay behind. Any underſtanding man may eaſily conſider here what benefit is to be hoped for from ſuch a Deſtillation of Metals; for ſeeing that all things are by deſtillation brought to the higheſt purity (as is clearly evident) it may well be concluded, that when in impure metals the pure parts are ſeparated from the impure, ſomething of excellency muſt therefrom proceed. I will ſay no more of this matter at preſent, for I have already clearly enough demonſtrated and plainly enough delivered this kind of deſtillation or purification of metals, in the third part of my *Spagyr. Pharmacop.* and have there ſhewn, that every imperfect metal, if it ſhall be deſtilled, yields volatile Gold, and that that volatile Gold may be made corporeal, without almoſt any Coſt in a particular way, (and haply alſo in a univerſal, which I confeſs I have not as yet proved) thither therefore referr I the ſtudious Reader of Hermetick and truly Philoſophical *Arcana* and Secrets.

But that the difference of thoſe waies of fixing or concentrating the volatile Minerals, and likewiſe the imperfect Metals, may rightly be perceived and laid open, and that it may appear how much more compendious and eaſie that way which is done by Nitre is than that which is done with common fire; it will be a good help to ſet down here ſome proceſs for an example, by which it will be manifeſt how laborious this way of doing it barely with Wood is, and contrarily how eaſie that way of doing it by the moiſt Fire of Nitre is.

It is impoſſible to fix *Arſenick*, *Auripigment*, *Cobolt*, and ſuch-like as theſe are without the help of Salt-petre, unleſs they are firſt introduced into other metallick bodies, and are together with them, burnt with a Fire of Coals, and reduced into Aſhes, and turned into Scoria, and wholly deſtroyed, and then at laſt reduced again into a metalline form, by the force of the intenſe fire of a Blaſt or Bellows: All which, that they may be dexterouſly performed, you muſt proceed on this manner, as followeth.

Firſt of all, the *Cobolt*, *Arſenick*, or any Realgar like theſe, that is auriferous, is to be introduced into Copper or Iron by cementation, in the way that we have aforementioned; then the Copper or Iron thus cemented with the Realgars, is to be reduced into fine powder, and to be commixed with Antimony, Calmei, or Calaminaris, the Marchaſite, and ſuch order is to be taken, (if for Gains ſake you would do a greater heap of matter) to have them ſlowly and by little and little made red-hot in Furnaces or Ovens, ſuch as in which the flame may have room to play, and as 'twere brandiſh it ſelf at top of the matters, and ſtir them, and ſo let them be calcined and burnt into aſhes, until they emit no more fume, and this will be in ſome few daies; then are they to be reduced in a convenient Furnace, and reſtored to their metalline form; then again muſt they be put into the former Oven, and there be calcined and burnt into aſhes, ſtill ſtirring them to and fro, and the aſhes are to be reduced, by the vehement Blaſt of Bellows, and this aſhifying and reduction is to be ſo long repeated, till there be a Regulus found in the reduction, and all the reſidue turns into unprofitable Scoria. This Regulus then is to be reduced on a Teſt into Scoria, and the Regulus being cupellated, the Gold and Silver which the volatile Minerals contained in them, doth ſhew it ſelf.

NB. Altho' this ſeparation is attended on with indifferent labour, yet notwithſtanding (if there be a great quantity of matter dealt in) it is alſo gainful, eſpecially where Minerals and Coals are to be had for a ſmall price, and alſo the other imperfect metals (as Lead, Copper, and the like) that concurr in this kind of Operation; by which it alſo comes to paſs, that there is a greater quantity of Gold and Silver extracted. For example, I burn Copper or Iron with Arſenick, Cobolt, and other poiſonous volatile Realgars, or with bare Calmei only, which alſo avails to conſtringe or bind faſt; with theſe I mix Antimony, Biſmuth, Zink, and Lead, and melt them together: Hence ariſeth a brittle maſs, which is to be reduced into aſhes, either in Ovens, as is already aforeſhewed, with the flame of Wood, which darts it ſelf at top of that mixt matter, and by heating ripens it, or by live-Coals in a peculiar Furnace, and that on this wiſe: Let there be built a great or ſmall Furnace, (of good Bricks or Tiles that will endure the Fire) according to the quantity of your matter which you take to prepare, let it be at leaſt a foot over in the inſide: in the forepart let it be open a foots heighth from the Pavement or Ground, to this end, that the Grate may be put in and taken out, as need is. Then ſome 2 or 3 foot higher than the Grate, let a door be made, whereby you may throw in the Coals, and above or at top of the Furnace are to be made Chimneys, fitted to receive and condenſe the fume of the metal, that it may not fly into the air, but being there cool'd, may be taken out. All this being done, fill the Furnace with Coals, and when they are well kindled, caſt in a portion of your metalline mixture, which will quickly melt, and being melted, will run through the fiery Coals, and ſtill keep fuming, and elevate it ſelf up into the appointed Chimneys; that which melts down through

through the Coals and Grates, and is in the form of metal under the Furnace, (which bottom must be made somewhat shelving, that the metal which falls down may run into a hole or pit, is to be taken up with an Iron Spoon, and again thrown in upon the Coals, and this is to be so often repeated, and so long, till all your whole mixture be burnt into ashes, or carried up in fume, and so shall be ashified and sublimed in the appointed Tunnels or Chimneys, which Flores or metalline Fumes you must take and reduce them in a reducing Furnace, so part of them will pass into a fusile Metal, but brittle. This Metal now must be again ashify'd in that roasting or burning Furnace, and be reduced by blast of Bellows; and this ashifying and reduction is to be so often repeated, till all be seen turned into Dross or Glass; which Dross or Scorias are then to be reduced with the most vehement blast of Bellows, and so they will produce a Regulus which is to be cupellated with Lead, as is abovesaid.

NB. But if so be that of the last-made Scoria a Regulus cannot be made by the blast of the Bellows, and that the Scoria remain Scoria, 'tis a sign that you have taken too much Tin, or that your Fire hath been too intense; and therefore you must take such Scoria, and beat them to powder, and mix them with a little of either the fluid Ore of Lead, or Spume thereof, and make them flow in a reducing Furnace, then the Lead draws the Gold and Silver out of the Scoria, which may afterwards be cupellated. But as concerning the manner of making the roasting or ashifying Furnace, as likewise the fusing or reducing Furnace, I cannot indeed at present here decipher it, but I will do it in the Third Part following, where more such-like concentrations of Metals shall be mentioned and treated of. And farther, the well-minded Reader must also know, that this kind of Concentration is not at all written for those that are as yet wholly ignorant of the Art of melting metals, but for such only as have already sweated at the Fire, and have been often and much versed in such Separations or Liquefactions.

I question not, but there will be many that will despise this my way of operating, and count it an impossible thing, such are to be left to please themselves with their own fancies. But withal, some will be found, to whom the nature of metals is known, and these will give credit to what I say, and will abundantly profit themselves, especially in those places where Minerals, Coals, and other things requisite are to be had for a small price. The greatest Expence in this way of Concentration is the Coals, which too cannot be any thing much in those places where there are such vast Woods. Every one may have his liberty to try it or let it alone.

NB. But I do openly affirm, that if so be any one shall know how rightly to handle and manage this Work, it may be compared with the perpetual or alwaies-lasting mines; and where minerals may be had, it will be most gainful; but I will not perswade any to attempt it in those Coasts where all things are dear. Nor do I think it amiss to dissuade them that have no experience in these kind of Operations, lest upon the ill management of the Operation, the effect should not succeed so luckily as they hoped for, and that then they should lay the blame upon me. That which I have at present written, is agreeable to the Truth, and may be successfully and gainfully performed by an experienced Artist or Laborator: And therefore as I have afore warned, so do I again advise the unexpert to abstain from this Work, unless he means to lose his Labour and Expences.

Such things as I have here omitted for brevities sake to speak of the *Concentration of Metals*, the Third and Fourth Part shall abundantly declare; but whoever he be that shall know how to bring to pass such a Concentration, either by the means of Salt-petre, by the dry way of a flame, or the moist way, by the help of *Aq. fort.* shall have a better effect than he that useth the Fire of Wood; but on the other hand, this Fire by Wood is of less Cost than the administration of the Work of Salt-petre is. Alas! What a deal of costs and labours have I bestowed in my life, in searching out and trying those kind of businesses, and having now brought it to this pass, as to be able to yield me the Reward of my Pains, I am not able to manage so vehement a fire, and to order the matters which require so great an heat? Therefore do I now with a willing mind make an offer of these my Experiments, to those who are of a vigorous age, and have Bodies capable of undergoing the toiling in the Fire. But that I may return to the things afore spoken of, and that that ashifying and reduction may not seem to the unexperienc'd altogether impossible and incredible, I will for their sakes bring undeniable Reasons or Arguments, whereby it shall be sufficiently enough evidenced, that such a cineration or turning into Scoria, hath its foundation in Nature, and that after this manner: Whosoever he be that hath seen or experienced somewhat in metals, knows, that the separation of the more excellent metals from the more vile, is to be done by the benefit of the Fire: for if so be that Gold, Silver, Copper, Iron, Lead, Tin, should be melted together into one mass, and you would separate them by the Fire the one from the other; this cannot be done any other way, but by adding to that mixture some other adventitious and destructive thing whereby the baser metals may be dissipated and deprived of their metallick form, of which sort is common Sulphur and such-like; for this works first on the imperfect metals, destroys them, or brings them into scoria and dross, which when they are so, and no more metals, they have no communion with metals, nor desire or love to be commixt with them afterwards: and by how much the more sulphureity there is in Metals, so much the easier doth common *Sulphur* destroy them and turn them into Scoria: But, by how much the nobler the metals shall be, so much the less detriment doth *Sulphur* bring upon them, and the less able is it to disturb (or alter) them. But besides, *Sulphur* does not only do this, but even the Fire, and Salt-petre both in the moist and in the dry way. It is done with *Sulphur*, if the metallick mixture be granulated and burnt therewithal, or that it be despoiled of the metalline Nature, then must it be molten and by precipitation be driven or be separated into divers Regulus's. For the *Sulphur* converts the *Mass* into Scoria, which when they are molten, that which in them is the most noble doth always separate it self from the Scoria, and settle to the bottom; then next the most noble part comes other which is excellent, but yet short of the former, and so consequently it descends from one degree to another, as from Gold to Silver, from Silver to Lead, from this to Copper, from Copper to Iron, *&c.* as hath been by my formerly described separatory Art sufficiently enough shewn. But Nitre performs the separations it makes in a different manner: For after that the metallick *Mass* is molten in a Crucible, and that this (*viz.* Nitre) hath been thereinto put, it doth in the first place set upon the sulphureous part, and turns that into Scoria, then the baser Metal, and thus it does on, so long till it hath attracted all the imperfect Metals to it self, and reduced them into Scoria: and so the perfect Metals remain alone, pure;

which order or governance of Operation, is alſo to an again, extant in my Writings.

Again, the bare fire is wont to keep another different way of deſtroying and ſcorifying Metals, than Sulphur and Nitre do.

For if a Metalline mixture be put in the fire, the more imperfect part thereof is conſumed in the firſt place, and driven into aſhes, the more excellent part gathers up it ſelf into a globular form; and as long as it finds any conſumablething therein, ſo longdoes it work and act thereupon, nor leaves it off afore it hath reduced all into aſhes. But that part which is of a conſtant and durable nature, remains unhurt by the fire; but yet if the combuſtible part be too much bigger in bulk than the abideing part, it does not only carry away with it the ſilver, but ſometimes alſo a good part of the Gold, and brings it into aſhes. And now, if thoſe aſhes ſhall be molten with a ſtrong fire, then the aſhes which ariſe out of the imperfect Metals, are turned into Glaſs, or ſcoria, but the aſhes of the perfect Metals do reduce, and reſtore themſelves into a malleable Body, whether it be Silver or Gold, according as it had this or that Metalline mixture in it; and if you proceed yet farther, with melting the aforeſaid ſcoria in the fire, there will a new Regulus fall out, which contains in it that Metal, which is the nobleſt next Gold and Silver, *viz.* Lead, and Copper; the Tin, and Iron do for the moſt part abide in the ſcoria: Even as it is in Cupellation, or the ſeparation of the Metals by the Cupel, the ſeparation is there alſo done, by the bare fire only, and when the fire acts upon the mixture, it reduceth the Lead into ſcoria, or ſpume, or Litharge, and while this is reduced thus, it ſpares not the Tin, Iron, or Copper, foraſmuch as they are likewiſe combuſtible, and of affinity thereto, but turns theſe together alſo into ſcoria, which ſaid ſcoria do then creep, or ſink into that penetrable, and porous Cineritious Veſſel, or Teſt, as long as any of it remains: But the Gold and Silver which know not how to be thus burnt up into ſcoria or aſhes, like the other imperfect Metals are left depured and cleanſed upon the Cupel: The like alſo, is to be judged of the aforeſaid incineration of Volatile Minerals, or imperfect Metals; that is to ſay, when they undergo the force of the fire, they cannot but go into ſcoria and aſhes, and if they have in them ſomewhat that is eſpecially good, and durable, yet the greater part being combuſtible, has the prevalency; ſo that the more excellent part which is in it, is converted together into aſhes and ſcoria. But yet it may be afterwards reduced, for by the vehement blaſt of Bellows, it ſeparates it ſelf from the more baſe part, and again aſſumes a body Metalline, whether it be Gold or Silver.

By this Diſcourſe any one that is not wholly void of all Metallick knowledge may ſee, that the Metallick Incineration and Reduction, which we have afore delivered, is built upon a firm foundation: But he that cannot underſtand or apprehend theſe things, is uncapable of being holpen by any art. But the following third and fourth parts will yield a more clear light, or inſtruction. Furthermore you are to obſerve, that there are likewiſe other ways whereby Metals are reduced into ſcoria, and the better and more excellent part is afterwards extracted out of the ſcoria, *viz.* by the help of Terreſtrial things which are together, ſulphureous, of which ſort is all Sand, Flint, and the like. If ought of this kind be permixt and molten with the metalline Calxes, it retains with it the viler part, and lets go the more excellent; as for inſtance, there's the Glaſs of Lead: For if the aſhes of Lead be molten with Sand, or Flints, all the Lead together with the Flints is converted into Glaſs, or ſcoria, but the Silver or Gold which was in the Lead ſeparates it ſelf like a Regulus, and deſcends to the bottom.

Some kinds of Salts alſo are able to make thoſe ſcoria's, *viz.* thoſe Salts which are extracted out of burnt aſhes, and are commonly called Alkalies, ſuch as are the burnt fæces of Wine, the Tartar of Wine, Potters-aſhes made of the aſhes of Wood, and other ſuch like; theſe alſo love to diſſolve the ſulphureous parts of metals, and do leave the Gold and Silver that is therein whole and ſound, and ſo make a ſeparation of the good from the evil, and give them a notable ſplendour: Concerning which waſhing, we will treat more fully in the following third part.

Beſides too, even common Salt deſtroyeth and reduceth the imperfect metals into ſcoria, but not after ſuch a manner as Alkalies do by waſhing, but by diſſolving and extracting. For if a metallick Calx, or Ore, be powdered and mixt with common Salt, and molten together, the Salt doth more readily ſeize upon the metal, than on the reſt of the droſſineſs, diſſolves it, and turns it into as it were ſcoria. But to illuſtrate this thing by an Example, If I would ſeparate a mineral which hath in it, Iron, Copper, Gold, and Silver, and ſhould melt it thus mixt with the Salt, then the Salt would the firſt time lay hold on the Iron only, and leave the other metals; but if ſo be there were not ſo much Iron, as for the Salt to ſatisfy its devouring ſelf, it would diſſolve the Copper too, the Silver and Gold remaining untoucht; for Salt is a common Enemy to Silver, but a Friend to the Iron and Copper, which it willingly diſſolves in the melting, and attracts to it ſelf, whether it be each apart by themſelves, or both jointly together, which if you are minded again to ſeparate each from the other, you muſt powder that molten Maſs, and pour water thereupon, and boil it; ſo the Iron and Copper enters into the water, together with the Salt, whereinto if you afterwards put ſome Iron Rods, the Copper precipitates it ſelf, and the Iron abides in the ſalt water, and is made very fit to uſe in dying like Vitriol; but if it will not be coagulated like Vitriol, then the Copper (which hath precipitated it ſelf about the Iron) is to be waſht and molten, out of which comes purer Copper. But yet ſuch a Copper may be converted to better uſe than to be molten, of which more ſhall be ſpoken in the third part.

By this means, may one ſeparate and bring into uſe thoſe Coppery Minerals, which have much Iron in them, and by which, the Copper is otherwiſe rendered unmalleable and unprofitable: and this is ſuch an Evil, as the Metal-workers have hitherto little known what remedy to apply; whereas in the mean while there lie in many places no contemptible Mines of Copper, neglected and unmedled withal, becauſe they have Iron commixt with them. Some there have been, who have endeavoured to extract the Iron by the help of a Load-ſtone, but this way is too troubleſom, and ſo is not profitable; but it may be aptly and conveniently done after this manner, did they but know how rightly to uſe here that aforeſaid ſalt water, and the precipitated Copper: For the ſalt exalteth the Iron, and the Iron doth again exalt the ſalt, and animate it, ſo as that it may afterwards with a little labour and coſts be, all of it, and without any loſs, converted into good Salt-petre. But ſome or other may ſay, what profit would there redound unto me, if I

ſhould

should season one or two, or more Copper minerals with salt, whereby the Copper may be thence drawn out? I would have such an one to know, that in that Operation, some hundreds, or thousand pounds may be done together, and the business may be ordered upon fire in distinct Furnaces, that so a great profit may be gotten; and not only thus, but the same may likewise be done without any Furnace or Oven, with many hundred, or thousand pounds in one Operation, at the open Air in the Field, or in a Wood, where that Ore and salt are to be found; so that the salt may serve as a covering to the mineral, and the mineral as a covering to the salt, and the Wood may serve both for the Furnace and fire.

This now in my judgment is an artificial extraction of Copper out of the Mines, (especially when 'tis such an Ore, which (otherwise) is not of any profit by reason of the immixt Iron, or else consists of such a lean Vein of Copper, as will not suffice to quit the costs of getting it out, but yet it may by this means be separated, with no contemptible profit. For there are every where almost such poor Copper Ore as this which lie and are not dreamt of: For indeed it cannot be expected, that, (if when a Copper Mine (or Ore) doth contain in it some small matter of Copper, it being so overwhelmed as 'twere with the muchness of heterogeneal medlies or mixtures, that it cannot precipitate it self into Regulus's but passeth into Scoria) it should answer the costs that are to be spent on the forcing it out; and therefore such Minera's must of necessity remain without use. And how many such kind of Ores have I found in *Germany*, which a man may have by heaps, but no body regards them, for that (as we have already said) they are too barren or poor: Whereas notwithstanding they may be most easily perfected by the help of Salt, so as to be made very gainful, & the costs exceedingly well repaid that shall be laid out upon them, especially in those places where there is such an abundance of Salt, that the Inhabitants know not what to do with the plenty they have of it. Many such places there are in *Germany*, as *Tirole*, *Saltzburg*, *Bavaria*, and the Dioceſs that we call *Bergtes-gaden*: in which places all the whole mountains do not only abound with Salts, but have no small portion of Copper too: Nor is it so in those places only, but likewise every where; Salt is common and of a small price throughout all *Germany*.

And as we have already shown you, that Iron and Copper may be commodiously extracted out of the Ores by melting it with common Salt, and may be again separated from each other by precipitation: So likewise may the same be done in a moist way by boiling; and is thus, if the Ore be ground and a long while boiled with very Salt-water, the Copper will be dissolved and passeth into the Salt-water, out of which it is to be precipitated, and so fitted for use. But now, if the Salt be distilled into a Spirit, then is it apt not only to extract Copper, but also Gold out of the Ore, and will be of exceeding much profit: But this operation hath already been long ago described by me, in the First Part of the Mineral Work.

NB. But it will be yet more profitable and gainful to prepare that water out of the Salts and especially out of Nitre, which water is but of small price, and yet notwithstanding it is of that Power and Virtue, as to dissolve or extract all the Metals out of the Ores: and as well the Silver as the Gold and Copper in the solution, may be again precipitated singularly or each *Per se* one after another; and this kind of water may you likewise use about all Fossiles or Ores with a most wonderful abbreviation.

But now, if you use common *Aqua-fortis*, it extracts only the Silver and Copper, and leaves the Gold: and if you take common *Aqua-regia*, it attracts only the Gold and Copper, and leaves the Silver; so that neither of these hath (as we use to say) all the points in it, especially seeing such a kind of Water serves but once only; nor is there as yet any one found who knows how to separate the metals in the solution one from another, so as that the water may still remain good and fit for other the like uses. But as concerning this Water of mine, thus stands the case, *viz.* One Metal may be precipitated after another out of the Water, and each distinctly, and yet for all this, the Water loseth not ought of its Virtue, but may be many times serviceable; certainly it is a most profitable invention, which (in the doing or perfecting some metals and minerals) is to be preferred many degrees before any melting by Fire. For if that there are several Metals of diverse kinds, in one Ore; as Gold, Silver, Iron, Lead (and this often happens so) and they should be forced out by Fire, they would yet remain mixt together; and there's a great deal of work to separate them. For first they are to be cupellated on Tests with a great deal of Lead, that so the imperfect Metals, as the Iron, Copper, Tin and Lead if therein, may go off; then the Gold is to be separated also apart, or by a particular operation, by the help of a separating Water, and this is not every bodies work, nor have all such as are skill'd in the Art, in all places necessary provision at hand. But on the other hand, there needs not in that other kind of way, any thing save the Water and some Glasses, with these may you manage and compleat all the whole business, and get a great deal of gain without noise and trouble. For as to such a one as betakes himself to this kind of work, his Neighbours cannot accuse him, that he will (one time or other) ruine their Fortunes and Houses by Fire, for they hear no blowing of the bellows, nor see they any Coals carried into his House. Nor will the *Smiths* say that 'tis his fault that Coals are so dear, as 'twas objected to him who called himself the little Country fellow. Besides too, he will shun the suspicion of the Magistrates, nor will he give them occasion to suspect him to be a rich blade, and so torment him with the more grievous exactions and with quartering of Souldiers.

And now yet more, This kind of extraction does not only appertain to the getting out the Gold and Silver out of the Ores or Minerals and such as are volatile and crude, and which are every where to be met withal, and may without detriment to any, and with a safe conscience be fixed and separated by the help of this Water: But you may also by the mediation of this Water, profitably and with very small Labour separate all metallick mixtures, such as are mixt at their first forcing out of the Ores, or are melted into one Mass on any other account, and so obtain each Metal pure and free from all heterogeneities. As for example, Put case I have in my hands a certain metallick Mass, which hath in it Gold, Silver, Lead, Tin, Iron, and Copper: Now I would willingly separate the Gold & Silver therefrom: hitherto there hath been no other way known of obtaining it but by cupellating such a Mass or mixture upon the Test with Lead, and so depurating it; in which cupellation, the Copper, Tin, and Iron, do pass together with the Lead into the Test, but the Gold and Silver remain behind, which are to be afterwards separated with *Aqua-fortis*, that you may have each by it self. But the Iron, Copper, Lead and Tin do remain intermixt with each other in the Test, and should you again melt them even by the strongest

ſtrongeſt blaſt, yet will they be commixt, and can hardly be ſeparated the one from the other. But by this way of ours if they be diſſolved in the water together, you may continually precipitate thence one Metal from another, and take them each apart, and not only the Gold and the Silver by themſelves, but the Copper, Tin, Iron, and Argent-vive (each apart).

But it is not ſo neceſſary (if in ſuch a metalline Maſs wherein are contained ſo many Metals, the Gold and Silver be but the ſmaller part) to diſſolve all the other baſer metals together, to get out the Gold and Silver; this will not be adviſedly done, but it would be better, firſt to purify that Maſs upon a Teſt with Lead, and ſo to ſeparate the Gold and Silver by the help of that water, or elſe that Maſs may be burnt with Brimſtone, and the Gold be thence precipitated and depured. But if the Maſs hath leſs of Iron, Copper, and Tin, than of Gold, there will not be ſuch need of purifying the Maſs, by firſt burning it upon a Teſt, and then ſeparating it by *Aqua-fortis*, as is commonly known and uſed to be done; but the whole mixture muſt be diſſolved, and the Gold and Silver, which you pleaſe, be ſeparately, or apart precipitated into a clean Calx, then the Copper alſo apart, then the Tin; but as for the Iron, you may forbear to precipitate that, becauſe there are no great matters to be performed with its Calx, and it will be better to draw off the *Aqua-fortis* thence, whereby it may again be had pure, and fit for uſe.

Then the Iron which abides behind, if it be made red hot, yields a moſt excellent Crocus Martis, and a moſt excellent Ingredient for Chirurgeons, for all their Wound-balſams and Exicatory Emplaſters; it is ſtiptick; it will alſo be ſerviceable to Painters to make exquiſite colours therewithal, ſo that the Iron which is the baſeſt Metal in the whole mixture, if it ſhall be thus wrought upon and brought into good Crocus Martis, yields the money that was laid out upon the water, and yet this very water, after its abſtracting from the Iron is not leſs fit for uſe, but is better than it was before. For in its abſtraction from the Iron, it brought over with it ſome Goldenneſs, which Golden property doth afterwards, in other metallick ſolutions, aſſociate it ſelf to the Metals, is imbodyed, and yields as much Gold as the price almoſt (of the water) afore (thus uſed) couldbe judged at.

So likewiſe there's no need of reducing the Calx of Venus into Copper, but it is twice more precious than other good common Copper, becauſe it can in a few hours ſpace be changed into excellent Verdigreaſe, and ſo is 4 or 6 times the value of Copper it ſelf. Further, it is not needful to melt down the precipitated Calx of Silver without any farther profit, but 'tis better to melt it by the means of the liquor of Sulphur or Antimony; for by this operation will it become auriferous, and be meliorated. Finally, you are not bound to melt even the Calx of Sol, without any profit in melting, but you may even thereoutof draw ſome profit; for if it be amalgamated with the Mercury of ♄ or ☽ it becomes more augmented from the ♄ and ☽; or elſe it may be uſed by the Goldſmiths to Gild withal, and by Painters, if its brightneſs and ſplendour be firſt reſtored unto it, for ſo it may be uſed about Painting or writing. So then, from this operation doth reſult a manifold benefit, and both the Iron and Copper, as alſo the Gold and Silver are rendered better, and more precious than they would have otherwiſe been, if they had been ſeparated each from the other after the common manner, by the fire.

Therefore, there is not only a great benefit gotten in that way of operating, in thus extracting Gold and Silver out of their Ores, and out of the Crude Minerals, and in this ſo compendious a ſeparation of a Maſs (or mixture) of Metals; but alſo, that ſeparation brings more profit than the commonly uſed and perceived way of ſeparating Gold and Silver by *Aqua-fortis* doth, in which way the Maſs is to be firſt burnt to purity, and all the heterogeneities are to be taken away upon a Teſt; then the Silver is to be diſſolved in *Aqua-fortis*, and to be ſeparated from the Gold; this done, then the the diſſolved Silver is to be precipitated either by Copper, or by putting water thereunto, or elſe the water is to be thencefrom diſtilled; from whence, there is not only to be expected no greater profit than what is had (or gotten) out of the Gold ſeparated from the Silver, but withal even half the water is loſt. But now here (in my way) the greateſt part of the *Aqua-fortis* is preſerved, and is indeed meliorated (if there were Tin or Iron in the Maſs) the very bare Crocus Martis only yields as much as the water coſt, & the Flos Æris is meer gains; the Calx of Silver is by a ſolution of Antimony enriched with Gold, the Golden Calx is augmented by Saturn, and Luna, ſo that the gain is fourfold, beſides that Gold which is gotten by ſeparation out of the Silver; and now may not I juſtly call this an Artificial extraction or ſeparation of the Metals, by the moiſt way; but now, like as this is a very notably profitable way of extracting the Metals out of the Ores or Minerals, & of artificially ſeparating them by the moiſt way; ſo likewiſe may the ſame be done in the dry way by fuſion; if (*viz.*) the Minera's are diſſolved by Antimony or Lead, & one of the Metals after another ſhall be thencefrom precipitated; ſo that it is not ſo altogether neceſſary to cupellate ſuch a Maſs, and by the ſeparatory water (or *Aqua-fortis* to ſeparate that, which (by that burning on the Teſt) ſhall have been throughly purged; But if all the Metals ſhall be molten together into one Maſs, there may (firſt) be precipitated the Gold, then the Silver, then alſo the Copper, and by the help of Nitre be rendred pure and malleable; and this too may be done without much labour or coſts; ſo that as well by the moiſt, as alſo by the dry way, all the Metals may be very commodiouſly and compendiouſly, and in ſhort time ſeparated the one from the other by the benefit of Salt-petre. Suppoſe I have a Maſs that has Gold, Silver, or Copper and Iron in it, and I would have it ſuddenly depured; therefore I may only burn it with Sulphur, and by the help of Saturn precipitate one Metal from another, and purifie the Regulus, by Nitre, and ſuch a Maſs though it were 100 pound weight could I ſeparated with the eaſy labour of one day, & for 3 or 4 *Dollars* coſts; but as for ſuch an one as hath no uſe for ſolution & precipitation, or hath not convenient melting Pots and Furnaces, he may granulate ſuch a Maſs, and thence precipitate the Gold, Silver, and Copper, each apart, and draw off the water from his Mars; then the Mars yields him the price of the water; the Calx of Venus yields the reward of his pains and labour, and the augmentation or melioration which happens to the Calx of Sol and Luna in the reduction is clear gain; ſo that the Gold and Silver are, as it were gratis, and without any expence ſeparated from each other, and that both by the dry way and by the moiſt way; for the Silver is equally as well graduated and made auriferous in the dry way, by the fuſion or melting in the operating, or by the transfuſing (or through melting) with the Antimony; ſo then good Gold may by this way be precipitated out of any Silver

which

not aureous, provided the business be but dexterously managed.

In the first part of this Book, (where I treated of the concentration of wood,) I wrote, that a Juice might be pressed, by a peculiar Press, out of any wood, which afterwards might be turned into good Salt-petre by the benefit of the Air and time: I likewise there added some reasons, whereby it might be evinced, that it was possible for Art to perform such things, which are no other but the Rewards Nature her self yields, and that the Salt-petre which is wont to be every where digged out of the Stalls, or Stables of Cattle, is nothing else but the essential salt of Vegetables, and Animals, which is in a long tract of time, and by the hidden virtue of the Air, turned into Salt-petre.

But now if any one should haply perswade himself, that if he exposeth that Juice of the Woods to the Air for some Days, or Weeks, that it will presently become Salt-petre, certainly he would be much besides his aim, neither indeed is it lawful to prescribe Nature the time of her Operation.

Does not a Husbandman deserve to be called Ass, or Blockhead, if some few days after he hath sown his Corn, he should go into his Field to see if his Corn were ripe or not? Just thus are you to conceive of this work, for in all things must you expect the due time, in the Generation both of Animals, Minerals, and Vegetables, so that there is not the least need of any farther proof of this matter: For every Generation requireth its own proper time.

But, that very many haply have wearied themselves with imagining about that kind of Press, which I have mentioned in the first part of the *Prosperity of Germany*, and yet have not found it, is not to be much wondred at. However it is assuredly true, that such a Press may very easily be prepared, by which you may daily press a great quantity of Juice out of Wood, be it believed or not believed. But seeing that such a Press hath been seen with me, and hath been beheld prepared, and wood squeezed out therewithal, and set to ripen in the Air, sure it cannot be long ere the truth will manifest it self and publickly vindicate it self from all its slanderers.

I say again, that such a Press is found by me, and that it is an artificial one, and is of less costs than will be easily believed. Nay more, every day brings forth new and better Compendiums, so that there will not hereafter be any use or need for the Press, to squeeze the wood out by: but every Vegetable and Animal, may without labour and trouble be in a short time, and without the press, transmuted into good Salt-petre, so that many hundred weight of Salt-petre may be generated, or produced (by the labour of only one person) out of the bare Wood, Leaves, and Grass, (where they may commodiously be had) and yet 'tis not the person aforesaid, but the air that causeth this Generation: for the person doth no more but expose to the air the subject matter, upon which it may operate, and out of which it may bring forth Salt-petre.

But there is nothing which I admire more at, then, that this present Age is so sluggish and averse from searching after the secrets of Nature. Whereas, were but the Properties only of that stupendious, or wonderful subject Salt-petre, well known, there might well be a forbearance of reading many Chimical Books seeing that by it alone may many wonderful things be performed. I have a little afore shown, how both a moist and dry extraction of Gold and Silver, & the other metals is to be done by Salt-petre; and if Nitre were of no other use but this only, yet were it well worthy to be beloved and esteemed by all, and they should as much as in them lies labour not only to produce it in plenty out of vile things, but withal to know how to make use of the same with profit.

But whereas I have not so very openly and clearly described, or published the precipitation which is done as well by the moist, as by the dry way of the extraction and separation of metals; I would not that any one should take it in evil part; for there are exceeding weighty reasons, that make me fear to prostitute such excellent Inventions, or to chew meat (as it were) and thrust it into every Asses mouth. Let it suffice, that I have shewed, that such things are possible. But yet the Art lies not so fixed in my breast, nor is it my mind to suffer it to lie buried with me: No, God hath blessed me therewithal meerly for this end, that I might help and succour others, to the performance of which, I am most ready and willing; but yet not every one without any exception, but such as are ingenious Lovers of the Wonders of God, and know how decently to use all things, least I being too improvidently liberal, should put new Weapons into the hands of mine enemies.

I could have buried-over these things in silence, and haply been at more quiet, but it was no ways possible for me to suppress the wonderful Works of God, so as to withhold them from coming abroad to light, and to the view of Men, to the Honour of God. And whensoever it so comes to pass, that the things delivered at present in this second part, and which shall be delivered in the following third and fourth parts, shall be believed, and be brought to effect and be done: then all the crew of Slanderers and Enemies of the truth shall be confounded with shame, before the whole World, and that Genuine Alchymy, shall again be embraced, and honourably flourish: For Salt-petre must be the Master, as *Paracelsus* saith, in a certain Chapter where he treats of common salt, and mentions Salt-petre with a commendable Testimony. Nor hath *Basil Valentine* done a less faithful Work as to his Nitre; but few there are that understand it.

I am not of the mind to boast of the knowledge of many things, but yet thus much I find, that there is not in all nature any subject given that may in good deed be compared with Nitre, as to eminency or excellency; much less deserves to be preferred before it. Let not the Lover of this Art be disquieted in his mind, so long as there are two parts to follow, and come forth: For then men will see, and be even enforced to confess these things which afore they did not believe. And upon this score do I shorten this part, that I may the sooner come to the third and fourth parts: In which parts (God willing) there shall be discloses many most highly profitable inventions for the benefit of mankind, but yet they shall be veiled, after that same way and manner, as others afore me have used to do, that so Pearls may not be cast afore Swine.

But that I may return to my purpose, and shew that what I have said is true, and that great things may be done (as to the melioration of Metals) by the help of Salt-petre, it will be necessary, that those things which we have already written in this second part be made a little more clear, and may be visibly demonstrated to the unskilful and incredulous, in what it is, that this profit we at present speak of, is seated.

And first, as concerning the Generation of Salt-petre, there hath been enough said already, *viz.* That it may be prepared by heaps out of otherwise-unprofitable Wood, Shrubs, Briars, *&c.* which rather endamage the Ground, than do any good, because they become a refuge for cruel Beasts, which sustain themselves upon the great ruining of the other Wild ones: Nor needs this work any greater costs than to cause a House to be built in the Woods, under which the wood, together with the circulatory Vessel, may

ſtand dry; and beſides too, one man is ſufficiently able to manage the whole buſineſs, nor is there any thing elſe required but thoſe unprofitable underwoods, or Briars, *&c.* or if you have not ſuch, then, the Leaves that the wind blows off from the Trees. And if alſo you add ſome Salt thereunto, even it will be likewiſe turned by the help of the wood into Salt-petre, and hereby will ariſe a greater profit: Neither is there any neceſſity of taking the Salt we uſe to ſeaſon our meat withal. But yet if you can have it in plentiful quantity (as may be in many places of *Germany*, where it much abounds) it will be well, but if it be not to be ſo eaſily had, the wood it ſelf will make Salt-petre enough; nor needs there any other thing, but to begin the work, and let Nature alone to perfect it, and to produce the Salt-petre. But farther, as *Germany* doth never want ſtore of wood, ſo wants it not ſalt, for there are whole Mountains of ſalt, which to exhauſt, is a thing impoſſible; eſpecially in the Territories of the Arch-biſhop of *Saltzburg*, in the Elector of *Bavaria*'s Country, the Dioceſs of *Berchtsgaden* as we call it, which places, beſides their abounding with Salt, do alſo abound with ſtore of Wood. Have I not reaſon to believe that great Treaſures and Riches may be hence reaped. Salt they have at their Feet, and vaſt Deſarts at hand, which are of no uſe: O improvident Mankind! What account ſhall we give that ſo behave our ſelves in our Stewardſhip. Would it not be much more praiſe-worthy to have drawn forth thoſe Treaſures, to the Honour of God, and not to have ſuffered them to have remained without being uſed, and unmanaged; what is the greatneſs of the charge requiſite to the carrying on this Work that deterrs them? What expence I pray is it, ſeeing that a little ſhead may eaſily be built in the Woods? And beſides, where great Woods, and many Trees are, there are alſo found Minerals both ripe and unripe, and the ripe may be forced out by Wood, or Coals, the unripe may be fixed, or ripened by the help of Salt-petre, and the Gold and Silver alſo may be afterwards thence ſeparated by the Salt-petre.

And now I pray, would not the Country be enriched hereby with vaſt Treaſures, and ſtore of Wealth? But put the worſt, if every Country did not abound with ſtore of Wood, yet hath it a great deal of ſuperfluous Graſs and ſtubble, and this yields as good Salt-petre as the Wood does. And if in caſe every Country, or Seignory had not Minerals of their own, which might be ripened by Salt-petre, and from whence Gold and Silver might be drawn, yet nevertheleſs may they be had out of the bordering Provinces. Nay more, if ſo be the already excocted Metals ſhould be advanced to a maturity by the means of Salt-petre, yet would not even this kind of work be without an acceptable gain, and it would be better for us ſo to do, than to hang them up at the Walls in our Houſes, for Ornament, and Pride's ſake. If an Enemy comes, one Ounce of Gold, is better than a Thouſand pounds of Tin, or Copper, which the owner thereof muſt neceſſarily be conſtrained to leave behind him, whereas he could carry away the Gold with him; which kind of concentration we ſhall treat of in the following third part: and in the fourth part ſhall be taught, by what means even Gold and Silver may be concentrated, that ſo it may lie hidden from the Enemy, and be tranſported (under another kind of form or ſhape) into ſuch places, where it may be free from the Enemies Clutches.

And farther, that water which we ſpeak of, ſerves not only to extract Gold and Silver out of the Ores, or Minera's, (which otherwiſe, could not be drawn forth by any excocting or forcing) but alſo for the taming, and bringing to uſe that which is in huge Stones, Flints, and the baſer Foſſiles (in which, Gold and Silver are only as it were, a little ſticking, and will not be thence had by any art of melting) and that with profit too well worth the Labour. So that there is ſcarce required 6 or 7 Loths of water to extract the Gold and Silver out of 100 *l.* of Ore; and if there were but 2, 3, or 4 Lots of Silver at the moſt, in 100 *l.* of ſuch matter, yet would it be a gainful extraction, eſpecially if the things, or ſubject, be Arſenical, or as yet Volatile, and cannot brook the intenſeneſs of the fire, but are driven away by a ſtrong blaſt. *For in that extraction by the water, that which is volatile, is fixed, and retained together*, that it afterwards admits of being fuſed, or molten, and that this is ſo, will evidently appear to any, experimentally. Let him but take Arſenick, and diſſolve it in Aqua-fortis, and again draw off the water, and he will be able preſently to melt the Arſenick, and make it red hot. Quickſilver is well known to be a very Volatile matter, but yet even that, (if the water of Salt-petre be ſeveral times drawn off thencefrom) is made ſo fixt as to ſtand and abide wholly in a moſt intenſe fire. For, that which Wood and Coals do (in a long time) perform; the very ſame doth ſuch a water effect in a few hours ſpace.

But ſome or other may oppoſe or queſtion thus; How can it poſſibly be, that if thoſe matters be ſo very poor, 8 or 10 pound of water ſhould be ſufficient to extract the Gold & Silver which is contained in them; for it ſeems as if 8 or 10 pounds of water were hardly enough to moiſten 100 *l.* of Ore or Minera, but would be loſt amongſt ſuch a deal of Stuff: Let ſuch an one know, that what I have written is poſſible and true; I can prove it and demonſtrate it even to the ſight; but as concerning the adminiſtration of that Work, 'tis not fit it ſhould be made too common.

And verily, in this ſticks the main difficulty, here is the Art and Skill; 'tis not for every one to acquit himſelf here, and if that the gold and ſilver were extracted by means of this Water, yet even then the chiefeſt of the Art is to know how to precipitate the pure Gold and Silver thencefrom, and incorporate it, which knack I juſtly reſerve for my Friends; for verily, this is ſuch an Art, as by the benefit of it alone I ſhall renew ancient friendſhip with many, and moreover purchaſe me more new friends: And therefore let no body be angry at me, or count it amiſs, that I would not publickly diſcloſe ſo excellent an Invention, and put new Weapons into mine Enemies hands to hurt me withal. [*This is taught in the following parts.*] And if I ſhould do ſo much as clearly to mention every thing, yet nevertheleſs ſhould I incurr the enmity of many men, as much as if I never had done it; and beſides too, it cannot poſſibly be, that all things ſhould be ſo nakedly and plainly decyphered to the unskilful, as that they ſhould preſently be able to do every thing. If they once make trial, and cannot do the buſineſs that they aimed at in their minds, then they curſe him that writ, and beſtow many a bitter wiſh on him, as if he had been too obſcure in expreſſing himſelf, and ſo they deſpiſe that which is otherwiſe laudable.

But if ſo be that the poſſibility of a thing is only demonſtrated, and no Receipt added, then they will not undertake any fruſtraneous Labours, nor will have cauſe of curſing any. But ſome or other may here enquire, Where ſhall I find ſuch a ſort of Minerals and Foſſiles, out of which I may extract Gold and Silver? If any ſuch had been to have been found, they would not have lain idle & waited for my coming; others would have taken them away long ago, and converted them to their own uſes. I think it expedient to demand as well of ſuch a one, who thoſe others ſhould be, that ſhould have taken them away before thee? If their Experience be as little as thine, and thine no greater than is theirs, there's no danger of your fore-preventing

ing or deceiving one another, seeing you are all alike ignorant of the thing.

Think'st thou that the number of those that are experienc'd in Metals is so large? 'Tis confest, there are enough Excocters or Metal-Separators, but yet they must *per* force leave that untouch'd which they cannot find out, seeing they know no other way of ordering their Affairs, but the old Road. It oftentimes happens, that there is more Gold driven away into the air by these Excocters, than is left behind in the fire, and yet forsooth that Crew arrogate to themselves abundance of knowledge, and perswade themselves, that they stand not in any need of any ones advice. Nor indeed do I invite them to any new Studies and Operations; let all such as list, use the same way of excocting or separation that they have learned; but if there be among them those that are not ashamed to learn better, such may be counselled. My purpose at present is, to do some acceptable Service to those that have no Mine-pits, and who cannot separate Minerals or Ore in gross, as I may say, and yet would be very glad to enjoy in private some little small gleanings as 'twere of the bits or small pieces that the Excocters leave, whereby they may get sufficient gain for the commodious sustaining of Life. These are they whom I have a mind to assist; the Richer sort have enough already to fill or satiate themselves withal; nor need they any information of mine; as for the Poor, there's no regard had to them. The whole Artifice therefore consisteth in the extracting (when there's but a very little Water used) and then in the precipitation of the Metals, so that the Water may remain good, and fit for other uses. There's plenty enough of poor Minerals and Fossiles even every where, and which no body regards and knows. It would not be amiss to look upon or consider of all Flints, Rocks, and Stones you meet with, and consider what property they are of.

Concerning this I have written in the First Part of the *Mineral Work*, *viz.* How by the Spirit of Salt Gold may be extracted out of a Flint: But as hitherto, few there are that have set about that Work, partly because they could not prepare the spirit of Salt, and partly because they knew not how to precipitate from it the extracted Gold, nor knew how to melt the extracted Calx of *Sol* with Antimony; all which I must needs confess, is not for every one to perform. But now this Extraction which is made by the Water of Salt-petre, doth extract the Silver too, which being thence precipitated, the water remains as virtuous as afore; and indeed, if a comparison be made 'twixt this and that Extraction, there is as much difference as is between black and white, and between the day and night; therefore I say that this is a thing worth the learning, for it may be of exceeding much profit in times of affliction. Greatly is that pledge to be esteemed of, *Which* (as the old Proverb is) *redeems its Lord.* Art is no burthen to a man to carry, but it rather carries or bears up a Man, easeth him, and makes him be of a cheerful mind, because it is a thing on which we may safely trust. It is more precious than Gold and Gems, which may be lost, but this abides firm and constant even to the Grave, and doth abundantly enrich its master.

This Extraction doth likewise serve for the drawing forth Gold out of Silver, tho' it be not gilt, which to do is not in every ones power, tho' many know that Silver hath Gold in it, yet if it be not of so much value as to quit the Costs that are necessarily to be expended upon it, it is left as it is; and now there is no where separated Gold out of Silver, unless it be gilt, and they see it sticking thereupon. Any other silver whatsoever, how much gold soever it possesseth, is not separated, when as though, sometimes there might be made more gain thencefrom. But I must needs confess, that the separation of the Gold from the Silver, the usual and known way is conjoined with abundance of labour, and not worth the costs spent about making the separation, unless, haply, the silver partakes much of the Gold: Whereas on the contrary, this my way of separating is done with light labour and small costs, and therefore may be used about all silver whatsoever, though it has in it never so little Gold.

But that the business may be yet more clear, and the better perceived, it will be useful to add this information. When you would separate the Gold from the Silver by Aqua-fortis, it must first be purified with Lead, by burnnig it upon a Test, now in this work there's the Test, Fire, the sufficient portion of Lead, the labour and time spent hereon to be considered, and when all this is done, then the Lead has entred, together with the Copper that was in the Silver, into the Test, and may be esteemed of but as a thing just kept from being lost. Besides too, the Copper carries away with it, a good part of the silver into the Test. And altho' that by a most vehement blast of Bellows the Test may be molten, and part of the Lead, Copper, and Silver recovered, yet the expences necessarily requisite to this operation, are more than the regain'd Metals are worth, so that these costs, charges, and troubles are too great. Then finally, when all this is done, and that the silver shall have been depured by burning, then it must after all this, be granulated, and this is some charge, and then when all this is done, it may be separated by Aqua-fortis, and being separated, be again molten into a Mass.

Now my way of working is freed from all these kind of linked labours, and so much trouble and loss of expences and time may be avoided; for when I take on me to separate any Silver, whether it has much or little Gold, I cut it into bits about the length and bredth of my Finger, so as that I but put it into my separatory Vessel; then I make it gently or by degrees red hot, to the end that the defilements may be the better washt off, and the separatory water may the better work upon it. Then pour I in the water, and suffer the Gold, Silver and Copper to be dissolved; then (after this) do I precipitate the Gold, then the Silver, then the Copper; all which operations, from the beginning to the end, are done in three or four hours space, nor requires it any expence save only the water, and a little fire, to keep the water warm, that it may the more strongly work upon and dissolve the Silver; the Metals thus separated from each other and edulcorated, may be melted; and now from thence may any one see, how much difference there is betwixt ours and the common separation of metal, by the moist way; and if there be any one that would use this way of mine, of separation, he would doubtlesly get much gain and riches, neither could any one endammage him by way of prevention, and he would get himself an exceeding profit wheresoever he be, not only out of guilt Silver, but also out of any other; for there is not a City so small, but it hath a Silversmith, who buys up the old Silver, and separates it his own way, which is very laborious and costly, and therefore he would the willinglier give his Silver to another to separate, whereby himself might be spared the labour and cost, were there but any one that would offer him his help thereabouts.

And seeing that all Copper holds Gold hidden in it, and that that Copper is not any impediment in this my way of separation, but is resolved together with the Silver, therefore doth it always bring some increase to the Gold and consequently more gain; but the labour will be yet more gainful if it be prepared with a separatory water, which hath other Golden species or things added thereto in the making, and which render

the

the water aureous, ſuch as are Lapis Calaminaris, Zink, the Minerals (or Ores) of Iron and Copper; for hereby is made a water that is in it ſelf auriferous, and which doth readily (in the ſeparation) join its volatile Gold to the Silver, and ſuffer its ſelf to be incorporated; in ſo much that even ſuch Silver as hath already been ſeparated and purged, will yield Gold enough in the ſeparation, if it be diſſolved with ſuch a ſeparatory water, which hath been impregnated by graduating things.

And even as this ſame extraction which is done in the moiſt way, by the water of Salt-petre is exceedingly eminent and of much uſe, as being ſufficient to ſupply many thouſands of men with food and neceſſaries for life, ſo as that they need not at all to be compelled to deceive or damnify one another; ſo likewiſe, no leſs excellent is the extraction, which is done by the dry way; if, *viz.* the Volatile Antimonial Mineras, or Ores (whether they contain in them Gold, or Silver, or Copper, Iron, or Tin, and what metals ſoever they contain in them) be molten with twice, thrice, or four times as much Antimony in a Crucible, and be (by the means of Iron) precipitated into Regulus's; for by this work, what good ſoever there was in the Ores, and even the Metals themſelves, may be obtained each apart: for when the Antimouy hath extracted the Gold out of the Minerals, the Gold may then be firſt precipitated, then the Silver, laſtly the Copper; and all of them with a very ſmall coſt and little labour, inſomuch, that in one days time many pounds of Gold and Silver may be drawn by this art out of the Minera's: and this too by a little fire. For the Antimony penetrates the mineral like water, and diſſolves what is good in it; and as for that which is of an earthy nature it caſts off from it ſelf, and brings it into ſcoria. But it brings the Metal to a Metalline form in the precipitation, which muſt then be cupellated, or purified by the help of Salt-petre. And if haply you cannot get Antimony for this work, than common Brimſtone may ſerve in its ſtead, and it will perform the ſame thing, if the Minera be ground and mixt therewith, and be molten in a covered Pot or Crucible, and be precipitated by Iron, for ſo the Metals falls down in a Regulus, and the Sulphur abides behind in the ſcoria. But this kind of work requires a skilful Artiſt or Melter, who hath already been long and much verſed in precipitations; for elſe he will be intangled therein, and not find the wiſh'd for ſucceſs.

NB. This is to be underſtood of that kind of Minerals and Foſſiles which partake of *Antimony*, *Arſenick*, *Cobolt*, *Marchaſite* or *Sulphur*, being ſuch as *Antimony* and *Sulphur* love to ſeize upon and diſſolve in the melting: ſuch Minerals or Ores as have ſand and ſtones among them, they (*viz. Antimony* or *Sulphur*) will have nothing to do with them; of this kind are Granates, Talk, and ſuch like: ſo neither, doth the water of Salt-petre in the moiſt way extend its virtue to all the Minerals, nor extracts it Gold and Silver out of all of them; but eſpecially it acts not at all on them which are very ſulphureous, unleſs they are firſt Torrified or Calcined as 'twere, and ſo freed from the *Sulphur*, then at length the water performs its office elſe not. Nor doth the water act upon Granates or other Minerals and Foſſiles which are (as to the outward appearance) ſmooth and as it were glaſſy. And therefore all ſuch muſt firſt of neceſſity be maſter'd by an incenſe fire, and ſubdued.

There are likewiſe to be found ſome Minerals and Foſſiles which ſuffer not what they have in them to be introduced into either Lead or Antimony, or to beſtow their Treaſure upon them; nor will they be forced out nor cupellated, but both are and remain ſcoria, and do retain that form of glaſs which they afore had, unleſs haply you make them ſtoop, and maſter them by a moſt ſtrong blaſt; for by this means they ſuffer their Gold and Silver to be wreſted from them: But they may be maſtered too, if you thereto add in the fuſing ſome Potters-aſhes, or ſalt of the Lees of Wine, or Aſhes made of Wood, and melt them together, for ſo by this means alſo will they be obedient to thee; for ſalts diſſolve in flux all ſtony Minerals, and ſuch as reſemble glaſs and ſcoria, which otherwiſe no other fire is able to do. But to make any more accurate deſcription of that thing, appertains not to this place, but to the following Third Part of this Book; that which we have here minded, is only to make light touches as 'twere about ſhewing the variety of Foſſiles and Minerals; and that, if haply any one ſhould light on ſuch a Mineral, out of which he cannot extract the metal, neither by the help of Antimony, nor by the water of Salt-petre, he ſhould not think it void of every thing or that he has not dexterouſly and conveniently enough handled the ſame, but may know, that the only cauſe is, the property of the Mineral it ſelf.

And now, even as the Sulphureous minerals do cheifly admit of being ſeparated by Antimony admixed in the melting, and thoſe that are ſtony, not ſo; even ſo the water of Salt-petre doth more willingly extract the ſtony Minerals, than the ſulphureou ones; but yet, if the ſulphur be taken from them by Torrefaction, it is able to diſſolve even theſe too.

But it chiefly loves thoſe that have Stria, and are a ſpotted (Quartzig) ſandy, poor kind of Minera: which (otherwiſe) you cannot extract commodiouſly neither by Fuſion or by Mercury: But that you may never be deceived here, it will be altogether expedient to be acquainted with both ways, both with this which is done by flux, & with that moiſt way which is done with Water; both ways are good, and exceedingly profitable in the ſeparation of the Minera's or Ores; and that not only of ſuch as may be every where had, but likewiſe of metalline mixtures: whether it be by melting them together, or elſe by ſome ſad miſchance of your Houſes being burnt; or finally, if it proceed from thence, that Gold and Silver do lie hidden unknown in copper, Tin, Iron, or Lead; now they may with eaſe be ſeparated from each other by both thoſe aforeſaid ways, and on ſuch wiſe as that nothing may be loſt.

The ancients knew not how to extract the Gold and Silver out of Copper as the modern Refiners are wont to do, but took them together as they lay, and ſo applied them to any uſes whether to make Bells or great Guns. Neither was the ſeparation by *Aqua-fortis* ſo much in uſe in thoſe days as in ours: Nay more, if in a Mark of Silver there was no leſs than the quantity of a Ducket of Gold, yet notwithſtanding they did not ſeparate it, but did make it up into money as it was, as the old Coins do ſufficiently teſtify. For it is evident that all Silver almoſt, partakes of Gold, and ancients being unexerciſed and not well verſed in the Art of ſeparation, all the Silver though never ſo auriferous was Coined into Money, or put to other uſes; but their ſucceſſours ſmelt out what they had done, and therefore bought up all ſuch Money, and ſeparated it, & made thereof an exceeding gain: ſo that there is not in our age ſo much as a Dollar, Schrenckbergick, Groſs, Crucifer, even to the ſmalleſt half Penny, of Gold Coin to be had throughout all *Germany*, all being changed and bought up and wiped off the Gold. But yet there is Silver enough left, both made into money, and wrought up by the *Gold-ſmiths*, a Mark whereof contains, $\frac{1}{8}$ or $\frac{1}{4}$ of a Ducket of Gold; and therefore ſeeing the common way of ſeparation by *Aqua-fortis* cannot be of uſe here, becauſe the coſts are too great, and the little portion of the Gold will not countervail the ſame; it may be done this way, and ſeparated by either the moiſt, or by the dry

dry way, and that with profit, though there should be less than $\frac{1}{8}$th part of a Ducket in a Mark of Silver. And besides, Bells ever have much Silver in them, neither was it separated therefrom by the ancients (as we have said afore): and likewise old Tin hath a great deal of Gold and Silver in it, which was of old wont to be molten and wrought up with the Copper into Bells or great Guns. Many there are that well know, that there is Gold and Silver in these things, but how to extract them thence, they know not: For Copper admits not of being cupellated (or purified) by Lead, much less of being separated, & yet more difficult is it to do it by *Aqua-fortis*. But yet, it may be effected and that with a great deal of profit by the way which we have shewn, both the moist and dry too. And therefore he that shall be well skill'd in these operations, doing it either by melting with Antimony, or by the Water, will get abundance of profit out of your old and broken pieces of Bells: Nay should he buy them whole, yet would he get no small matter, for he may extract their Gold and Silver, and then melt them anew. For there is not barely in Bells that portion of Gold & Silver which the Copper and Tin had naturally in them, and of which the Bells are made; but also, it was the custom of the ancients, (when a new Bell was molten or founded,) to call some God-fathers or Witnesses (according to their ancient custom) who named the Bells afore they were baptized: And like as it is even at this day the usual custom every where throughout Christendom in the baptizing of Infants for the God-fathers to give their God-child some Money (or Plate) as a remembrance; so the ancients did do in the baptizing of their Bells, as they were flowing in the Furnace they cast thereinto Gold and Silver, to testify their affection to Holy uses, and also that the Bells might fuse the better, and yield a clearer sound. Upon this account I say, that 'tis no small gain that may be gotten out of old Bells, seeing there never is a Bell which is destitute of Gold and Silver.

And now the well-minded Reader sees what use this extraction and precipitation of Gold & Silver which is done either in the moist or in the dry way, is of; and that not only in Minerals and Fossiles, but likewise in metalline mixtures too, out of which there can nothing be obtained by any other way.

Who I pray will not now magnifie or highly esteem of Salt-petre, and take care about having it prepared in great plenty, and so convert it to his profit, seeing it is clearly manifest that so much good may be done with it both in Metalline Affairs and Medicine? I do what I am able, I offer my self to all good Men: If they will not listen to me, I am not to be blamed but am void of fault. Man's Life is too short, than for one Man to be able to describe all the things that may be done by the help of Salt-petre; neither indeed is it to be wished that many should know it.

But seeing I but now treated of the precipitation of Metals and Minerals, I think it worth while, to shew the cause of that precipitation, that so the studious of Art may have a more certain foundation of this thing. That which is to be separated, must of necessity be a bound up or fast knit body, for else it would not need any separation; therefore forasmuch as one Metal knits up, or incloseth another, they cannot be separated from one another, but by the breaking or destruction of the bonds which they are tied withal, and knit each within another; this destruction now, is to be done by the Fire, both in the moist and likewise in the dry way. Copper, Tin, Iron, and Lead, may in the dry way be separated from Gold and Silver, if they are Cupellated together on a Test: For then the superfluous or burning *Sulphur*, in the imperfect Metals, acts upon it self and reduceth its own proper Body or Metal into Scoria, and seeing that there is a great part of Lead therein, those Scoria are fluxile, and it doth by little & little (as much of it as goes into scoria) insinuate it self or slide into the porous Tests or Hearths. But the Gold and Silver which have no superfluous *Sulphur*, do remain unhurt upon the Test, washt and clean, & do now shew themselves in their clarity & brightness; This is the separation of the good from the bad, or the combustible from the incombustible, which is done by the force of Fire only, and solely: by which, the imperfect Metals are by the help of Lead converted into brittle scoria, and so creep into the Tests, and separate themselves from the perfect Bodies; and this is a very easie work, and well enough known to every body, and is by the Refiners called Cupellation. But now in this separation, there's only a separation made of the imperfect Metals from the perfect, but the Gold and Silver remain mixt together, and if you would have each apart too, then 'tis necessary that the one be dissolved and separated from the other by a most strong *Aqua-fortis*. But if the portion of the Silver be more than the Gold, then the Silver is dissolved by a common *Aqua-fortis* made of Salt-petre and Vitriol, and so the Gold will fall to the bottom: and this way of separation is well enough known and used by all the Refiners and Goldsmiths; but if there be more Gold than there is Silver, then do they dissolve the Gold by *Aqua-regia*, and so the Silver remains undissolv'd; nor is the *Aqua-regia* any thing else but a strong water of Salt-petre, in which some *Sal-armoniack* is dissolved; for the common or simple water of Salt-petre doth dissolve the Silver only and leaves the Gold; and contrariwise the *Aqua-regia* dissolves the Gold only, and meddles not with the Silver; but if they know not the right way of ordering the *Aqua-regia*, they are wont to add to the Gold in the melting so much Silver as may make up three times the weight that there is of the Gold, and so they separate it by *Aqua-fortis*, which (kind of operation) we call (die Quart).

There is yet another way of separation, which is known unto them, and this is done by Cementation, if (*viz.*) divers Metals are commixt together, and they are mixt with Vitriol, Salt, and Tiles, *Stratum super stratum*, and so kept together a while for some due time in a continual fire; then the Salt and Vitriol do assume to themselves the imperfect Metals, and leave the most perfect, that is the Gold, alone. Cementing doth also attract Silver and Iron, Copper and Lead; but this kind of separation is only used to impure Gold, perfectly to purifie it.

There is yet another way of separation, which is done by Antimony, and is likewise only used to Gold, to cleanse it from its impurity and vitiosity. There is also another way of separating by fusion, in which, if you would have a metalline mixture which hath Gold, Silver, Copper, Iron, Tin, and Lead in it, to be separated into its several kinds, then the mixture must be granulated and burnt with Sulphur, and being burnt, it must be melted in a Pot, and so by precipitating it either with Lead or Iron, one Metal must be separated orderly from another; which way is wont to be used (as far as I know) but by few, because they are not so understanding in Nature, nor know any cause why one Metal separates it self from another, sooner and more readily out of the mass or metalline mixture, and settles to the bottom.

But that the ingenious Lover of Art may have some directory, as 'twere, and some occasion to consider with himself more deeply, and may have a willingness to undertake so excellent and profitable an Art, I have a mind to discover the cause of the precipitation. It is sufficiently evident, that *like rejoiceth with like*, and that there's a disagreement 'twixt unlike things. Oil loves to be mixt with Oil, & Water is willingly united with Water, but not at all with Oil, lest by a *medium* intervening. Hence it is, that forasmuch as one Metal is of a different nature from another, that such as are alike, love each other, and such as be unlike do abhor and shun each other; and therefore when there are divers Metals in one mass, and that you would separate them, it is necessary that you do it by adding such a thing as is of affinity to the more imperfect part, and is at Enmity with the perfecter part. As for examp. Sulphur is a friend to all the Metals, save Gold, and that it hates; but yet it loves (even in the imperfect Metals) one better than another: for by how much the more like they are thereunto, and the more imperfect, so much the more rea-

dily is it a friend or enemy thereto. And therefore when the Sulphur ſhall have been put into the maſs in the combuſtion, then the moſt noble parts flie off, and do their beſt to free themſelves from the fellowſhip of the imperfect and unclean metals; but yet they cannot rid themſelves without ſome aſſiſtance; and therefore if ſome ſulphureous or imperfect Metal ſhall be put to the ſulphureous maſs, then the ſulphur laies hold upon it, and lets go the more perfect part, tho' not ſo pure as yet, but it needs a greater purification; concerning which there may be read more at large in the Explication of my *Miraculum Mundi*. This work is called *Precipitation*, when the more perfect part is precipitated and ſeparated from the more vile, and that out of one and the ſame mixture. The ſame reaſon is there in the precipitation made in the moiſt way, if (*viz.*) *ſome* Metals, or *all* together, be diſſolved in the water, one is thence precipitated after another orderly. Firſt, That which is the moſt noble and moſt perfect, then the 2 & 3, and ſo regularly, until they are all precipitated. This is that moſt excellent and hitherto wholly unknown, and moſt gallant Invention wherewith I hope to become ſerviceable to my Friends.

He that well underſtands this precipitation, will gain much, but if he only meddles with this operation in a careleſs manner, and meerly cuſtomary as 'twere, and ſo not know the reaſon it ſelf, why ſuch, or ſuch a thing is, he may worthily be compared to an Aſs that carrys a ſack, but knows not what is therein contained, nor whither he is to carry it. Therefore I will yet farther add a more clear information. Iron precipitates Copper out of both the dry and moiſt ſolution; Copper precipitates ſilver both in the moiſt and dry ſolution: *Mercury* doth chiefly precipitate Gold, and altho' Copper, Iron, Tin, and Lead, do alſo precipitate Gold and Silver, yet each Metal hath its own peculiar precipitation, and farther note, that Precipitations done with Salts do exceed thoſe done with the Metals, for by them may all the Metals be precipitated; and this hath even hitherto been kept ſecret.

And beſides, one Metal does not only precipitate another, but doth likewiſe change or alter it. As for examp. If I put the Plates of Copper in a ſolution of Silver, then (whether the ſolution or operation be done either in the moiſt way or in the dry way) the ſilver precipitates it ſelf by means of the Copper. And if I but know how to manage that buſineſs knowingly and skilfully, the Silver will alſo graduate ſome of the Copper into Silver in the precipitation, and there will be gained more ſilver than was put in the ſolution. In like manner, if I precipitate Copper with Iron, out of a ſolution of Copper, then doth the Copper precipitate it ſelf by reaſon of the Iron, but withal, ſome part of the Iron doth exalt it ſelf in the precipitation into Copper; and ſeeing that this kind of operation is confirmed by often Experience, there is none can ſafely queſtion it. But I do not ſay, that in ſuch a gradation all the Iron is turned into Copper, or all the Copper into Silver; nor did I ever try it; but yet I readily believe, that it is a thing poſſible to be done by reiterated workings. Mercury precipitates Gold moſt willingly, but only in the moiſt way, for in the dry way it cannot ſubſiſt; but to precipitate it in that way, Iron ſerves excellently well; Copper alſo and Lead are profitably uſeful hereabout alſo, but yet Iron is better.

There is a ſingular precipitation of Silver with Mercury, which I will here mention. The Chymiſts ſome hundreds of years ago, made Silver out of Cinnabar, but without any benefit or profit; neither did their ſilver they got come from the Mercury, but from that ſilver which they added to the Cinnabar. They took common Cinnabar, made of Quick-ſilver and Brimſtone, and brake it into ſmall bits, about the bigneſs of the Nail of ones Finger, and made Layes, or *Stratum ſuper ſtratum*, thereof, with filings of pure Silver, then they luted up all well, and kept it in a moderate heat for 20, 30, or 40 hours, and by this way they found that their Cinnabar, which at firſt was red, was made black; this matter they cupellated with Lead upon a Teſt, and ſo got as much Silver as was the weight of the Mercury in the Cinnabar.

NB. As much ſilver as they got, ſo much wanted there of the ſilver they put unto it, and ſo there was no Gain made from hence; and they ſuppoſed (but falſly) that the Quick-ſilver extracted the ſoul out of the ſilver put thereunto, and that therefore the ſaid ſilver was rendered volatile. Nor indeed is it contrary to Reaſon, that *Argent-vive* ſhould extract the ſoul from Silver, & thereby convert it ſelf into ſilver; and that on the other hand, this exanimated ſilver be made wholly volatile, if it be not animated anew by other Metals; and this is what ſome have done and attained to, by the help of Lead.

But the Operation which I treat of at preſent is rather an attraction or precipitation of ſilver by Mercury, and this precipitation is to be done in the moiſt way, and is moſt wondrous eaſie; nor is it without Encreaſe or Gain, provided you are willing to wait its time, and 'tis thus.

If one part of purer ſilver be diſſolved in *Aq. fortis*, and in the ſolution two parts of Rain-water be added to one Part of *Aq. fortis*, and there be likewiſe thrown in three or four parts of Quick-Mercury, and all this be left ſome daies or weeks in a cold place, unmoved, then the ſilver precipitates it ſelf out of the Water to the Mercury, and the Mercury diſſolves it ſelf into the Water, and both together yield a wonderful repreſentation of growing things, like Mountains and Vallies, and certainly is of a moſt pleaſant aſpect. The reſult of which is this, *viz.* if they ſtand ſo a long time and ſhall be afterwards edulcorated and reduced by Lead, then the Silver gets no ſmall encreaſe from the Mercury: But yet there's no gain to be thence had unleſs thoſe out growings (or repreſentations of fine things) be ſuffered to operate and germinate above a Year: And this, few operators will yield to do, and to be withheld ſo long a time from the fruits of their Labours. Now the reaſon of this operation is thus: The *Aqua-fortis* is a moiſt and cold Fire, and ripens as well as the dry and hot Fire, but he need be a skillful Artiſt that ſets upon this Work.

It is evident that ſome of the ancient Philoſophers maturated their Univerſal Medicine by a moiſt fire, as you may ſee in *Artephius* and others. Otherſome Philoſophers extracted a certain ſecret water, or univerſal Menſtruum and diſſolvent out of the Nitrous Sea, and did thereby perform moſt notable things, but they always kept it ſecret, and the deſcription they have made thereof, hath been obſcured, or painted over with Riddles, or dark expreſſions, when they ſay, that ♄ draws his ſecret water out of the Sea, of as clear brightneſs as the Moon: which way of drawing it belongs not to this place to ſhew: only thus much is hinted, that out of Nitre may be drawn an Univerſal Menſtruum, which is more excellent than the Corroſive Spirit of Nitre, which ſaid Spirit doth indeed diſſolve all things, but after the manner of corroſives, whereas this which ♄ draws and is of the clear brightneſs of the Moon, hath nothing of Corroſivity in it, but is mild and ſweet, and wets not the hands, or tingeth them, as that Corroſive doth; and altho' ſuch a water be Volatile, and not fixt, yet is it of ſuch a nature as to conſtringe, and fix other fugitive, and unfixt things. 'Tis a thing moſt worthy of admiration to conſider how thoſe Natures have a mutual love each to the other, and embrace one another, and are converted the one into the other. And thus much may ſuffice to have been ſpoken concerning the precipitation of the Metals out of both the dry, and moiſt ſolutions.

Let no body ſeek to fiſh ought more out of me by their Letters; but as for ſuch as formerly have been my friends, and even now are, or ſhall hereafter be, to theſe I will not deny any thing, always provided, that nothing be done againſt a *decorum* (as they uſe to ſay) or a diſcreet behaviour.

But now if any one thinks that (if he comes flying from the Eaſt or Weſt) I muſt preſently lay aſide all my buſineſs, and only attend upon doing and anſwering what he demands: No, that's a thing my Affairs won't permit me to do, for I have ſomewhat elſe to manage. And therefore would

would Iforewarn such an one,that he enters not on such a Journey afore he be certain whether or no it stands with my convenience or not. For this hath many a time already happened unto me,*viz.* for some one to come with a desire of knowing this or that secret, who (when I would have told it him, but that I had no time then to accommodate him) hath gone away stomaching at me, and began to reproach me publickly afore allMen,as if I were some inhumane,or mercilesse fellow,and would not satisfy his requeste. Some also there have been, who out ofthe meer malice of their mind have divulged,that I my self have nothing, seeing they can get nothing from me; there are many such perverse kind of men to be found, who make no Conscience of enervating, or sucking out the very Marrow of the Bones of others,so as they may be but benefited thereby themselves;which verily is a great evil and inhumanity. How often have such kind of men come unto me, whom, (when they have spoken with their kind words unto me, and also carry the garb, and outside show of very honest Men, and promised all decent thankfulness) I have satisfy'd, and yet have afterwards fled off from, and broken their Faith: Therefore it is the best way for him who has any singular thing, to bury it over in silence, and so he need not fear of being drained by others, that know how (by the perswasive flattering Art) to get out his skill, and give no thanks afterwards for the same.

If I had not already began to describe the *Prosperity of Germany*,certainly I would not now begin; but forasmuch as I have taken upon me to finish what I have begun, I will stand to my promise, and will in like manner shortly publish (if God shall see it good) the third and fourth part.

And seeing that in both the following parts,the melioration, or concentration of the Metals, is chiefly to be done by the help of Salt-petre, I was willing more amply to confirm in this second part, that which I wrote in the first part of the Generation of Salt-petre. And I do again and again averr with the greatest asseveration, that such a generation of Salt-petre out of wood is very true, and is founded on Nature her self.

Now must I proceed a little onwards, and withal demonstrate to the simple, that the putrefactory Stomack, in which the wood is digested and putrefied, and which transmuteth all wood,and resolves likewise all Leaves and Grass in a short time, transmutes and reduceth it into Dung, is as the stomack of Animals is, and this may be done in a most vast Quantity, as hath been proved in the first part of the *Prosperity of Germany*; and this no Mortal Man can ever refute, *viz.* that the essential salt, or salt of Nature,is no other thing but Salt-petre, but is not as yet burning,or flaming up,until it be animated by the air,and conceive a life thencefrom,the essential salt of Vegetables, barely such, is not so, *viz.* Salt-petre, as hath been sufficiently manifested.

Now whatsoever gives fertility and power of growth, is Nitrous; if therefore there lay hid no Nitre in Minerals,as in stones, why would the Gardiners carry slackt Lime into their Fields,and use it instead of Dung to dung their Fields withal? Whence doth the Salt-petre come that grows on upon old Walls, if not from the Lime? What is the reason that the Salt-petre men do seek after old ruined walls, to make Salt-petre thereout of,were nothing in them? I verily believe that this is an indubitable Argument, that there is Salt-petre hidden in all things: For the salt of the World, or the Universal Essential salt, is nothing else but Salt-petre, when it hath after a due time attracted a life out of the air, to which end my secret circulatoryinstrument was invented, that such an animation might be the more conveniently brought to pass.

Nor do the other kinds of salts, *viz.* Sal-Gem, the salt made out of the natural salt fountains,or sea-salt, likewise all salts which are made out of the Lees of Wood ashes,or of Lime,also Alume and Vitriol,all these are not so widely different from salt-petre, but they may easily be transmuted,and converted into salt-petre by the animation of the air,by the help of my circulatory vessel; but for the better perception of the operation, I will subjoin this Example.

Dissolve as much Sal-Gem, sea salt, or salt made out of the salt fountains,or common salt which is frequently used in boiling of meats,or salt made of Wood ashes, or of the stones of Calx-vive, in Aq. fortis, as much as the water will assume to its self, or be able to dissolve, and let it again cool; then the salt does not concrete or shoot granularly,any more but into longish Cones like salt-petre.Pour off the Aq.fortis,or Salt-petre water, and dissolve it, *viz.* the salt, again in a Lixivium of Lime, and crystallize it, so shall you have therefrom a Natural, or Genuine Salt-petre,and no less combustible than any other Salt-petre that is digged out of the stables where Cattle have stood. Then again may there be, by the said Salt-petre water, more salt prepared, either common salt, or salt out of Herbs,or Wood, and be dissolved and crystallized, from whence results a new salt-petre, and this operation may be so long repeated,until all the salt-petre water be turned together with the salt, into salt-petre.

This transmutation of salt-petre is perfected in some hours, and from hence may a worthy reward for your pains be reaped, could it be otherwise performed than in Glasses; and indeed,out of one pound of salt-petre, would there come an hundred pounds of petre, if a part of the transmuted salt be still distilled anew into water, and more new salt be by it again transmuted. But there is no such need of setting about a work so laborious, seeing there is at hand a far speedier, or more dexterous way of doing the same, if *viz.* those salts shall be animated by the air, by the circulation that I have contrived, and so be turned into salt-petre in great quantity: which animation, or hatching as 'twere,may be done in vast quantity by easie labour, and little costs, the air (as we use to say) turning or making both sides of the Leaf: For one portion continually kindles and animates another, no otherwise than as a little Leaven doth a greatMass of Dough,and as a little Fœces, or Yeast, yea, as little as will lie in a Spoon, serves to ferment a whole Vessel of Ale; the same is done here. And indeed, common salt-petre may be implanted into other salts, even as a Vegetable Seed is sown in the Earth, so as thence to get in a short space of time a great encrease, even an hundred, or a thousand-fold.

But the sluggish Companions who had rather fatten themselves with eating,drinking, and sleeping,and wholly give themselves to laziness, who is able to wait so long in the expectation of this thing? Alass for ye, ye sloathful, lazy, and devouring Gluttons,with what face dare ye so manifestly to betray your laziness? I pray, if you put out your Money to Use,and have 5 or 6 *per C.* as we use to say, a Year, must you not expect the years revolution afore ye receive it? And besides, you run here a hazard too, least your Debtor breaks, and defraud you of the very Principal it self: If you lay out your Moneys on building Houses, so to make a great gain thereby, may not your Tenant be reduced to such wants as not to have wherewithal to pay you, unless haply, out of the very Stubble, or Litter of his poverty? May not your Ships which float about in the Sea, be cast away by Storms and Tempests, or be taken by Pirates? Why are ye not as Patient in your expectation as the Husbandman is, who after he hath sown his Grain, must wait a whole year afore he reaps with advantage what he hath sown. Nay, yet more, if he be pretty fortunate, he scarce gains 6 in the 100, the costs and pains being reckoned; and in the mean time he is in fear, lest the Corn should be blited by the cold, or being near ripe, should by a bad season be spoiled and corrupted in the field.If there happens a year that is droughty,then the Corn cannot grow up high, or 'tis eaten by the Mice; but now in the preparation of Salt-petre all those Cares are saved, and 100 Dollars may yearly yield thee 2, 3, 4, or more gains, and that without any wronging thy Conscience, and without endamaging any other, and without Extortion; for if thou hast much Salt-petre, thou maist promise thy self much gold and silver also, for there will alwaies be such as buy it up; and if thou attentively heedest,thou hast so much delivered thee in my Writings, as

that

that thou thy ſelf maiſt ſpend it all on the melioration and ſeparation of Metals: Nor needeſt thou, if thou thinkeſt it good, ſell any of the ſame. Nor is there any reaſon that thou ſhould be aſham'd or repent of ſuch a Work, becauſe one man is ſufficient, without any others help, to manage the greateſt operation: nor need there great expence, ſave only a little to build a ſmall Cottage, wherein the Salt-petre may be kept dry. If you have huge Woods at hand, you may make your Salt-petre out of wood; if you want wood, then out of the dung of Horſes, Oxen, or other Beaſts, and Sheep, or elſe out of even common Salt, which we uſe in ſeaſoning our Meats, out of wood-aſhes, and out of Lime: Whatever it be prepared from, it will not coſt much, for 1 *l.* of Salt will yield thee 1 *l.* of Salt-petre.

But haply ſome or other may be in the mind to think or demand, why *Glauber* himſelf ſets not about this work, and reſerve the whole Gain to himſelf? To theſe I anſwer, that I am not of ſuch a greedy deſire, as to wiſh for all to my ſelf; nor will it at all be unacceptable to me, if another hath likewiſe ſomewhat; nor will it be at all leſs lawful for me to do for my ſelf ſo much as ſeemeth me good, as for any other to take his liberty, and to do to himſelf as ſeemeth him good. Beſides too, I am not of the mind to make the thing ſo very common, but will ſee whom I communicate ought unto, that ſo it may be applied to good uſes, and not come into the hands of the Unworthy.

The firſt ten years however Salt-petre will not be of ſo vile a price, but that it may be made and ſold to profit; Who knows whether or no he ſhall live ſo long? And if at the utmoſt it ſhould after 20 or 30 years be of ſo mean a price, becauſe of this Invention of mine, yet in the interim they may all that while enjoy the profit of the ſame; and it may be expected from the hands of God, that He will, for the time to come, provide for them ſome other waies: But never will it be ſo vile, as to be worth nothing; and if it were ſo, that you could not make any Money of it, (tho' it is impoſſible that it ſhould ever be ſuch a drug) yet (by that manuduction which I have afore given in the 1, 2, and 4*th.* Parts of my *Furnaces*; as alſo in *The Explication of Miraculum Mundi*; in the 2*d.* & 3*d.* Part of my *Pharmac. Spagyr.* and in This Second, and ſhall be in the following Third and Fourth Parts of the *Proſperity of Germany*;) it may be improved about many eminent uſes, and ſo Gain be thereof made; for Salt-petre is ſuch a Subject, as you can never have too much of, and is therefore worth our labouring after, and our endeavouring how to prepare it in good quantity, and withal, of finding out what benefit it is naturally able to afford us; for it is even a wonder to conſider how great things may be done by the help thereof: It is the greateſt Poiſon and yet may a moſt excellent Medicine be thereoutof prepared: Colder it is than Ice, and yet hotter than any fire. It is the Generator of all things, and alſo their Corrupter; it vivifies and kills all things; it is heavier than gold, and yet lighter than the Wind; it is alſo Fire and Water, Air and Earth, Male and Female; it impregnateth and ſuffereth it ſelf to be impregnated; it is light, and is alſo darkneſs; it is black and white: There are in it as many Colours as the world affords; it is fixt and volatile, corporeal and ſpiritual; it kindles and burns all things, and doth alſo quench all burnings; it is the Beginning of all things, and yet it cauſeth the End of all things; that which is ſoft, it makes to be congealed and become ſtiff; and again, that which is ſtiff or hard, it makes ſoft.

O Thou Creator of all things, How great a vaſtneſs is there of thy wonderful Works? and what a fewneſs is there of thoſe who underſtand, or know, or labour to know it! O thou eternal Light! illuminate the dark breaſts of the loſt Sons of the World; O thou viviſying fire, mollifie, enkindle, heat the ſtubborn hearts of ſluggiſh Mankind, that are oppreſſed with ſleep, and frozen with cold, that ſo they may ſeek thee, and know thee, and learn to fear thee in true Humility, and to honour & worſhip thee without Hypocriſie. *Amen.*

An Admonition, and ſhort Repetition of thoſe things which are treated of in this Treatiſe.

THat the Friendly Reader may make this Book yet of more uſe and benefit to himſelf, I thought it worth while by way of an Overplus, again to ſet here afore his eyes thoſe Secrets which have been herein mentioned, what 'tis that the uſe of them doth conſiſt properly in.

Firſt of all, it hath been ſhown, how by the means of Salt-petre, all Volatile, and immature Minerals are to be brought to a ripeneſs both in the moiſt way and in the dry way, that ſo they may yield forth out of themſelves in the melting, good durable Gold and Silver. Then I taught by what way the Volatile, Arſenical, Coboltick, and Antimonial, Auriferous, and Argentiferous Minerals, may by an eaſy labour, be by an artificial fuſion, and extraction, and alſo by a precipitation into Regulus's, and by the purification or cupellation of the ſaid Regulus's, by the help of Salt-petre, converted or brought into uſe in the dry way, and the Gold and Silver hidden in them be drawn forth. Thirdly, I have ſhown the extraction of Gold and Silver out of all the barren, or poorer ſort of Minera's or Ores, which are not worth the charges of excocting, or the uſual way of proceeding, and of the drawing them out by a ſingular Art, with the water of Salt-petre, and of rightly working them; which way is to be preferred far afore any uſual excoction of thoſe poorer kinds of Minera's, not only becauſe ſuch an extraction is performed without a melting fire, and a Furnace; but alſo, becauſe in this extraction there is more obtained than is by excoction or forcing out: And yet farther, that which was Volatile in them is fixed together, and retained, by that Water of Salt-petre which would otherwiſe in a melting Fire fly away in fume. And more than this too, Gold and Silver may by this moiſt way and that with very eaſie Labour be extracted and in a due manner perfected, and that commodiouſly and with no ſmall profit, out of any, the vileſt Foſſiles (or things dig'd out of the Earth) as out of diſeſteemed Earths, Duſts, Sands, and Flints, from whence, otherwiſe you cannot extract any thing neither by Excoction nor by Mercury: So that in all places of the World what coaſt ſoever, ſo it be ſomewhat a dryiſh ſoil, is to be found ſuch kind of Earth, Clay (or Marle) Sand, Flints, and ſuch like which contain in them a thin or ſparing kind of Gold and Silver, and from which they may profitably be extracted. Verily it is a dainty Art which may be uſed in all parts of the World, nor is it at all burdenſom to carry, but may be excellently (well, or ſafely) preſerved till need requiers. But this is to be noted that the latter Earth or Clay muſt firſt be made red hot and burnt afore it be moiſtned with the Water of Salt-petre. For without ſo doing, the Earth would always remain thick (or clammy,) would drink up much water, and it would not eaſily be ſeparated, but being burned, it ſuffers it ſelf to be extracted no other than as if it were Sand. So neither do the Ore or Foſſiles of Iron which are auriferous and abound with Iron, ſuffer the Gold to be extracted and precipitated out of them as readily as other Minera's or Ores do. But the Iron, (if there be overmuch of it) makes the Water thick and pappy like Mud. And therefore you muſt put into that ſolution a part of common Water, to make it the thinner, that ſo the Gold and Silver may be the eaſilier precipitated thencefrom. The auriferous Coppery Ores are to be burnt firſt, if they are ſulphureous, if not, they may then be extracted, though not burnt. The ſandy, ſtony, brittle, and pebbliſh, Foſſiles need no other preparation but to be burnt and ground.

Likewiſe all auriferous Irony, or Coppery Ores, may be ſeparated by common ſalt, without a Furnace, or melting fire, and that in the open air (as we ſaid afore where we treated of the poorer Coppery Minera's, or Ores:) and many hundreds of pounds may be done at one time, and with one labour, and the Gold which is extracted mixtly with the Iron and Copper, may be ſeparated out of the ſolution, by the moiſt precipitating way there delivered, and that with a mighty profit and gain, becauſe that ſame precipitation hurts not in the leaſt either the Copper, or the Iron, as to their malleability.

In like manner may you precipitate the Gold out of any Vitriol water, and that in quantity (when it has any in it): and on ſuch wiſe too, that the precipitation of the Vitriol ſhall not at all change ought of its nature; and this is ſo compendious a way, as that if there were contained no more than one quarter of a Drachm of Gold in 100 *l.* *of Vitriol, yet would not that precipitation be of no uſe or profit. And on this wiſe and manner may all other Mineral waters be precipitated.*

Moreover, as concerning the means of eaſily preparing the ſalt ſo as to ſerve for the extracting the Copper, in all Countries, but eſpecially on the Sea Coaſts, the Concentration of ſalt out of the waters, or the Sea will afford you no mean, or obſcure Documents touching that thing; which contration it treated of in the Book Intituled, The Conſolation of Navigators.

But foraſmuch as there is mention made in this Treatiſe of a yet other certain Artificial ſeparation of Gold and Silver out of the imperfect Metals, in which, Antimonial ſcoria have place, in a forenamed extraction, which I would willingly (but as yet have not) delivered; let no body ſo conſtrue it, as if I either purpoſely, or careleſly omitted the ſame: No! The Caſe is far otherwiſe, and this is the true reaſon; ſeeing this Book now in hand is become more prolix than I intended, I determined with my ſelf to reſerve that moſt profitable proceſs for the following third part, which God willing, I will very ſhortly publiſh, till then, I entreat the Friendly Reader to expect or wait for it with a good and patient mind.

Mean while he may acquieſce with theſe two ways, viz. *the dry and the moiſt, and delight himſelf herein, and withal take care (as far as in him lies) to have ready by him, ſome quantity of Salt-petre; for the following third part ſhall treat of nothing elſe but the performing and doing of proceſſes by the help of Salt-petre. He therefore that knows how to make it in plenty at a ſmall rate, may hope for ſo much the greater benefit; and this I judged expedient, to add here for admonitions ſake. More ſhall be diſcovered (God willing) in the third and fourth following parts.*

THE

THIRD PART

OF THE

Prosperity of Germany.

In which is Delivered,

The way of most easily and plentifully extracting *Salt-petre* out of Various Subjects every where Obvious and at Hand.

TOGETHER

With a succinct Explication of *Paracelsus* his Prophecy; that is to say, in what manner it is to be understood the *Northren Lion* will Institute or Plant his political or civil Monarchy; and that *Paracelsus* himself will not abide in his Grave; and that a vast quantity of Riches will offer it self.

LIKEWISE

What an one that Artist *Elias* is, of whose coming in the last Days, and his discloſing abundance of Secrets, *Paracelsus* and others have predicted.

To the READER.

Friendly Reader,

Although there are very many Causes that might dissuade me from Publishing this Third and the Fourth following Part of the Prosperity of Germany *in Print, (because of the inconveniencies and hurt done me by the perfidious* Farnner, *against whom no body hath hitherto opposed himself; but all have connived and wink'd thereat; and consequently have every one left such a perfidious Treachery unpunish'd) and incourage me to leave* Germany, *a most ungrateful* Germany *as it is. Yet notwithstanding, the Love to my Neighbours (amongst whom there are many honest and good Men to be found, who lead a troublesome kind of Life to get their daily food) hath compelled me. To such therefore as these are, would I willingly give [or hand forth] a Torch [so to direct them] that they may for time to come fare better and more easily get things necessary to uphold Life withal; but yet after such wise, as that they set their Hands to the Work, for the Gods sell not ought to those that Labour not, but all good things are sought, and found out by daily Labour and diligent search.*

Now albeit, that all those things which are throughly handled in this book are true, and so confirmed by experience as that any one may easily understand and imitate them, yet notwithstanding, I am certain that there will be a very many who by reason of their ignorance, cannot understand them, and apply them to use; because the greatest part of mankind are too much addicted to lazines, and do for the most part refuse to apply their Limbs to work, but would rather walk abroad, and discourse of Arts when they are in their cups.

I say that these secrets of mine will no ways profit such kind of Men, for such must first learn in what manner the [necessary] Instruments are to be handled, and how the Operations are to be rightly instituted and managed in seemly Order.

There are abundance of Men who (if they hap to read some Chymical Writings, or hear others talk of the profitableness of them, (they) are presently inflamed with such a love, that they will even wholly devote themselves to Chymistry on the hopes of growing rich. And now when they have proposed any thing to themselves, and attempt to do it, if they hap to have a sparkle of Fire light on their hands, or that by reason of some other obstacle, all things do not immediately fadge to their minds, they throw away the Tongs, and the Crucibles upon the Ground, and detest (or curse) the Author, because he hath not Written clear enough, and that they do not presently extract great store of Gold.

Let not such as these at all perswade themselves that they can receive any instruction from these my Writings; for my Writings require Men that are diligent, whose minds are never wearied with labour, and who are not sloathful, and impatient of Labour. Now to the studious (searchers) and especially to such Children (or Disciples) adopted or chosen by God, all these things will be unto them clear, manifestly evident, and easie to be imitated.

Forasmuch therefore as I have spoken many things in the First and Second Part of the Prosperity of Germany, *concerning the making and use of Nitre, I do now go on in God's Name, and do teach in this third part, by what easie ways Nitre may be variously made, and be fruitfully and profitably used both by Noble Men and common Men; so that there is not a man in the whole World, but may (if he please) get great benefit thereby.*

The Omnipotent God, the Author and giver of every good thing, bestow upon us to be able to enjoy and make use of his Gifts, that all things may tend to the Honour of his most Holy Name, and to the Safety and Preservation of us all. Amen

Of the Preparation of SALT-PETRE.

I Shewed in the First Part of the *Prosperity of Germany*, the way whereby Wood may be concentrated and turned into excellent Nitre, and which otherwise is every where for the most part consumed by lying rotting in the Woods, and yields no benefit at all unto any Man.

This Operation is to be done with the help of a certain Press artificially contrived for that particular business, the due (or right) description of which, we gave you in the *Continuation of Miraculum Mundi*. But the circulatory Vessels by which the Lixivium of the wood (or the distilled Liquor out of the wood) is to be excited and heated by the Air, have not as yet been described; and therefore we have determined to do it in this Third Part. This Figure therefore represents them, and its use; and is as follows.

There must be two Boxes (as 'twere) made of Boards, each of them of like bigness and capacity, as the Figure (or Letter) A shews. These Boxes are to be so placed, that a Vessel may be set under one end of each Box, to receive in it (if need be) the Lixivium poured into them: Let one of the Boxes or Vessels be filled top full of Horse-dung, Hens or Pigeons-dung; or else with the Leaves of the Trees, amongst which Fir-tree Leaves are best; then pour thereupon so much of this Lixivium which we shall make a description of by and by, so much as may suffice to moisten the Dung or Leaves contained in the Box or Vessel, and a little to over-top it. The next day (after you have so done) when you judge that all the matter is throughly wetted, let the Lixivium run out by a Tap, the which said Lixivium you must pour into the other Box filled with the like matters, and which stands just against it. Let these things stand thus wetted for some days; In the mean time, the matter contained in the first Box, grows hot, and the useless moisture being most plentifully resolved into Vapours out of the Lixivium, the said matter doth daily get more and more efficacy. As long as you observe the heat of this Box to continue, and the evaporation of moisture to last, so long must it be left in the same positure whereby the Lixivium, thus poured on, may by its notable power consume and dissolve the Dung, or the other matters contained in the Box, and turn them into Water. And here you are to observe this direction. You must always put in new matter instead of that which is turned into Liquor, and so one Box may be always at all times kept full of the matters. But now when your materials being put in the first Box, begin to cool, the Lixivium which now lies in the second Box or Vessel, must be poured upon the matters yet warm, in the first Box, that so it may again contract a heat thence-from by little and little, and so may dissolve those matters. And now whilst these things are thus detained in the first Box or Vessel, the materials that are in like manner put in the second Box do heat each other, and the unprofitable Phlegm evaporateth: Now as long as this second Box vaporateth, the Lixivium must not be drawn out of the first Box and be poured thereinto, but all the matters are to be left to heat or burn (as it were) themselves. And when you perceive that the materials cool, then the Lixivium must be drawn off from the matters in the first Box, and be poured upon them in the second Box; and hereby the matters contained in the first Box will again wax hot, be burnt, and be turned into Liquor. By how much the oftner and longer this repeated pouring on of Lixivium is done, so much the more, and sooner are the materials consumed; from which matters thus consumed, a most excellent Salt-petre may afterwards be made, for the heat makes the matters rot. Now then to make trial (if it be well enough done) take some of this Lixivium boil it away to a sufficient height for Chrystallization, set it in a cold place to shoot, dry the salt you find, being dry, put it on a live Coal, which if you find it burn up, it is a sign that it is full time to draw off, and take all your Lixivium to the intent that Salt-petre may be thereof made by due evaporation and coagulation. But if you chance to find it otherwise, and that the salt does not flame up, the Lixivium must lie longer in the Boxes to be heated and animated by the Air which is magnetically attracted by means of the heat: This labour being rightly ordered, there may be made excellent Salt-petre out of the said matters by the help of a convenient Lixivium, in ten or twelve Months space without any costs, save some small trifle about the Lixivium; neither is the Work so grievous or troublesome, for there is nothing more required but that the Lixivium be several times poured out of one Box into the other.

NB. There are yet, besides the other aforenamed several sorts of matters that offer themselves, out of which, Salt-petre may be made by the help of the Boxes, & a due Lixivium far speedilier & plentifullier; but I judge it not needful to divulge every thing: Likewise there may be made a convenient Lixivium to prepare Salt-petre sooner, by and after another manner, to wit, in a dry form, without such putrifying as is done in the Boxes or Circulatories; but even this Artifice too, will I reserve yet a little longer for my Friends.

Nay yet more, there may be (by a yet secreter and shorter method) excellent Salt-petre extracted by the means of such a Lixivium in three hours space, and that with most great profit: And this way of preparing Salt-petre, I do preferr before all the others, and have found it the most excellent (Petre) of them all.

The Lixivium *is on this wise made.*

MAke you a strong Lixivium of Wood-ashes, and when you burn the unprofitable Wood in the Woods into ashes, make by the same labour of your Fire some good Lime of stones fit for such a purpose; Then quench this Calx or Lime with Water, that so it may fall into powder, then pour thereon as much of the Lee of the Wood-ashes now spoken off, as is sufficient, mixt it with a wooden *Spatula*, and repeat this mixing and stirring it very often, some days following, that so the Lee may be made the stronger by reason of the Lime, and be like Fire, the which has an excellent virtue to putrefy the vegetables and animals, and to turn them into burning Salt-petre. (See the foregoing Figure belonging to this Operation noted at the top page, 1.)

G *The Bottom of the Chests full of holes.*
H *The second or lowermost Bottom where the Lixivium is kept without running out.*

Another way of making Excellent Salt-petre in great Quantity out of Lime and the Lee of Wood.

TAKE the aforesaid Lime and Wood-ashes, of each as much as you will; and twice as much Horse-dung or Cows-dung, mix these matters exactly in a wooden Vessel or Tub, with Mans Urine or beasts Piss, and make it of the thickness as the thicker sort of Mortar that the *Masons* use, is wont to be of. You must have good store of this Paste made. Then make a certain arch of boards, which said arch must be some three, four, six or more feet broad, and deep or high, and the length of it must be double to that (or twice as much, as broad, and deep, or high) according to the conveniency of the place, and the quantity of Salt-petre you would make. The arch thus made, must be all over dawbed with the aforesaid mixture, the thickness of an hands breadth, just as we see Vaults, or Arches built up, of Stones and Lime upon wooden arches. Now when all is duly ordered, there must be put some Fire in under the vault of the arch, at first it must be very gentle, least the arch (of wood) as being the very foundation and supporter of the (other) arch should presently kindle and be burnt, which must not be, but be kept whole rather, untill the arch or covering thereon which is made of Lime, Ashes, and Dung, be perfectly dried. This done, there must be dawbed on, upon the said arch formerly made, more of the aforesaid prepared Calx, of about an hands-breadth thickness, and you will find that the humidity of this latter mass or second arching will be in a short time attracted by the first arch, and that this second pargetting will soon be dried: When this is done, there must be again the third time made another dawbing on, after the afore-prescribed manner. And this Operation is to be so long and so often repeated untill the arch be a foot or two in thickness, which when so, it is strong enough, nor needs it any more its wooden prop, and therefore now the Fire may be put thereto, and it may be burnt. And thus have you a vault or arch prepared, which is a most commodious instrument to make a quantity of Salt-petre by: And now if occasion require, and the condition of the place will permit, there may be built or made three or four arches after the same manner; though it be better to have them placed one by another, and to be of less magnitude or capaciousness; for so they are more convenient for Operation, as any one that practiseth hereabouts will easily apprehend and find.

Likewise it is better to build this arched Vault which we have called an Arch, long and narrow, than short and broad, because the Fire being put under one part of such a long Chimney-like Vault, will very well diffuse its heat to every place thereof, and so keep the arch continually hot.

When this Chimney like vault is wholly dry, it must be again moistned with Mans or Beasts Piss, that it may thence contract more new humidity, which we observe will easily be, seeing we know that it is made up of Horse or Cows-dung, and not barely of Lime, for then it would not so readily and easily receive the humidity, as when Dung is mixt with it; the wetted Chimney-arch must be dried by the force of Fire put thereunder, the which may also be a little augmented proportionable to the bigness and thickness of the vault or arch.

NB. You must take good heed, that the Fire you put under be not too much augmented, and so hurt your arches, but let it always be such as may suffice to dry your arch by little and little, or else the Dung will be burnt up, and the already generated Salt-petre will be spoiled, for the Fire can easily endamage the Petre.

But now when we shall have often thus moistned the said arches with Piss, and shall take notice that they (*viz.* the arches) do attract no more thereof (*viz.* of the Piss) as being already filled with the Salt of the Urine, the which may be done in some four or six Weeks time, there must be little bits broken off with an Iron Instrument in several places of the arch, and these bits must be powdered and be dissolved in Water so to make a Lixivium of it, be filtred, and after a due evaporation made, must be Chrystallized and dried; the dried Salt matter must be put upon the Fire to see if it will flame or not: If we shall find it thus to be and to burn like Salt-petre, we must break down all the arch, and by the help of a certain Mill, reduce it into powder very fine, and pour hot Water thereupon, to extract the Lixivium with, then evaporate it as much as is convenient, and set it by in a cool place to Chrystallize; this artifice of Boiling and Chrystalliſing shall be declared in proper Figures or Cuts in the end of this Work. But now if so be we perceive that the Salt extracted out of those little bits of the arch do not as yet flame up, 'tis a sign that it is not as yet sufficiently animated by the air: For the air gives life, which the Fire strongly attracteth, so that by the help of the Fire the air and life are attracted, whereby the Salt is animated and made inflammable. The Fire therefore here, is to be again administred (or put under) and the arched matter to be continually moistned with Rain water; and that Rain water is best, which (if it may be had) falls down when the Wind is in the North; though when there is no Rain water to be had, other water may be substituted in its stead. This pouring on of water is to be so long continued (always, permitting the Furnace or Arch to be rightly dried afore it be sprinkled with new water) untill the Salt, sticking in the arch, be found to be sufficiently animated by the benefit of the fire and air, and be inflammable when you make trial thereof by the aforesaid method.

This is a compendious way of making good Salt-petre in quantity enough, by only Lime, Wood-ashes, and Mans or Beasts Piss. If you proceed rightly on, you may get you a great quantity of Salt-petre in a most short space of time, and that for small costs, & in a manner no labour at all. The Lime and Ashes from whence the Petre is extracted, may be mixed again with new lime and new ashes, and other arched vaults be made thereof, upon which Urine must be continually poured

in

in like manner as we taught afore, that ſo they may be animated by the help of fire and air into Salt-petre. But if you have always at hand new Calx, or Lime and aſhes, it is better to make new arches, thereof in the place of thoſe you have pulled down, and to imploy the reſidue of that, out of which the Salt-petre hath been already extracted about dunging ſome barren Soil, eſpecially the moiſter ſort of Ground, becauſe it is impoſſible ſo thoroughly to ſeparate all the Salt that nothing abides behind in the reliques.

This way I communicate to all, but I reſerve for my Friends only the way by which, with the help of other Waters that coſt nothing, and may be had in every place, a far greater quantity of Salt-petre may in a yet ſhorter time be prepared by the ſaid arches, than is done by the help of Mans or Beaſts Urine. Nay more, there are ſome waters which in eight days time, we have obſerved to have been coagulated into burning Salt-petre, which ſecret verily may be practically improved with moſt notable benefit in all parts of the World that Men live in.

Beſides the ſubjects already mentioned, here offer themſelves to our Hands many others which are obvious to all, of which ſuch arches may be made, and which will yield more Salt-petre than the afore recited matters will; but let what has already been delivered, ſuffice. I cannot here forbear, but muſt tell you that there are ſome ſubjects to be found which (without the making the aforeſaid arches, though there lie notwithſtanding abundance of ſecrets therein) will bring a moſt notable benefit, and that belong not to this place, and which may be changed in three hours ſpace into excellent Petre; which labour (or operation) I keep for my Friends, and ſhould it be divulged, it would bring nothing but hurt, and therefore it is better to be ſilent: There ſhall more ſecrets be delivered in the following diſcourſe, where we ſpeak of the Northern Monarches.

Here follows another way of plentifully extracting Salt-petre *out of Rocks and Stones without Vegetables or Animals.*

TO the intent therefore that it may be ſufficiently evidenced, and that I may prove it to be true, that Salt-petre is an univerſal Salt or Subject, and is conſequently contained in all the things the World poſſeſſeth, I judge it a thing worth while to ſet down here ſome proofs or trials thereto accommodated.

It hath been ſufficiently enough already ſhown in the firſt part of the *Proſperity of Germany*, that good Salt-petre may by Art be extracted out of all the ſubjects of the World: But the way of ſo doing was not at all diſcloſed. For as much therefore as all Men do ſo greedily deſire it, I determined with my ſelf to deſcribe firſt of all, the Preſſes requiſite to the extraction of Salt-petre out of Wood, to the end that ſo it may evidently appear unto all Men, that it is a thing agreeable to nature, and that it is moſt eaſily accompliſhable, to preſs a juice out of any Wood, which may be turned by the air into good Salt-petre. But as for the circulatory Veſſels, I was not willing (then) to communicate them, but rather kept them a little longer for my Friends, which ſaid Veſſels I have notwithſtanding ſet down in this Third Part.

Likewiſe it ſeemed not expedient unto me to reveal unto ſuch as are enemies, the transformation (or changing) of Animals, much leſs of Minerals into Salt-petre. Yet however I have done ſo much by my Manuduction, as for any wiſe Men eaſily to underſtand the ſame by what hath been exhibited, and I have in ſome ſort opened it, that ſuch things are poſſible to be done. But I have not ſo clearly ſhown the way of effecting the ſame, leaſt I ſhould take away the occaſion of other Mens exerciſing their ingenuity in bethinking themſelves how it is to be done: Otherwiſe, it is not prohibited any one to ſeek a fuller information, from thoſe that have knowledge in theſe affairs.

Therefore foraſmuch as the way of extracting Salt-petre out of Stones, is look'd on as a moſt impoſſible thing by ſuch as are not skill'd in this Art, I have determined to deſcribe the ſame, for the ſake and benefit of ſuch as ſucceed us; The knack of this Artifice conſiſteth more in the knowing of the Stones, than in the extracting of the Salt-petre out of them, for the extraction is not any other way to be done, than as the making of their Lee out of the common Nitrous Earth is wont to be, concerning which thing, *Lazarus Ercker* hath written at large. The knowledge therefore of the Stones, and the preparation of them whereby they may communicate (or let go) their Nitre unto Water, is the principal thing, and without that, there cannot be any thing done in this Operation.

Firſt of all therefore 'tis neceſſary that the lover of Chymiſtry knows, that there are various Stones to be found that yield Salt-petre, *viz.* all ſuch Stones of which (being commonly calcined by the force of the fire) they make Lime for to build houſes withal. For there lies hidden in theſe kind of Stones, abundance of Salt-petre, which cannot be gotten out thence by the help of common Water by any kind of way or method: But when they are burnt with a violent Fire, they yield an hot Salt, extractable by the benefit of common water; which Salt indeed is not Salt-petre, but yet may moſt eaſily be turned by the air into Petre, like as it was formerly Salt-petre afore the Stone was burnt, and now firſt got another nature by the burning.

The truth of this thing, *viz.* That there reſides natural Salt-petre in all Stones, which may be burnt into Lime, may be proved on this wiſe following:

Take of theſe Stones which Lime may be made of, ℥ſs. or ℥j. powder it very fine, pour thereupon as much of the beſt *Aqua-fortis*: Place the Glaſs in which this matter is contained, in a warm place upon aſhes or ſand, that the ſtone may be diſſolved in the *Aqua-fortis*: After it hath thus ſtood for about one quarter of an hour, take out your Glaſs out of the aſhes or ſand, though the ſtone be not wholly diſſolved as yet, and pour thereon drop by drop, ſome Lixivium of wood, untill the ebullition of the Lee or Lixivium poured upon the diſſolved ſtone ceaſeth, and (the noiſe ceaſing) you ſhall perceive ſome kind of Salt produced from them thus commixt, *viz.* from the diſſolved ſtone and the Lixivium. Pour ſome common Water upon this Salt, ſo much as may ſerve to diſſolve the Salt in a warm place, the ſolution being made let the Liquor be filtred, or be ſtrained through ſome thin Linen cloth, that ſo the part of the ſtone undiſſolved, and the fæces may abide behind in the Filter or Linen cloth: The filtred Liquor muſt be coagulated into Salt by evaporating it away in a braſs Veſſel, then you are to weigh it: And now that we may exactly know, how much Salt-petre was in that ℥ſs. of the ſtone, you muſt proceed on farther thus:

Take the ſame quantity of *Aqua-fortis* as you uſed but now, about the ſolution of the Lime-ſtone, and pour thereon likewiſe the ſame quantity of Lixivium, that you

you used about the precipitation of the dissolved stone, and let there be made a precipitation, let the precipitated matter be coagulated into the substance of a salt, and then also weigh how much this quantity of salt is: and now, as much less weight, as you observe to be in this salt than in the first salt in which the Lime-stone is, so much Salt-petre was there in that half ounce of Lime-stone. This is a most certain trial, and by this means may we most easily find how many pounds of Salt-petre, are contained in an hundred weight of stones.

NB. To the end that the proof you make, may be most certain, we must use the lesser Centenary, or hundred weight, as being more usual, and more accommodate for the trying of Metals.

And albeit, that the using of Aqua-fortis to this Operation, is altogether without profit, where you would extract that salt in great plenty out of the stones, yet notwithstanding, it is not so slight or trivial a thing to know a certain way of trying what stones do most abound with Salt-petre, that so if we have a mind to extract Salt-petre out of them, we may take those, in which it lies in a plentiful manner.

Besides, those stones which do commonly yield a Calx or Lime by Calcination, and which the Bricklayers use; there are found other stones, out of which there cannot be made any Lime by Calcination, and yet nevertheless, abundance of Salt-petre may be thence extracted without any previous Calcination. He that delights himself in this work, must exactly know aforehand such kind of stones: Forasmuch as no body would easily perswade himself that Salt-petre is contained in them. Nor do I think that ever afore this time the way of extracting Salt-petre out of these kinds of stones was used; but whether there was no body that knew that there was such a Salt contained in them, or judged it a thing not to be regarded, this I know not. But this I know well enough that that way of extracting Salt-petre out of them was never observed and used in *Germany*, though there lies a most notable quantity of Petre in them, and easily extractable thence, did we but know the way.

Therefore, forasmuch as there is plenty enough of such stones in all places, and that Salt-petre may easilier be made of them, than of wood, I could not forbear, but must needs open and disclose this artifice for the good of the Country, and clearly explain it in this place.

Therefore, as concerning those stones which are here mentioned, there is such a plentiful store of them in most places, that they even make whole Mountains; they are in substance like a soft and tender stone, whitish in colour, [or of a shining colour] ashy colour'd or reddish, and are easily broken, and may be fashioned into all kind of shapes, or figures; and therefore they are frequently used about building Houses, for the making various Ornaments about the House, as for the corners of the Houses, the Doors, Windows, Steps or Stairs, or other External Ornaments. As long as they are yet in the Mountain, and not exposed to the air, they are of a considerable hardness enough, and do always hold it. When being used about Buildings, they are put in such places, where they may abide at all times dry, or else always moist.

But if so be they are one while dry, and another while moist, and are always obvious to the air [or weather] they easily become soft, and there scales off from them yearly, a little portion of the back of a Knifes thickness, like Meal, so that they are yearly lessen'd, and are not at all fit to build stable, or durable Houses with. The Stone-Cutters can easily distinguish these kind of stones from others, nor do they willingly use them where there is plenty of others to be had. And now, if you should go about to make your trial with these stones, like as you did with those that they make Lime of, according to the afore delivered Probation, so to know what quantity of Salt-petre is contained in them, it will not succeed so, because the Salt-petre becomes Volatile in the Calcination of it, and doth for the most part fly away into the air: and much less can you with [bare] water extract ought out of the Crude, and not Calcined stones; for such do not yield any Salt-petre at all, unless they have been placed in a moist air for about half a years space, whereby they may of themselves fall in pieces; for being so ordered, they easily yield forth their saltness to the water that is poured on them, and consequently yield plenty of Salt-petre. Of which thing, this is a most certain Testimony, if (*viz.*) such stones are laid in some dry place, whereto the Rain cannot come, and we do most frequently sprinkle them with common water, and they do thereby turn into a powder. And if it fall out otherwise, 'tis a sign that there is very little Salt-petre to be found in them, and that the labour you shall bestow about them will be in vain. But such stones as grow soft, and fall in pieces, in six or eight Months time, do promise notable Rewards for your Labour, *viz.* a great quantity of the wisht for salt; an hundred weight of these kind of stones thus fallen in pieces, will easily yield you ten pound of Salt-petre, more or less according to the Condition of the stone. The extracting of the Lee, or salt, is done with common water, in the same manner as the Lixivium is otherwise extracted out of that Earth which is digg'd up in the Stables where Beasts stand; which way of extracting Salt-petre, of coagulating and perfecting it, is clearly and perfectly enough described by *Lazarus Ercker*, heretofore the Emperours chief Overseer of the Metallick Affairs, in his most experienced Book of his Art of the proving of Metals; insomuch, that I esteem him to have rendred the hardest, or most difficult part, very clear, and therefore I will referr the well minded Reader thither.

But for as much as every one cannot buy himself a Book of such great bulk, only to get thereby the knowledge of the way of extracting and evaporating Salt-petre, I have judged it worth while to set down here for the sake of the Chymical Students, such directions as the aforesaid *Lazarus Ercker* hath delivered us hereabouts. For I was never of the mind to cast off such things as have been well delivered by other men; I only add unto them, those things that are mine: Let others do the like, that are the Authors of any new thing, that so there may arise some benefit thereby unto our Neighbours, for whose sake, that we may (*viz.*) serve them, the most great and blessed God hath bestowed on us such various knowledge.

But that we may get a certain knowledge of distinguishing the said stones, I think it altogether necessary to treat of them more at large.

Therefore although this kind of stones are plentifully enough, to be found every where in the World, yet they are not known, or regarded, because we cannot perswade our selves, that there is any the least portion of Salt-petre contained in them; for albeit, that an hundred pounds of such stone should contain in it ten pound of Salt-petre, and we should reduce the same into a most subtile powder, and should labour to

extract from thence a Lixivium or Lee, with either cold or hot water, yet ſhould we not hereby get ſo much as one Ounce of Salt-petre. The reaſon is this, becauſe there is not to be found in ſuch a ſtone as ſoon as ever it is digged out of the earth, any Corporal Salt-petre, which may be extracted by means of water, but there lies hidden only a certain Soul or Magnet of Salt-petre, by the virtue of which, that which gives a Corporeity thereunto is to be firſt attracted out of the air, to the end that Salt-petre may ariſe thencefrom. And this is hereby evident, for were it otherwiſe, and were there in that ſtone any Corporeal Petre at the firſt digging, it muſt neceſſarily be extracted thencefrom by the help of water; but we find it impoſſible to make any ſuch extraction, unleſs that ſtone be before laid for ſome certain time in the air, and doth, together with its ſoftneſs, acquire (or make) Salt-petre in a Magnetical manner.

But for all this, we know that this our reaſon ſo exceedingly well founded, will not yet ſatisfie the unskilful, unleſs we make it yet more clear unto them with other Expreſſions, and various Examples; but I pray how is it poſſible to declare all ſuch Circumſtances to one that is utterly ignorant. 'Tis too much labour to boil Meat for another, and to thruſt it into his Mouth too. It is ſurely ſufficient enough to have ſhown the truth, and diſcovered the way by which the operation is to be contrived, though all things be not founded on ſuch palpable Reaſons.

But foraſmuch, as the work, which I treat at preſent of, is an altogether new thing, and unknown to any men, the neceſſity of the thing requires, that we do a little more openly and clearly exhibit (and ſet down) the whole knack.

We preſuppoſe, that it is a thing well known already, even to all, that each thing hath in it its peculiar magnet, by the benefit of which, it attracteth unto it ſelf from the air, or earth, whatſoever is profitable for it; and eſpecially, becauſe we have largely treated thereof in our Works; inſomuch, that we deem it altogether needleſs to repeat the ſame here. However 'tis requiſite that I add thus much, *viz.* That the Minerals do abound with a certain Magnetick Virtue, more than other things do; and that they do attract their Life, Figure, or Shape, and Eſſence, out of the air, like as the Animals do, that ſo they may be nouriſhed, and encreaſe; but being deſtitute, or deprived thereof, they are obſerved to be as it were dead, and bound, or wholly void of vigor.

As for Example. Let the Minera, or Ore of Vitriol, or Alum, be digg'd out of the Earth, that the Vitriol, or Alum in this Minera, be already duly digeſted and ripened, the ſalt may even preſently be extracted thereout of, with common water. But if they have not as yet attained their full maturity, there is no ſalt extracted thence, unleſs the Minera be firſt torrified, or calcined. Nay more, a Minera, or Ore, that is yet leſs ripe, will not yield any Salt, neither by the force of the fire, nor without it; but muſt be yet farther expoſed to the air for ſome time, that ſo it may firſt attract that out of the air, that is requiſite to make Vitriol or Alum of, and thus (theſe things being firſt done) the Alum, or Vitriol, is moſt eaſily gotten thereout of, by a convenient Extraction and Evaporation.

We made mention in the ſecond part of the *Philoſophical Furnaces*, of a certain Minera, or Ore of Vitriol, which is plentifully found at [*Herckeroda* in *Haſſia*] ſticking in that Earth, which in that place they make their Crucibles or Pots, in great quantity with; and we ſhewed a way of making a red and ſweet Oil of Vitriol thereof, yet with this Caution, *viz.* That we ſhall not have from the ſaid Minera, not the leaſt portion at all of this Oil, if we do not expoſe it, broken in bits, to the cold air, for half a year, that ſo it may fall into powder. Such as have heeded this going to work, have made thereof a moſt ſweet Oil; but ſuch as have neglected the doing this, which I publiſhed out of a ſincere heart, and have reduced the ſaid Mineral into fine powder, and laboured to extract a ſalt thencefrom, by boiling it in ſimple water, beſtowed their labour in vain, becauſe of their refuſing to expoſe that Minera for a while to the air, and they received not ſo much as one Grane of Vitriol; and thereupon they took occaſion to ſlander me, and to accuſe me of Lying.

But now, when they have obſerved that this Mineral that they caſt away, being expoſed to the air, had attracted therefrom a ſalt by its Magnetick Virtue, when it had lain ſo long as to mould into powder of its own accord, and that thereout of a Vitriol doth proceed, they were enforced to believe that there lay hidden ſome Vitriol in thoſe ſtones; which notwithſtanding, could not be extracted by means of water, and ſo they have afterward publickly confeſſed, that what they afore gainſay'd, or oppos'd, was agreeable to the truth.

Thus likewiſe, there are various ſorts of Copper (Ores) endued with an attractive power, and upon that account, there cannot be ſeparated any Metal, by fuſion, when it is firſt taken out of the Earth, unleſs we have firſt expoſed it for ſome Months unto the Air.

Every Nitrous Earth, out of which Salt-petre hath already been extracted, doth (when it is again expoſed to the air) attract Salt-petre anew, and this we obſerve to happen in all Wood-aſhes, but eſpecially in Lime-ſtones Calcined; for, it attracteth more ſalt out of the air, than its weight was afore its being Calcined. For, at the firſt time, you will ſcarce get *ij.* or *iij.* ℔. of ſalt out of a centenary, or hundred weight; now by how much the longer it lies expoſed to the air afterwards, ſo much the more plenty of ſalt doth it yield, as is ſufficiently well known already. He that is ignorant of that we ſpeak, or elſe cannot underſtand it, let him make trial, and he ſhall find that what we ſay is a truth. Such as are Ideots do extreamly need theſe kind of Admonitions, that ſo, the buſineſs being the better underſtood, we may take from them all occaſion of ignorantly detracting from my Writings.

I ſay again, that if the ſtones which we here treat of, are but well known, though they do not at the firſt yield any ſalt, by endeavouring to extract it with ſimple water, yet is there no difficulty at all therein, nor ſhould we at all mind that, but let them only be left in the air for ſome due time, and by this means they will plentifully enough attract, and yield us, by a convenient extraction, good Salt-petre. The Ancients did extract Salt-petre, chiefly out of ſtones, which way of Extraction is now wholly loſt, or out of uſe. All the *Europeans* do now extract their Salt-petre out of the Earth of the Stables where Beaſts ſtand; albeit, that the very Name it ſelf of Salt-petre, doth declare, what matter it was firſt produced out of, *viz.* out of Rocks and ſtones: For 'tis as much as to ſay, ſalt educed out of Rocks.

Nay, even to this day there is Salt-petre extracted out of Rocks in the *Eaſt-Indies*, the which they tranſport thence in Ships into our Lands: Our Commonwealth

wealth of *Amsterdam* only doth yearly receive some thousands of hundreds of that Salt, which is extracted out of the bare Rocks without the addition of any other thing; I wonder what the reason is, that, that way of extracting is unknown to us *Germans*; surely I impute it meerly to the want of skill to manage this business.

Thus therefore do we think we have sufficiently declared that Nitre may in very deed be extracted out of stones; and that so clearly that I cannot see what reason any have to misbelieve my words.

But now that the certainty of the thing may be the more apparent, and that no body may think it a fable, that Salt-petre may be extracted out of stones, we will shew some places in which Salt-Petre lies in the stones in a most plenteous manner: And although that there are sundry such places that offer themselves unto us, where the stones contain Salt-petre in them, we will demonstrate the verity of this in those places we have lived in, for 'tis impossible for us expresly to pronounce such or such a Mountain in this or that Country full of Salt-Petre, which places we never saw. 'Tis not given us to search all places of the Earth, but such places as we have seen and come to, we have left but few things in them untoucht, whose nature we have not throughly examined.

Therefore for Examples sake, we will take some part out of our own Country, and exhibit or shew unto all Men, those stones which are therein found to participate of Salt-petre, any one that is studious in these affairs may do the same in other places, and make a diligent inquiry into them, and he will find that almost all Mountains are filled therewith, and yet is known to none or at least-wise to but a very few. In *Francia*, (or *Franconia*) and indeed at *Kitzing* where I dwelt before I came to *Holland*, I often went into the Field in clear weather, with an intent to search out Minerals, and although that sundry Men ignorant of (such) businesses, do report that there are not any Minerals atall to be found in *Franconia*, and that never any Veins of Gold or any other Metal have been found there, because all the Inhabitants do live contentedly with the plentiful provenue of Wine and Corn; nor do they labour about finding out any other Treasures (for there is not any Country in all *Germany* in which is gathered more abundance of Wine, and of a better sort, than in *Franconia* aforesaid; which gathering of Wine is to be accompted to the *Franks* or *Franconians* instead of Mine-pits, and yield them imployment enough) yet nevertheless forasmuch as my mind was ever bent that way, and I was naturally inclined to search very inwardly into those things which offer themselves unto us, amongst the wonderful works of the most great and glorious God, I could not omit the visiting such places, which seemed to all Men as unfit for bringing forth Minerals, and which were judged to be clearly void of the same, as being willing to try whether or no some things that others knew not of might not offer themselves unto me. Nor was my hopes in vain, for I found far more than my expectation was, and if necessity required I could shew those very places.

But forasmuch as I have proposed to my self, here to shew such places only in which Salt-petre may be plentifully made, I will at this time pass by the other Minerals in silence: Yet so, as not wholly to leave such things, as offer themselves in the way, untoucht. I will therefore take in hand some part of the *Rhine*, which is between *Kitzing* and *Aschaffenberg*, and will will very briefly (for my purpose is not to write a Chronicle) shew what treasures the most Great and Blessed GGD hath vouchsafed unto those places, besides Wine and Corn so plentifully abounding there.

Kitzing is an Eminent Town and well built, belongs to the Bishoprick of *Wurtsburg*, and is founded upon Lime-stone, and therefore the soil is very fruitful; and yields Wine and Corn in abundance. But as soon as ever we are past over the Bridge of the *Mhene*, the Earth begins to be sandy, and has abundance of Flints in it, which contain in them some Gold as well as Iron. The manner of extracting it, is described in the second Part of the *Prosperity of Germany*, and is confirmed in this third Part.

About a mile distance opposite to the said City is situated an high Mountain, very full of huge Trees, in this Mountain are various Castles (or Houses) the chief of which is the *Coffel* Castle, which is the House belonging by succession to the Lords of the County *de Coffel*: At the bottom of the Mountain there is a Village of the same name, belonging to the said Castle (or Palace.) In this Village there are abundance of Springs, the Waters of most of them I have often times tasted, and have perceived them to be mightily impregnated with Salt-petre, insomuch that the Beasts do altogether shun the drinking of them, much less can Men use them about the boiling of their Victuals: Yet some of them yield sweet water very fit for domestick affairs. These Nitrous Fountains are of no use, nor do they effect ought, save that they drive some Mills, and run through the Village a particular way afore they fall into the *Mhene*.

And forasmuch as the aforesaid Earls have known that the chief part (or most part) of the said Fountains are wholesome by reason of the plenty of Salt-petre in them; they have therefore taken care to have a great House built, that so the place may be rendred commodious for those that by reason of some disease should come unto this place for the sake of washing their sick bodies; and there are abundance known to come, that are ill, in the Summer time, from places far remote; several of them too by a due using this Bath are restored to their former health.

They know not any other use of these nitrous Fountains than what is aforesaid; whereas if they did but know how to add some Virtues to the said waters by the benefit of the Juice of the wood, of which there is great store in that place, they would find by the use of them then, many wonderful effects in the curing of Diseases.

Being therefore earnestly intent upon the search hereof, *viz.* from whence these nitrous Waters should chiefly proceed, I found that the Mountain nigh that place, extending it self for some miles, was every where full of Salt-petre, and that it stuck in the Rocks themselves, out of which whatsoever is on the Mountain grew. I did therefore diligently search out, what condition those Stones were of, which the workmen dig'd out in these places, and I knew that there was a great quantity of Salt-petre contained in them, insomuch, that as many Mountains as here (abouts) seem to be repleniished with the same: Nay more, if you shall break one or two of those Stones with which the Houses of the Village of *Coffel* are built, you shall find every where in them abundance of Salt-petre. I went to visit the place it self where those Stones are digged out, but found not any Salt-petre among the digging, because the Air had not as yet displaied its Virtues thereupon: But I observed that in those stones exposed a while to the Air, there was plenty of Salt-petre. He that would see it with his own Eyes, let him go into any House of the *Coffel* Village, whose

Wall

Walls are of ancient ſtanding, and he ſhall find that there is abundance of Salt-petre in thoſe ſtones, and withal, that the Pillars belonging to the Bath-houſe do yearly wax leſs, for as much as ſcalings of the thickneſs of the back of a Knife do ſtill fall off, by the power of the ſeparated Salt-petre, as I have often very accurately and curiouſly obſerved. If the Earls or Counts did but know the true uſe of this excellent and occult Treaſure, they would get far greater riches out of that bare Mountain only than by all the County. I doubt not but that ſeeing I have in this place detected this Treaſure, there will ſome be found that will labour for their own profits ſake to find it out.

Not far off from the ſaid Mountain the whole Earth abounds with Iron, not in the form of Veins but of Reins, inſomuch that the Metal of Iron offers it ſelf in various particles or pieces of diverſe magnitudes; for in ſome places it is found as big as an Hazle-nut, or an Acorn; in other places as big as an Egg, or ones Fiſt, yea and as big ſometimes as ones Head, which by the force of the Fire is made facile and yields abundance of Iron; nor did I ever yet meet with any Metal of that ſort more excellent than that is, but no body knows it, though it may be commodiouſly prepared or fitted for the uſe of Man, becauſe there is in this place plenty enough of Wood and Water to be had [for ſuch a purpoſe.]

This Mountain ſtretcheth out it ſelf ſome miles, reaching as far as *Iphovia*, and the juriſdiction of the City of *Wurtzburg*; ſo that the chiefeſt and greateſt part thereof is ſeated in the Biſhoprick of *Wurtzburg*: And therefore might immenſe and vaſt Treaſures be gotten, were there but ſuch as were lovers of Art and would make themſelves skill'd in the Operation.

Beſides, this Mountain yields abundance of white and red Gypſum, which may be reduced to an exceeding whiteneſs by the force of the Fire.

Beſides this too, we have known Marble and Alabaſter digg'd out hence, and yet it has not been very durable, for it becomes nitrous after it hath lain expoſed a while to the Air, and falls to powder, and yields plenty of Salt-petre, were it but rightly managed, for there's no want of Wood here.

There is yet moreover found in the ſaid Mountain another Caſtle which is called *Swansburg*, and belongs to the Biſhoprick of *Wurtzburg*, where the Soldiers did heretofore uſe the Metallick Rods, to ſearch after, and to ſee if they could find (by the uſing them) ſome Treaſures; and they tried whether or no (the Caſtle being burnt by the occaſion of the War) any ſuch Treaſures lay any where hidden. What they found I do not yet know: But this I know, that the ſaid Rods did ſhew good Metal to be every where (thereabouts) The which thing gave occaſion of explaining or unfolding the ſaid matter in its proper places. Beſides this, they digged up nothing elſe but ſuch nitrous ſtones for ſome fathoms depth. I once viewed this place, and found that the ſtones extracted ſome years afore out of this Mountain were altogether brittle, and is a manifeſt token that the whole Mountain is fill'd with Salt-petre.

There is beſides this Mountain, another nitrous one that I know of, of the like condition in the mid-way 'twixt *Kitzing* and *Wernfeld* (and is about a miles diſtance from *Carlſtadt*) but that which is here had, differs from the former in this, *viz.* that the ſtones which it exhibits are of a red colour, nor are they ſo much impregnated with Salt-petre, as thoſe of *Kitzing* aforeſaid, for they are richer in Petre, and are of a more aſhy colour.

There are likewiſe ſuch kind of ſtones alſo that they cut or dig forth at the *Mhene* near the City *Rotenfeldt*, but they have not in them ſo much Salt-petre as thoſe have that are found in the *Coſſel* and *Swanſburg* Mountain.

There's abundance of ſuch ſtones in ſeveral places in *France*, but my purpoſe is not to mention them all, for I was minded to mention ſuch only as my ſelf have ſeen, and that are near bordering upon the *Mhene*.

They that have a mind to deal with them may make their ſearch, and they will find in all Countrys of the Earth fit ſtones for their purpoſe, the which we may hereby know, if being kept a while in the Air, they wax ſoft, and ſcale off in moſt thin leaves, and there ſticks to your Fingers in rubbing them off, a reddiſh Meal.

Beſides this too, you may have a moſt certain ſign of ſuch Petry places by thoſe Spiders that have a ſmall body and round, and long feet, for they ſtick to thoſe ſtones in abundant meaſure: For ſuch Spiders do not feed upon hearbs, graſs, flies or other inſects, but on old Walls, and they ſeat themſelves chiefeſt of all on thoſe aforeſaid ſtones. They are not all venemous as the common houſe Spiders are, and therefore the Children do gather them, and are much delighted with them. Now they ſticking on to the ſofter ſandiſh ſtones do moſt certainly demonſtrate that Salt-petre is contained in them; for tis that which they are nouriſhed with, and conſerve their life by, and this I was willing to ſignify unto you. But put caſe that that no ſuch nitrous ſtones were to be found, yet however there is not the opportunity denied us of making Salt-petre of the common Lime-making ſtones, and of them there is every where plenty enough, if they are calcined by the benefit of Wood, and made nitrous with the juice of wood.

What ſhall I ſay of the Calcined fæces of *Tartar* which are yearly gathered up and thrown away in vaſt quantities, in all that tract which lies on the River *Mhene*, between *Bamberg* and *Franckfort*, whereas notwithſtanding ſome hundreds of hundreds weight of Salt-petre might be extracted thence-from, did they but mind it. For whatſoever Tartar is therein contained, is all of it Salt-petre when 'tis duly boiled with a Lixivium of Lime, and being hence ſtrained, and a ſufficient evaporation made, it be ſet by to Chryſtallize. For it attracts the ſoul after a magnetick manner, which Operation if rightly inſtituted, there may be prepared thence-from a moſt inflammable nitre in three days ſpace, the which is likewiſe of far greater profit than the getting out the Tartar by the help of a Preſs, and with a great deal of labour; or elſe than the making Potaſhes, as we ſee uſually done.

Beſides too, there are found other ſtones that being burnt do yield abundance of Salt-petre, ſuch as are the Tophi (or ſoft ſandy ſtones) which may be abundantly gathered near *Triefelſtein*, which is a Monaſtery ſituate on the *Mhene*, and in other places of *Germany* they make even whole Mountains: So that it is evident that there is no where any want of convenient matter to gather Salt-petre from, if Men would but ſet their hands to the work. Theſe ſtones are obvious unto all; and who knows what Treaſures the Woods (which we do not at all ſearch into) abound withal? Would time permit me I could ſhew that various kinds of Metals are conſerved in the Mountains ſituate between *Kitzing* and *Franckfort*, and eſpecially in the *Speſhardenſine* (Mountain,) the diſcloſing of which, ſome other more commodious place will admit of.

Now

Now follows what we mentioned of the aforesaid

LAZARUS ERCKER.

Of the manner of Boiling Salt-petre.

AND FIRST

By what means a Lixivium is to be made out of a Nitrous Earth.

IF you are minded to make a Lixivium of such an Earth, dig it as deep as you shall find by proving it to be either good or naught, especially if you intend to make it in great quantity, and keep it in a dry place. Then take care to have some great wooden Tubs, or Vessels made, so large, that each of them may hold about some ten Wheel-barrows full of the Earth, and whereby you may be able to prepare Lixivium enough, answerable to the work you have proposed to your self to do, and to the bigness of your Copper. Now there are commonly required for such a work, to one Copper Pan that weighs two hundred weight, eight Wooden Vessels which are to be placed in such order, that on each side there may stand four in a row, opposite to each other. These same Tubs are to be so far distant from the next Collateral Vessels, as is requisite for the Wheel-Barrow wherein the Earth is brought to come between: Yea, and it is necessary that there be half an Ell's space betwixt the said Tubs and the Earth, or Ground, it self, whereon they are placed. Likewise, each of the Vessels, or Tubs, must have a hole in the fore-part, and towards the bottom thereof, fit to put in a Plug (or Tap) at: Then finally, there must be put under those Plugs, a long Vessel like a Channel-pipe, which may receive in it the Lixivium running out of the Tubs, and may guide it along into a peculiar Wooden Vessel, as into a common Store-house set in the Earth hollowed for that purpose, to receive the said Lee in.

All your Tubs being thus rightly ordered, put in upon every Tubs bottom another (false) wooden bottom, perforated with many Holes, and let it lie two Fingers breadth distant from the true bottom: Upon this (false) bottom lay yet another made of Bull-rushes, or your small sort of Reeds which grow plentifully in Ditches about the thickness of a quarter of an Ell: In want of these Reeds throw in upon the aforementioned perforated bottom, the quantity of a Span (thick) of Chopt Hay, or Straw, laying some very thin boards thereon, that so it may not be scattered (or float) abroad. And your Vessels are made compleatly ready.

Now then, put of the Earth you have already tried and gathered, as much into each of your Tubs, as they can hold, yet with this Caution, That the top part of your Vessel be empty a Spans heighth. And observe this, that if you can get some old ashes of the Curriers, or Soap-boilers, as much of it as two or three Wheel-barrows will carry, it must be put in upon the topmost (made) bottom of the Tub, afore the Earth, but now spoken of, be put in. At the top of the earth, lay a Cover made of Twigs, (or Withes) and fasten it with a wooden stick at the top of the earth. This done, pour common water upon the earth contained in the Vessel, an Hands breadth in heighth, so as that it may rather touch (or be poured) on the Twigs, than the Earth it self, least the said earth become unequal thereby, and hollowed in several places. Let it stand thus for eight hours, which time being overpast, draw your Plug out, and let the water you poured on, run out at the hole beneath, which as long as it is muddy, you must always pour in again into the Vessel, repeating this so often, till it comes out clear, then keep it, and this water is called a weak Lee or Lixivium.

This done, pour common water again upon the earth from which the Lee hath been already, once separated, that so it may extract the residue of the Lixivium out of the earth; and this Lee is of no use, save that it may be poured on upon new earth, instead of simple water; for it oftentimes doth even yet contain a great deal of Nitre, insomuch, that you may sometimes extract out of an hundred weight thereof, three or four pound of Nitre.

This Extraction being finished, take out the unprofitable earth out of the Vessel, and put in new; and continue the Operation, after the aforesaid manner, reiterating it so long, and so often, until you have gotten store enough of the Lixivium, that the work of boiling be not intermitted for want of Lixivium.

Besides, there must be some Wooden Vessel placed at the upper part of the Copper which this Lixivium is boiled in, out of which may run so much Lixivium into the Copper as is wasted away by boiling, that so there may be still kept the same order of boiling, and the same quantity of Lixivium in the Copper. This boiling is to be on this wise continued, until a Centenary, or hundred weight of Lixivium in the Copper, yields according to the less assay (or weight) twenty five pounds of Nitre; and this may be done in two Days, and one Night.

This being thus done, you must have ready yet two Tubs, or Vessels (more) of Wood, made after the afore prescribed manner, and furnished with a (false) perforated wooden bottom, besides its own bottom, and likewise with such a bottom as is made of Reeds (or Bull rushes); only you are to observe this here; That there must be put yet another perforated wooden bottom upon this topmost bottom of Reeds, upon

which there muſt be firſt caſt in ſome chop'd Straw, then ſome Aſhes of Firr, Beach, or any other Tree, ſo much in quantity as may overtop the Straw an Ell or Cubit, [*Ulna*] high; or rather (if it may be had for a very mean price) as much as may fill the Tubs, or Veſſels. But yet, theſe Aſhes are not to be juſt ſimply thrown in (as they are) upon the Straw, but afore this is done, they muſt be firſt well mixt together, then moiſtened with ſome of the beſt hot Lixivium, that there may be made a Maſs. Then when the Aſhes are on this wiſe prepared, and put in the Veſſel, the Lixivium boil'd to its heighth, and which yields in the proof twenty five pound, muſt be poured thereon, as hot as poſſibly it may, and is to be often drawn off by the lower hole, until (if troubled or muddy) it becomes clear.

After that all the Lee hath thus paſſed through the Aſhes of both Tubs (the which is done upon this account, That all its fatneſs may paſs into (or be left with) the Aſhes, which Aſhes are hereby rendred ſtronger to waſh withal) keep it in a peculiar Veſſel.

Then pour the common Lee or Lixivium upon the Aſhes remaining in the Tubs, which when it hath paſſed through the Aſhes, is called the ſecond ſtronger Lixivium: Then again pour on yet a third time, hot Lixivium, and when 'tis drawn off, it is called the ſecond weaker Lixivium: Laſtly, the common Lee, or Lixivium, may be poured on cold upon the Aſhes, that ſo all the virtue of the ſame may be wholly extracted.

The Figure before going (*Numb.* 1.) will ſhew you the way of placing the Tubs, of preparing the Lixivium, and ordering the boiling.

A *Are the eight Wooden Tubs, wherein the earth is put.*

B *Channels, or Conveyances, by which the water runs into the ſaid Tubs.*

C *Channels, or Gutters, by which the Lixivium is conveyed into a Veſſel ſet thereunder.*

D *The Veſſel in which the Lixivium is gathered, or received.*

E *The little Veſſel out of which the Lixivium runs into the Copper.*

F *The Furnace.*

G *The Copper.*

H *The door of the Furnace whereby Wood is put in under the Copper.*

I *The Lower Wind-draught (or Aſh-hole) of the Furnace.*

K *The inward ſhape of the Furnace.*

L *An Iron Grate, which the Wood is put upon.*

The manner of preparing the Liquor, out of which Salt-petre *may be made by Boiling.*

Firſt of all, pour your ſecond weaker Lixivium into your Copper, and ſet it a boiling, then let your ſecond ſtronger Lixivium run thereinto by little and little; and then laſtly, the firſt Lixivium it ſelf, and which is the chiefeſt of all, until the Copper be almoſt filled, and the Lixivium be boil'd enough to ſhoot.

And now when you perceive that your Liquor is made ſtrong enough by boiling, put in a Braſs Ladle perforated (or full of holes) ſeveral times, even to the bottom of the Copper, and if the Lixivium lets fall out of it any Salt, you will find it at the bottom, the which you may take up with your Ladle.

Note alſo, That the Scum which at the end of this Boiling is plentifully gathered, muſt be carefully taken away: Now then try the readineſs of your Lixiviums Cryſtallization, on this wiſe: Put either two or three drops on a cold Iron, or on a Poliſh'd Plate of Iron, and if it ſtands, or grows hard; that is, if when you turn the Iron up and down, it does not run (or flow) down, theſe are ſigns of the fitneſs of your Liquors Cryſtallization. Or elſe, you may put ſome of the Lixivium in a Braſs Veſſel, and ſet it in cold water, and ſo you ſhall ſee whether the Liquor be fitted enough to Cryſtallize; for aſſoon as ever the Lixivium ſhall be cold, there will be plenty of Salt-petre generated: Nay, even the very Braſs Spoon it ſelf denotes the goodneſs of the Liquor, it being put into the Liquor, and again taken out, it will ſhow it ſticking on it, as if it were Oil.

Out of a Centenary, or hundred weight of Liquor thus perfectly prepared, there will proceed more than ſeventy pound of Salt-petre.

The way of rightly uſing the Liquor for the Generating of a more Crude Salt-petre.

POur your Liquor prepared after the aforeſhown manner, out of the Copper into a narrow Tub, or Veſſel, made of Firr, or Pine-tree wood; wherein let it remain quiet, till it be a little refrigerated, and the muddineſs, or ſlimyneſs [*Limus*] appear, and you find that the ſalt ſticks on in Granes to the ſides of the Veſſel; now when you perceive your Lixivium ſo cooled, as that you can put your finger thereinto without burning, pull out the Plug, wherewith an hole made in this long Veſſel, about a ſpan's heighth from the bottom, was ſhut, or ſtopt, and ſo let the Liquor run forth, into very great Wooden Veſſels, and deep, purpoſely made for ſuch a buſineſs; or elſe into Copper Pans, buried almoſt (up to their Necks) in the earth, (for the cooler the place is, which they ſtand in, ſo much the better, and the more plenty of Salt-petre is gathered, and Cryſtallizeth) and you will find that your crude Salt-petre will ſhoot therein, the thickneſs of almoſt two fingers breadth, partly of a whitiſh colour, partly yellow, and partly blackiſh.

After that this boil'd Liquor hath ſtood for two days, and ſo many nights in the Veſſel, the Lixivium of the Salt-petre which ſwims at top, muſt be taken away, which you may mix with the ſtrong Lixivium, and pour a ſecond time upon Aſhes, for elſe the Lixivium will contract too much fatneſs, and there will be no Salt generated.

Sometimes it happens, that when the Aſhes are not good, there's no ſalt at all gathered in the Liquor, in which caſe there is no preſenter Remedy, than to mix ſuch a Lixivium ſtronger than is fit, with another, and ſo pour it again upon new, and good Aſhes, and then let the boiling be again perfected after the afore-preſcribed manner.

Likewiſe, when in the boiling you find the Lixivium very muddy, whereby the Collection of the Salt is oft-times hindred, it muſt be taken away, and let the Waſher-Women, or Lawndreſſes have it, and other muſt

must be substituted in its room, and be farther purified by the help of Ashes.

The Figure signed (*Numb.* 2.) shews the manner of preparing the Liquor by boiling, and of extracting and gathering the Salt thereout of.

A *Long narrow Tubs, or Vessels, in which the decocted Liquor of the Lixivium is cooled.*

B *The Furnace wherein the Copper stands.*

C *The Man that manageth the boiling, and extracts, or draws out the salt with a Ladle, the which he lays in a Withy Basket placed on the Copper, that so the Lixivium (in it) may again run down into the Copper.*

D *The little Basket.*

E *The little Tub out of which the strong Lixivium runs (by little and little) into the Copper.*

F *Coolers, or Vessels, in which the Crude* Salt-petre *shoots.*

G *Four Brass Pans put in the Earth, hollowed for the purpose, in which likewise the* Salt-petre *is generated (or shoots.)*

H *A strong Vessel whereinto the Lixivium remaining after the generating (or shooting) of the* Salt-petre, *is put.*

The way to purifie the Crude Salt-petre.

WHen all these things are thus done, and the Lixivium that swims at the top of the Salt-petre is taken away, lift up those Vessels, or Brass Pans, containing that salt, and turn them up and down in some convenient place, that so the residue of the Lixivium, that lies as yet in them may flow, or run clearly out, into another Vessel set thereunder.

This done, take the Salt-petre out of the Coolers, or out of the Coppers (or Brass Pans) with an Iron Spatula, or rather with such an Instrument as your Plasterers use (une telle, a Truel) and put it in a Tub that has a hole in the bottom thereof, that so the Lixivium may be perfectly separated therefrom. They that sell that crude Salt-petre, and not at all purified, for the Salt-petre Boilers, do pour thereon pure (or clear) Well-water, by the means of which, it is made more white, that which is thencefrom separated they do again mix with other stronger Lixivium and so boil it up for the following use.

But if you have a mind to purifie this crude Nitre from its salt, and all its Impurities, that it may be rendred fair, and white, you are to proceed this following way:

Take almost as much Well-water as is sufficient for the dissolution of the Salt-petre, put it in the purifying Copper Vessel, first cleaned with water, and dried with a cloth, and put the fire under it, and make it most exceeding hot, then throw in your Salt-petre by little and little, and in pieces, continually stirring the Salt-petre that sticks at the bottom with a spoon, that it may be the easier, and sooner dissolved; this only is to be observed, that there is required a more gentle fire, while the Salt-petre is cast into the Copper, so as the water may be kept always hot. When all the Salt-petre is almost dissolved in the water, promote the boiling thereof, by augmenting the fire, then try if there be any salt in a (biggish) gross form, residing in the bottom of the Copper Vessel, which if you find to be, (for indeed, the Salt-petre it self is not so very easily dissolved, nor doth its being admixt in a more copious manner, at all benefit the Lixivium) take it forth with a Spoon, (or Ladle.)

This done, separate the Scum swimming at top of the boiling water, then have ready a Brass Vessel that will hold about ℥j.ſs. of Liquor, fill it half full with the Lixivium, set the Vessel in cold water to cool, and you shall find your Nitre presently to Crystallize, or shoot therein.

Hereby may you try whether your Purgative water be strong enough, or not; for if it be stronger than is fit, you will find a little skin spread it self over the matter contained in the Vessel, and when it comes to be so, add thereunto more hot water, keeping the fire in that degree of heat, as may suffice to keep the water contained in the Copper, gently boiling.

Now when you have kept it thus boiling for some season, try the goodness of your water again, after the aforesaid manner; and if you shall find a Crystallization therein, and no Concretion, or heaping-together, leaving a gaping, or chap in the midst, the business is well done; but if it be otherwise (than thus well done) so that it be wholly shut in (or gathers a skin all over) at top, pour on hot water, until your Matters come to succeed after the manner aforesaid.

Then after all this, take of the best Wine Vinegar, about one pound thereof, and pour it into the said water, and you will presently see a blackish spume, or filth arise in plenty at the top thereof, and when you have left it so a while, it may be easily taken off, because of the thickness it contracts.

The boiling being yet a while longer continued, pour in the same quantity of Vinegar again, and diligently separate the Scum as afore: This pouring on of Vinegar, and separating of the Scum, may be repeated yet a third time, and oftner, whereby the purgatory water may be made altogether pure, and that there appears not any more spume.

When all this is done, cast in upon this water two or three Ounces of Burnt-Alum, most finely powdered, stir all well with a Spatula, whereby the Salt-petre may shoot into longer Crystals.

Then after this, pour out the purgatory water into the aforementioned deep Vessels, and cover them over with Linen Cloths, that the Liquor cool not. Let it stand thus one hour or two at most, and a yellow slime will settle to the bottom: Then let the water while it is yet warm flow out hence, into other Vessels made of wood, and especially of Elm, and which are large enough; or else, you may let it run into Copper Pans set deep in the Earth, for the better coolings sake, which cover over very neatly with Cloths, that so the Crystallization may begin from the bottom, and not at the upper part, as we see it wont to happen, where it is not kept by Coverings from the External cold: And we also observe therein too, that the Crystals shoot not into that length, as when the Crystallization begins from the bottom.

Let them stand thus for two or three days, until you see no more Crystals generated, which you may on this wise try.

Put some of the Lixivium in your (little) probatory Vessel, wherein, if you find that there are no more Crystals generated, you may take out the rest of the Lixivium: Then take out the Petre with an Iron Spatula (or Truel) and put it into a Vessel that is full of holes in the bottom, that so all the Lixivium may be the better separated therefrom. And you shall

have

have your Salt-petre pure and white, and freed from its Salt.

Forasmuch as the Lixivium here separated hath as yet some saltness in it, it may be mixed with other strong Lixivium to be(agen)boil'd up,for the production of the Crude Salt-petre is usually holpen forward there-withal.

Some there are that for the better purifying the Petre, do put Calx vive in together (with it) whereby the water becomes most white like Milk, and the Salt-petre gets a greater fairness.

You must withal observe that during the time that the purifying water is contained in the Copper, your fire must be most gentle, least by overmuch boiling you get some damage, for a little fire is able easily to cause (a too vehement) ebullition, and when it has got strength (or the start of you) it is hardly allayed again. The scum which you take off from it you may pour upon ashes as if it were a Lixivium, that so nothing (from whence any profit can be hoped for) may be lost.

There is sometimes seen to stick to the bottom of the Copper (especially when it is used about many boilings) a certain stony and hard substance like Tartar, which unless it be taken away, your Copper will easily suffer damage under that same matter and be burnt.

The earth and ashes left, after the weak Lixivium (hath past through them) are to be laid up in some convenient place, and there kept for four years or more, that so they may be again apt to yield a-new more Lixivium by extraction; which, that it may be the better and easier done, there must be made in them (many weeks afore they are wrought upon) by digging some Pits or Gutters, that so they may be freed by the heat of the Sun from that moisture wherewith they as yet abound. Nor do the ancients so much wander from the Truth in that they suppose it much better and more profitable to keep all the earth under a roof or shed, and that it will be far sooner reduced unto a fitting goodness, than to lie open to the weather, for much of the Salt-petre is corrupted (or spoiled) with an abundance of moisture,especially with the Rain it self: For it needs only a little wetting whereby it may be generated, and extreamly shuns, or is injured by too much moisture.

Besides these ways, there are many that mix with this earth that is yet contained in the Tub the Saw-dust of Firr, or some other Wood (the height of) a Fingers length (on it): And they perswade that Salt-petre is also generated and multiplied from that fatness which is mixed with the Saw-dust, and that the earth prepared on this wise can be so changed in a years space (so it be kept in a dry place) that it may be again made use of as afore. Yea and they suppose too that they can do much here, if they pour upon such a barren (or lean) earth, thus lying in a dry place, the reliques or remains of the dyes, which the *Dyers* are otherwise wont to throw away, and evident it is that they are aluminous, but yet not so frequently.

Besides such waters of the *Dyers* they are wont also to mix soot with their earth, (yea and the ashes too of which Lawndresses do commonly make their Lee;) that so it may be made the more fruitful and may be the sooner brought to use.

This only is to be noted, that there are sometimes found earths that give a thick black Lee, which being used by it self is too fat, to which is to be added a leaner ad dryer earth, that so the Salt-petre may be the better and more plentifully generated.

The way therefore how, and the instruments by which crude Salt-petre is purifyed, is shown by the 6 and 8 Figure (in *Lazarus Ercker*,s Book I think he means.)

The manner of purifying the gross and blackish Salt *that comes out of the* Salt petre.

THat black or rather ashy colour Salt, which is found in the Copper while the nitre is prepared by boiling, and likewise in the narrow Tub or Vessel, may be reduced into very good Salt, and very convenient for daily use, and no ways at all hurtful to Man, if it be but duly purified; which said purification is to be thus ordered.

The Copper being well cleaned fill it with most clear Well-water, put fire under it and make it boil, throw in the said Salt by times (not all at once)into the boiling water, that so it may be dissolved; which,that it may be the sooner and better done, stir it continually with a *Spatula*,when you think that it is all dissolved pourout the Lixivium into some Vessel or Tub, & you shall see the grosser part will settle to the bottom, and the Lixivium will clear up: When you perceive this, pour this clear Lixivium again into the cleansed Copper, and boil it so long till the Salt settles to the bottom, which take out of the said Copper with a perforated Ladle, and put it in a Basket that is placed over the Copper, that so all the superfluous Lee or moisture may again run down into the Copper, and yields (or leaves) the Salt perfect and dry.

Some there are who afore they use this Salt about domestick affairs, do decrepitate it first, and perswade themselves that it becomes thereby the more virtuous (or strong.)

What remains behind of the Lixivium in the Copper, you may boil it up like as you would any other Lixivium appointed to be Crystallized, then pour it out into the Vessels destinated to that purpose, and you shall see Salt-petre to be generated in them; for seeing the said Salt proceedeth out of the Salt-petre, this Lixivium cannot be wholly void of Salt-petre, and therefore may it be separated from that Salt by the aforesaid way, and be purified.

But you are to note here, that where there is too great a quantity of Salt-petre permixt with the said Salt, or that the Salt it self is too black and impure, that Salt cannot get its due lustre and whiteness by barely one such a purifying Operation, and therefore there is requisite a reiteration of this Operation, so that it be again dissolved in new water, and be purifyed, whereby it may become altogether white.

However, such a black and impure Salt, may be purified even by this way (following.) Pour the solution it self, while 'tis yet hot, (the water I mean in which the Salt is dissolved) upon the ashes which a Lixivium hath been already poured on before, and you shall see the Salt Lixivium to be wholly purified: But yet all the Salt which is extracted thence, is not sufficiently white, but that which is gathered last of all is yellowish, and therefore must be yet once again purified. Note also here, that when such a Lixivium of Salt is poured on the ashes, they must be well edulcorated (after the operation is finished)least the Salt sticking in the Reedy or Bull-rush-bottom should give an unfitting saltness to theLixivium that is nextpoured thereupon.

And thus have you the common method of boiling and preparing Salt-petre, in which you meet with what

what may be well disallowed or rejected, *viz.* it is extreamly tedious, nor is it at all gainful, for out of a centenary of Lixivium, we have no more than three or four pound of Petre; to get which too, all the rest of the water must be done off by evaporation, which is a long time doing, and requires no small costs. Yet I will shew in what follows, by what means this inconvenience may be prevented, which I have proved by mine own experience.

The way of augmenting the Crude Lixivium afore its boiling.

THE Salt-petre boilers have hitherto variously sought after the way of augmenting (or fortifying) the Lixivium of Salt-petre, that is, of causing a more plentiful provenue of Salt-petre, in the Water remaining of the extraction of Salt-petre, but in vain, because they were ignorant of the lesser proof which all things here are tried by. Its augmentation is done on this wise.

Take of a Lixivium, a Centenary of which contains *iiij.* ℔. of Nitre, pour so much of it as a Tub or Vessel will hold, upon new earth, let it stand for twelve hours; then draw off the Lixivium, and as much as you find wanting of what you poured on (which may easily be known by the emptiness of the measure which it was in, afore you poured it on, and in which it is now gathered or received again) pour so much simple water on the Earth, which draw off in like manner, and mix it with the Lixivium, and you will then have the same quantity that you had in your Vessel afore. This done try the Lixivium by the lesser experiment or proof and you will find it to contain *vj.* ℔. of Nitre. Pour this Lixivium that contains in it *vj.* ℔ of Nitre upon other new earth, and proceed on the manner aforesaid, and you shall have your Lixivium to contain *ix.* ℔. of Nitre. You may pour this a third time upon other new earth & proceed on with it after the aforesaid manner, and you shall yet have more Nitre out of a Centenary of Lixivium. But you must be always wary in this Operation, that you draw off, neither more nor less Lixivium from the earth than you had before in the Vessel. These things it pleased me to add, concerning the second pouring on of water, meerly for the experiments or proofs sake, whereby we may be made certain of the augmentation thereof (forasmuch as the Lixivium doth by this means hold in it more Nitre) and that we may be forced to acknowledge its augmentation even in that way. Then after this is done, you may use the weaker Lixivium instead of water, to fill up the first measure, and so the Lixivium will be the easier, and more augmented; and we may in a short time have sufficient quantity hereof for to boil. And although this augmentation of the Lixivium requires a great deal of labour, yet are all the (pains, &c.) recompensed, because we hereby get in one Weeks space, and with less expence of Wood, far more Nitre than by the other common ways: But yet there are requisite more Vessels for this kind of working, wherein the separated Lixivium may be kept.

I will also give the Reader a manuduction here, by what way the boiling of the Lixivium is to be ordered, or contrived: First of all, this is well to be regarded, that forasmuch as a great boiling requires a great quantity of earth, and yet there does not at all times, earth of a like goodness offer it self (especially seeing a Man cannot make proof of it all) upon which the costs and labours (necessary about it) may be well (or at the best hand) bestowed: It seems wholly expedient, not to make such a great Coction (or boiling-trade) but to do it with only three or four Tubs, that so we may choose only the best convenient earth, which we may dig in the Cities (or Towns) out of Houses of long standing, and out of Stables, but yet not too deep: Such a Lixivium as contains in an hundred weight of it eight pounds of Nitre, may be increased to eighteen or twenty pounds, if we proceed according to the aforesaid method. And therefore such Nitre boilers as inhabit those regions where there is scarcity of Wood may give hereunto good heed.

Now the Lixivium augmented on this wise, doth not attract all the nitre out of the earth it self, but there doth yet some always remain behind: And therefore you need not presently throw it away, but pour thereupon some simple Waters, which after it hath stood thereon for some hours, draw off again, and you shall have a weak Lixivium, which you may try by the proof, and proceed on therewith in the method of augmenting it, and so you will have a continual labour.

This likewise is to be observed in an especial manner, let the Work-house in which this boiling up of your Salt-petre is done, be very low, and covered with thatch, that so the heat may be the better kept about the Tubs, and this Operation may be done as well in the Winter as in the Summer, and that the weak Lixivium may not at all congeal.

And now, even as Salt-petre is made by boiling, out of the Lixivium which is made of Earth, even so is it of that Lixivium which is gotten out of Stones or the Lime (and Dung) Arches (afore-spoken of;) only there is this difference, That this last way of my contrivance (with stones &c.) is easier, and yields more Nitre. Such as are pleased with this kind of work may set about it, nor will they bestow their Labours in vain; there may be abundance of things, and those wonderful ones too, effected with Salt-petre, as I have abundantly demonstrated in my foregoing Writings, and shall in my following ones too, more clearly demonstrate if God vouchsafe strength and abilities.

But before I come to the practice it self, and to describe the benefits of Salt-petre in specie (or in particular) it is wholly necessary to shew how wonderful, yea how incomparable a subject, that Salt-petre is. And this thing I have already handled at large in the *Second Part of the Philosophical Furnaces*, in the *Second Part of the Pharmacopœia Spagyrica*, but especially in my *Miraculum Mundi*, and in the *Explication*, and *Continuation*, and *Defence* of the same.

Here the Author runs out into a large digression in his own vindication, upon the occasion of certain Letters sent him by one I. H. S. *who Stiled himself the Son of* Sendivogius; *in which Letters he highly extols the Hermetick learning of the Author, but blames him for Writing so plainly of great secrets, add exhorts him to be more sparing and obscure for the future. Withal offering his service (and begging the Authors leave) to defend his Person and Writings against* Farnner *and others. The Author not taking his advice nor yet accepting of his service (suspecting him to be a self designer) this* I. H. S. *afterwards published a Book entituled* Lucerna Salis Philosophorum. *In which he offers to teach the making of the* Philosophers-stone *at a price or reward; and reproacheth* Glauber *whom he before had so highly magnified in several Letters, advising People to avoid his writings as Sophistical. In this Treatise he mentions a Prediction or Prophecy of three Monarchs that were to appear in the*

World: The first of Paracelsus, *concerning* Elias *the Artist. Secondly, That of* Cosmopolita *of the coming of the* Northern Monarch. *Thirdly, That of* Jacob Behmen, *That a Lily shall bring forth Flowers from the North. He intimates that himself is the* Elias *of Arts. Secondly, That some* Northern Monarch *shall do mighty things in the World: And Thirdly, that the Writings of* Jacob Behmen *should be again Printed a new. After the Author hath shewed the ill dealing of this* I. H. S. *with him, and vindicated himself, then he proceeds briefly to Comment upon these three Predictions or Prophecies.*

By what hath been said, may the Candid and well-minded Reader judge what judgment is to be had of this Monarch of Arts I. H. S. Every one that reads them will find whether or no such a Monarchy is to be expected from such a ones Writings. But now that I my self may likewise here produce my opinion, concerning *Paracelsus* his meaning where he writeth, *I say that the most eminent Secrets will not be known afore* Elias *the Artist shall come and teach them:* (But I pray) what hath the holy Man *Elias* to do with Arts? verily no thing at all. *Paracelsus* minded or pointed at some other thing, he well knew, that no body comes unto such knowledge, unless by Revelation from God, by godly Prayers, and by searching: This is the true *Elias* which *Paracelsus* speaketh of, if (*viz.*) the word *Elias* be read backwards, and E changed into A: For then 'tis the same with *Salia* (that is, Salts) such as these (*viz.* salts) are known unto, to them is *Elias* a master or teacher. And where the said *Paracelsus* speaketh of Salts he adds *Alchimy finds it (to be) in Nitre:* Hereby shewing and pointing at *Salia*, Salts, which word being read backward is *Elias*? And this is my opinion as touching the coming of *Elias* the Artist, and I do yet (again) say, that to him to whom Salts are known, hath *Elias* appeared. And let this be sufficient to have spoken of the first Monarchy of I. H. S. and what is to be judged thereof.

Now follows the Second Monarchy.

AS for the second Monarchy, he alledgeth the Prophecy of *Paracelsus*, which runs thus: *A Lion shall come from the North, and become the Monarch of the World:* Which Prediction is not at all to be understood according to the Letter. What has *Paracelsus* to do with the Northern Lion? What business has he with the Monarch of the World. Some there are that endeavour to attribute that Prophecy to one or other of the Northern Kings, but yet that was not in the least *Paracelsus*'s meaning, he drove at a far other-gues's business, and by that Lion he meant Salt-nitre, which is wont to be brought unto us by the Northern Winds, Rain and Snow, and that several times yearly as is well known unto all; hereupon many amongst the Philosophers, and some of them the latter Philosophers, have filled great Vessels with the Rain and Snow that comes out of the North, and aimed at the preparation of a Tincture thereout of, but they found nothing else but Salt-petre, which to get, I have shown a much shorter way.

Paracelsus, *Basilius*, and others have Written many things of the green and red Lion, all which are to be understood of Salt-nitre, which may most easily be transmuted into the green or red Lion, concerning which thing I my self have made mention in many places.

But some or other may reply, How can it be said that the Lion shall be expected out of the North, if *Paracelsus* did by it understand or mean Salt-petre, for that cannot be said to be expected (or waited for) which hath always been? Surely the approach of this Northern Lion is not to be supposed or thought to be as to the outside aspect and known use, but only according to the internal virtue, & the Treasure therein hidden; concerning which, the Philosophers have written many things enigmatically, and kept up all things most secretly. Verily he to whom the inside of Salt-petre is known will be able to report wonderful things, for 'tis that only that is the true Monarch, and is able to institute a good governance for those that possess and know it. This Monarch will not be to any one a stirrer up to kill others, and to take from others their Goods and Kingdoms, and to disquiet the whole World, as we see other Monarchs do, but he will bring Peace and Concord, and will perswade the Soldiers to stay at home and to get their food by the labour of their hands, and not to shed the blood of the innocent; he will injoin the greedy Usurers to be beneficial to the poor & to put an end to their immoderate usury; he will shew to the Divines, that all their contentions are vain, and that they cause nothing but inquietude, dissention and discord amongst Men, and will require at their hands to Preach concerning friendship to, and love of ones Neighbour, which under this unprofitable contending is wholly lost, and to banish away all hatred; and contrary-wise to strive after patience and Christian humility. These kind of Doctrines and governance the inward or inside knowledge of the Northern Lion will bring with him, and not any War or shedding of Blood. But afore the said Lion is tamed and made gentle, he is very ravenous, and the venomous Basilisk, and devouring Dragon, preying both upon Men and Beasts, demolishing Cities and Castles, and destroying Goods and Men together. Thus have I in brief expounded my opinion of the coming of the Lion from the North, let every one believe it as he listeth. And thus much shall suffice for the Second Monarchy, and how it is to be understood.

Now follows the third Monarchical Prophecy.

AS for what concerns the third Prophecy which I. H. S. doth also make mention of, (& will have it) to concern a certain Writer, whose name is *Jacob Behmen*, who exercised the *Shooe-makers* Craft, and published many Theological and also Chymical things, which *John Beth* doth again Print: As far as I know by his writings, he was an honest Man, but I do not know what he understood in Alchimy; but however this is evident, that he never exercised or practised Chymical Operations, and that his Chymical writings are most difficult to be understood, but his Theological writings are read by many. My opinion concerning the business is this, that this same I. H. S. was minded to quarrel with me, that so there being a brawling bred between us he might make his Books the more saleable. I have therefore thus plainly answered him, but if he proceed on in contrarying and opposing me, I shall be constrained *Nolens Volens* to meet with him another kind of way, for I am even wearied and glutted with contention. If he will needs brawl and scold let him do it with those that have no work to do, such as he himself & his associates are, who have no Family to rule and look after, I can for my own part bestow my time better than in those contentions, which bring no

no profit, but only to the Bookseller, whose Books before they are known sell well.

But to conclude, I will in a few words open the ill affected mind of J. H. S. to the Candid Reader. When I had lookt into his Treatise, and perceived that he had ranked me amongst the Sophisters, I showed to some of my faithful Friends, the Letters which he had written unto me, that so I might hear their Judgment concerning them; verily, there was not one amongst them all, but wondered at the wicked mind and falseness of this Man: Yea, one of them did afterwards inform him by his Letters, what way I had purposed to take, *viz.* again to wipe off that undeserved Title he had put upon me, and to defend my self against such Monstrous Impiety; To which he received from the said *J. H. S.* an Answer, which he likewise shewed me, wherein (amongst other things) he pretends, that the cause of his hatred [against me] was, because I had in some places written so very clearly of the Universal Medicine: Yea, and he farther adds, that it is no such great despising one, or Contempt to call one a Sophister; for *Geber* was accounted for a Sophister, and yet was he a King. And that if I wrote against him, he would do the same against me, and endamage not only me, but my Children too; which Epistle is yet kept safe. Now let any Honest Man consider whether this be a Human, or Diabolical action.

Some, when they heard this, perswaded me to pass over all in silence, and that there would come of it such another brawling business as was with *Farnner*, whose Exhortation I yielded to, that I would not so much as once answer him, how great Lies soever he told, but rather purposed by referring all till the next Spring, to get me Friends by the benefit of my very eminent Inventions (God willing) which should not only intercede, or stand up for me, but also for my Children too, after my Decease: I doubt not, but that there may be some principal persons found, which are capable of overturning such Inhuman Perverseness.

These few things was I constrained to add (in a Parenthesis) for the defence of my Writings, thereby to paint out the deceitfulness of Men, and to discover what is to be opinionated concerning such turn-coated Foxes: The which I entreat the Reader not to take in evil part, but to accept of the Secrets laid open in this Treatise, as a Reward for his pains in reading this Apology.

Now follows the Most Potent Lion, and Monarch of the North; to whom none in the World may be compared, nor *did* ever any excel him in Glory and Power, or *shall be* like unto him.

But before I begin to write any thing of that Omnipotent Monarch, I have thought it profitable to add here in this place, for the better knowledge of the same, *Paracelsus* his Propheſie, as I met with it, whereby any one that is skill'd in nature, may sufficiently see, that *Paracelsus* did not mean a King, but the great Philosophical Mistery, and would point that out unto us: His Words therefore are as follows.

The Propheſie of Dr. *Philip Theophrastus Paracelsus* of the *Northern Lion.*

They will not leave me in my Sepulchre, but will hale me out thence, and lay me down towards the East: And I do foretell unto you, that there are three great Treasures hidden.

1. *The First is at* Weyda, *at the* Alps *of* Julia.
2. *The Second is between* Suevia, *and* Bavaria: *The place I do not poine at, because of avoiding the being the original of many evils, and because of the shedding of Bloud.*
3. *The Third is between* Spain *and* France.

He now that shall find these, will be carried in Triumph, and be admired by all: Likewise between Suevia (*or* Scawben) *and* Bavaria, *there are Books which contain no mean and common Artifices, that will offer themselves together with precious Stones and a Carbuncle.*

I will here likewise declare the Age of such as shall find them.

The First will be 31 *years old.*
The Second 50 *years old.*
The Third 28 *years old.*

And these shall be found not long after the exit (or ruine) of the Austrian *Empire, and it shall happen, that in this very same time, a Yellow Lion shall come out of the* North, *which shall be Persecutor of the Eagle, and at length its Conquerour: He shall subject under this Empire all* Europe, *and a part of* Asia *and* Affrica, *and shall profess the good and* Christian Religion, *and shall have many Followers thereof. It shall first of all be a most troublesom work for him to chase away the Claws of the Eagle out of the Empire; but afore this comes to pass, there will arise extreamly great Dissentions, and various Grudges amongst all Men in all Countries; the Inferior will rise against the Superior, so that there will be a great tumult, but yet notwithstanding the Members shall suffer the punishments of their wickedness, and the head abide safe.*

Nor shall here be an end, but there shall be kindled a great fire, which shall turn all into ashes, but the Omnipotent God will be at hand to help his own people, for there shall yet remain a small sparkle of Piety, which will take rooting, and encrease by little and little, and strike a terrour into the plundering Robbers, and make that alive, which seems to be dead. The Enemies and Persecutors of Christ, will call themselves powerful, and every where bring in great Devastations, insomuch that there will seem to be an end of our Actions.

Now whilst the Enemy is placed in the very topmost pitch of fortune, the most Just God, will (by the help of a small company) destroy, and utterly root out the Northern Lion, accompanying him, together with all his Clerks; yet abundance shall be Converted, and believe on his Omnipotence, and in the most Holy Name of God.

When therefore this Lion hath gotten the Eagles Scepter, every body will reverence, and run after his Majesty: He

shall

ſhall be powerful in Deeds and Counſels, and the Subjects that now refuſe him, ſhall receive him with the greateſt joy, and ackowledg him their Superior.

Then muſt the aforeſaid Treaſure 'twixt Suevia *and* Bavaria *be found, which is equivalent to the Riches of twelve Kingdoms, where alſo lies hid, a Carbuncle, as big as an Egg, richer than any price.*

The other Treaſure that lies between Spain *and* France, *is indeed great and potent, but yet it gives place to the former, it ſhall be manifeſted at the entrance of the Lion that comes from the North, and, which ſhall take the Eagle, and then at length ſhall men conſider well what I* Theophraſtus *have been.*

Now when the praiſed Northern Lion hath finiſhed his Courſe, and hath broken the edge of the Eagles Claws, then ſhall Peace and Concord every where ſpeedily and vehemently fly thereunto, but yet he will ſend afore, ſome ſigns and tokens by which it ſhall appear unto us, that the Meſſengers ſent forth ſhall declare the coming of the Lord. There is yet one only thing that I Theophraſtus *do beg at your hands, that ye do not any of you impute unto me the things which I now lay open; foraſmuch as I cannot be againſt the Will of God, which I muſt put in execution in the Nature of things.*

Theſe are thoſe Secrets of Secrets that I was willing to open unto you. This Treaſure far exceeds other Treaſures; my Arts are hidden in that place betwixt Suevia *and* Bavaria, *and they are theſe,* viz. The true Tranſmutation of Metals of a ſhort way: The Univerſal, more than perfect: The *ſo much talk'd of* Aurum Potabile, *and* Philoſophers ſtone: *But he that by the guidance of God has an entrance opened to the finding of them, ſhall there find (beſides other ſtones) a precious Carbuncle, which lies hidden in a little Box cunningly made by Men, and covered over with Gems; the Key of the little Box is in a Golden Coffin, the Golden is put in a Silver one; the Silver one in a Tin one; and it lies in ſuch a place as God hath choſen, or appointed.*

The Omnipotent God will beſtow upon him that finds them his Divine Benediction in all his Affairs, and will give him power to oppreſs all evil, and to draw out good; whereby things neceſſary may likewiſe be obtained from God who is able again to reduce the world he made of nothing, into a nothing: Let the Son and Holy Spirit be alſo with us, the Bleſſed Trinity, for ever and ever. Amen.

Firſt of all, *Paracelſus* ſaith in this his Propheſie, that Men ſhall draw him out of his Grave, and place him towards the Eaſt; who is ſo ſimple as to think that this is to be underſtood according to the Letter? What Profit and Honour would thence ariſe to *Paracelſus*, if his Bones were digg'd forth, and tranſlated into another place? Whereas if he were even now living, he could not deſire a better and more excellent Tomb, than that he lies in. Whilſt he was living, he was not ſo proud; he very well knew that the Honours of this World are fading and vain. Nor did he ever require, that any Epitaph ſhould be erected to his Honour: Although (when his Friends had taken care to lay him in a decent place.) The Magiſtrate commanded a very notable Epitaph to be engraven on his Tomb-ſtone for a Teſtimonial of his Deeds, the which Epitaph will bring him Praiſe enough while the World laſts. The ſaid Epitaph runs thus.

The Epitaph of Theophraſtus Paracelſus; *which is to be ſeen Engraved on a Stone at* Saltzburg, *in the Hoſpital of St.* Sebaſtian, *erected againſt the Wall of the Church.*

HEre lies Buried *Philippus Theophraſtus*, an Eminent Doctor of Phyſick: Who by a Wonderful Art, took away thoſe Dire Maladies, the *Leproſie*, *Gout*, *Dropſie*, and other the Incurable Diſeaſes of the Body; and Honourably Diſtributed, and gave his Goods unto the Poor. He Died the 24*th.* Day of *September*, *Anno* 1541.

How could he be poſſibly more praiſed after his Death, than I ſee to be done by this Epitaph. But yet I would not have you think that I deſire you to account of my Opinion as if it were Goſpel. It pleaſed me here to put it for this end, to ſhew, what my thoughts are, as concerning this thing, every one may believe as liſteth him, but as for my part I will in no caſe believe, that the Prediction is to be explained according to the Words or Letter: But whereas it is ſaid, that he ſhall be taken out of his Sepulchre, and put in another towards the Eaſt, I do thus interpret it: That if any ſhall underſtand his Writings, they ſhall thencefrom perceive what, and how great a one he was, and ſo will make his Cauſe their own, and will defend his Writings againſt Inimicitious Zoiliſts (or Carpers) and Ignorants, who as well ſince his Death, as whilſt he was alive, entreated him very inhumanly, and as it were, oppreſſed him with Lies, and Infamous Libels, and ſo do they take him as it were out of his obſcure Tomb, and place him towards the Eaſt, by which it may appear to every one what an incomparable Man he was; to the performance of which, I will not refuſe to lend my poor help, though ſmall, (God permitting.)

He doth afterwards add, that there are three great Treaſures hidden, which whoever ſhall find, ſhall triumph very nobly; the places which *Paracelſus* points at, and where thoſe Treaſures are hidden, are, where the Metals are digged; and indeed ſuch places they are, as in which there lies hidden the higheſt Tincture, and which otherwiſe is not to be found neither in Gold, nor Silver, nor in all the other Metals, or Minerals.

I do think that *Paracelſus* knew theſe Minerals, and made a Tincture of them, and thereupon was willing thus obſcurely to deſcribe ſuch Treaſures.

He that ſhall find, that is dig it forth, and ſhall know the way of preparing a Tincture thencefrom ſhall doubtleſly be magnified, eſpecially if he will diſcloſe them unto others.

Now I believe that if theſe Treaſures ſhould be digged out by ſome godly, honeſt, and wiſe Man, (for the finding them is denied unto reprobates) would not hunt after or affect vain Glory, but be contented in

in that he knows it: But it is not convenient to open or discloſe what this *Minera* is, wherein God hath put ſuch a ſingular Tincture, and which he hath hidden from the proud and covetous. But ſeeing that all things reſide in the hands of God, who can give unto his own People that which he denies unto others, I do not at all fear any one's exhauſting ſo eaſily a Treaſure lying ſo profoundly hidden, although I ſhould make known this ſubject.

Thus much I have experienced, that there lies in them a much more excellent Tincture than in the other Metals or Minerals, but I do not boaſt that I have thence drawn the univerſal Tincture and made it fix, for time and occaſion would not as yet permit it. But I have often times in a particular way inſtituted a graduation of *Luna*, by the help thereof, inſomuch that it hath left ſome fix'd *Sol*: Whereby I have obſerved, that many excellent and profitable things may be effected, when that volatile Tincture is by the rule of Art made fix'd and fluid. However I will make trial, if God ſhall vouchſafe me life and ſtrength, and ſee what I ſhall thence obtain.

As concerning the name of the ſubject, it is called *Magneſia Saturnina*: which is found between *France* and *Spain* in the *Piedmont* Mountains; 'its commonly called the *Piedmont-magneſia*, but 'tis very much unlike (to one another) for ſome of it is of a yellow colour, and this the *Venetian* Glaſs-men uſe, when they make Glaſs, that it may become pellucid and tranſparent. The Glaſs doth at firſt become of a purple or Amethiſt colour, but this colour abides not one hours ſpace in the ſubject, but it evaporates, becauſe it is not fix'd enough as yet, and then the Glaſs becomes wholly tranſparent and bright, but if they would have the Glaſs hold the purple colour, they preſently work it up as ſoon as ever the Magneſia is therein molten. Many years agoe, when I attempted operations about things of leſs moment, and changed Cryſtals into variouſly colour'd Glaſſes, I found that this purple colour was not fix'd in the Fire; and that the Magneſia had in it many impurities, whereby my Glaſſes were obſcured: But yet I attempted to extract from thence the pure Tincture by Art, and to free it from its unclean fæces, and to this end uſed various Menſtruums, but yet effected nothing; until at length I ſaw that by mixing that magneſia with fix'd nitre, it was by boiling them in a ſtrong Crucible, opened by the Nitre, from whence proceeded a delicate purple colour. I poured out the Maſs and powdered it, and extracted it with hot Water, and paſſed the Liquor through a Filter, and then had I a moſt dainty purple fiery liquor, which did almoſt every hour (ſtanding but only in the cold) change colour, ſo that it became one while green, then sky colour, another while of a blood colour of its own accord, then again preſently it received other moſt elegant colours. Out of which liquor I did a-new ſeparate the more pure part, and I uſed this red powder to tinge my Glaſſes, the which thing I indeed obtained, but becauſe the Tincture was more fuſile than the green ſtone it ſelf which it was extracted from I was conſtrained to leave it off. However this I experienced, that there lies a mighty Tincture hidden in the ſaid Magneſia, and thenceforward I pondered upon the buſineſs more deeply, and adjoined the Magneſia thus fuſile unto *Luna*, and then I found ſome *Sol*: but I could not bring the work to any fuller perfection becauſe of the want of time, & ſtore of buſineſs. I am of that opinion that (by Gods permiſſion) a Tincture may thence be extracted for Metals and Animals. Theſe are my conceptions, but I well know, that the ignorant *Momus*, or Carper, will hence take occaſion of mocking at me, but this I cannot at all hinder.

This *Saturnine Magneſia* in the *Alps* of *Julia* is much purer and excellenter than that *Piedmont Magneſia*, is and there is in it more Tincture, the which we may extract moſt eaſily by the help of Nitre, and albeit the *Minera* be of a yellow colour, yet is there extracted thencefrom by the benefit of Salt-petre, a moſt elegant Tincture, of a greeniſh colour, and is likewiſe one while purple; then sky colour, then again red, and by and by again it aſſumes a green colour, the which alſo is ſo fuſile, it fixeth every *Luna*, and doth in ſome ſort make it golden. Theſe two Minerals I have often times handled, and have thencefrom gotten the green Lion, but have not proceeded any farther.

The third Treaſure 'twixt *Suevia* and *Bavaria*, is not much unlike unto theſe two, and without doubt ſuch kind of Treaſures will offer themſelves even in many other places where ſuch Mountains & Mine-pits are found out, were but the right way of digging out and ripenning them, but known unto us; which knowledge is only granted unto the Sons of GOD.

Theſe things was I willing to mention, that ſo it may be known what my opinion is as touching thoſe Treaſures. For I am firmly perſwaded that the univerſal Medicine may be thence prepared, eſpecially out of that which very much abounds ſhining in Metal reſembling a vein of Lead, and yet yields not any Metal by fuſion, bucauſe of its exceeding volatility, and of wholly flying away in the form of a vapour: Yet nevertheleſs, that Northern Lion is able to maſter it and to fatten its young ones thereby. And if GOD ſhall vouchſafe any one ſuch a Treaſure, he will verily find more Art-containing Books than is indeed needful. And whereas *Paracelſus* adds that the Lion out of the North will (after he hath found the aforeſaid Treaſures) become a Potent Monarch, this is eaſie to be believed, for he is enriched with the digged-out Treaſures, and is able to manage his affairs as liſteth him. He will be able to give whole Kingdoms unto others, and yet his power will not be diminiſhed, he will in like manner be able to inſtitute good precepts and government, and there will be a notable affluence of all things, inſomuch that there will be nothing wanting. There are many Men would lead an honeſt Life, were they not conſtrained by poverty and need to do evilly.

The Northern Lion is able (when he hath found the Treaſure to aboliſh all theſe vices, and contrarywiſe recover a good political Governance, Peace and Quietude. For Wealth and Riches are able to tranſmute Strife into Peace, and theſe the Northern Lion can abundantly exhibit, inſomuch that he may deſervedly be Stiled a moſt Potent Monarch. But if ſo be that evil companion, *viz.* Sulphur be joined unto him, which may provoke him, he becomes more venomous than the Baſiliſk, and is able to kill in a moment of time, both Men and Beaſts, yea to ruin Caſtles, Mountains, and Fortifications, and to annihilate them. But on the contrary when he hath found the Treaſure, he becomes tame and liberal, and lays off his anger, and beſtows on all Men ſundry moſt acceptable gifts.

Furthermore, *Paracelſus* ſaith that a yellow Lion ſhall come out of the North, which ſhall dull the Eagles Claws; all which verily is to be only underſtood concerning Salt-petre's tranſmuting virtue much conducing to a perfecter augmentation of the Metals, from whence ☉ and ☽ together with the Carbuncle may be atchieved; and not at all of a certain Northern King and the Roman Eagle. For the yellow and fiery

Lion which is here treated of, is fixt Nitre, and if it be joined to the volatile Eagle, that is, to the volatile Corrosive Salt; this (Eagle) is overcome by that (fixt Salt) and is tamed, because the Corrosive virtue which it abounded withal, is taken away: So that he that is skill'd in Chymistry may well enough understand what *Paracelsus* drives at, and that he does not at all mean those Monarchs and Rulers, as may be gathered out of his Manual, where he Writes, that the Blood of the red Lion is to be commixt with the liquor of the white Eagle, and that from them by a due Coction is the universal Tincture to be extracted.

Therefore they do evilly that interpret the Writings, and these predictions of *Paracelsus* otherwise, they earnestly expect external Monarchs, but experience hath taught that those Lions do bring with them nothing but an hungry Stomach, which can hardly be well filled (or satisfied) with the Sheep and Lambs of all Countries. And I pray God, turn them from us and continue unto us Peace and Concord, which is most of all to be wished for.

Moreover *Paracelsus* further saith, that he was constrained to detect this Treasure and hidden secrets, to shew the neareſt way to the description of the Philosophers-stone, which (Stone) whoever finds and knows how to open the Gate, he shall find a Carbuncle as big as an Egg, together with other Gems, which are conserved in a Chest made of Gold and Gems, and this Chest in a Golden Sepulchre, the Golden one in a Silver one, the Silver one in a Tin one, on which the Key is placed.

And now will there be any one so foolish as to interpret this according to the alleaged Words: No certainly unless he be deprived of the light of Nature. It was never heard off, that ever there was any Carbuncle found of the bigness of an Egg: neither the *Roman*, nor *Grecian*, nor *Persian* Monarchs are reported to have had such an one, and from whence then should *Paracelsus* only have the same? All Men therefore see that this Prophecy is not at all to be understood barely according to the Letter. Now in that he calls the universal Medicine a Carbuncle, he does not therein offend, because even other Philosophers have imposed upon their Tincture this very name, and this meerly because of the form it has, for if there is to be a certain Tincture that should tinge the white Metals into yellow *Sol*, it must of necessity be red; and therefore some of the Philosophers have likewise called their Tincture *Hæmatitis*, for likeness sake.

Nay more, forasmuch as it is mentioned of the Carbuncle that it shines in the night like a burning live-Coal, and yet such a stone was never any where seen or found, it necessarily follows that those things which are delivered thereof are not to be understood according to the Letter. The chiefest *Lapidaries* do Witness that they never saw it; the Oriental Rubies are the chiefest red Gems that we know of, of which there is scarce one found that is bigger than ones nail, which notwithstanding, if it be pure and shining, is sold for many Thousands of Duckets. In like manner, Granates are red, and of a meaner price, and shine no more in the Night than Rubies do. But that a shining in the Night like a live-Coal, should be attributed to a Carbuncle, is not done without cause; verily, the Authors of that thing are not at all to be supposed to be such Merchants, continually handling Gems, (as if they had ever seen such a stone): No, but they were the Philosophers themselves, whose words which they wrote of the prepared Tincture, the after Writers did falsly construe their meaning and understood it literally, perswading themselves that there was such a Carbuncle in the nature of things. Therefore we have no reason to induce us to believe that the ancient Philosophers did in very deed describe or mean such a Stone as shines by night, but let us rather perswade our selves as being thereto constrained by the Verity of the thing, that they did not in the least mean a natural stone, but a stone prepared by Art, and their Tincture. And this, the very Name it self seems to point out; for *Carbo* signifies a greater Coal; and *Carbunculus* signifies a little, or lesser Coal.

Now if so be that any one would endeavour to prove with Oaths to this blind, proud, and wicked World, that such a red stone shining by night, may be made of a Wood, or stone Coal, certainly every body would mock at him, and would say, That he propoundeth meer Lyes; and therefore no body ever dared (though he were never so certain of the Truth of the thing) to write ought of the same.

But some or other will say, Whence come you to know these things, and by what Notes or Testimonies do you prove that you are to be credited, as touching this Business, seeing no body ever writ that these things were so? To such an one I answer, That I leave every one at his liberty; for whether he believes my Sayings, or believes them not, 'tis all a case to me. However I say, that I can change by melting, a meer black Coal by the help of a Salt (but not common Salt) into a most red stone in one hours space. For Coals are nothing else but a fixt and volatile Sulphur, which if we will fix it, will be fixt; if we will volatilize it, it will be so. A wood Char-coal (though there's much difference amongst them) should it lie shut up firmly & most tight in an Iron Vessel even for an hundred Years so as that no air get in, and should be (all that while) kept in a most vehement fire, yet would it not shew the least sign of being consumed or changed, but let but the air come unto it, and it will be reduced into ashes in a moment. If now you have understanding and sense, consider with your self more largely as touching this thing, and you will find many profitable and good things if GOD shall open unto you the Eyes of your mind: This red stone having the form of Glass, being poured out of the Crucible, shines in the dark like a burning Coal, according as is the Coal you prepare it of. And albeit that this Glass can perform many good things in Medicine and Alchimy, yet it is not at all the Stone of the Philosophers, which they call a Carbuncle, for that must be fixt, and resist the Fire, both which are denied to this Glass to be, for it is volatile, and can easily be changed by the Fires force.

I have several times made this stone of Salt and a Coal, but never had time as yet to bring it to a perfect fixation, and therefore I cannot determine certainly, what may be farther hereof made. However I would not have the lover of the wonders of GOD to be unacquainted with this, that (*viz.*) my said Stone of a Coal, or my red Carbuncle, if it be dissolved in the air, it yields a green fiery Liquor, which if smeared upon any Silver it gilds it as Sulphur does. If the Divine Clemency shall supply me with life and strength and that my enemies, and opportunity shall permit, I will some time or other set about the work of fixation, that so it may appear what is thence to be hoped for.

And now friendly Reader who art not addicted to either party tell me, whether or no there does not re-

dound

dound unto thee more light from this most brief treating of the Carbuncle, than from the obscure *Lucerna* or Candle of I. H. S. in whose Book there are indeed the names of a many Authors cited, but none of their Writings are explained, and therefore it is rather a bringing others into a Labyrinth, than a showing of the true way.

Paracelsus adds, that this Carbuncle is hid in a little Chest made of Gold and Gems, this Chest in a Golden Coffin (or Tomb), this in a Silver one, and finally this Silvery one in a Tin one; which sayings verily are to be taken or understood in a far other sence than they are uttered, as well as the words foregoing: For to what end should there be such a multitude and variety of Coffins? My opinion hereabouts is this: Forasmuch as there lies in Tin (as *Paracelsus* testifies in his Book of *Vexations*, when he saith, that *Jupiter* has much Gold in it, and not a little Silver) a spiritual Gold and Silver hidden, and that ☽ contains ☉, and ☉ contains Tincture, we are to understand these things of them, they being as so many Coffins.

But some may say, to what use serve the Tin and Silver, if they are to be removed afore we can come to the Golden Coffin, and get to that which contains the Carbuncle, may we not presently even at first dash seek such a stone in ☉, and leave Tin and ☽ untoucht? I could most easily satisfie such an objection, and give a sufficient reason of *Paracelsus* his Writing such things, but that I judge it inconvenient to communicate such things of so great a consideration (or moment) to wicked Zoilists or Carpers.

However I cannot here let this slip, *viz.* that there lies hid in ☿ an excellent Mercurial Liquor, which is thence extractable by the benefit of that Key which lies upon the Sepulchre or Tomb, *viz.* by the benefit of Salt-petre. This mercurial Liquor, loosens the bonds of ☽, and makes it fit, so as to be extracted (or made into the best ☉), out of which the Carbuncle is to be afterwards made, for every (kind of) ☉ doth not at all resemble the nature of a seed, but supplies the place only of an House or covering, which containeth seed in it, and which (covering) must of necessity be removed by him who desires the seed it self.

I have in other places shown how properly the metalline stock or nature may be compared to a Vegetable Apple: *Saturn* is the root of the Tree; *Mars* the Trunk or Body; *Jupiter* the Bark of the Trunk; *Mercury* the Juice contained betwixt the Bark and the Trunk; *Venus* the green Leaves; *Luna* the white Flower or Blossom; *Sol* the Fruit or Apple of the Tree containing the seed of the Vegetable.

Now then, even as it is a thing evident to all, that the Apple it self is not the seed of the Tree, but the Nut or Kernel is hidden in its inward part, so that the Apple doth only keep or hold in it the seed; even so in like manner ☉ is not at all to be accompted as the seed of Metal, but only as a preserver (and coverer over) of the seed. He now that lights on the true Key, which *Paracelsus* hath put upon the Golden Coffin, (*viz.*) the inside of Salt-nitre, he will be able to open, not only the Tin Coffin, but the Silver and Gold Coffin too, and to take that Coffin thereout of, which contains the Carbuncle and other Gems.

These are the things I was willing to publish according to my opinion, concerning that great Carbuncle lying so deeply hidden in those Coffins: I permit others to expound them otherwise, for I do not offer these things to the old Men who stiffly contend for their own conceptions as it were for the best thing they have, it being an hard matter to tame an old dog; but I present them to such only as are the younger students of the true Hermetick Physick or Medicine, and who are not already drawn into various errors by the reading of many Authors. And he that refuseth to believe that even the greatest *Arcana* may be handled or treated of in a meer simple or plain Stile, and that they need not at all any prolixity, shall never attain his wish'd for end, though he were able to recite by heart even all the Philosophers Books. And thus much may suffice in this place.

Lastly, *Paracelsus* adds at the end of the Prophecy, that the most Great and Blessed GOD will grant to the finder out of these Treasures notable Power and Fortitude, whereby he may oppress all evils, detect good things, and get every profitable thing, certainly whoever he be that shall find such an universal Treasure, he will labour to suppress every noxious thing, and to disclose (on the other hand) whatsoever is any ways profitable for man-kind, and necessary, and this to the very utmost of his power. For the Philosophers say, *Our Art doth either find a Man honest and godly, or it even makes him such an one*; that is, it is altogether impossible for such an one that lights on such Treasures to be an ungodly Man, so, as for those highly precious gifts of God not to stir him up to godliness and Mercy.

I could render this Prophecy of *Paracelsus* more clear, but that I study to be brief, and could manifestly prove, that it is not to be understood according to the bare Letter, but that *Paracelsus* had regard to this great universal of the Philosophers, which is clearly enough hinted in these words which are mentioned at the end of the said Prophecy, *viz.* *That all evils may be kept under, (or abolished) and that all good things may be drawn forth or advanced, and withal, all necessary and useful things may be gotten.* These words do openly enough point at the universal Treasure of the Philosophers, by which all evil is kept under, and all good educed, and all necessary and profitable things acquired. On this wise are my Conceptions of them, let another interpret them according as seems him good. For when the Lion shall have found the said mineral Treasure, he will be incited or stirred up to such a great passionate wrath and power, that is able easily to dull the edge of the Eagles Claws, that is, his adversaries. 'Tis impossible for the Eagle to get such a Treasure, but a thing most easie to the Lion; For there is not a subject in all nature that can make the Lion so fiery and powerful as the *magnesia Saturnina* can, and therefore it easily tames all Corrosives, and cuts off their Claws. Experience confirms the things I here mention, and therefore I will say no more: Yet however I think it expedient to add this one thing more of the nature and properties of the Lion and Eagle.

It is sufficiently manifest, that the Eagle is called the King of all Birds, and the Lion the King of all four-footed Beasts. Not, as if the Eagle were the greatest amongst the Birds, and the Lion the strongest and greatest Animal amongst the Beasts: No, no, There are bigger Birds and Beasts than the Eagle or the Lion; Geese, Swans, and our Country Storks are bigger than an Eagle, (I omit to speak of the other huge Birds in *Asia*, *Africa*, &c. Amongst which the Ostrich is reckoned for one, which is as big almost as a Horse, and runs swifter than a Horse.) Then, for Beasts, there are some of the (like proportionable stature) as the Rhinoceros and Elephant, which fear the Lion no more than the Ostrich and other (great) Birds do the Eagle; yet nevertheless do they acknowledge

knowledge the Lion and Eagle for King, and that deservedly too, because of the Velocity, strength, valour, and other virtues that those Creatures have.

But yet Historians rank the Griffin and Dragon amongst the Birds and the greatest Animals. They paint (or describe) the Griffin, a winged Animal, one half part resembling a Lion, the other half part an Eagle; the Claws, Wings and Head like an Eagles, the other part of the body like a Lions. But this is a Philosophical and Poetical Fable, by which they would disclose and lay open other Mysteries and Arcana's. For there is never to be found in all this whole compass (of the World) such a Dragon as flies in the Air or spits out Fire; but all these sayings, point at Salt-petre. They likewise feign the Griffin to be of such power as to be able to carry away through the air an armed Souldier on Horse-back; these and greater things than these can Salt-petre do; for 'tis able to blow up whole Castles and Fortresses with many myriades of Men into the air; and would to God this were not so well known. The Philosophers have only shadowed out their Dragon amongst other Birds. Our Dragon never dies but by the help of his Brother and Sister, that is of the fixt Lion, and corrosive fluid Eagle, the which thing may be likewise said of the Griffins. For of the fixt burning Lion, and fluxil or fluid corrosive Eagle, there is created no other thing but a Griffin, part Eagle and part Lion, which lifts (or blows) up Mountains of most vast weight; when they fight each with the other they kill one another and are raised up again out of the dead Carkass. And thus there are regenerated (or again born) other Lions and other Eagles out of the Griffin, and (if you are so minded) both the Lion and also the Eagle may be fed and fatted with the common Flesh of other Wild Beasts, so as thence forward they may generate innumerable Griffins, which you may use not only in time of War against the Enemies, but also in the Mountains, to dig out Treasures thence, and being digged to carry them into the Nest.

N B. It is reported of the Griffin that he gathers much Gold which he carries with him into his Nest; But all these things are to be understood of the strength and virtues of Salt-petre; concerning which I could be much more prolix and more clear were I not even constrained to over-pass it and let it alone because of the ungodly crew of wicked men.

And now let us enter with the Philosopher *Virgil*, into the dark Cave or Den of the *Sybill*, and let us see whether or no we can find the Book there (that is Salt-petre) wherein are found all the secrets of nature: Or rather, let us enter into the Stable with the three wise Men or Kings that came from the East, and let us there seek the Son that was born of a Virgin, who is the King of the World & the King of all Kings, and let us apparel or adorn him with due gifts or presents, that his age & strength may grow up and be augmented, & he may at length drive away the Diseases of his three brethren, *viz.* of the Vegetable, Animal, and Mineral. This Infant needs not Gold, Myrrh, and Franckincense for his sustentation, but we will bestow upon him instead of Gold Myrrh, and Franckincense, three other things for multiplications sake; common Sulphur shall supply the room of Gold; common Salt, of Myrrh; the external green boughs of Firr or Elder, of Franckincense; thereof will we make his Bed, and these shall be his coverings.

The Salt which is animated by the Sulphur and converted into Milk shall be his food, so long until he becomes great and strong enough, yea a Potent Monarch, and then will he gainfully reward his Tutor (or Guardian) *Joseph*, for his laborious Wardship.

The Magi and Philosophers observed the Star of our Infant, which shineth so brightly as that it dazles the sight of the beholder; nor can any one look long upon it without hurting his sight, and thereupon it is worthily called the Son of the ☉: For there is not any clear or bright light without the Sun, the Country fellows therefore do not perceive such a light, but the Chymists can (whensoever pleaseth them) make and see such a light.

The things which I here declare concerning the nativity of Salt-petre, are most easie to be understood. It is generated or born in the Stables, The ☉ is its Father, the ☽ is its Mother, the Wind conveys the Paternal seed in a spiritual manner, into the moist Earth of the Stable, by which, the Virgin Earth being impregnated doth after due time produce its young to light.

N B. That Earth which produceth and conserves Herbs, Grass, and Metals is called the Mother; and that Earth which doth not produce (as in Stables, &c.) is as yet to be accompted as a Virgin, which doth afterwards yield so noble an offspring. No Earth out of which, Herbs, Trees, and Minerals are born doth ever conceive again, or ever intermits the production of such things, and for that reason is it called the Mother of all things. But now that Earth that is found in Stables, which conceives neither the *Solar* nor *Lunar* beams, nor is moistned with either Rain or Dew, cannot produce any thing, unless the beams are conveyed thereinto from the Sun by the Air, then the impregnated Virgin in the Stables, brings forth an offspring, which is by the Philosophers presented for its sustentation, with a threefold kind of gifts; to wit, Sulphur instead of Gold, and that being in like manner fixt and most pure; with Salt instead of Myrrh, which is pure and preservative, and with the Juice or Resin of the Firr-tree, or Elder, instead of sweet smelling Franckincense. These three things are the Aliment or food of the new Infant; The Green Boughs of the Firr or Elder, do furnish him with a Bed for his Cradle; The Sulphur and Salt yield him sweet milk to nourish him; so that there needs not any thing else but a good overseer, *Joseph*, that may keep off the Rain and the cold Air from this Infants Bed.

By such a means as this may we nourish our most tender Infant and advance him to his Kingly Monarchy; when he shall arrive thither he can make all his Brethren sound and rich: For the Vegetables do only desire profitable and convenient food, or some fat earth, whereby they (being well and sound) may attain to their perfection and encrease themselves; which thing Salt-petre does better than any other.

Nor do the Minerals desire ought else but that the impurity and superfluous Sulphur be taken away from them, that so they may (after a perfect Purification) cast forth their seed, that is Gold; and this, Salt-petre does most perfectly. Then Lastly, the Animals seek not after other food than what the Earth supplies them withal, which to effect, Salt-petre must of necessity be at hand.

Salt-petre therefore is the only preserver of all Vegetables Minerals and Animals, but the soul of Man doth not at all belong thereunto, for it is the propriety of Jesus Christ; but as for the bodies, Salt-petre is the most profitable medicament. Whatsoever I have here produced in this place, I have already Written the same in other places of my Treatises, in another kind

kind of manner and expreſſion, and therefore I ſuppoſe it to be plainly needleſs to make any farther addition: He that will not be able to light his dark Candle at this ſhining light, will be blind all his life time, and conſequently incurable.

As concerning the preparation of Sulphur with Salt, how it is to be made a *Lac Virginis* I have already mentioned it abundantly in many places. And as for the making of the Cradle or Bed, and what form 'tis of I ſhewed about the beginning of this Work: So that now there remains nothing behind but the applying the hands to the work, if we deſire to get honour and goods from (this) principal Monarch.

Salt-petre is the only Artificer to reduce Metals unto their firſt matter, or of making them Aſtral. For the Stars are nothing elſe but pure fire. They exerciſe fiery Operations, and produce fiery things; like as the Vegetables do putrefy by the Salt-petre in the Dung, and are reduced unto perfection and multiplication, without which putrefying there can never be made any multiplication of the Vegetables, as Chriſt himſelf witneſſeth; if the Wheat does (not) putrefy in the Earth it can produce no fruits. The like is in the Animals too, yet eſpecially in the Eggs of Birds, which ſaid Eggs muſt ſtink and rot afore the hatching of the Chicken comes. Therefore in vain have many tried ſo to deſile (or putrefy) Metals and reduce them to their firſt matter. Now though the Philoſophers tell us that Metals are to be firſt putrefied afore they can be multiplied, yet they meant not ſuch a putrefaction, but the putrefaction of Metals muſt be done by the help of fire, and withal muſt be ſo effected by Artificers, here below, as the Metals are wrought by the Stars in the Heaven, for we muſt imitate Nature. And forasmuch as nature generates all Metals by a Celeſtial Fire, therefore the Artiſt muſt go no other way, but muſt imitate nature if he would do any good on't.

As for Vegetables and Animals, we willingly allow them a moiſt putrefaction, but for the Metals, a dry and fiery putrefaction ſuits with them, and which may be perfected in two or three hours ſpace, as may be ſeen in my *Continuation of Miraculum Mundi*, and in (my) *Teſtimony of the Truth*, [or *Explication of Miraculum Mundi*:] And this is the only cauſe (or rock) againſt which many have fallen, and ſo have not gotten any good thing, (or profitable.) Now, afore putrefaction it cannot be enceaſed; and every thing which induceth a putrefaction into other things muſt of neceſſity conſiſt of two contraries in its nature: Water poured upon Water remains Water, and there is no change wrought; but from Fire and Water do many wonderful things proceed. If we pour the corroſive Spirit of Nitre, of Salt or Vitriol upon another corroſive Spirit, they eaſily embrace each other and are commixt without noiſe, and there is not thence generated any new thing, but it always remains an acid corroſive Spirit. If we put one ſtrong Lixivium to another like Lixivium, there is no noiſe (or hiſſing) ſtirred up, nor any change made; but now if we mix that ſame Lixivium with a corroſive Spirit the one operates upon the other, being both contraries, and there is generated of them both ſomewhat of a middle nature, which has not the likeneſs of either. This now is clearly evident in ſtrong fixt Nitre, or any other Lixivium of Wood, when it is poured into *Aqua-fortis*, and they act one upon the other; then of them both, there proceedeth a certain middle thing, *viz.* burning Salt-petre, which brings all things to putrefaction, and promotes or advanceth their multiplication, the which thing is after a ſort known in the Vegetables, and Animals; but as for the Metals, the Philoſophers have accompted it as a ſecret even to this very day; and therefore hence comes it to paſs that there hath been ſo much erring in putrefaction (which is the very key of the Art) and nothing hath hitherto been brought unto the wiſh'd for end.

Foraſmuch therefore as Metals ought to be putrefied by the Fire, we do not find any thing more commodious than Salt-petre, which in one hours ſpace, putrefieth all the Metals prepared aforehand, and multiplies them, *viz.* when a commodious and moiſt Matrix is put into the Fire, wherein (a man) may put his (metalline) ſeed to be therein multiplied; for ſeed is not multiplied without a Matrix, and this is daily obſervable in the Vegetables and Animals.

Now, as a Vegetable ſeed needeth for its multiplication a fat and moiſt Earth, and an Animal Matrix; ſo likewiſe the ſeed of Metals needs a metalline Matrix, without which it cannot be multiplied: And by how much the more apt and commodious the Matrix is, ſo much the more noble is the Fruit, and ſo on the contrary.

So then, by this time all men know that by how much the ſtronger and better the contraries be, ſo much the better are the fruits, as hath been already ſaid. The ſtronger the *Aqua-fortis* is, and the more fixt the Salt or Lee is, that are mixt together, the better and the more plenty of Salt-petre is there generated. But eſpecially if we concentrate corroſive Spirits by Metals & do make them (thereby) yet more corroſive, as alſo if we concentrate fixt Salts by Flints, and ſo make them yet more fiery, they do then perform many wonderful Operations. For whereas the bare contraries do yield but only Salts; being concentrated, they do yield forth fruits that break out as if it were Trees: Concerning which you may ſee in the ſecond part of the Furnaces, about the Liquor of Flints. This is that which we ſee and believe, *viz.* that by how much the more the contraries are contrary to each other, ſo much the greater product is there of Fruits. But becauſe Fire and Water are naturally exceeding contrary to each other, therefore do they alſo produce the greater fruits, *viz.* Metals, which are greater than either the Vegetables or Animals are.

N B. If the Artiſt can think upon a yet hotter Fire than the common Fire is, and a colder Water (than uſual) and know where to find them, ſuch will of neceſſity likewiſe produce Metals that are more excellent than the Vulgar.

But ſeeing that amongſt all the fires there is not given a hotter than Salt-petre, a cold wife is to be aſſociated unto him, and the wedding is to be celebrated in Hell, then will both of them leave (behind them) Sons of Riches and Health.

'Tis an uſual cuſtom throughout all *Germany*, haply other Kingdoms have the like, that when two contract Matrimony, the Bridgroom and the Bride, are led into the bathes two or three days afore the Wedding is Celebrated, and they are there waſh'd, to the end that they may be the more acceptable to each other: And although they put on their beſt apparel and do adorn themſelves with moſt clean dreſſings, yet do they at laſt put off all their fine Ornaments when they deſire to conjoin themſelves and multiply.

The ſame is here to be underſtood of the new metallick multiplication: If each party be but only ſound & of a good conſtitution (though the outward raiment be vile) yet are they able to beget as fair Children, as Royal Perſons, (who are loaden with Gold, Silver,

precious Stones, and Pearls,) can. Hence it is apparent, that the Garments contribute nothing to the buſineſs, but that the multiplication doth ſolely depend upon the ſoundneſs and good conſtitution of the bodies; and this *Pythagoras* well knew, and willingly left it to poſterity, for he obſerved that the ſoul of the Metals being by Art forced out of the body did preſently paſs into the nigheſt bodies and after their death, again into the next: Hence it was, that he fell into a great errour, when he concluded, that the ſame was alſo true as to the tranſmigration of the ſoul of man, and the order therein the ſame; to wit, that the ſoul of one man did not preſently paſs into another man, but as well into Sheep, Birds, Fiſhes, *&c.* And for that reaſon, his ſucceſſours, (a great part of whom inhabit *Africk*) will not to this day kill ſo much as a little Worm, fearing leaſt that they ſhould kill ſuch an Animal, as contains in it the ſoul of their Father or Mother. Beſides too, he ſignified that the ſoul of a man was better and more pleaſant in Frogs than in the moſt Potent King. Without doubt this errour aroſe from hence, *viz.* his ſeeing the ſouls of Metals that are forced out of their bodies, to occupy or poſſeſs the neareſt and more commodious ſubjects. By how much the purer the Subject is that the ſoul of Metals finds or lights on in its departure (or going off from the Metals) the willinglier doth it poſſeſs it. We Chriſtians have a more perfect knowledge of the ſoul given us than was given *Pythagoras*, but if we ſpeak of Metals, then this ſaying of *Pythagoras* hath good foundation, which thing, no experienced Philoſopher will ever be able to gain-ſay or confute with truth. This we know moſt certainly, that God doth eſteem the ſoul of a beggar as much as of a King; the bodies do indeed make the difference for ſome bodies are better adorned than other ſome. Likewiſe, the noble and not adulterated Alchimy teacheth us that the ſoul of ♂ or ♀ is as good as the ſoul of ☉ is; herein is the difference between them, that their bodies are bigger and ſtronger, and ſo their noble ſoul is contemned and rejected by the ignorant, becauſe of the rude groſſneſs of their bodies. Hereupon, the curious ſearchers of nature have laboured to deſtroy thoſe groſs bodies, and to draw out their pure ſoul, that they might tranſlate it into better and purer bodies, (the which thing alſo ſucceeded according to their deſire) and by the extracted ſouls they tranſmuted the imperfect aud impure bodies of the Metals into moſt pure Gold: Nor were they ignorant of the Artifice of particularly purifying the groſs and impure bodies of the Metals, like as the ſick bodies of men being purified by the virtue and help of medicaments are reſtored to their former health and vigour. For when an impure Patient meets with an expert Phyſician whom he (*viz.* the Phyſician) undertakes to cure, he doth firſt of all (if his Patient haps to have the *Itch*, *Scabs*, the *Scurvy*, *Lues Venerea*, *Puſtules* and other ſtinking ſores) preſcribe him a purge whereby all the impurities may be firſt expelled. Then he permits the ſick perſon to uſe a ſweating-houſe, or ſtove, in which he may ſweat ſo much as to be very much debilitated by the heat. Laſtly, he brings him into a Parlour or Chamber that has a pure air in it, to refreſh him, and therein he manageth the cure of him, until he hath recovered his former health and purity; and if the ſick be not made clean or pure by the firſt purgation and ſweating, he reiterates the ſame remedies as often as need ſhall require, and till the ſick be perfectly freed from impurities.

Juſt ſo, doth the skilful Chymiſt proceed in the purification of the imperfect Metals, for he expels all the excrements which they are in an eſpecial manner endued (or ſoil'd) withal, *viz.* the impure and ſtinking Sulphur by the help of the fire, and by the help of little appropriated ſtoves (or pots) even until they get their due purity; Art therefore imitates Art. But if ſo be that all Phyſicians were skill'd in Alchimy and Aſtronomy we ſhould not need ſuch plenty of Coffins, for in them (*viz.* Alchimy and Aſtronomy) one true Art doth continually produce out of it ſelf another.

The Aſtronomer when he would give a man his judgment as to the manner and term of his life, doth firſt of all look to the hour of the nativity, and fiſheth out what condition that aſpect is of, that doth at that time bear chief rule in the Firmament, which when he hath found out he doth by the means of calculation, predict what good or what evil things will befal the Child (or party) whileſt he lives.

Although theſe prognoſtications are not at all Infallible, yet are they not therefore by any means to be totally rejected. For we oftentimes find many things true by experience which otherwiſe we would not credit: Nor is it ſo much without reaſon that we ſo eſteem them, but this ought not to be done compulſively (or, as if they forced us) for 'tis the uſual Proverb, *The Stars incline, but do not neceſſitate.* For like as a man that is born under an evil aſpect may by doctrine and information be made good, ſo that here the aſpects may be of no moment; ſo on the other hand, we often find that ſtuh an one as is born under a moſt excellent aſpect is corrupted and depraved by his converſation with evil men. And theſe very things doth even Alchimy demonſtrate the truth of: For even as ſoon as ever the Infant is born & begins to ſuck in the air, he doth even then attract ſuch influences (according to the opinion of Aſtronomers) as the Stars do that very hour emit from themſelves upon the inferiour bodies (or things here below,) and ſo conſequently he imitates the nature of theſe: Even ſo the new born Metallick Infant, doth in the moment of his birth attract a metallick Aſtrum or Conſtellation, like to that which did at that time bear the chief ſway, and ſo conſequently receiveth qualities like the qualities of this Star or Aſtrum. And although that the metallick Infant were made a partaker of a good Star (or aſpect) the firſt time of its nativity, yet notwithſtanding it may be accidentally infected afterwards, ſo as thence to become an evil Metal: And on the other hand, that which was bad at the firſt may be reduced to that paſs by Art and a convenient diſcipline of the fire, as that the beſt Metal may thencefrom proceed, and this, experience witneſſeth every day, nor can it be denied by any but ſuch from whom the light of nature lies hidden.

If now the ſuperior Stars can exerciſe ſuch great virtues, what hinders but that the inferiour ones may exerciſe the ſame if not greater, provided we but rightly govern and tame them. The ſuperiour Stars are not at all ſubject unto our power, they are ſubmitted or put under God's guidance only. But the inferiour ones may be handled by us according to our pleaſure. The Phyſician may apply them to Medicine, the Chymiſt may apply them to Alchimy. He then to whom the knowledge of uſing the inferiour Aſtrums aright, is granted, may uſe them with moſt great honour, and eminent benefit, whether he be a Phyſician or a Chymiſt, which (ſaid Aſtrums) others are conſtrained to leave untouch'd to their great diſgrace and loſs. But men now adays are too much given to lazineſs and ſloath, ſo that there are but few to be found that will ſearch after nature's Secrets. A many there are that chal-

lenge

lenge to themselves the title of learned Philosophers and yet are altogether ignorant of the foundations of true Philosophy. There is not in this age scarce any esteem at all, of true Philosophers, though notwithstanding they deal with us so sincerely and do clearly set afore our Eyes, the interiours of nature, and leave us excellent Writings. So *Pythagoras* whom we mentioned afore did upon this accompt suppose, that, (because he saw the souls of Metals to be carried out of one body into another, and to Operate as well in this body as in the other former, and consequently to animate this, and make it more perfect,) the case was the very same with the human soul; and by this means he directed as it were his successours to the universal and particular work of Metals.

And even just after the same manner hath *Virgil* done, when he would that his Carcass should be cut into pieces, and be reduced unto a Life by a continual instillation (or dropping in) of burning Oil. Perhaps the occasion of his falling into those cogitations was this, either because he observed that the dead metallick bodies were by the operation of the Fire, and addition again animated, and so he perswaded himself that the like might possibly be done in man; or that well knowing the impossibility of doing this thing he would give an occasion to such as came after, more curiously to search, and so was willing to point out with his Fingers as it were at the multiplication and propogation of the metallick bodies (as *Pythgoras*, of the souls.)

Most certain it is, that it will not be any difficulty to him that knows Nitre aright, and can so order it as to operate in metalline bodies in the form of fire, to multiply *Sol* (in an universal way) and to make the viler Metals more perfect (in a particular way.) And this I was willing here to add. 'Tis well for him that useth the gifts granted him by God, to his glory and the benefit his neighbour.

And thus much may suffice to have been spoken in this place concerning the nativity and multiplication of Salt-petre, and the Potent Monarchy; more shall be spoken upon some other occasion if God please.

Now follows the use and benefit of Salt-petre.

HAving thus shown the Generation of Salt-petre out of every Kingdom, *viz.* of the Vegetable, Animal, and Mineral Kingdom; it now remains yet, briefly to shew what wonderful things the same doth effect in Medicine and Alchimy, which thing we do not find that ever any one of the Philosophers did perform, but kept all to themselves for secrets.

Forasmuch therefore as I have made a beginning of the thing already in the second part of this Book, where I spake of a certain moist separation; that is, I there delivered that it is possible to extract Gold and Silver out of all (yea even the most vile) Metals, by the benefit of a nitrous Water, so as that any one that will but set his hand to the work may thence get his sustenance most plentifully; it seems a thing necessary to finish what hath been already well begun.

Now forasmuch as I did in that place let pass the describing the manner it self of Extraction, a many Friends have much desired an illustration of the things there spoken, but I could not hitherto by any means satisfie their petition, because that the abundance of my imployments denied me the time of Writing.

Now therefore I have determined both to gratifie these and others by opening this most noble artifice, but yet so, as that I will reserve some things unto my self, that so all things may not be made so common to my Enemies. And if so be that any of my Friends desire a more plain explication, and desire an addion of the things I have omitted here, it will be an easie matter unto me to satisfie their requests.

This Art therefore doth not only conduce to this, *viz.* to extract fixt Gold and Silver out of all sand, earth, stones, yea and out of the more vile Metals (or Ores of Gold and Silver; (but also to extract the volatile and immature Gold, and Silver, and to make it fix, and that in such a compendious manner as that it will be a matter of (in a manner) no costs or labour: Nay more, if so be there cannot be had any poor Metals, Stones, or such like subjects that contain in them Gold and Silver (though even these are plentifully enough to be had in every part of the World): Yet nevertheless may that Art be exercised with profit, about even the imperfect Metals such as ♂, ♀, ♃, ♄, ☿, *Calmei*, *Zink*, *Bismuth*, *Cadmia*, *Arsenick*, *Auripigment*, *Granates*, *Talk*, *Smiris*, *Hematitis*, and such kind of Fossiles, are; and which contain ☉ & ☽, partly fixt, and partly volatile, and may be commodiously extracted by the help of a nitrous Water.

Besides too, most excellent Gold may be in like manner profitably separated out of all such things as are made by Art of Silver, whether they be gilded with Gold, or not, insomuch, that if there be but a most few grains contained in a large portion of Silver, they may be separated with gain. And if so be any be so minded to impregnate the separated ☽ again with Gold, that so it may again yield Gold by a following separation, he may most easily do so; yea, this operation may be so often repeated after this wise until all the ☽ pass (by Graduation) into *Sol*, which thing may be compared to a perpetual durable Mine-pit of Gold, and is perfected by the benefit of Salt-petre only; and therefore it both may and ought to be called and that deservedly a Store-house and comfort for mankind. For when we prepare that Salt-petre of medicinal Subjects, all the Salt-petre doth not put on the form of christals, but much of it abides permixt with the water, whih water doth abound with a most notable nitrous virtue of thoroughly promoting Christallization, insomuch that the seeds of Rye, Wheat, Millet, Oates, Beech-wheat, and such like, when they are macerated or steeped therein some due time, afore they are sown in the Earth, do multiply themselves extraordinarily, so that we see 3, 4, 6, yea and sometimes 20 plants spring forth out of one single Grain.

With the same nitrous Liquor too, (so it be prepared of true medicinal things, may be made a most excellent Medicine (which may be in a manner compared with potable Gold, and by the help of which, great diseases and as it were incurable, are happily healed) and that in a few hours space.

Forasmuch therefore, as such a Kingly medicament (of which I have made some mention in the Second Part of my *Pharmacopœia Spagyrica*, where I treated of nitre) & such a most excellent & incomparable dunging of the Ground, may, together with the Salt-petre, be prepared & instituted; so most easily & almost without cost, (on which depends the health of the body, and fertility of the Ground, whether you respect Corn, or Wine, or Hops, or any other things, that man useth instead of Meat and Drink for the sustaining of Life; or else the extraction of ☉ and ☽ out of all the most abject Subjects every where found) may we not justly pronounce thus much of Salt-petre, that it is altogether profitable and commodious to all men; and

and therefore well worth the ſearching after, and the application to the uſe of Man.

Therefore like as by the help of Salt-petre, we ſee we are able to get all ſuch things as an honeſt man ſeems to need, ſuch as are Food, Drink, Health, yea and ☉ and ☽ too, and all this moſt plentifully and perfectly: ſo on the contrary, the uſe of this Salt-petre is very hurtful when it is uſed for evil, and this is ſufficiently ſeen in the time of War. Yet nevertheleſs we ſhould not eſteem leſs of it than it really is, becauſe of its being abuſed, but rather the benefits attending it (which are very many) ſhould ſtir up our minds to make a diligent enquiry into it. The end of the World is at hand, and ſundry things are detected, which the ancients reſerved amongſt the higheſt Secrets, but they are but little eſteemed; ſome of them, I will here exhibit and ſhow unto you.

Now follows the Proceſs, Operation, or Manner of extracting Sol *and* Luna *out of all the Metals with Profit.*

THat you may gainfully extract ☽ out of the Metal (or Mineral) of Silver, Litharge, ſtones, and the like foſſiles, which have ☽ in them, Firſt of all you muſt commit them to the fire, that they may be made red hot (but yet this needs not be done with ſand) then powder them, and put them in a Glaſs Cucurbite, pour thereupon as much *Aqua-fortis* as is ſufficient, put this Cucurbite in a pan full of ſand, and then heat the ſand by little and little by putting Fire thereunder; that ſo the *Aqua-fortis* may by the help thereof attract the ☽ out of the powder; then pour off the *Aqua-fortis* from this powder, and pour it upon the other like conditioned powder, that it may alſo extract the ☽ out of that too, and this decanting and pouring on, muſt be repeated ſo often until there be no more diſſolved.

The *Aqua-fortis* is always diminiſhed or waſted becauſe ſome of it adheres to the Metal, and therefore muſt there always be other *Aqua-fortis* put in the room of that which is waſted; The *Aqua-fortis* which adheres to the Metal is to be thence ſeparated by the benefit of boiling, on this wiſe; Pour common Rain-water upon the Metal contained in the Cucurbite, and mix it well by ſtrong ſhaking of the Glaſs, then heat the ſand ſo as to make it boil, and ſo that hot water will draw to it ſelf the *Aqua-fortis* out of the Metal, which ſaid water contains ☽ in it. Then when this water is abſtracted by inclination or pouring off, put on ſome Rain-water a ſecond time upon the powdered Metal remaining in the Cucurbite, and this will extract that which the former water left of the *Aqua-fortis* partaking of ☽ (unwaſh'd off:) and ſo let nothing of the ☽ remain in that metallick powder; when it's thus done the matter is to be thrown away as altogether unprofitable, unleſs there lies hid therein any Gold; which if it be ſo, we muſt pour ſome *Aqua-Regia* thereupon, and order the operation according to the foregoing method; then mix both the ſtrong waters together, both that which extracted the ☽ and that which extracted the ☉, mix them diligently, and there will thence ariſe a certain white Water, and the ſolution will be like Milk; For the ☽ cannot abide the *Aqua-Regia*, but there will precipitate a white powder which ſnatcheth (or precipitateth) down with it ſelf out of the Waters the Gold too. We may make uſe of the decanted Water to extract ☉ out of the other Metals; for the pouring on of the *Aqua-fortis* with the ☽ in it, to the *Aqua-Regia*, doth not at all take away ought of the virtues.

Upon the precipitated powder of ☉ and ☽ hot Rain-water is to be ſeveral times poured, that ſo all the ſharpneſs of the *Aqua-fortis* may be extracted. The powder of the ☽ is to be put upon ſome Cap-paper and dried. And as for the way of ſeparating the ☽ from the ☉ we will preſently teach in what follows.

The edulcorating waters as well of ☉ as of ☽, are to be all of them mixt together, and then the ☽ will ſettle to the bottom, and attracts the ☉ which was in the other water (or waſhings): ſo that there remains not any either ☉ or ☽ in the edulcorating Water (or waſhings): nor are theſe waters of any farther profit as to the work of ſeparating as afore, yet notwithſtanding there may be made excellent Salt-petre of them, as we ſhall mention in what follows.

When you have rightly edulcorated and dried the precipitates of ☉ and ☽, they are to be put into a ſtrong Crucible, this Crucible is to be placed in a Gentle fire, until the matter therein contained doth flow, which is eaſily done, for it is very fluxile; as ſoon as ever you perceive it flow, turn it out, for fear leaſt any of it ſhould penetrate the Crucible, and ſo bring damage or loſs to the Operator. When the ☽ is poured forth, you will find the ☉ ſticking to the ſides and bottom of the Crucible like pale Gold, altogether Crude and not at all fluxile. The ☽ turn'd out is brittle, fuſile, and volatile, and is by the Chymiſts call'd Horny-Luna, but I call it the ☿ of ☽, it being of excellent uſe in Alchimy, as ſhall be ſhown in what follows.

The Crucible in which that ☉ remained may be kept to melt ſuch like precipitates of ☉ & ☽ in again; when this hath been done pretty often (in the ſame pot) melt down this ☉ by adding a little borax, and you ſhall receive a paliſh Gold, becauſe in this firſt melting, ſome of the ☽ doth adhere thereunto.

This now is the common way of ſeparating theſe precipitates of ☉ and ☽ from each other, there ſhall follow a better way in what enſues.

NB. That if ſo be, both the Metals are boiled in a ſtrong Lixivium after their edulcoration; or if ſome fixt Salt made of a Lixivium, be powdered and permixt with it afore melting, then the ☉ and ☽ are reduced together, and may be afterwards ſeparated by the help of *Aqua-fortis*: There is yet a more accurate way; (and it is this) when we mix the edulcorated Calxes of *Luna* and *Sol* with (A.) and being mixt put them in a coated Retort, and put fire thereunder by degrees (as is wont to be done in deſtilling) and keep it for 6 or 8 hours in a continual Cementation; and ſo the volatile ☿ of ☽ is made fixt by the help of (A.) and corporeal: Yea and tingeth ſome part of the added (A.) ſo that by the benefit of this Cementation, the ☽ is made more Golden. This Cement is to be moſt finely powdered and to be reduced by the following melting: and you will find your ☉ and ☽ augmented. The melting is thus; Take of the beſt Salt-petre, and (A.) each alike: mix them, and ſeparate the Spirit of Nitre by a Retort, which (Spirit) is much fitter for ſeparation than ſimple *Aqua-fortis*: The *Caput Mortuum* remaining behind in the Retort, is to be powdered, the fixt Nitre is to be extracted with Rain-water out of the powder. This Lixivium or extracting Liquor will be of a green colour which is to be coagulated into a Salt by a due boiling; which Salt is able to reduce the ☿ of ☽; and

to

to make aureous or Golden, yea, and to reduce the Cemented ☿ (of ☽ too.

NB. It is better to mix the fixt Salt-petre, or the Green Lyon simply with the horny ☽, to cement it in a Retort, than (to take it) out of the Retort, (and) reduce it with a stronger fire; and so we shall have an excellent augmentation of ☉.

NB. The *Mercury* of *Luna* cemented with (A) may be likewise reduced by this means, (*viz.* with this flux) that we take one part of Flints that will melt in the fire, and of the fixt salt of ashes four or five parts, and so mix them together, and melt them into a white glass; 'tis able to reduce the best Cements. And this is the best way of all of reduction.

Besides, all those ways of reducing a Cement, there may even this way too be instituted, and that not unprofitably. Take of the fusile Glass of Lead four parts, of the cementing Powder one part; melt them in an iron Crucible in a strong Fire, and some of the Lead will be reduced out of the Glass of Lead, and will be near (or partake of) ☽: This Lead is to be blown off on the Test, and you shall find an aureous ☽: But for as much as the Lead separated from the Glass of Lead in the iron Crucible, contracts a blackish colour from the Iron; it is profitable to add to the matter in the fusing or melting, some Salt of Ashes, as being that by which the Lead becomes depurated, and so is easily separated on the Test.

But if so be, that (for this work) the Metals (or Minerals) of ☉ & ☽ cannot be had to precipitate the *Mercury* of ☽ out of them, (then) the artificially-made (vessels or plate) whether simply Silver, or else guilt with ☉, may be made use of; let these be dissolved with the *Aq. For.* left after the precipitation, & precipitated with Salt water or *Aqua Regia*, and be edulcorated and mixt with (A) and be fixt in a Retort. Now this Operation is to be done in a Retort, that so the precipitated ☽ that is altogether volatile, may not be wasted. which in a Crucible evaporates away, a good part of it, which cannot be so done in a Retort; for in a Retort, that which flies up, sticks in the Neck, and may be separated thencefrom, and be mixt with other Cements: And besides too, the Cement is easilyer separated from the Glass, than from an uneven Crucible; for some part always sticks thereon, and cannot be gotten off.

When you are minded to purifie this Cement sooner (or more speedily) it may be molten with an equal weight of Antimony, and there will arise from your golden ☽ a Regulus, which must be purified with Salt-Petre. Concerning which work of Reduction, and which is far easier than that which is done by the help of the Glass of Lead, I have most clearly and fully handled it, in my Testimony of the Truth, or the Explication of my *Miraculum Mundi*. By this means every ☿ of ☽ may be rendred aureous, and that as oft as one will, yea, even until all the ☽ be changed into Gold by Cementation and Gradation. Now if you would otherwise separate ought of the aureous or golden ☽, or extract the Metals (where nevertheless you would reduce the separated ☉ and ☽) it may be effected by this means most commodiously and most gainfully of all, because the Calx of ☽ is made aureous by Cementation. This labour yields a continual augmentation of ☉, by which we may live very well and plentifully.

Another Augment or Encrease of Sol.

DIssolve ☽ or ♄ in *Aqua Fortis*, also ♀ in *Aqua Regia*: (NB. Let there be always thrice as much Silver as Tin;) mix the solutions very accurately, and when you see that all the matter is fallen down (or precipitated) to the bottom; pour off the water, which said water will very commodiously serve instead of *Aqua Regia*, to dissolve other ♀ in. NB. If your *Aqua Regia* be not strong enough, it will not at all dissolve the Tin, therefore in such a Case, you may pour on the Tin, *Aqua Fortis* mixt with simple water, which after they have a while acted upon each other, there must be some salt-water poured thereupon, that so the ☽ or ♄ may be precipitated to the bottom of the Vessel, in which (Vessel) the white ashes of the Tin ly. This matter lying in the bottom, is to be edulcorated, dryed, and reduced by a strong fire, by which operation you have not only an augmentation of your *Luna*, but it is likewise made golden.

NB. This business may also be thus managed, First, dissolve ♄ or ☽ in *Aqua Fortis*; to the solution add an equal quantity of Rain-water, pour this mixture upon ♀, and let the solution be made in a pretty warm place with sand; separate that which is dissolved, the matter that is yet somewhat harder, by decanting or pouring it off, then make the precipitation with salt-water, edulcorate it dry it, and melt it, and you shall have Encrease.

But if this Mass will not so easily melt, then powder it, and mix it either with Antimony, Glass of Lead, or with a fluxing matter made of salt of ashes and flints, that thereby it may be made fluxile or meltable: That which is made fusile by the help of the Glass of Flints, is presently pure; so is not that which is done by the help of the Glass of Lead, for that must be hence separated, and be (by the benefit of ♂ and ♂) reduced into Reguluses, and be purified and washed by Salt-petre. Therefore it is the better way to promote the melting, with the Glass of Flints than with Antimony, because the ☽ may be afterwards separated without Loss, which is not so easie a thing for every one to do (otherwise.)

The Reduction which is made by the help of the Glass of Lead, is indeed (otherwise a most easy way, but by that way which is done with Antimony, we get more ☉ than by any other way.

Another way of Augmenting Sol.

TAke the golden Talck, Granates, Smiris, Hematitis, the aureous Scoria's of Copper, the greenish, reddish, golden Flint, Sand, or Clay; extract their volatile Gold with a strong *Aqua Regia*; pour into the solution, a solution of Lead made by *Aqua Fortis*; mix it well; when the matter is settled, separate the *Aqua Fortis* by inclination; edulcorate the said Calx of ♄ with water, and dry it, and so have we gotten the volatile Gold extracted out of the *Aqua Regia* by the ♄: This volatile Gold is made fixt on this wise. Take the most subtle Powder of ☉, or its most thin Leaves, add thereto thrice as much of this ☿ of ♄; or four times as much, or six times, according to the quantity of it, by which we formerly got (or fish'd out) the volatile Gold: Set it in such a place where it may have a gentler heat, so as that the ☿ of

♄ may juſt flow, and not fume; the matter is to be thus kept in this heat for ſome hours, or rather days, that ſo the filings of ☉ or its thin Leaves may by little and little attract the volatile Gold out of the ☿ of ♄, and conſequently be therewithal augmented.

NB. But ſeeing it is a moſt difficult thing to keep ſuch a very temperate heat as that nothing at all of the ☿ ſhall fly away, and the ☉ ſhall not melt in the Crucible: It is better to put the ☉ mixt with the ☿ of ♄ in a coated Retort, and ſet it at a ſtrong Fire for a; ſeaſon for ſo nothing of the ☿ of ♄ flies away, or penetrates the Crucible. That which aſcends up to the Neck of the Retort may be ſeparated, and be kept for common ☿ of ♄, out of which may be prepared a moſt excellent Medicine.

Another Augmentation of Sol.

TAke of red Arſenick, Auripigment, *Hungarian* Antimony or Cinnabar one part, of ☿ of ♄ three parts, and ſome thin Plates of Gold; let them ſtand in a Glaſs Retort in a pretty hot place, and ſo the ☉ will attract the volatile Gold out of the added Minerals, and will thereby augment it ſelf. And if ſo be that there be any thing ſublimed up to the neck of the Retort it may be taken thencefrom, and be reduced to a kind of Tincture. And ſo we may here have a particular augmentation of ☉, and a matter whereout of a Tincture may be prepared.

NB. The veſſel that is moſt fit for the fixation of the Tincture, is ſuch an one as is made of fixt ♄.

NB. The ☿ of ♄ or ☽ may be reduced by a ſecret fuſion (or fuſile matter) whereby it preſently yields an aureous ☽ or ♄: but eſpecially this ☿ of ☽ or ♄, by the help of which, there hath bin a fixt or volatile Gold extracted out of the earth, ſtones, ſand, and ſuch like Minerals, is to be on this wiſe reduced, whereby we may receive (and get) as well the volatile Gold as the fixt.

Likewiſe too, the ☿ of ☽ or ♄ may be artificially diſtilled, purified, and prepared for a ſingular Medicament; But yet let no body perſwade himſelf that ſuch a diſtillation is to be perfected after the common way with retorts or cucurbites, for it is a meerly vain thing to hope for the ſeparation of the pure from the impure that kind of way, for becauſe the fire forceth up the good and bad alike, the which thing is not at all ſo done by my more ſecret Philoſophical diſtillation; for by it, the moſt pure ſoul only of the Metal is driven up; as for the terreſtreity that remains, it is ſeparated of it ſelf by that more impure (thing) to which it is conjoined, and makes a dirtyiſh ſlime. The purer part will be found (by the help of the Cementatory Copple) to contain both ☉ and ☽; as well the purer part of that which is prepared by it ſelf of this (bare) ☿ of ☽ and ♄: as that which is prepared of ſuch (a ☿,) as by whoſe help fixt and volatile Gold hath been educed (or gotten) out of the nitrous Water; which way alſo is a moſt compendious one, of reducing the (extracted) volatile and fixt Gold. For when we reduce this ☿ of ☽ or ♄ by the help of fuſing things, ſome part of the ☉ may eaſily periſh and evaporate: But now here, nothing at all periſheth: For that which does not remain (behind) in the ſaid artificial diſtillation, and ſo ſeparate it ſelf from impurities, goes out (or paſſeth over) and yields a moſt excellent Medicament more excellent than ☉ it ſelf, which you are well to obſerve.

Beſides too, it is a thing moſt eaſie to be done to fix the ſoul of ☽ or ♄ (that is carried [or forced] up, together with the volatile Spirit,) in the ſaid inſtrument with ☉; which to effect, there (otherwiſe) needs a longer time. Therefore even by this one only proceſs is both made a moſt excellent Medicament, and withal, ☉ is gotten too. Theſe things we have here expoſed in very few and plain Words moſt agreeable to the truth, and do moſt exactly anſwer to experience; nor is there any reaſon of blaming me becauſe of my ſpeaking ſomewhat obſcurely, ſeeing it is evident that not one of my Predeceſſors did ever exhibit (or publiſh) any of thoſe things. Well, what ſhall I ſay? Excellent Gold may be extracted out of all the kinds of Metals, by the help of Salt-petre; yea with ſo much facility; that it would ſeem an incredible thing to moſt Men, though I ſhould clearly ſet down all the circumſtances, word for word: But yet this (extraction is) not (to be done) without the benefit (or help) of ☉ and ☽: For when we have a purpoſe of augmenting any thing, there muſt in the firſt place of neceſſity be the ſeed of the thing that is to be augmented, and according to the quality of the ſeed there muſt be a fit matrix in which it may take its growth or increaſe. For example; When we ſeek for the increaſing of any vegetable ſeed, we prepare a convenient Earth for the ſame, to which Earth we commit that ſeed, and ſo the like ſort of Herb buds forth, which doth again produce thouſands of ſeeds; which ſeeds are again put into the Earth, and ſo are multiplied even to infinity. This multiplication of Vegetables is ſufficiently enough known, and a moſt eaſie work it is to multiply a Vegetable, if we have but its ſeed, and that it be well conſerved leaſt it die. So likewiſe out of one Fire may be made many yea infinite other Fires, for one is always kindled by another. But when all the ſeed is dead, 'tis an impoſſible thing to produce a new ſeed.

Therefore the moſt Great and Bleſſed GOD, hath moſt excellently ordered it, ſo that the ſeed of Vegetables may be kept the year about; for if it ſhould not be ſo, we might well fear the deſtruction of the chief Herbs in the Winter ſeaſon, which now (by the benefit of their ſeeds ſowed in the Earth) we are able to produce a new.

Now the progreſs or order of the ſeed of Animals is widely different from theſe, although that even they are committed to ſuch like Animal bodies, as being their fruitful ſoil, for multiplication ſake: But yet this ſowing is done by a vaſtly different way from that of Vegetables; For we can keep the ſeed of the Vegetables, and carry it from place to place and ſo plant or ſow it in any part of the Earth we pleaſe; which cannot be done with the ſeed of Animals for we cannot ſo conſerve that, or tranſport it out of one place into another, or ſow it as liſteth us our ſelves. But it muſt be committed unto the matrix, in that very moment of time that it paſſeth out, for it cannot be fruitful and entire if it be but a moment of time out of the body. The ſowing therefore and conception are performed both together by both bodies, *viz.* by the Male and Female. The cauſe of this thing is thus, becauſe the ſeed of the Animals abounds with a volatile, inviſible, and living Spirit; which once loſt the work of multiplication is wholly taken away. Therefore like as one [Animal] multiplication is perfected ſo is the other, nor may we by any means tranſgreſs the courſe of nature.

In like manner are the Minerals alſo multiplied, and by the ſame manner that it is once perfected by, is it to be always after perfected by.

The

The Multiplication of the Vegetables and Animals is well enough known to every one, and is every where done, nor (by reason of its being so very common) doth it at all cause in any one an admiration; But the multiplication of the Minerals is not so publick a thing, for there are but a very few that understand it, though it be as easie as the multiplication of Vegetables and Animals, insomuch that I also believe, that there is not any one to be found, that is so stupidly fooliſh, that would not be able presently to apprehend and do the same, were the way but shown unto him. Now that there are so many that erre, and who walk in an unlawful or contrary path, this is not to be imputed to the art it self, but to those that meddle therewithal so inconsiderately, and do not imitate nature, who always keeps her course allotted her by God.

The Multiplication therefore of the Metals doth solely consist in the knowledge of the seed; for as the condition or quality of the seed sown is, like fruits will follow, such nature as the seed you sow is of, such fruits will you reap, and no other. For Example, I seek after ☉: Therefore I must first of all, of necessity have the seed of ☉, at hand, afore I can sow it, or multiply it. Now to have this seed, we must not set about it with words or imagination, but by (getting) the knowledge of nature; for she shews us the safest way, if we did not withdraw our selves from hearing her teach us. Now like as she commits ☉ and ☽ to the Earth, even so, and no otherwise must we also do, if we hope for any good success.

And as we said above, that there lies hidden in every Vegetable and Animal seed, a certain vital or procreating Spirit, without which it is wholly unfit for ought; even so, there resides a certain Spirit in the Minerals, which vivifies and effecteth all, which being absent, death it self follows. This spirit is of no weight or form, and there is nothing to be seen by us but only the habitation or house wherein it dwells; so that scarce the thousandth part of the seed is life and spirit, all the rest is dead. The truth of this thing doth (among other things) appear even from hence, *viz.* if some Vegetable seed be kept beyond its due and naturally appointed time, whereby the Vegetative virtue and spirit vanisheth, it doth not yield any fruit at all, nor can it multiply it self, though it hath its former shape, bigness, and former weight. And therefore, there is not any thing in the three-fold Kingdom of either Vegetables, Animals, or Minerals, but is procreated and multiplied meerly and solely by the benefit of this spirit and implanted Life.

Therefore, even as all the Metals were first wrought after a spiritual manner by the Stars in the Earth (in a convenient Matrix) by the Stars, and made fix; so according as the Matrix it self is pure or impure, so pure or impure Metals are generated; now the Matrix of all things is water or moist earth, in which the Stars are congregated (or united together) are made corporeal, grow up, and are multiplied. Here therefore, if Art would imitate nature, there are required Male-like Astrums and Feminine Matrixes, in which the Astrums may exercise their operations. Therefore by how much purer the metallick Astrum or seed is, and the Matrix purer, so much the nobler effect is produced; and so on the contrary.

But seeing that there is not any Star nobler than ☉, nor Matrix nobler than ☽, there is no more required, but that we make common ☉ Astral by Art; and that we prepare ☽ on such wise, as that it may be instead of a Matrix, wherein the Astrums of ☉ may exercise his operations, and so without doubt, there will thence come such Children as will be like their Parents. Nor is there any ground for any one to think that there is any other way allotted to augment ☉ and ☽, besides that afore mentioned which is to be instituted in a spiritual manner: After this manner the World it self was Created, where the Spirit of God moved upon the Water and impregnated it; and even as we daily see that the Stars do impart to the inferiour things their virtues, and they are thereby multiplied; even so may we do the same by art in these inferiour things; for such as are above, are also beneath. Those above are beyond our reach; but the inferiour ones, not so: For art can do the same with or upon the inferiour things, as the Stars upon the superiour ones. As *Hermes* doth clearly demonstrate in the *Smaragdine* Table. He that understands these my sayings, will also understand those things, which *Paracelsus* delivers in his Book of the *Vexation of Alchymists*, in the 5*th*. Rule especially of ☽; and *Basil* (*Valentine*) where he treats of Sulphur.

It is a thing most easie to be done, but most difficult to be found out, to multiply even the most vile Metals, by the help of the Astrums, and by this secret way. He that well knows Salt-petre and can rightly handle the same, will by the help thereof perform a many profitable things; for as it is altogether impossible to get ☉ out of the viler Metals, without it: So on the contrary it is most easie so to do by its help. Briefly, He that knows how to handle Salt-petre aright, he will excellently well understand the Writings of the Philosophers, and let him know, that he has a light given him, to arrive unto great Secrets.

For we may extract ☉ and ☽, out of all the common meaner or viler Metals, so that an expert Chymist needs not seek after peregrine, or strange Materials. An excellent purification, fixation, and augmentation may perfectly be done by the help of Salt-petre, which being a thing that but few know of, so seems it impossible, and yet the things I propound are most true. It makes bodies volatile and spiritual, and by and by again makes them fixt and compact: So that unto it alone is that saying of the Philosophers due, (*Make the fixt volatile, and the volatile fixt*) and to no other Subjects: Now if Metals be not spiritualized, there's no hopes of their augmentation. *Of something must a nothing be made, and again out of the nothing must something proceed*: So saith *Paracelsus*, which likewise is very true, though there are but a few that believe the same.

The melting together of variously mixt corporeal things, yields forth neither ☉ nor ☽: But contrarywise a spiritual Union which is done with a most strong heat, is a notable author (or promoter) of Multiplication; for the Spirits do most notably penetrate, and by variously acting upon each other, do induce alterations and meliorations, which is denied to dead bodies to perform. The Spirit doth diversly bestow a life, and vivifieth, but the body is of no other use, but to yield an house or habitation to the Spirit; the which is well to be regarded.

Those metalline Spirits (when the work is finished) do insinuate themselves anew into other bodies, which bodies they make far better than the former were, and all this by the help of Salt-petre.

Basil brings in Salt-petre speaking of it self on this wise. He that intends my death needs be a prudent Man, that so he may expel (or force out) my soul from me; when this is done, I adventure upon all the things I am able to do, but I can do nothing that has in it firmness (or substantially) in the bottom, (or radically:)

dically): *Venus* is my chearful Woman, whom (in this place) I take to Wife, but the wedding is celebrated in the very inward parts (or center) where the ſweat flows out of us both in a moſt plentiful manner. So the ſubtile (part) in us, expelleth all defilements, whence it is, that we leave behind us moſt rich Children, and do reſerve (or keep in ſtore) moſt eminent Treaſures for the dead bodies, which we give them by our Will and Teſtament. Who would ſpeak more clearly, and would not underſtand theſe words of themſelves, (or as they are) without any interpretation.

The ancient Philoſophers wrote, that at the riſing of the Sun is a Bird found in thoſe hotter Countries; which builds his neſt with Gold; and when he is grown old, and can live no longer, he gathers together exceeding dry Wood, which being kindled by the heat of the ☉, conſumes both the Neſt and the Bird too, from the aſhes moiſtned with rain Water, they ſay there ariſe Worms which will be again changed into other Phœnixes.

Theſe ſayings are indeed Fabulous, yet nevertheleſs there is a moſt high ſecret diſcloſed by them: for if we rightly conſider all circumſtances, we ſhall find that Salt-petre is hereby meant, which gathers the Gold into his Neſt, that is, extracts the Gold out of Metals, Stones, and Minerals, and doth afterwards increaſe his Family by the burning them. This to a wiſe man is enough.

Now that this Arcanum may be the more manifeſt, I will add over and above, another way of extracting the fixt and volatile Gold out of Stones and all kinds of Minerals, by the help of Salt-petre, and of making them corporeal.

We may very well compare this work to a fiſhing Trade, concerning which the Philoſophers have written many things, but very obſcure; *Sandivog*, hath more clearly treated of that thing, but *Iſaac Holland* cleareſt of all. Verily this Philoſopher was an excellent fiſher of Pearls and an excellent preſſer of Cheeſe, and for this very reaſon he aſſumed to himſelf ſuch a name. For *Iſacus* by tranſpoſition of Letters is the ſame with *Caſius*, (or Cheeſe.) So that it may be ſaid to be *Holland* Cheeſe; not that *Hollandus* was in very deed a maker of the uſual Cheeſe with milk, but that he bears ſome kind of reſemblance (in his work) with ſuch Men: For he beſtowed abundance of labour about working on that Univerſal, that hath ſome Cheeſe-like faſhion in it.

Even as the *Hollanders* gather the greateſt quantity of Milk more than all Nations beſides, out of which they preſs their Cheeſes, and ſo ſuſtain them and theirs; ſo the more skilful Chymiſts do frame or make Cheeſes after a Philoſophical manner, and that out of Metals, Salts, and Herbs: and this very much agreeable to that method, according to which we ſee the *Hollanders* proceed in making their Sheep-milk Cheeſe, where they boil in the Milk ſome green Herbs, and ſo do thence extract a colour afore they ſet about the coagulating or curdling of it. That is, they diſſolve ♄ or ☽ in *Aqua-fortis*, and a Golden matter, though it be but ♀ or ♃ (if they have not at hand any better) in *Aqua Regia*: They mix together both ſolutions having both of them the form of Virgin-milk, and they add as much Salt as is ſufficient. (NB. 'Tis better to add Salt-water, or Spirit of Salt,) and you ſhall preſently ſee that milk to be coagulated, like as (when we pour on ſome Salt-water or Spirit of Salt upon Cow or Sheep milk) we obſerve daily to happen: where the Water is partly ſeparated by decantation, and partly by expreſſion from the coagulated or cheeſy ſubſtance wrapt up in a Linen cloth, that ſo a Cheeſe may thence be made.

Juſt ſo do we proceed in the making of our metallick Cheeſe; for when we pour Salt-water or Spirit of Salt upon the ſolution of ☽ or ♄ mixt with that (ſolution) which is of a goldniſh Nature, *viz.* of ♀ or ♃: we preſently ſee a precipitation made; which done we abſtract the clear water ſwimming at top of the precipitated matter, by inclination or pouring off; the which we may keep for farther uſes, principally for the ſolution of other Metals and golden Subjects. We put the Cheeſe or white Coagulum abiding in the bottom of the Veſſel, into a Linen cloth, and by ſtrong ſqueezing it free it wholly from the waterineſs, which ſaid water is to be kept as well as the former, for being uſed about making new Cheeſes, it makes them of the better ſavour, and more aureous and vendible.

This Whey, or that water which is plentifully gathered in the making the Cow-milk Cheeſes, though it affords varieties of Profit to mankind, whether they give it their Hogs to fatten them, or uſe it themſelves for their daily drink, eſpecially in Summer time, or apply it to other uſes as we ſee daily done, yet do not I ſee any better benefit than that which it yields to the *Curriers*. For they put in it ſome old Iron, and when the ſolution is made, they moiſten with that water the hide already perfect (or ready dreſſed) and when 'tis dry they moiſten it therewithal again, and this they do three or four times, until it hath gotten a fixt colour, blacker than a Coal. They do alſo ſometimes adminiſter ſome of it unto Children (with good ſucceſs) to kill and expel the Worms: Nay more, they are likewiſe wont to make a Bath thereof very profitable for thoſe that are troubled with the Scabs or Itch, becauſe it hath gotten a drying force from the ♂, and thereupon it makes the skin ſmooth and hard: and ſeeing that the Country Fellows, and Labourers can do ſo much with it, what hinders but that we may inſtitute ſuch a curing more perfect, and that on this wiſe.

Take ſweet Cow-milk, or (which is better) Goats-milk, two meaſures, boil it over the Fire, put thereinto while it is yet warm ℥j. or ℥ij. of Spirit of Salt, mix it well, and you ſhall ſee the coagulum or curd preſently ſeparate from the whey; out of which, Cheeſes may be made by expreſſion, which are far better than others, by reaſon of the addition of the Spirit of Salt, whereto if you add ſome Cummine, Carraway, or ſome ſpices, they are yet better and more to be preferred. The Whey here ſeparated is of a grateful ſavour, and by reaſon of the admixtion of the Spirit of Salt, is ſomewhat acidiſh, and a moſt certain and moſt ſafe looſner or abſterger, being adminiſtred to Infants that are troubled with the Worms, or even to Elder ones that are feeble. How many Infants have we obſerved to die unexpectedly after they have been for ſome while and often afflicted with a burning Fever, the Convulſion fits, and other ſuch like effects, and meerly becauſe we will not perſwade our ſelves that they have the worms, & ſo forbear the uſing any remedies to purge them out? Now in ſuch a caſe this whey is exceedingly excellent, being uſed after this manner.

Take of the moſt ſubtile filings of ſteel as much as will lie upon a knife's point, mix it with as much honey as is ſufficient, and give it the Children: and for their ordinary drink, let them uſe the ſaid Whey, and ſo by this means, that filings being diſſolved by the Whey kills the Worms, in the ventricle or ſtomach and drives them out, and verily is a moſt excellent Medicament:

cament; especially if taken two or three days; nor have I hitherto met with a nobler, than this is. And so there will redound some profit to Children and Infants too, by this our way of making Cheese, for which we owe immortal thanks to the Great and Glorious God.

Besides this, I have likewise observed the excellent use of this Whey, in the administration of my Panacea of Antimony, if there be taken a draught or two thereof, at the end of the Purgation; for it gently carries off the reliques that stick to the intestines.

He likewise that is so minded, may before his dropping in the spirit of Salt, add some Anise-seed or Fennel-seed to the milk as it boils, thereby to correct its Flatulency or Windiness.

And I do most curteously intreat the well-minded Reader to take it in good part, that I have been so prolix in declaring the virtues of our Whey; necessity it self, and the love of my neighbour forbad my concealing of them: For very many Infants are killed with the Fever, and Epilepsy, or Convulsion-fits, and so suddenly die, for no other cause but our not meeting with the Worms, which their bodies are full of, being ignorant of convenient remedies.

Now then to return again to our Cheese, and to demonstrate the most eminent benefit, both of it, and of our water which is thence separated; we are first of all to know, that even it is also able to tinge (some) subjects with a certain colour, not with such a black colour, indeed, as the Whey of Milk, prepared as aforesaid, dyes the Curriers Hides with, but with a yellow colour, and more durable than that which is given to the hide, for that we therewith extract a Tincture out of ♀ and other aureous Subjects, and with the Tincture, do sometimes anoint (or tinge) *Luna*. If now the water abound with such virtues; what virtues will not the Cheese it self abound withal? And like as our Cheeses are diversly impregnated with spices, so are they of different savour, and price, and more or less wholsome. But now if that virtue which is in ♃ is also added to our Cheeses, there will proceed from thence admirable Cheeses; and this, that Philosopher was minded to point at, who writes that by the help of the Saturnine net, he is able even in a clear night to extract the little Fish *Eschineis* out of the Sea.

The Ultimate (or extream) letters of this word *Eschineis i.* and *s.* if conjoined together, so as that the letter *z.* be thereof made, and then the word read backward, it will sound in the *German* tongue the same with *Zieneſch*, (*viz.*) the ashes of Tin; but yet let not any one perswade himself that those ashes of Tin are such as are made by means of the (bare) fire, but are prepared by the benefit of the spirit of Nitre.

Saturn does not only claim (or merit) the praises of being a husbandman, but also of being a good fisher, and hunter, as (among other writers) *Basil Valentine* doth egregiously shew.

When ☉, ☽, ♃, and ♂ pursue (or hunt) the wild beasts, ♄ is bound to carry the net: *N B.* the hunting dogs here are Salts, the hare that is caught, is much like the colour of the hares skin, being stript of the same, he will yield excellent flesh, which the Princes can as little want as the Subjects can. *See the foregoing Figure of the Hares and Hounds, with a Flaming Heart, and the word VENUS.*

Common Vitriol, but that especially which is found in those places where Gold is, is the green Sea containing excellent fishes.

Neither was *Isaac Holland* an excellent maker of Cheese only, as we said but now, but withal, he was a singular fisher of Pearls; for with the net of ♄ (the night being clear) we may catch most excellent Pearls, but yet 'tis a very hard thing to take them out of the net, nor can they be separated but with a great deal of prudence and art, from the threds of the nets, to which they do stick so firmly.

But yet this separation is best of all done in a clear Light, the Sun shining upon the Earth with his beams, and wholly dissipating the Vapours, least it should be hindred by their being present. For the parts being exposed to the Air in a (perhaps he means unseasonable) seasonable weather are corrupted, nor does any thing remain behind but the shells. And even these shells do in their inside shew forth such diversity of delicate colours, as that the most ingenious Painter cannot imitate them with his pencil, and such they are as with which the other shells of mother of Pearl or the commoner sort cannot at all compare: For in one place they represent pure ☉, in another pure ☽, in another they are of a Green colour, Sky colour, Red, Yellow, and variously coloured, so that they much exceed in beauty, the Peacocks Tail. If then the shells are so fair as that we cannot sufficiently enough admire them; what I pray will the beauty of the Pearls themselves be? Nor let any one perswade himself that I do here cast Pearls before swine by too much divulging secresies; (no) for here are yet many necessary things hereto requisite to make the Pearls come in sight; and if so be that any one should know the way of dexterously extracting them out of the net it self; yet the fixing of them doth require abundance of labour still, whereby they may be able to defend their fairness and excellency, against all the Elements; however, in the mean time the lover of Chymistry, may delight his mind with those shells, and admire at the most admirable variety of the colours in them.

Some haply there will be, that when they have taken the said Pearl, by the help of ♄ and ☽, will think it a most easie thing to separate it from the net, by the benefit of destillation; but let those good men know, that this is a thing impossible to be done; for I my self bestowed abundance of labour in vain on this operation, and this hath to my knowledge so happened to others too; for in the common destillation, that Pearl being commixt with the net, even the Mother together with the Daughter do jointly ascend and get out; and thus to do is not at all agreeable or helpful for the great work; though nevertheless *an excellent particular Medicament may thencefrom be made.* Concerning which, I have spoken in the second and third Part of my *Pharmacopœia Spagyrica*; nor may we expect (by such a destillation) the thing we wish for. But if so be you desire to see the Mother, wrap the net together with the Infant in pure linen, first mundifyed, and washt in the fire; or put them in a glazed Stove, and put fire thereunder by degrees, and make the Net and Pearl to sweat largely, which being kept apart, yields a singular Medicament, for to quench all the Internal heat of the Body, and always to cool the burning Mercury.

The provocation of the sweat being finisht, break the sweating glasses, and look for your Pearl, and you shall find that it is gone out of the shells, by the force of the heat, and is roasted (as it were) toge-

ther with the Net, and cannot poſſibly be (as yet) ſeen; yet nevertheleſs it is brought to a farther maturity, and doth yield ſome profit in an eſpecial (or particular) way. But the Sudatory it ſelf, contracts incomparable Colours from the ſweat of the Pearl.

Now then, live contented with the moſt beautiful mother, and delight thy mind by barely beholding it, until it ſhall pleaſe God to give unto thee, the infant alſo. When it was my hap at firſt to behold that beauteous mother, my mind, that was wearied with the long labour of ſearching thereinto, was ſo refreſhed, that I can ſcarce declare it with words; yea I was ſo delighted, that I placed that delectable mother in ſuch a place, where it might lie always open to my ſight, and that ſo long till ſhe ſhewed me her infant likewiſe, which Infant verily was not unlike to *Cupid*. Do you alſo ſeek, and you will find what you wiſh for: Implore God, and he will give unto you; Knock at his doors, and they will be opened unto thee, if ſo be that GOD ſhall find thee worthy; for he beſtows his Grace and Mercy upon none, but ſuch as are of an humble and thankful mind. Take for an example of this ſome Tinder, or Touchwood, which being handled with dirty fingers, refuſeth to take fire, though it be never ſo copiouſly ſmitten out of the Steel with the Stone (or Flint.)

All things depend on the mercy of GOD, nor can we effect any thing by our labour. Him only ſhould we ſeek, and he will manifeſt himſelf by the works of nature, even as the nature of a man is known by Chiromancy, and Phyſiognomy.

Two contraries do always produce a third thing, and are the cauſe of every generation, and change of things; if fire be added to fire, there ariſeth no new thing from thence; neither if you put water to water; but water and fire being conjoined, there are produced new Generations; for the fire acts upon the water, and impregnates it according to the nature and properties of (both) the water and fire; from whence there proceed things pure or impure, according to the purity or impurity of the water and fire.

The thing (or operation) it ſelf, muſt be accurately known and handled, if you would have any good to redound from thence unto you. The Sun is in himſelf always good, yet doth he operate as well evil as good. If this ſame Sun beſtows his Rays or Beams upon the Rain as it falls down, the Rain doth thence contract (or get) a honeyiſh dew, which falling upon the bloſſoming of Trees, makes them corrupt. Now we cannot rightly impute this evil to the Sun or to the honey it ſelf; but we ſee that it proceedeth from hence, (*viz.*) becauſe that honeyed dew is not duely and ſpeedily enough waſht away with the rain, but is evaporated by the heat of the ☉; whence it comes to paſs, that the bloſſoms wither, and worms are generated in them, and ſo the whole bloſſom is corrupted.

We will ſet down here yet, one more ſimilitude for the ſake of ſuch as love the truth. Put caſe thus then; a diligent Gardiner walks abroad in his Orchard for his recreation, and if he happens to find a large, great and curious principal Apple lying on the ground, he preſently takes it up, and does not only well view and conſider of it, but taſts it too; which if he finds to be of an acceptable ſavour, he ſeeks out the Tree it ſelf, with an intention to pluck off more ſuch like conditioned Apples; having found out the Tree, he much ſets by it, or eſteems it, becauſe the fruits thereof do exceed all the reſt in the Orchard, both in taſt and fairneſs, and he takes care about that more than the reſt, dungs the roots well, prunes off the withered branches with a ſharp crooked knife, and artificially cuts off thoſe that are unprofitable, and uſually called ſuckers, that draw away the juice from the fruit-bearing boughs.

Even juſt after this manner doth a diligent Chymiſt act; if therefore, (as he walks in his Laboratory,) ſearching out the ſecrets of nature, he happens upon a Golden Apple, he ſeeks after the tree, that bears ſuch fruit, and having found it, he very charily keeps it, and miniſters unto it all ſuch things as are neceſſary to its conſervation, that ſo he may thence receive more ſuch like-conditioned Apples; and therefore gardiner-like he puts dung to the root, that is, Nitre; he prunes off the dry barren wood, and alſo the hurtful ſuperfluous boughs, that is, the ſuperfluous Sulphur, with a ſharp red hot iron, whereby that ſame tree may, for the future, yield egregious or ſelect fruits, without any impediment, which thing he alſo finds to come to paſs.

N B. *Paracelſus* doth very openly ſet before us this labour in his *Cœlum Philoſophorum*, in the ſixth Rule of Mercury, where he ſaith, Sacrifice the fat Vervains (or ſuperfluous ſuckers); and yet, theſe words of his, are only ſuperficially lookt on, moſt people not underſtanding what *Paracelſus* means by thoſe words, though he hath clearly and perſpicuouſly enough ſigned his writings.

It is a neceſſary thing here for the Chymiſt to know, how the caſe ſtands, as concerning the metalline tree, and what is to be accompted its Root, Trunck, Bloſſoms, and Fruits; ♄ is the Root; ♂ the Trunck or Body, ♃ the Bark about the Trunck; ☿ the nutritive Juice between the Bark and the Trunck; ♀ the green Boughs and Leaves; ☽ the pleaſant Flower, or Bloſſom; and ☉ the ripe Apple containing in it ſelf the ſeed of the Tree.

That Apple which yet ſticks on the tree, doth, when it hath arrived to its full maturity, fall down upon the earth, of its own accord, if it be not gathered by the Gardiner; and then afterwards the leaves themſelves, when the weather is ſomewhat colder, fall off, which do as it were bury the apple, which lying hidden under the leaves, is conſumed by rottenneſs, by little and little; but the ſeed aſſuming to it ſelf a natural humidity from the putrefying tree (or fruit rather) inſtead of nutriment, begins to take root in the ſpring time; out of which there grow up, in proceſs of time, Apple-trees, which are to be in their fit ſeaſon tranſplanted: this tranſplanting being finiſhed, the Gardiner joins to ſuch a wild tree, generated from the ſeed, the Scions of ſuch fruit as he has a mind to, and that by either ingrafting, or inoculation. And ſo an induſtrious gardiner may get from the fruit of one tree, an innumerable company of great trees, and thoſe of ſuch a nature and kind, and grateful a ſavour as he likes beſt.

Even on this wiſe doth the Chymiſt do, joining fruitful Scions to wild truncks or ſtocks, by inoculation, ſo that he never wants good fruits.

He that cannot learn ought from theſe things, I cannot help him any other way, for I do not ſee how I can ſet down thoſe things clearer than I have done.

But for the undertaking of this labour, there is required an Artiſt, no leſs diligent than ingenious. And of how much the better quality the dung is,

that

that is laid to the root of the tree, and (by how much) the knife which the boughs are cut off withal, is the sharper (that so it may not hurt the green (or growing) bark of the tree, and so the nutritive juice flow forth, so much the better are the fruits generated. As it is easie for a wise man to reap hence some things; so it's difficult for an imprudent man.

I doubt not but that there will be some, that being judicious men, will know that there is an opportunity given them by my writings, published out of a sincere mind, of making farther inquiry after a true transmutation, and consequently of esteeming it, more than we find to be usually done (because that most things are oft-times propoled craftily and cautiously.

But that such a noble art may be freed from any farther contempt, I have purposed, the next following Spring, to frame a convenient laboratory, and to demonstrate the truth thereof to my friends. And although my endeavours shall be to prohibit any entrance by any means to the faithless brethren of *Farnnerus*, yet notwithstanding, I know I cannot so prevent and foresee, but that one or other may adjoin himself to the number of the true lovers of Chymistry, and feigning friendship, lay snares for me.

But put case that such a thing should not happen, it cannot be but that the Arcana's will be divulged; for such things as this or that man sees, and writes down, may reasonably be thought, will come to other mens hands after they are dead; especially if the preparation of Salt-petre be afore instituted, or set up in divers places; for nothing can be done in Alchimy, saith *Paracelsus* without Nitre; Alchimy is found to reside in Nitre say I. Salt-petre shewed us Alchimy, or, Alchimy was found out by Nitre.

He therefore that has abundance of Salt-petre, can perform egregious things in Alchimy. Had not the *Ægyptians* been possessors of great plenty of Salt-petre, verily they would never have been so skilful in Alchimy; nor could they have had those riches, by which they were able to avert (or decline) the yoke of the Roman Monarchy.

As long as they knew the use of Sulphur (Saltpetre I believe he means) they enjoyed Monarchy (without servitude to others) (and this was even to the time of *Diocletian* the Emperour, who knowing their power, commanded all the Books they used, to be burnt) and then their Monarchy and their Art it self perished together.

The Poets have feigned many stories of *Jupiter*'s Golden shower; certainly did we but know the manner of duely managing Salt-petre and ♃ together, we should be likewise able to produce the golden shower.

Jupiter, when stirred up with anger, doth with his Thunder and Lightning, strike a terrour into all the Gods, and into whatsoever is upon the Earth; and yet the rain that falls then, at such a time, is of an excellent Quality, and makes the Earth more fruitful than the rain that commonly falls is wont to do; because there is a certain tinging and penetrating spirit sticking in the Thunder, that tingeth the air and the rain, and animates it; if therefore we can (by the virtue of Nitre, and this same ♃) produce such Thunders, & can give to the Thunder fire & air, by which it might operate; verily there would nothing hinder, but that we might (*Jupiter*-like) make a Golden shower too. The purer the ♃ shall be, and the more clear the Air, so much the purer will the Rain be, and the Air is more impregnated and filled with the common Vital Spirit.

He now that knows how to separate the life out of the water and air, rightly animated, gets a true *aurum potabile*, or the Soul of the world: besides this too, there offer themselves apparently such things to be done, as are able to exhibit his daily food. And thus much let suffice for this time.

He verily that perceives (or understands) not these things so clearly proposed, surely he will not, though all the Gods themselves should relate them, understand ought of those things that are taught. In the mean time, I hope that my friends will see with their Eyes, and feel with their Hands, the most certain truth of these, and the like operations, and consequently of my writings, in a laboratory, which God willing, I will in a short time erect, and will then defend me against all envious, and carping men.

This one thing I will yet add over and above, that the astrum of Gold doth tinge his own proper Mercury, or (the ☿) of the first *ens*, (therefore) chiefest of all: The Astrum of ♄ (tingeth) ☽; the Astrum of ♃, common ♀; the Astrum of ♂, ♀; for those three superiours do always operate upon these three inferiour (Planets;) so that they are, as it were, upper men, and lower women: ☉ he is left in the midst, which whosoever adds unto the others for the compleating of the operations, will perform excellent things.

But he that knows how to make that Astrum of ☉ corporeal and fixt, he may translate the Astrum of ☉ on this wise prepared, out of one place into another, and conserve it like a Vegetable seed, to be implanted into all the Metals, in time and place convenient; which blessing, we rightly attribute to the blessed great GOD, the giver of every good thing, in the first place, and then to Salt-petre as being the Northern Monarch.

It now remains, that we briefly shew, by what means that Nitrous water, out of which that most noble Pearl, ☉ and Gems are taken with the Net, may be prepared for farther uses, so that such a fishing may need but very small costs, and may nevertheless (besides the daily food which it most plentifully provides us) bestow on us a most excellent medicament.

We have taught in the foregoing directions, how we may by the help of *Aqua-fortis* or *Aqua-regia* most easily extract both the fixt and volatile ☉ and ☽ out of the Metals, Flints, Sand, Clay, and such subjects as are every where obvious, and precipitate, coagulate, dry, and reduce it into a fixt metallick body.

Now in doing these things, part of the separatory water here used, is as yet good enough, and may be kept for farther uses; but part thereof (*viz.*) that which is extracted out of the Metals by the help of common water, is, by reason of the mixing sweet or fair water therewith, rendred too weak for operating withal, and therefore must it be corrected and amended by some certain singular way, so as it may be again used about doing the same work.

Were it not for costs and labours we might separate that fair water from the *Aqua-fortis* and *Aqua-regia*, by the benefit of a glass Cucurbite, but forasmuch as there is given us a more compendious way, we will make choice of that.

For he that intends to get himself riches by the benefit of this separatory work delivered by me, or by the extraction of ☉ and ☽, will need a great deal of *Aqua-fortis* and *Aqua-Regia*, for what profit is it if you would extract them out of (but) a few Metals

or

or Minerals? Seeing that ſcarce the one half of thoſe ſtrong Waters can be ſeparated by pouring off from thoſe ſubjects upon which they are poured, but the chiefeſt (or biggeſt) part of them ſticks to the ſaid metalline Matters, and contains in it as much ☉ and ☽, as that which we have abſtracted by decanting it, and requiſite it is that we thence abſtract the ſame by the benefit of fair Water by due boiling, from whence it comes to paſs that there will be alſo gathered a great deal of (inſipid or uſeleſs) Water, (over and above.)

Thoſe *Aqua-fortis*'s that are poured off, and hold in them ☉ and ☽, when they are mixt together, the ☽ and ☉ precipitates to the bottom of the Glaſs like powder, ſo that there remains nothing of the Metal in either water, nor is that water ariſing from the mixing of the *Aqua-fortis* wherein the ☽ was diſſolved, and of the *Aqua-regia* wherein the ☉ was diſſolved, at all the weaker, but it retains the virtues of extracting ☉ but not of ☽, becauſe that the *Aqua-regia* being added to the *Aqua-fortis* converts it all of it into *Aqua-regia*.

This precipitation being made, and the clear water ſeparated from the precipitation by decanting it, you may extract that acid Water, which yet adheres to the precipitate, with fair Water; but for as much as the virtues thereof are thereby much weakned, 'tis better to proceed after another kind of way, and we preferr this way (as beſt.)

Take the Calxes of ☉ and ☽ as they lie at the bottom of the *Aqua-regia* (or the acid mixt Spirits) and put them in a Linen cloth placed in a Funnel or over a Glaſs with a wide mouth, and the greateſt part of the *Aqua-regia* will ſtrain through into the Glaſs ſet thereunder; when no more water drops out, which we find is wont to be within half an hours ſpace, tie up your cloth with a ſtrong thred, that ſo nothing of the calx therein contained may get out; put it under ſome weight or heavy matter, that ſo all the *Aqua-regia* may be ſqueezed out, and the calx only may remain behind like Curd or new Cheeſe.

But for as much as the Calxes of ☉ and ☽ are not edulcorated, hence it comes to paſs that the Cheeſe thence prepared, after the manner now ſpoken of, is as yet corroſive, nor is it eaſily dried. Both of them (☉ and ☽) we may eaſily correct, if we only admix therewith (as 'tis laid in a diſh) a fourth part of fixt Salt, for by the virtue thereof even the corroſive Spirits ſticking as yet therein are mortified, and the exſiccation, cementation, fixation, & reduction thereof is promoted. The Reduction being made of ☉ and ☽ which we are now made partakers of, that goldeniſh ſilvery Maſſe is to be granulated, and to be diſſolved in new *Aqua-fortis*, and be precipitated with that *Aqua-regia* by the help of which, ☉ hath been extracted out of the Metals; the Cheeſe is to be freed from the water by ſqueezing it, and is to be ſprinkled over with a fixt Salt, and to be melted. And all theſe Operations are to be ſo often repeated as neceſſity ſhall require, and there ſhall be at hand any Metal whereout-of Gold may be extracted; and ſo there may thence ariſe a continual Labour, which is beneficial, becauſe that *Aqua fortis* may (when the Labour or Operation is finiſhed) be uſed about other ſuch like extractions, and that which is the weaker ſort may be prepared into Salt-petre: out of which may he made anew, excellent *Aqua-fortis* by the addition of Vitriol or Copperas, and ſo deſtilling them. The Veſſels wherein the precipitation of Metals is performed, yea and the preſſes too by whoſe help the water is ſqueezed out of the Cheeſe, muſt be framed of ſtrong Glaſs or of glazing Earth well glazed.

But for as much as the Veſſels of Glaſs are very ſubject to be broken, and earthen Veſſels, unleſs they have the ſolidity of Glaſs, waſte abundance of water, and ſo moulder away; it would ſeem more convenient in my judgment to make the expreſſion of the water out of the Cheeſe, between two Plates of Silver, for the water of the Cheeſe doth not at all corrode the ☽: Yea and if the Tunnels requiſite to this work were made of ☽, it would not be amiſs, nor would there be any fear of their breaking.

NB. The Extraction alſo of ☉ made with *Aqua-regia* may likewiſe be put into a Silver Cucurbite, whereby the work may be facilitated, and all loſs and damage which otherwiſe may be lookt for (feared) from the uſing of Glaſſes, may be prevented. And ſuppoſe a Cucurbite, a Preſs and two Tunnels did coſt one hundred imperials; yet notwithſtanding the certainty and celerity of the Work will repay thoſe coſts very eaſily, ſeeing that all things are hereby done much ſafer, and much more ſpeedily: Beſides too, there's nothing loſt but the price of the faſhioning your Veſſels, for the Silver is always of the ſame value, and may again be ſold at your pleaſure. But he that wants ſuch like Silver Veſſels or cannot buy them, he may make uſe of Glaſs ones ſo long till he can get Silver ones; but it is neceſſary that the Silver of which theſe Veſſels are made be very pure, and have no Copper in it; leaſt the *Aqua-regia* extract the Copper thereout of, and ſo the Veſſels (eſpecially the Cucurbites) do in proceſs of time get an undue ſoftneſs.

The manner of extracting Metals by the help of this Cheeſe-water, is already diſcloſed in the foregoing (writings); however this I am conſtrained to adviſe here, that it is much more expedient, to uſe preſently at the beginning for the extraction of ☉, rectified Spirit of Salt accuated with *Aqua-fortis*, than *Aqua-regia*, becauſe that by thus doing there will be more plenty of ☉ gotten in the reduction than when the operation is accompliſht by *Aqua-regia*. It would be too long to reckon up the cauſe of this thing in this place: 'tis ſufficient that I have ſhown which is good, which ill. Nay more, Spirit of Salt is cheaper than *Aqua-regia*, if prepared according to my deſcription: Nor is there any reaſon to give credit to that ſlanderous fellow, *Farnnerus*, as if ſuch a Spirit made by Vitriol, according to the manner mentioned in the firſt part of the Philoſophical Furnaces, were not of any uſe, or at leaſt-wiſe could not be prepared in great quantity by the aforeſaid way: For when all circumſtances fall not out as is wiſht, the blame is not to be imputed to my deſcription, but to the ignorance and unaptneſs of the Chymiſt himſelf.

If now thoſe good men cannot accompliſh ſuch operations which are word for word faithfully deſcribed unto them: how would they be able then to arrive by ſpeculations and various trials to the knowledge of any thing, as I my ſelf have done? I do therefore atteſt here too, that we are able moſt eaſily to prepare not barely 10 or 20, but even 30, 40, 50 pounds and more every day with one only Furnace.

Nay more, if men did more accurately ruminate upon this buſineſs, they would find, that out of one pound of Salt may be made in a Glaſs cucurbite in ſand, one pound of the beſt, moſt grateful Spirit of Salt needing no rectification, and that in one hours ſpace: And by the benefit of a Furnace ſcarce a ſpan wide, and with a very few Char-coal, ſcarce exceeding three pound weight. Verily if there be any artificial deſtillation

this

this is it: And now let the Find-faults look about them and see if they can understand these things we have spoken; we can at all times demonstrate the truth hereof. It is altogether inconvenient to shew such an artificial destillation unto swinish Men, it is only due to the Lovers of the truth, of which sort there are to be found but a very few in this present age.

And that this is true, *viz.* that a most grateful Spirit of Salt may most easily be prepared in vast quantity, doth even hencefrom most evidently appear, in that there are some in these places who having followed my information, do, because of their making it in great plenty and without any great Labour, sell a pound thereof for an imperial. For my own particular affairs do not permit me to take on me that Labour, yet notwithstanding, I have bestowed the artifice on such Men as now know it as well as I my self do, and who likewise do make that Spirit in such quantity as may supply all *Europe*. But forasmuch as I did not heretofore find out so far, as to see it excel *Aqua-regia* in the extraction of Gold out of such Stones, Sand, and Clay as contain Gold in them, and which are every where obvious. I could not omit the commending of it in this place, most highly unto all Men; for that Spirit hath an especial delight in ☉, not only in that which is fixt, but also with that which is volatile, whereby it extracts it and renders it fixt. There are some Minerals, Stones, Sand, Earths, which have in them abundance of volatile Gold, which is not in the least durable (or fixt,) but is carried up (or forced away) in the form of a vapour and vanisheth into the air, and so consequently not at all to be accounted for true ☉, seeing it cannot brook the force of the melting Fire. Besides this, there do oft-times occur most precious Treasures of no profit to any man, which may be brought to most eminent uses (or benefit) by the Extraction, Precipitation, Cheese-making, and Liquefaction delivered by me. For such Metals as the Spirit of Salt do not tie and make fixt in the extractions, ☽ or ♄ makes them such, with which we have taken or fisht the *Sol* out of the *Aqua-regia* or Spirit of Salt; to the obtaining of which this is also of much conducement. If the Cheese now made be altogether fixt by the help of an artificial Cement, and the gradatory fluxing matter be especially reduced in such a Vessel, out of which not so much as the least volatile part can evaporate: by which it comes to pass, that not only the volatile Gold you have caught is made fixt, but even a part of the net of ☽ or ♄ is by graduation made aureous: For every volatile Gold doth exercise its operations in the Fire upon other Metals, and makes them aureous, so that the *Sol* ariseth thence to be of a greater quantity, than that was which by the help of the silvery or leaden Dart was taken out of the extract. Heed these things and proceed on in a legitimate course, and you shall find such things as you cannot as yet conceive of. The Fishing is clearly enough described in this place, and so is the Cementation and Reduction of the Cheese clearly proposed, and may may be most easily perfected.

But God (if thou becomest acceptable unto him) can yet shew unto thee a much more compendious way of perfecting this work with less labour, and of obtaining greater things.

Be content for this time with what hath been at present taught, give God the thanks and forget not the Poor, and He will then shew unto thee more and more compendious ways, of cheerfully managing the work (here) described, to his Honour, and the Comfort of the Poor, and without any wronging thine own Conscience, or hurting of thy Neighbour.

You need not be much sollicitous about such kind of Earths, Stones or Sand, from which you may extract the Gold, for every land is every where stored with such, nor need we spend much time in searching after them. Likewise it will be a most easie thing for thee by my writings to make Salt-petre, of Salt-petre to make *Aqua-fortis* and *Aqua-regia*: One bare pound of *Aqua-fortis* may be sufficient for thee to begin the operation withal, for there is not much of it lost in the work it self; and what of it is wasted may easily be repaired by an addition of common Salt: And as for the extracting both the fixt and volatile Gold and *Luna* out of the Earth, and of perfecting it, thou hast no reason to hope of finding a more compendious way than that is which I have here exhibited unto thee.

You may leave such Metals (or Ores) as have in them plenty of *Sol* and *Luna*, unto others; and take only the scoria as 'twere, and thencefrom extract your part, and none will forbid you that. But if so be thou canst be but a partaker of an aureous Earth (or Ore) then will all things fadge the better.

NB. The ☉ and ☽ that is in the Extractions may be precipitated by the help of ☿, but much more chargably and more difficultly than by ☽ or ♄, because the ☿ used in this operation cannot be used a second time.

NB. The ☉ and ☽ may be also extracted from the water without precipitation; by abstracting the *Aqua-regia* from the ☉ and the *Aqua-fortis* from the ☽: but besides this kind of proceeding being full of Labour, we should receive but little fixt Metal, and scarce the one half of what is gotten by the aforementioned way: For the ☽ and ☉ do retain with them some part of the *Aqua-fortis* and *Aqua-regia*, and thereby become sharp or sour which is a thing contrary (or an Enemy) to all Fluxes, and which also does not only cause an evaporation of such Volatile Gold and Silver as is therein, (but withal some part of that which is fixt too,) in the melting. But now in this Fishing trade that I have described, being caught it is either edulcorated, or the corrosive power is extinguisht by the addition of a fixt Salt; so that hereby the ☽ or ♄ holds with it self as well the volatile as fixt Gold and ☽.

NB. He that shall institute this operation aright, will find that the volatile Gold will (in the secret Reduction) yet farther transmute part of the ☽ and ♄ into ☉ by Graduation, and so will reap a double (portion of) ☉, for which God is deserved to be thanked.

I have herein been more prolix than I intended, which I entreat others to accept in good part: It could hardly be that the things I have delivered, could be couched in fewer words. Wise Men indeed need not many words, but where are such? Better is it therefore to set down things at large.

Now it follows that we shew by what means we may have benefit out of the edulcoratory Water, and not be forced to throw it away.

WE have taught in the precedent discourse, how those waters which ☉ is extracted and precipitated with, may be used for a farther extraction of ☉: For when the *Aqua-fortis* in which ☽ or ♄ is dissolved is mixt with the *Aqua-regia* wherein ☉ is dissolved, there ariseth not any mutation or changing, but that ☽ or ♄ only which was in the *Aqua-fortis* settles to the bottom, so that this water wherein such a precipitation is made, may afterwards serve instead of *Aqua-regia*, and so consequently with it may ☉ be extracted out of the Metals.

But seeing that the precipitated ☽ or ♄ must be excellently well edulcorated by often pourings on of water, afore it be dried, hence it comes to pass that there is gathered a vast deal of such edulcoratory Waters. Now that even this may not be thrown away as useless, and that nothing may be lost in so noble a work, I have here determined briefly to declare, by what means we may likewise catch some benefit even out of that too.

To do this, 'tis necessary that the useless water be separated from the *Aqua-fortis*; now such a separation can-

not be effected in metallick Veſſels becauſe of the ſharpneſs of the *Aqua-fortis*; leaſt in length of time they ſhould be diſſolved: But to perform the ſame in Veſſels of Glaſs would take up much time and fire; there is therefore of neceſſity another way here required to perform the ſame; and a better than this, which I will here deliver, I think can hardly be contrived. Make you therefore an Arch of Lime, Aſhes, and Horſe-dung, according to the afore preſcribed manner, where we treated of making Salt-petre (about the beginning of the book) dry it by putting fire thereunder, *&c.* The Arch being dryed, pour on, by little and little, ſo much edulcorating water, as the Arch is capable of attracting, and until you ſhall find it to be made thoroughly moiſt; the Arch being on this wiſe moiſtned, dry it again: and being dryed moiſten it again as afore. and ſo repeat this work of moiſtning and drying ſo long till the Arch will receive into it ſelf no more water. This done, there remains no more, but to do thus, *viz.* Let the ſaid Arch be broken to pieces, and be ground with a Mill into fine powder; upon the powder let be thrown fair water, and ſo let there be made a Lixivium, out of which by due boiling may be made moſt excellent and delicate Saltpetre.

But here muſt be very good heed taken, that you uſe about the building of the Arch, Wood-Aſhes, and Lime made of Stone (or Chalk); whereby the ſharpneſs of the edulcoratory water may be extinguiſht (or mortified) by the fixt Salt inherent in the aſhes and lime, and the corroſivity be taken away, and moſt excellent Nitre may ariſe thencefrom; for if *Aqua-fortis* be permixt with the fixt Salt of wood-aſhes, both of them loſe their Nature, and Nitre is made thereof.

But that the operation may more luckily ſucceed, and we may be the more certain of the event, it will be the beſt way, to put in, by little and little, ſome Lee of wood-aſhes firſt of all, (afore the edulcorating water be thrown upon the Arch) and this putting on, to be ſo long continued till all ebullition and noiſe ceaſe, whereby all the ſharpneſs of that water may be taken away; this done, that water is to be poured upon the Arch, and you are to proceed on according to the afore-preſcribed method; and ſo ſhall you have excellent Salt-petre, whether your Arch be made of Lime and Aſhes, or of Mud and Aſhes.

NB. If this taking away of the ſharpneſs of the edulcoratory water by the benefit of a wood-aſhes Lee, be not finiſhed, and done before it be poured upon the Arch, it is clearly requiſite that it be done in the Arch it ſelf, by the goodneſs of the Lime and the ſaid aſhes, by which that ſharpneſs may be extinguiſhed.

It is, I confeſs, all a caſe whither that ſharpneſs be extinguiſht with a *Lixivium* afore; or elſe be done in the Arch it ſelf. Yet nevertheleſs, ſeeing that Operation is the ſafer which hath a foregoing taking away of the ſharpneſs afore it be poured on the Furnace, therefore it is better ſo to inſtitute it; ſpecially, ſeeing it then matters not at all any thing, what condition the matter is of which the Arch is made with; becauſe then ſuch a water needs no more but an unfolding (or evaporation) and coagulation, and this may as well be done by the help of an Arch made of mud, as by one made of Lime: Otherwiſe if the ſharpneſs of the edulcoratory water be not taken away by the *Lixivium*, an Arch made of mud is of no uſe, for by this means you would not get any *Salt-petre* at all, but rather all the water would be conſumed by evaporation, which need not be at all feared, if we uſe an Arch made of Lime and Aſhes, ſeeing that that water is by this means mortifyed.

And ſo, by this means, that edulcoratory water may be moſt commodiouſly prepared for farther uſes, and the Salt-petre which is extracted thence, is exceeding good to make *Aqua-fortis* with; and we may gather as much in quantity thereof as the extraction of ☽ and ☉ out of the Metals, Stones, Clay, and Minerals requires.

NB. If any one be deſirous of more excellent benefits, let him diſſolve, in that edulcoratory water, (*B.*) or (*C.*) and in the Lixivium (let him diſſolve) (*D.*) then mix both Solutions: When the fermentation is over, he will have double the quantity of Nitre, than what he would otherwiſe have from the bare mixtion of the contraries together, and pouring them on the Arch; the reaſon of which thing is this; becauſe (*E.*) is nothing elſe inwardly but Nitre, but it cannot come forth to light before the body be broken, and till that ſalt which ſticks (or lies hid) within, be wholly freed (of its bonds) whereby it may be turned, together with the Corroſive Spirit into Nitre.

The like is to be underſtood of (*F.*) becauſe even that alſo is broken (as I may ſay) to pieces by the Lee of the wood-aſhes, and ſo the Salt that lies hid within, and which is nothing elſe but Nitre, ſhews it ſelf to ſight, and paſſeth with the other Salt of the Lixivium into Nitre.

Certainly this labour, *viz.* the mortification of the edulcorating water by a Lee of wood-aſhes, and the concentration of Nitre, upon the Arches made of lime or mud, is an egregious invention; nor do I think that this buſineſs can be better managed any kind of way, than by what hath been here ſhewn, eſpecially if the Species, here notified, be alſo thereto adhibited (or made uſe of) (I know not I ſay, any way) by which greater plenty of Nitre may be gathered; for the coagulation cannot be done in a Copper or Iron pan, becauſe not only the Pan would be corroded and waſted, but the Nitre would be rendred impure. But if now the operation be inſtituted aright, we ſhall get more Niter than indeed is requiſite for the extracting ☉ and ☽ out of the Metals; ſo that we may get us ☉ and ☽ withot any coſts: which invention verily is a moſt noble one even in all parts of the World, and a moſt high gift of God: for which, we have good reaſon above all things to render Him deſerved thanks, and next Him, to thoſe who open ſuch a Noble and Unheard-of Invention, and which is ſo profitable to all Men.

But this Invention will be eſpecially profitable in thoſe places of the World, where *Aqua-fortis* is much uſed, and is preſently after the firſt uſing thereof, thrown away as unprofitable, as it uſually happens in the Mint houſes, where abundance of ☽ and ☉ is ſeparated in great quantity, and conſequently abundance of *Aqua-fortis* conſumed, ſo that by the benefit of this invention of mine, we might get much every year; but moſt of all in thoſe places where are found ſuch Stones and Sand which are endued with Gold, but yet will not yield any by the help of the uſual melting.

Beſides too, this invention is exceeding profitable for ſuch kind of Metals of ☉ and ☽, that have not as yet gotten their due ripeneſs or fixity, and ſo fly away in the melting, and yield either none at all, or at beſt but very little of Gold. For the common melting fire forceth away the Volatile Gold, and ☽ that reſides in the Metals (or Ores) which is not at all ſo here, for all (of it) is made fixt by the *Aqua-fortis*, and preſerved.

I do believe that there is not a place to be found, where ſuch kind of Stones, Sand, or Clay may not be gathered, as hold in them Gold and ☽, either fixt or Volatile, and which may be extracted thencefrom moſt eaſily, and with exceeding profit according to the way aforeſpoken of.

But, for as much as there are many, who pretend that ſuch like Stones, Sand, Clay, and Minerals as have Gold in them, are no where to be found, and that conſequently this invention of mine is altogether in vain: To ſuch as theſe I thus apply, *viz.* That ſuch like Subjects are therefore unknown, becauſe few there are that ſeek after them, or are willing to experience ought, but remaincontented with ſuch things only as the Ancients have taught, and perſwaded themſelves that ☉ and ☽ cannot be

be separated out of the Metals, but only by the force of fire, where as notwithstanding the operation may be far easilier, and more profitably instituted, according to the method by me prescribed, but especially in those Metals (or Ores) of ☉ and ☽, which either require too much expence for their melting, or are as yet unripe and volatile, and so fly away in the melting; for a great quantity of ☉ and ☽ may be extracted with a little quantity of *Aqua-fortis*; yea the extraction being duly made, and to the best profit, there may be thereof made Salt-petre; so that such an extraction of ☉ and ☽ requires but very little costs.

If any one desires an easier way of extracting ☉ let him use Spirit of Salt prepared after the manner by me delivered, which said Spirit he may fortify by adding a fourth part of Salt-petre, which very same (when the Extraction is finisht) may be reduced into Salt-petre, like as we have said of *Aqua-fortis* that hath been already used.

NB. An easier operation yet then all these, is this, which may be performed the dry way.

Take the Metal, Stones, or Mineral, reduce them into powder, mix them with the Salt (G) and make them with clay into Balls about the bigness of a little Head. Make these balls red hot, and by this means the Salt will dissolve the *Sol* in the Fire, and attract it out of the Metals. This done, grind the Balls or Pellets, and extract thencefrom in a large Pot or Vessel a Lixivium with boiling hot water, for the Salt which hath attracted the ☉ in the Cementation, mixeth it self with the Water: Out of this Salt-water mayest thou afterwards catch the ☉ by the help of a solution of ♄, added for the precipitation; now out of the Salt it self mayest thou make excellent Salt-petre. So that you may most easily extract out of the Earth both fixt and volatile ☉ and ☽ without any melting it. Nay not only ☽ and ☉ but even Copper too, whether we proceed the dry way or the moist way: For we may extract good *Sol* out of the scoria of *Sol* and *Luna* and *Venus* which are cast away, yea and out of *Mars* it self too, and by the afore-shown way.

NB. The reason is this, because the Iron being purged in a strong Fire is heapt up as it were into goldenish Scoria which but few know of, and will believe, though it be most true. For when a Metal is so burnt with such a vehement Fire as to resemble glassy Scoria, it hath gotten to it self a more noble nature, and thenceforth is able to exhibit or yield good *Sol*: Yea though they be the Scoria of ♀ or ♂, which thing that excellent *Metallurgist Isaac Hollandus* did also know, when he said, *If any one makes ☽, ♄ or ♂ into Glass, and reduceth it, it will not be ☽, ♀, or ♂, but ☉: And if any one shall turn ☉ into Glass, and then reduce it, it will not be ☉, but Tincture.*

Nor was this knack unknown to *Bracescus*, who taught the making of the Philosophers stone out of the scoria of Iron, but he is laught at, by another Philosopher, though undeservedly. Though I do not know the way of extracting the Tincture out of Iron, yet this I know; that there have been many who have extracted good *Sol* by *Aqua-regia* out of the very green Scoria of Iron, when notwithstanding, the ♂ it self out of which the *Scoria* came was destitute of Gold; the cause whereof we showed but now.

Now if they had but known my invention of most easie preparing a convenient Menstruum for the extracting of the Tincture, and then the manner of afterwards separating the *Sol* again, without losing the Water, certainly they would have been able to perfect that Extraction with a great deal of benefit, whereas (not having this) they only beheld the possibility of the thing without profit.

For if this Labour be instituted according to my invention afore-written, we may extract the *Venus* (which commonly is in the poorer Minerals) out of them, and that with much profit and in great quantity, and the extraction being made, (whether it be done the moist way or the dry) we may by the benefit of the solution of ☽ or ♄, get out the ☉ thence whilest it is yet mixt with the water, yea and afterwards by the benefit of ♂ the Copper it self. He now that well understands the reason of this Fishing and reduction needs not to search after the Metals (or Ores) of *Sol* and *Luna*, for whatsoever Metals (or Ores) of *Venus* contain but even a very little portion of them, will be able to furnish a man with necessaries sufficiently enough.

But that the Reader may not think that these sayings of mine, *viz.* that there are subjects to be in all places found that are endued with Gold, are fictions, and are not founded upon any experiments, (for I doubt not but that abundance will not only account these sayings for falsities, but deride them too) I thought it not much from the purpose, if I shewed some little place only, where you may find such Metals (or Ores) as are endued with Gold, which notwithstanding were never brought into use, that so it may hence appear that such Golden subjects must be likewise found in many places.

Let us therefore cast an eye to a part of the *Mhene*, and let us get out those Treasures that are there hidden, and at present are not profitable to any, which nevertheless may be of mighty conducement and benefit to the whole Inhabitants of those parts.

The *Mhene* is a River most abounding with Boats and Fish; it hath its rise out of a very high pine-bearing Mountain, it is in some sort conjoined with three bordering well known Rivers, *Sata*, *Adrana*, and *Nava*; which again spread themselves unto the ¼ quarters of Heaven, as *East*, *South*, and *North*. (*This piniferous Mountain is not barely one Mountain, but consists of many which are exceeding full* of Pine-trees, Beech, Oakes, Birch, *and other Trees set very thick together, and so yields an Harbour for both wild and tame Beasts.*)

This Pine-bearing Mountain, and which is the highest in all *Germany* (and of which *Gaspar Bruschius* wrote a particular Treatise, which is exceeding profitable for such as study metallick affairs to read,) is stored with many notable Metals (or Ores.) For there was not only Gold digged out plentifully in various parts of that Mountain, many years since, (and thereupon there's a City called *Goltgangh* by the *Germans*, as if you should say a Vein of Gold:) But withal the other more common Metals that lie here hidden do for the most part all of them contain Gold, with notwithstanding is not at this day by reason of the ignorance and unskilfulness of Men separated from them. Nor are the bare Metals only of that place all of them endued with Gold, but almost all the Earths, Sand, and Stones have *Sol* in them. Yea even in this time even Antimony the first *Ens* of Gold is digged out in that place. Therefore it may most easily be proved, that this Mountain out of which the *Mhene* flows for th is stuffed with *Sol* both in the outside and inside parts, with which proof I must at present in this place rest, least I should be too tedious. All such as are skill'd in metallick Affairs do well know, that all the metalline Ore, that they get in and about this Mountain, is endued with Gold.

The most studious searcher of nature *Mathesius* in *Sarepta* testifies that he saw an Iron Stone or Ore endued with Veins of fixt and malleable Gold.

The afore-praised *Gaspar Bruschius* in the description of this Mountain, mentioneth amongst other things, that in a little Town called Einsiedel, situate near the said Mountain, was a Tin-mine heretofore found, by the Treasures of which the aforesaid little Town was built. There did a certain Metal-man called *Sigismund* Wans learn from an *Italian* Woman, whom he married after the death of her former Husband, how *Sol* was to be separated from *Jupiter*: From whence he got him so much riches, that even afore he died, he caused an egregious Hospital

ſpital to be built; and withal contributed thereto many thouſands of Crowns, with which twelve ancient Men, and three Prieſts ſhould be always nouriſhed; to the performance of which there is verily a great deal of Gold required yearly.

This now is not to be at all accompted as a meer fable, but the very pure truth: For in that edifice, the Effigies of the Founder *Sigiſmund* Wangs, and the Foundreſs *Barbary*, are yet to be ſeen even at this very day. Of which likewiſe *Matthew Merianus* in his Deſcription of *Franconia*, maketh mention. But it is ſufficiently enough evident (beſides theſe Teſtimonies) that this Mountain is repleat with Metals (or Ores) and eſpecially with Golden ones, both within and without, and hence aroſe that Proverb of the ancients, *viz.* That the Country-man doth in this Pine-bearing Mountain oftentimes throw a ſtone at an Ox (or Cow,) that is more worth than the Ox it ſelf. Strangers give credit hereunto, as *Italians* and others, and do yearly viſit this Mountain, and dig the Gold out of thoſe places where they know there lies much hidden, and take it up at their backs, and carry it away with them: And many ſuch there have been with me, who have afforded their help to ſtrangers in digging out Gold: Who foraſmuch as they knew not the manner of extracting it (and that they underſtood by others that I alſo dealt in Metals,) brought me various kinds of Earths, Stones, Sands, Clays, that I might try whatwas in them: and they did all of them abound with Gold.

The Country-men that live about that Pine-bearing Mountain do daily for Gaine's ſake carry ſuch earths and ſtones, endued with Gold, unto *Norimberge*; which one or other likewiſe buys, extracting thence by melting excellent Gold.

But now if ſo be theſe men did but know the extraction of ☉ by the help of *Aqua-fortis* only (without melting) out of the earths and ſtones (as is here taught): the needy Country-men might live like the richeſt Citizens, the Citizens like the Nobles, and the Nobles like Princes; which ſeeing it hath not ſo pleaſed God (to have it) all (theſe) things have remained hidden. Every one may eaſily believe the things I here utter, ſeeing it is already taken for granted that this Mountain doth abound with egregious Metals (or Ores) and eſpecially with Golden ones. Upon this accompt therefore the moſt Noble Marqueſs of *Arſpach* who is Lord of this Pine-bearing Mountain hath prohibited any Foreigner from exporting ſuch Earths (or Ores) thence for the time to come; and though he hath thereby done ſomething to it, yet he cannot wholly hinder it, foraſmuch as that Mountain is too vaſt and large.

But now when I paſs down from this pine-bearing Mountain along the *Mhene* downwards, to ſuch places as are more plain (or even ground) where Wine and Corn grows, there's no body ſeeks after *Sol* and *Luna* there, but each man profeſſeth himſelf well enough content with the Wine and the Corn, nor hath there been any Metal digged thence or there ſought for many years: Becauſe they thought that no plains can produce Metals, which thing I judge to be falſe, and do gain-ſay it; and contrary-wiſe affirm that there are ſome parts in plains, that as to the production of Metals may be compared with the moſt high Pine-bearing Mountain. Now, elſewhere there ly high Mountains of each ſide of all the *Mhene*, out of which there comes a mighty quantity of Wine, but the Metals ly hid to all.

Beſides theſe, I my ſelf tried, that there are Ores of all kinds to be found on both ſides the *Mhene* throughout all the Eaſt of *Franconia* even to *Maguntia* where the *Mhene* runs into into the *Rheine*, but yet as far as I know, there is not any Metal anywhere digged but Iron only; and therefore neither can I poſitively ſhew and direct to ſuch or ſuch Mine-pits, out of which you may apparently get Gold and Silver, but as is ſaid, there are every where found ſome footings (as 'twere) that contain Gold and Silver, and that ſuch Stones in the *Mhene* are rarely without Metal: But no body proves or tries them, or puts them to uſe.

At *Bamberg* (which is an Epiſcopal Metropolis) men are become more diligent, inſomuch that they have found out ſeveral places wherein is to be had the Metal (or Ore) of *Sol*: Such as this Metal (or Ore) of *Sol*, hath been very oft-times brought me by the Inhabitants of that City, but all of it in a manner did contain a fluxile and immature Gold, which cannot be extracted by the common way of melting, but vaniſheth away into the Air, and ſo I did not at that time much eſteem it, but left it as an unprofitable Ore. But now I have found that ſuch fluxile Metals (or Ores) of *Sol* may be brought in uſe, not by the help of a vehement melting, but only by a nitrous Water, in which this kind of fluxile Metal (or Ore) of *Sol* is fixed in the extracting it, and then ſtays in the melting, and yields perfect *Sol*.

Concerning ſuch a fixation of fluxile *Sol* in ſtones, by a nitrous Water, I did not at that time know it, otherwiſe this knowledge of mine would have been extraordinarily profitable to the Inhabitants of thoſe places. Yea and the Biſhop of *Bamberg* himſelf who is a great Lover of the Metals gave me ſome proofs of his Clemency for ſervices of no moment that I did him, ſo that I would then gladly have beſtowed my utmoſt power in lieu of his favours, but nothing could be effected by the way of melting, becauſe of the volatility of ſuch a Metal. But now there may be gathered very conſiderable Treaſures by the benefit of nitrous Water. For not far from *Bamberg*, there is found a Stone of great bigneſs that is exceeding full of Granates, which are about the bigneſs of Millet or Hemp-ſeed: Beſides too, all the Mountains of that place do moſt plentifully abound with Metal (or Ore) of *Sol*.

There is ſuch a Vein of unripe Gold, not far from *Bamberg*, that lies thwart the *Mhene*, which much hinders the Veſſels, and eſpecially thoſe Boats which are wont to bring vaſt quantities of Boards, Beams, *&c.* yearly; inſomuch that they cannot always get over it, but at ſuch time only when the waters are increaſed. Now in the Summer time, when Rain hath not fallen awhile, this Vein is ſeen bare, when the water is fallen away ſome Ells height; and hereupon the Mariners have ſmote againſt it with force, and Tools therreby to remove it, if poſſible, but all in vain.

But for as much as I never was minded to run thither, nor yet am ſo conditioned, as that envious Dog, who having hay under his poſſeſſion, could neither eat it himſelf, nor would ſuffer the Ox to eat the ſame; therefore I was willing to lay open theſe things: I eannot at preſent ſay any more of this fluxile Ore of ☉; yet if any one deſires more, let him repair to an Inhabitant and Citizen of *Bamberg*, by name *N. N.* a Farrier, who many times delivered to me that kind of ore during my aboad at *Kitzing*. This man will ſatisfy every ones requeſt, and will ſhew where it is to be found.

There have verily been others that have brought unto me various kinds of Ores; but I have long ſince forgotten their names. If you only ſeek, you will find in that place, abundance of ſuch Golden Metal (or Ores) but all of them in a manner, fluxile (or crude,) and poſſeſſing but little fixt Gold, and although they ſhould not have in them any fixt ☉, and that not any thing could thence be extracted by the way of melting, yet notwithſtandging it is now known to *D. G.* by what means (by the liquid way of Nitrous water) all the fluxile (or crude) ☉ may be abundantly extracted out of the ſtones, be fixed, and be turned into good ☉ with abundance of profit.

The *Mhene* near *Bamberg* is occupied with Veſſels or Ships, and I my ſelf have ſailed along the *Mhene*, and on both

both sides of the *Mhene* from *Bamberg* even to *Wirtzberg*, did light upon various kinds of Metals (or Ores) which were not void of ☉ and ☽, out of which much ☉ and ☽ may be extracted by the help of this invention of mine, by the moist way by Nitre water, if men would but only apply themselves to the work.

But indeed the Corn and the Wine which God hath so abundantly vouchsafed to those Countries, is the cause that no body minds any thing else, for they have enough to suffice them, and therefore leave the Metals (or Ores) of ☉ and ☽ untoucht.

Without doubt, the whole Wood that reacheth from *Wirtzberg* or *Kitzing*, even almost to *Bamberg*, is full of Metals (or Ores) and yet (as far as I know) there is not digged any of the Metal (or Ore) of *Sol* or *Luna* therein.

It is reported that there was *Sol* and *Luna* digged up heretofore at *Cassel*; at the other side of the *Mhene*, towards the Town which the *Germans* call Koningshoeken, in the Mountain they call Hasbergh, there was heretofore, Copper digged, which now is left of, because the Copper is not fusile enough, nor hath it any sulphureous flint joined with it, by the help of which it is made fluxile (but is) inclosed in a Sandish Stone. Now out of 100 weight of this, there can hardly be extracted, by the help of a strong melting fire *iiij.* ℔. for the Sandy Stone being destitute of a sulphureous flintiness, doth in the melting turn the Copper it self together into Scoria; yet notwithstanding we are able by the help of Vinegar to extract above *xij.* or *xvj.* ℔. of Copper, and this I have tryed more than once. But whether or no that Metal (or Ore) of Copper, contains in it any Volatile Gold, I never tryed, but that there is some ☽ therein, is true; yea, and the Copper is very malleable, and we can thence extract by the help of Vinegar, that which is most fair, and this I humbly declared to the most noble *Moguntine* Elector, he being at this time Bishop of *Wirtzberg*; but by the Tryers (or Refiners) of that place, it is haply accounted of as unprofitable because it yields but little by the help of Fusion.

I must needs confess that but little can be gotten out by melting, but such Copper may be profitably extracted by the Acetum of the Wood, which Grows in the places all about in abundance, and may be had for nothing.

The *Mhene* doth every where yield such kind of Flints as are endued with Gold. Near *Carlstadt* there offers it self in a Wood a certain white and fat Earth, and after some sort silverish, otherwise firm (or strong,) and is fit for making of Crucibles, and other Instruments (or Vessels) to be used about the Fire.

You may likewise find such conditioned Earth at *Klingenberg* upon the *Mhene*, where most excellent Wine grows, which the *Glass-makers* of *Spechart* use to make the Crucibles or Pots in which they melt their Glass.

It hath not as yet been known that there hath been any Ore found in the County of *Wertheimen* where great plenty of *Russellein* Wine is gathered; yet nevertheless I have proved several Earths, which I found about *Breiberg*, which is the inexpugnable Castle of the Lord *Charles Ferdinand* the Count of *Wertheimen*, in which I found there was contained much Gold.

Besides these, I found opposite to *Wertheimen* where there are Vineyards, an Iron stone (white like snow, covered over with other stones,) which is endued with ☽ and ☉: as to the external shape it resembles a white Flint, very weighty, so as that it scarce yields to the weight of a piece of Iron of like bigness: But it is nothing regarded, and is accompted of as a common stone.

The County of *Erbach* doth indeed yield plenty of Iron, but there is nothing at all found of other nobler Metals; yet my opinion is, that even in this Iron are contained both ☉ and ☽: because that there is sand found in several places thereof which yields good Gold, as I have observed more than once; the extraction of which may be excellently well performed by the benefit of Saltpetre.

Likewise Talk of sundry kinds is found in the said places, which is endued with ☉ and ☽: and it would easily yield them forth, were it but rightly handled, and dealt with according to the way by me prescribed: which hitherto we never heard to have been done by any.

The County of *Erbach* and likewise of *Wertheimen* do abound with Iron Metal (or Ore) and all kinds of Minerals, which contain in them, ☉ and ☽.

Nor are the Metals (or Ores) of less goodness that are in the *Specharten* Wood, and the bordering Countries; and yet notwithstanding 'tis evident that it yields nothing at all save this, *viz.* That there is excellent Salt made there and Glass, in great plenty. It is a thing well enough known to all men that here are various Metals (or Ores) found, but never hath any so procured as to have them wrought upon, and thereby to enjoy them.

We find in several places, an Earth impregnated with white, black, and yellow Talk, especially (in that part) which is near to *Aschiburg*, and which contains both ☽ and ☉: which notwithstanding by reason of the smalness of the quantity thereof have never hitherto been thencefrom separated.

Not far from a Village which the *Germans* call *Schiltkrop* there offers it self a stony Talk, somewhat ruddish, which besides Copper contains also volatile ☉, and of no use at all because there's but little ♀ therein contained, and that the ☉ is volatile and cannot be obtained by the means of melting. Perhaps this Talk was known even of old time, for the place where it is found in plenty is by the Inhabitants of that place called the Gold-pit even to this day: for it is not incredible but that there was Gold found there.

However there is not at this time any extracted out of that Talk. I have very often extracted thence most beauteous Verde-grease by the help of destilled Vinegar. For seeing that there is plenty of Wood to be had in that place, and consequently requires no costs, we may get us vast quantities of Acetum *gratis*, (or for nothing): and by the help thereof extract the Copper out of the said Talk: Verily many noble Men would have (thencefrom) whereon to live honourably.

NB. But if we make a Spirit of Salt, and with it being fortified with a fourth part of Nitre, extract the Copper and the ☉ out of the said Talk, and then first catch the ☉ by ♄, and then precipitate the ♀ by ♂, we shall not only have very malleable Copper, but shall likewise receive even pure ☉; and this I testify upon my own knowledge.

He that hath determined the experimenting of these things, and yet sees that he does not rightly perceive the things we have here mentioned, I advise him to come unto mein a friendly way, and I will not be wanting unto him to serve him and the Country by any farther information.

Verily there lie hidden incredible Treasures in those places, which none know of, and which yield nothing at all by the help of Liquefaction, and which we are constrained if we would have them fixt and metalline to make them so by the benefit of a sharp Water, and this I was willing to open and notifie for the Countries sake.

O thou Zoilist or Carper that understandest not this knack, pass not thou thy judgment hereupon, but rather examine thy Wines, and tell us which is best, either the *Heubachen*, *Klingenbergick*, or *Wertheimen* sort: Verily neither of these Liquors though they are strong, are convenient for the extracting of *Venus* and *Sol* out of that Talk: There is a far stronger required, to wit, some nitrous Spirit of Salt, or Spirit of Nitre acuated with common Salt. When the extraction is ended there may be gathered plenty of Nitre out of the remaining Menstruum. Insomuch that there is nothing else required but labour, for the costs expended on the work are not at all considerable: And thus in a little space of time, we may get a great quantity of Copper and *Sol*.

After the same manner as we have shown that it is a

thing possible to extract Volatile *Sol* by the help of Salt-petre out of such a disregarded Talk and other Stones, and to make it fixt, so we can also extract the same out of several other Minerals, that are plentifully enough lying on both sides of the *Mhene*. So that now, no body hath any ground to say that the Ores cannot be found in this or that Country, or such convenient Minerals, as out of which we may extract the volatile and also the ripe Gold acording to *Glauber*'s prescription.

If now such may be found in those places that are adjacent to the *Mhene*, which we always judged to be void of such treasures, what shall we not find in those places, which have already yielded us various kinds of Metals for some hundreds of years successively, and do yet daily exhibit them; such as as are *Hassia*, the Dukedom of *Brunswick*, *Saxony*, *Thuringia*, *Moravia*, *Bohemia*, *Hungary*, and that such like parts of the Earth abound with Metals. Therefore, Friendly Reader, do not thou perswade thy self that there is any place in which we are not able to extract many good things out of the Earth.

I have likewise found various Metals in our *Holland*, and yet never, did any one ever hear that there was the least particle of them therein found, especially in that place that they call *Velauw*; yet notwithstanding it yields Veins of Iron, and a Yellow Sand which hath in it ☽ & ☉.

Neither doth that, place afford only such Sand Stones, & Earth, out of which volatile ☉ & ☽ may be extracted, but withal there offer themselves at the Sea-shore in those Sand hills, which the *Hollanders* call *Duynen*, which the stony Sea heaps up, Stones of a Sky colour, which contain ♀. They are called by the *Hollanders*, *Ultramarine*.

In this place, is likewise gathered plenty of Ostiocolla it is about the length and thickness of ones Finger; yea and sometimes is as big as ones Arm; and as in a clear Season it is easily noted, (or met with) so in a Rainy Season it is not to be seen: It is in some sort hollowed in the inside; it is of a white colour, like stone-lime, and thereupon the Chyrurgions use it to consolidate the broken bones of their Patients.

Some (as they have related to me) have extracted ☽ thereout-of. There is not therefore, any place that does not contain some Metal, and especially ☉ and ☽.

Thus Friendly Reader, you see that there are in all parts of the Earth, such Subjects, as do contain, if not fixt, yet at least wise volatile Gold; insomuch that no body may on good ground, complain that nature hath denyed him ☉ and ☽, so he but knows how, and be willing to extract it.

Did *Germany* but know those Treasures which the Earth contains, and did use them aright; certainly they need not give place to the power of any Monarch. But it seems as if God had cast a blindness upon men, or at least keeps them blind, even until the due time approacheth of helping those that are his.

I have here shewn the way for the Country to get riches and power by; but as concerning the way by which we may extract both the volatile and fixt Gold out of Stones, Sand, and Clay, without any considerable labour & costs, acccording to this invention of mine; I will shew it in my Laboratory, which by Gods permission, I have begun to erect for the sake of Friends.

But whereas I have omitted some words in the description of this invention; you are to know that it was done upon this account; least otherwise such a noble Artifice should fall into the hands of my enemies; I will never be wanting to illustrate (or explain) such things as are somewhat more obscure, unto my friends. The main things are delivered clear enough, to such as are in any measure skill'd in Chymistry, but the unskilful may not hope for any thing else (thereby) but labour in vain. The thing in it self is easie, and without rubs, so as that any one who hath but once seen the way, may understand it, and manage it.

I could have exhibited the things I have delivered, in a briefer stile, but upon consideration of the common good I would not; he that cannot from these things perceive and learn ought, let him think that God is not willing to vouchsafe him the Grace of understanding them.

And now, if I had been minded to have exalted this work with mighty praises, I should not have done unseemly at all, for as much as this labour shines even in the dark, and makes many doubtful things firm and clear.

For by the means of this labour, we may get us, not only abundance of ☉ and ☽ very easily, but likewise most excellent medicaments, and which are not to be accompted common; nay, even the off-drawn Salt-petre it self, is a most excellent medicine for all Vegetables, because it is capable of multiplying them abundantly, in so much that he who is skilful in this kind of work and does not forbear from setting about it, will never want any thing.

What greater things can a man desire from God, than a sound Body, daily Bread, and as much ☉ & ☽ as necessity requires? now these gifts of God do abundantly flow in upon us by this labour; if it were not for the wicked Farnerianists who are not worthy of any good thing, and do contemn every thing that they understand not, and (so consequently) restrain me from treating of these things, with any longer and clearer discourse. The whole world would be amazed to see the so exceedingly easie method of bettering of the Metals, and of making them perfect, and which method but few there are that know. But whatsoever we have omited here, shall, God willing, be shortly delivered in my work of ♄, where we will demonstrate by what means ☉ and ☽ may be extracted with exceeding profit out of vile (or common Lead, so that we need not any other subject, but Lead and the Salt of the Earth or a Mineral fire (by whose help, nature bringeth (or advanceth) all Metals to maturity) for the performing this work; and hence the word Alchymy (which signifies nothing else but the melting of Salt) seems to have taken its original.

He therefore that knows how by the help of Salt, to make Metals volatile, and again fixt (which is not to be done but by solution and coagulation) such an one knows the true and unsophistcate Alchimy, and follows the universal exhortion of the Philosophers, where they say, *Make the fixt Volatile, & the Volatile fixt, Dissolve & Coagulate*, &c.

He that hath in any measure meddled with Salt-petre, easily perceives what my meaning here is, and what I drive at. He whom Nitre obeys, him do all things else obey. I have determined (by God's permission) to erect a Tryumphant Chariot for Nitre, & to set it thereupon, as the greatest Monarch of the Word & to exhibit it to the ignorant.

Whereas now I had written down this most noble way of compendiously extracting volatile and fixt Gold out of Stones, Sands, and Earths, and of farther augmenting other ☉ and ☽ thereby, I found nothing pretermitted of what may any waies help to the profitably accomplishing the Work, save this, *viz.* Whence such aureous Subjects are to be taken, out of which we may extract volatile and fixed *Sol*; or by what means they (*viz.* ☉ and ☽) may be prepared by such like labour in great quantity.

To satisfie such as these I neither will, nor can deferr it. So then, as touching the Golden Materials, there hath been enough shewn already to prove that they are every where to be found, and put case there were none to be found, is there not a Golden Silver every where to be found, and that Silver may be separated from the Gold, be Cemented, and again made aureous, as often as one shall please. Yea, and Gold may be profitably extracted out of a certain (sort of) Tin, especially the *Geyersbergick*, and so likewise out of some Iron too.

Now that such, (*viz.* Gold) may be made in great quantity we may dissolve the ☉ that sticks in Stones, with Spirit of Salt, acuated with a little quantity of Nitre; for such a spirit will not be so costly as Nitrous water is,

and

and besides this too, it will (after it hath been used in the said separation) yield excellent Salt-petre, of full as much price and value as the Spirit of Salt it self was of. So that by this means we may extract the ☉ without those costs (too): And this moist extraction may be excellently well well performed in a Vaporous *Balneo*.

But if we seek after the dry way (of doing it) then the Stones are to be mixt with Salt and a fourth part of Nitre, and being mixt are to be made up into little balls by the help of some fat Earth, so as to stick together: Then are they to be dried in a peculiar Furnace, or else even in the open field, with a Fire of Wood, the which may be done in ones hours time. The Cementation being made, they are to be powdered, and out of the powder is a Lixivium to be extracted by the means of Water, and you shall have the ☉ permixt with the Lixivium, which is to be thence extracted by the help of the solution of ♄, out of the Lixivium may Nitre be afterwards made. And now by this means may a most easie and no ways costly operation at all, be instituted with some hundreds weight.

But as concerning the melting and reduction of the ♄ which contains in it the ☉ which it caught, it may easily be done, but 'tis by the benefit of a peculiar * Tigil or Pot, the making of which is known only unto my self; which said Tigil or Crucible lasts a long time, and doth not at all let any thing of what is thereunto put, run out, because it has its cover made of the Lute of Wisdom.

* *Mentioned in the Second* Century.

But now again here may arise another doubt, and it may be demanded, how we may have so much Spirit of Salt for the moist way, or so much Salt and Nitre for the dry way, as is requisite to make this extraction of the Metals. Salt-petre is chargeable, and the Spirit of Salt will be difficultly gotten in such plenty; and haply they will stand us in more than the Gold thereby extracted would be worth? To such I answer, It is not so precisely necessary to buy Salt-petre for this work, seeing that the said dissolvent when it hath done what you would have it, both in the dry and moist preparation, may be again turned by the help of common Salt and other mean Subjects, into excellent Nitre: so as we may thence have more Nitre, than it was afore. And farther, as concerning the Spirit of Salt it may be made in great plenty, insomuch that (by the benefit of one Furnace) there may be daily made 50, 60, 70, yea 100 pounds thereof, and out of every pound of Salt may you extract a whole pound of rectified Spirit of Salt with the help of two or three pounds of Coals: So that, that spirit will in a manner cost nothing at all save Salt and Coals, which doth again after it hath been put to its appointed use, yield more Nitre than the Salt and Coals cost. This operation therefore may be done without any costs as it were. The things I here mention are true, although I well know that scarce one of a hundred will believe what I say; however I matter it not, but it is sufficient to me that I know these things, and can exhibit (or demonstrate) them to any Friends.

Albeit that this be a most easie Labour and of no expences to extract volatile and fixt Gold out of Ores, Sand, Clay, according to the prescribed rule; yet I question not but that many men that are given to slothfulness will desire here, a yet easier way, whereby they may heap up a great deal of Gold without any trouble at all. To such as these, I verily could shew an easier way of extracting ☉ out of the Minerals without melting, did I not count it wholly an unbeseeming thing, to detect all these secrets both to Friends and Enemies alike without any distinction. I will not be at all wanting to communicate my more secret way to those who deserve well, & thankfully acknowledge towards me and mine, the benefit they have received.

But yet, that the knack may be in some sort manifested, and it may be somewhat known by what means ☉ and ☽ may be gotten even out of the Ores and Minerals themselves, I will a little stretch out the thred of my discourse, and will in some sort delineate the very work it self.

You are therefore to know, that all those Minerals which contain fluxile (or unripe) or volatile Gold, whether they be stony or not, do for the most part contain in them some Iron: Now then, when a man would thence extract the ☉ by the Spirit of Salt, it cannot be but that together therewith the Iron would be dissolved too, to the doing of which there is much spirit required: And albeit you may make the said spirit most easily according to the way by me delivered, yea and may besides, by the addition of some even the most mean matter again make excellent Nitre, so as that the Nitre thence extracted shall be of more value, than the costs expended about the operation; yet notwithstanding, this business is not void of all kind of labour and trouble, and it requires diligent men (not drones) of which sort there's more scarcity than plenty. But now this which we treat of at present, may a beardless Country Boy of about some 10 or 12 years old perform: It requires but little Fire, and all the (Metals) may be extracted in great plenty. Which to do, you must know that where the Metals (or Ores) are sulphureous, that *Sulphur* must be taken away by the force of the fire, for else the Spirit of Salt leaves all untoucht.

NB. However it is your best way not to force away by the fires violence the *Sulphur* out of the goldenish Flints, because that so, there goes off part of the spiritual ☉: but rather extract every such aureous *Sulphur* with a strong Lixivium made of fixt Nitre, and precipitate it with ☿ dissolved, and so the aureous *Sulphur* goes to the bottom, and is to be edulcorated, and ♄, ♀, or ☽ is to be thereto added, and so they will seize upon the volatile (Gold) and the ☉ is by the means of the Lixivium made in some sort fixt, and is to be separated by destilling of the ☿: The edulcorating waters do again yield Nitre. So that the extraction requires no costs at all, at leastwise but very little.

NB. When we have extracted the aureous *Sulphur* (by the help of fixt Nitre, or some other very strong Lee of Wood-ashes,) out of the Flints, and have precipitated it with the solution of the ☿, and edulcorated it, and sublimed it by a Retort, there is thence made an elegant (or delicate) Cinnabar, which by the addition of the filings of Silver may be changed (by Cementation) into fixt ☽ which ☽ is aureous, by reason of the volatile ☉, which was permixt with the *Sulphur*. Whereas otherwise, other Cinnabar is by this way (of proceeding) wont to yield only ☽: For the filings of the ☽ thereto added, become volatile, and vanish away into the Air, for the Cinnabar hath extracted the soul thereout-of, and hath by it made it self fixt; so that there redounds no profit at all thence-from, save only that the possibility of nature is laid open. But now when the Cinnabar of this place (or mentioned in this place) is mixed with fusile ☽, edulcorated and precipitated with Salt, or with the Calx of ♄, either alone or else both mixt together (*viz.* the ☽ and ♄) they do greedily betake themselves into each other, and there ariseth thence-from a black stone, which being kept in an apt (or suitable) Fire by degrees, and that for a due time, doth daily more and more acquire a fixity: Yet do I believe that it needs a long time, to make it wholly fixt: which thing seeing I have not as yet any experience of, I will not here mention ought of certainty concerning it, perhaps some particular Tincture may thence be extracted, because that the subjects which constitute it are excellent ones, for as *Sulphur* is said to be the Father of all the Metals, so is ☿ called the Mother. What may not a burning *Sulphur* not unlike the common Mineral *Sulphur* that is in all Metals, be extracted by Art out of any Vegetable? which (said *Sulphur*) I have implanted in mercurial subjctes more than once, and have fixed it in them; yea and by the help thereof have so extracted natural Gold thence-from.

Verily it is to be wondred at, that this science or skill hath been hitherto unknown to the Inhabitants of the world

world, and that no body hath commited the ſame to writing.

But indeed all men may ceaſe to admire, when they ſhall conſider that the Great and Bleſſed God beſtows his gifts, and the knowledge of Nature to ſuch only as it Pleaſeth him, *viz.* to ſuch as bear an humble, and pious Mind; and contrariwiſe denyeth them to ſuch as are impious and proud.

And here falls in a thing highly needfull to be known; by him eſpecially, who would effect ought in Chimiſtry with profit (and that is this, *viz.*) That there can be no bettering of the Metals at all (be it either in the univerſal or in a particular way) but by the benefit of *Sulphur* (which is the father of all the Metals) & this both in the moiſt and in the dry way. (NB. The Spirits of Salt, of Nitre, Vitriol and Sulphur, ſerve inſtead of a ſulphur though a moiſt one, and perform their office in the moiſt way.)

If therefore all the Metals were at firſt a *Sulphur* (for no Metal is there wherein it may not be found, and beſides too, it is known to be in all the Vegetables) by what means poſſibly can it be, but that being by the help of a Sulphur, Salt, and apt Fire, reduced to fixity, it (*viz.* any Metal) ſhould yield good ☉ ſeeing that it (*viz.* Gold) is nothing elſe but a fixt pure *Sulphur*. But for as much as *Sulphur* (as being of the Maſculine kind) cannot produce any Metal alone, but that there muſt neceſſarily be ☿ thereto adjoined, (as being of the Feminine kind); every one is bound to ſeek after an apt or ſuitable ☿ (as being the Female) for his *Sulphur* (as being the Male) and to join that ☿ to this *Sulphur*, and let theſe two celebrate their Nuptials in Hell, where *Vulcan* is Preſident.

Now then, when the Agent hath acted on the Patient, and perfected the operation, whether by the moiſt or by the dry way, it ſhews it ſelf to be a pure product, and ſo much the purer too, by how much the Agent and Patient were more or leſs pure.

When we ſow fruitful Seed in a fat Soil, good Fruits do thence-from proceed. Now then let *Sulphur* be the ſeed there, and ☿ the field it ſelf, yet ſo as that your *Sulphur* (or ſeed) be pure, and that the ☿ (or ground) have no Tares in it; but let it be duely endued (or dungd) with Salt, and ſo let it have the fruition of the ſolar beams, and patiently wait for the thence proceeding fruits. Now if you meet with ſuch a ſubject as hath both *Sulphur* and ☿ already joined together by nature; you are there only to begin the operation where nature left of, and ſo by the help of Fire and Salt, bring it unto its due perfection, which nature was conſtrained *nolens volens* to leave imperfect, by reaſon of the defect of Salt and fire.

I could here preſent the Student of *Hermetick* medicine, with ſuch a foundation, as out of which abundance of commodious conveniencies might be expected; but the ingratitude of the men of this Age, prohibits the divulging ſuch things.

Therefore do I herein follow *Paracelſus*, who ſaith, *We could verily lay open moſt mighty Arcana in a very few words, if it ſeemed good unto God to grant unto all men the ſame* (equity of) *Riches.*

Turn over and over his Writings, Reader; and thou wilt eaſily attain the foundation of the truth; but eſpecially, view well ſuch writings as he hath left us concerning *Sulphur* and *Vitriol*, which we will here rehearſe in this place (becauſe of the affinity of the matter) for thy ſake and benefit, which writings of his if any one can make nothing of, verily neither will he underſtand thoſe things which we ſhall add.

And now are all things (requiſite) ſufficiently laid open to ſuch, to whom God vouchſafes his bleſſing; and contrariwiſe, the ſame will always remain hidden and unknown to the impious.

Thus much I add (*viz.*) That neither can any Tincture be obtained without *Sulphur*, nor any *Sulphur* fixt without Salt; both theſe now are found conjoined in Vitriol, from which the noxious ſuperfluity is to be ſeparated, and the pure is to be made fixt.

Now follow Paracelſus *his words, concerning* SULPHUR *and* VITRIOL.

I Will preſent unto you, as one well skill'd, my experience in all reſpects concerning Sulphur, viz. *what is contained in Sulphur, both as to Medicine and Alchimy, and to other things, and unleſs God be againſt it and hinder, the operations of* Sulphur *are ſo ſtupendious and admirable, that the natural Light in man cannot enough admire them. Now if God himſelf doth not hinder, then the defect is in the workmen, that ſo handles the* Sulphur *as that the operation anſwers not to the implanted Virtue.*

Now ſeeing that every babling fellow is a Phyſician, *and every prater an* Alchymiſt, *this is the cauſe why (in plain Terms) the Sciences (of* Phyſick *and* Chimiſtry) *cannot be brought to light.*

This now is the Foundation or Baſis, viz. *That in* Sulphur *are contained ſuch great Arcana and Virtues relating to both Faculties (viz.* Medicine *and* Alchimy) *that no body can ever ſearch them out ſufficiently: I ſay, that there lies ſuch excellent Virtues hidden therein, as may very deſervedly cauſe in all Men great admiration. For after long experience gained in both Faculties, ſuch are the Virtues of* Sulphur *found and known to be, that there are not many other things that are either its ſuperiour, or which may therewithal compare in* Medicine *and* Alchimy.

Sulphur *reproves* Ariſtotle, *when as he ſaith that the ſpecies of things cannot be changed: For* Sulphur *is tranſmuted; did* Ariſtotle *live now adays he would wholly be aſhamed and bluſh.*

Thus far he, as for the many more additions that he makes every one may read them in his Works.

As concerning my ſelf, I ſay thus, That nothing at all can be done in Alchimy without *Sulphur* or ſulphureous Salts; like as without ſeed, neither Vegetable nor Animal can; as is clearly evident, be poſſibly generated. *Sulphur* is inſtead of Seed, and *Mercury* inſtead of a Matrix: But you muſt not think that I do here ſpeak of common *Sulphur* only, and common *Mercury*: [No!] I do compriſe under them ſuch as are far more excellent, and this you are well to heed. If now a metal be not ſulphureous, it muſt be brought to a due ſoftneſs by the force of Fire, which is done thus, *viz.* Making it red hot and quenching it ſome times in water. But if ſo be it is already ſoft enough, then bare powdering it is ſufficient, without ſo much as ever heating it red hot and quenching the ſame. Put this podwer in Pans of caſt Iron, and that there may be the leſs waſte of Fire, let it be encompaſſed with a wall or mured in a Furnace; fill them half full, and pour thereupon (whether it be Metal or Ore, or Sand, Stone, or Clay, or golden Mineral,) ſo much of the water which we ſhall by and by deſcribe, as the Iron Veſſel can contain, yet ſo that the ſaid Veſſels want of being top full the breadth of 3 or 4 fingers, leaſt as you ſtirr it about ſome of it ſpil over. This done, put to an hundred pound weight of the Metal or Ore, about one pound of an aureous, ſilvery, *Magnet*. Then put Fire under the Pans or Cauldrons, and make the water boil, continually ſtirring the matter contained in the Iron Pans, with an Iron *Spatula*.

Now foraſmuch as this water is of ſuch a quality as that it can neither diſſolve ☉ nor ☽, it leaves both the ☉ and ☽, and by reaſon of the admixtion of the *Magnet*, it attracts only the Iron or the Copper. When the water hath attracted as much ♂ or ♀ as it can, it is to be drawn away, and more new put on in the room thereof, and you muſt proceed on to boiling as afore-mentioned, and thus are you to reiterate this work, until all the ♂ or ♀ ſhall be extracted out of the Metal, and nothing remain behind ſave a dead Sand, which may moſt eaſily be

ſeparated

separated from the *Magnet*, by the pouring on of common Water, for the sand mixeth in self with it, and the *Magnet* remains pure in the bottom of the Vessel, which hath received into it self the ☉ and ☽: This ☉ now and ☽ is again easily separated from the *Magnet*, which said *Magnet* may be again used for such another work.

Thus now, one only person can by this means daily separate a great quantity of Metal from the ☉ and ☽ it has in it; all the artifice consisteth in the preparation of such a water as extracteth ♂ and ♀ out of the Metals or Ores: And therefore must it be of such a nature, as to dissolve neither ☉ nor ☽, & be nevertheless strong enough to dissolve ♂ & ♀ and to separate them from the ☉: For that the *Magnet* cannot extract the ☉ out of the ♂ and ♀ unless they be afore dissolved. But as touching the quality (or composition) of this water; 'tis no ways expedient to divulge it, forasmuch as the whole business dependeth thereupon, nor can any thing at all be effected without the knowledge thereof. When now *Venus* and *Mars*, or else *Venus* alone, or *Mars* alone, are extracted out of the stone (or ore) by the benefit of the said water, the precipitation of them may be made by the addition of some contrary thing, whereby it comes to pass, that not only its sharpness is taken away but also excellent Nitre may be thence prepared afterwards, which is to be separated from the *Mars* or *Venus*: The precipitated *Mars* may be reduced with a strong fire, and so it will be made fluxile, and which easily melts in a Crucible like *Venus*, and becomes malleable; yea, and of more worth than the best *Venus*, because it performs very many profitable things in Alchimy, which we forbear to speak of here, for some certain reason.

He therefore that knows such a menstruum or dissolvent, and which requires no costs to make it, and yet notwithstanding doth very well dissolve *Mars* and *Venus* (and leave the *Sol* and *Luna*): Such an one verily may in all places find plenty of *Mars* and *Jupiter* (*Venus* I believe he means) which contains plenty of both fixt and volatile *Sol* and *Luna*: neither need he be much sollicitous about Golden Metals or Ores.

Forasmuch then as the whole Artifice consisteth in the knowledge only of the water, and in the manuals (or contriving) of the placing of the *Magnet*, and in the separating all the unprofitable matters from the ☉ and ☽; he that does not know such a *Magnet* and how to prepare such a dissolvent, by whose help ☉ and ☽ may be concentrated, and ♀ and ♂ be separated from them, let him search hereafter even as I my self have done: But if so be he cannot find out or invent either of them, let him get from me what he desires to know, and I will not omit to satisfy his request, provided it may be done without my detriment and disquiet. But now you must not think that therefore I will give answers to all such as trouble me with their tedious Letters, for my time permits not the doing of such matters.

There is yet another way by which we may expect profit out of such Minerals as contain in them much ♂ if we deal with them on this wise. Let it be reduced with the strong blast of bellows, and you shall find either a greater or lesser *Regulus* in the bottom (according to the muchness or lessness of the ♂ that the stone contains) which *Regulus* compriseth in it self the ☉ and ☽ which was in the Mineral or Ore, if such an Iron be malleable, Plates may be made of those *Reguluses*, with are to be dissolved (in the Cauldrons made of cast Iron) with that secret water, out of which solution, the ☉ may be extracted by the benefit of the *Magnet*, according to the afore-prescribed manner. But if the said *Regulus* be brittle, and not malleable, then may it be granulated: Nay, it would not be much amiss to make large Cauldrons and such like Pots thereof by melting, that may be of 2, 3, or 4 Fingers thickness. Nor must we suppose that what the said water dissolves of the Cauldron and takes from it, besides that which it receives from the Plates or Granulated Iron put therein to dissolve, is meerly lost: No, for even it doth in like manner exhibit its *Sol* too; so that by this means a most rich Mine-pit may be made.

But some will say, whence shall we have such Minerals that yield ☉, and that bring such great profit? We have said before, that such Minerals or Ores containing such Iron, are every where to be found: Nor can you light on any common ♂ which has not ☉ therein, which may easily be extracted from thence, and that with most great profit. This now is known unto most (Refiners) that there is plenty of corporeal ☉ to be found in the Iron that we commonly use which (said corporeal ☉) is far surmounted (as to quantity) by the volatile ☉; but if a man would separate it thence by the help of fusion and the addition of ♄, it requires too much costs, and therefore men never attempted any other way of extracting it.

All *Germany* affords this sort of Iron (that is thus endued with Gold) in a most plentiful manner, & I could shew very many places in which it may be found, if some pregnant (or notable) causes did not prohibit me from so doing.

But that all men may know, that I tell the very truth, and do not like a vain man tell you of great Treasures, and that they are every where to be found in *Germany*, and yet notwithstanding by reason of their not being known are not of any use; I will show some of them with my very Fingers as it were, which haply in respect of other some that I know not of as yet, will be but a very few, and these very vile or poor, too.

First of all then, all the Iron that is in the Pine-bearing Mountain and about it, doth contain both fixt and volatile ☉; and this I have often experienced some years since, when I lived at *Kitzing* in *Franconia*, and extracted thence from by the help of a melting Fire excellent ☉: For as then, the manner of extracting ☉ from thence by waters only, without any melting fire, was to me unknown: For at that time those most eminent Men Mr. *Christopher Herbst*, the chief Physician of the Prince of *Arsparch*, and Mr. *Adam Renningen* the said Prince's Lieutenant, and chief of his House, (or Governour) in the Castle of *Blassenburg* near *Culmbach*, presented me various kinds of minerals, to try what was in them contained: And amongst these Iron ones I find all of them to be endued with Gold, which might be exceeding profitably extracted thence by the afore-discloséd moist way. There were likewise given me such like conditioned stones and metals (or ores) which were found near *Bamberg*, of which we have said somewhat afore. The truth of this thing is the more confirmed by the Lord *Fleishman*, Governour of the Province of *Bamberg* my singular Friend, who wrote unto me some few months since, that an excellent Gold-mine is found in the Province of *Bamberg*, but yet that the Gold thereof cannot at all be separated from the Iron by the force of Fire; which volatility of *Sol* I signified to him in my answer might most easily be amended.

Now like as all the Minerals and the Iron it self which are found near the Pine-bearing Mountain, are very much endued with Gold, so those which are found in *Misnia*, *Saxony*, *Thuringia*, and *Bohemia*, do abound with ☽: both of which may be extracted thence by the way by me delivered, with very great profit. I know by good experience that in the *Hungarian* ☉ and ☽ Mine-pits much volatile Gold and Silver is forced away into the Air through meer ignorance.

Certain I am, that the Metals (or Ores) throughout all *Carinthia* and *Styria* do possess much volatile and fixt Gold; especially the Iron Metal (or Ore): For I have many a time made experiments of that thing.

Moreover, the *Hircinian* Wood, *Brunswick*, and *Hassia* yield such kind of Minerals. Nor is *Suevia* destitute of such Iron as is impregnate with ☉; and amongst other things I think good to declare, that some few months since, a certain *Basilian* Ruler sent me a potion

of such kind of Iron; withal relating, that the lesser experiment did there yield ten Crowns of Gold, and that an hundred weight was of this Iron sold for nine *Florins* price. Which Iron when I had tried by the help of a fusing or melting Fire I got a sufficiently great quantity of ☉, but in proceeding by my moist way, I got twice or thrice as much.

Such kinds of stones as these are found in plenty throughout all *Germany*, to which may be reckoned the red and black Talk, the Irony Talk, black and red *Granates*, *Smiris*, *Hæmatites*, and the like, which always are endued with ☉, if not with fixt, yet with volatile Gold. So that now it is manifestly apparent, that in those places where ☉ is digged, all the stones are repleat with volatile Gold at least, if not with fixt ☉ too: like as all the Iron that is digged in *Spain* doth of a certainty besides volatile Gold contain also corporeal Gold. Nay more, there are not only found such stones that have Gold in them in those hotter places, but also in most cold places too, witness *Norway*; where you may meet with whole Mountains consisting of Iron, Talk, and Granates; out of which there has not hitherto been any ☉ gotten by the help of a melting fire with any profit; though I my self have found ☉, in the lesser experiments.

Last year Mr. *J. W.* brought me various Ores out of the County of *Eysfeldein*, that I might try what they contained. Amongst others, there were some little grains of Iron round like a Pease, though somewhat lesser, thus generated in the Earth naturally: This Earth as I was informed, is altogether black, one handful of which contains 10, 15, 20 Grains: wherefore it is not improbable that all the Earth of that place is repleat with Iron; these little Grains are so very tractable, as that they may be made into Plates with an Hammer, and contain much Gold.

Such a kind as this of black Iron grains (yet not so round or tractable as those but now spoken of) were brought me from *Saxony*, which are endued with plenty of Gold, but volatile; they are easily pulverisable, and (as was related to me) are to be found near the Mountain which the *Germans* call *Geyersberg*, where also is gathered a Tin stone, which doth also contain Gold, such as *Misnia* yields more plentifully. Out of 100 weight of this Tin, I found that 10 or 12 Crowns of Gold might indeed be extracted; but this work requires such costs as far exceed the price of that which is extracted: and therefore they sell off the Tin, just as 'tis digged out, to avoid the expence of extracting the ☉.

That which is gathered in the said Mountain, I have often tried, nor did I ever find it destitute of ☉, the which may be very well extracted by my moist separation.

The *Stabelein* Abbot presented me with such like Iron stones and several others that had Gold in them, together with diverse Minerals, some 18 months ago, some of which were gathered in *Westphalia*, some in the Province *Luttinge*, in that part that is under the Government of the Elector of *Cologne*, *P. M.* The Prince himself having a mind to see by what means I would extract the volatile Gold out of them, came unto me, but he died in his Journy homewards; since that I have not received any more of such like aureous Metals (or Ores.)

Amongst other (Ores) I knew an Iron Metal (or Ore) found in *Westphalia*, the half whereof was very aureous, but of no use, because the Metal-men were ignorant of the way of separating those Metals from one another; whereas notwithstanding both the pure Copper, and the ☉ it self may be most easily separated from the Iron according to the way by me delivered.

There were also a while ago several Iron stones brought me by the *Cologne* Merchants, and especially Mr. *Peter Sevet* (*P. M.*) which are found in plenty in the Mountains, and do abound with much ☉: Besides this too, all the Mountains of *Germany*, do yield a yellow Earth, endued with Iron and ☽: of which kind a certain Physician of *Erfurt* sent me some, which (as he related to me) at *Eysfeldt* near *Erfurt* towards the Province of *Moguntia* is plenty thereof.

Such an Earth containing silver, I my self found here in the bordering places 'twixt *Arnheim* and *Embrick*, but not of such worth as that of *Eysfeldt* is.

Who knows but that that same place which we call *Velaw* hides in it vast Treasures. For I have found near *Arnheim* a white Clay and Earth out of which I extracted some ☽: Yea and I found there too, true Veins of Iron, which whether or no they contain ☉ and ☽ I cannot tell: For I never proved them, but the first opportunity I have I intend (God willing) to make an Essay.

Thus 'tis evident that there is not at all wanting unto us the matter of effecting some good and profitable thing by, but the love of idleness is the reason why we neglect abundance of sufficiently obvious Treasures.

The Earth nourisheth men of diverse natures; for some of them are altogether slothful, sluggish, and extraordinarily backward to labour, and yet nevertheless get fat bodies enough: On the other hand, there are some who are very diligent, & do too much consume themselves, and concerning whom (being like unto a burning Candle) they may say thus of themselves, *by serving others, am I consumed.* And as much benefit as the Candle gets by affording a light unto others and by consuming it self; so much doth there redound, especially from ungrateful men, to a diligent man who by serving others wasts and consumes himself.

These and such like most abject Subjects are plentifully enough to be found in all parts of the World where Mountains are, and out of them may you extract ☽ and ☉ by the help of my nitrous Water, were but the way of doing it known, which way hath been hitherto reserved amongst *Arcana* by reason of mens extream ingratitude. And I pray is it not altogether useful and expedient that we should gather such Treasures, and make use of them to Gods Honour, and to the defence of Kingdoms and Mankind? Is there not sufficient store of idle fellows, whom it would be very expedient either to invite to labour or (if they shun work) to banish them the Kingdom?

I believe that this blindness will hardly leave men afore they are reduced to straits, but beware least you hap to begin to grow wise too late.

This work, like as is every other perfection of Metals is done by Sympathy and Antipathy: For that dissolvent which drives off ☉ and ☽ from it self, by Antipathy, all this doth a mercurial *Magnet* greedily attract by Sympathy, seeing it it thus, that *viz.* as like loves like, and draws it to it self; so one contrary hates another contrary, and drives it away.

Two contraries do always produce a third thing. Where the Agent acts upon the patient, and that this patient is even enforced to suffer against its will, and cannot by any means shun the force of the Agent, there must of necessity arise some better product from them.

When water is added to water, neither of them suffer, because they are both of them of the same nature: But when fire and water are joined together, the weaker is the sufferer, and from them doth a third thing proceed.

The stinking and volatile *Sulphur* is the enemy of ☉, and common Salt, of ☽; and by how much these have more stench the one, and sharpness the other, so much the greater is the hostility they shew. The greatest matters are performed by love and hatred; such things as are friendly beget a chearfulness, joy, and vivacity: Whereas, on the other hand, the things that we abhor beget a teadious wearisomeness, grief and death: therefore the more acceptable a thing is, the more it brings of life; the less acceptable the more of dolour doth it bring. All the perfection therefore of the baser metals consisteth only in Antipathy and Sympathy: And if once we do but rightly know the nature of metals, all things are easily accomplished.

It

It is storied of a certain Philosopher in *Italy*, That he had committed some evil deed, for the which he was accused, apprehended, and cast into prison, being here shut up, he could not be brought, neither by entreaties, nor by threats; no, nor by any means to confess his fact; but at last they put into his company a man of no sobriety or modesty at all, who did so grievously exasperate him with his words, that the said Philosopher could not brook it, and so rather chose death; for he affirmed, that the mind of man was far more noble, than to be plagued by such a tagrag, with reproachful contumelies.

Even just so is it with Metals, by how much the nobler and puter they are, so much the less will they commix themselves with impure things.

Gold the purest of the Metals cannot be knit with stinking impure and common *Sulphur*; for there is an antipathy betwixt them. Salt alone is endued with those virtues as to be able to reduce contrary natures into agreement, and to commix them; and being commixt, the fixt ☉ is able to make the unfixt *Sulphur*, like unto it self in respect of fixity, whereas otherwise they always persecute each other with hatred. *Sol* cannot suffer any thing until it has gotten the nature of a Salt, and then may it be tormented (as it were) by the impure *Sulphur*, and be changed into better.

When the Soul of the imperfect Metals (which is a spiritual ☉) is to be forcibly pluckt, and severed from its body, it cannot possibly be done without the dolour or pain of the Patient; for where the pure and spirituous goldenish substance that dwelleth in the corruptible bodies, is to be made Corporeal, and consequently assume a more noble form, the first form must necessarily be annihilated, that so the hidden tender body may come forth to light and be seen.

And this verily is done by another kind of way than the common and already known; by which (said common way) the Metals are separated by *Aqua-fortis* from one another, and are afterwards Molten. For if any one should make one Metalline Mass of ♂, ♀, ♃, ☉, and ☽, by melting, and then would again separate them, by the help of common *Aqua-fortis*, he would effect nothing; for the *Aqua-fortis* would dissolve only ☽ and ♀ and part of ♃ and ♂, and leave the remainder with the ☉ undissolved; or if he should pour on *Aqua-regia*, there would be only ☉ and ♀, together with some part of ♃ and ♂ dissolved, and that which remains of the ♃ and ♂ (undissolved) would be left behind with the ☽, and so there would not be made any good separation.

But if so be that any one has a mind to attempt this thing on this wise, and should say, I will dissolve ♂, ♀, or ♃, by the help of *Aqua-fortis*, or as much of it as possibly I can, for so the ☽ that is in the mixture must needs be dissolved. Now then when 'ts dissolved I will precipitate it (*viz.* the ☽ out of the solution, by salt water (if it be so yet); the ☉ therefore remains, which could not be dissolved by the *Aqua-fortis*; or, if I should dissolve the Metal (or mixture) by *Aquaregia*, then the ☉ is dissolved, (but not the ☽), and so I can precipitate the ☉ out of the solution, by a Lixivium, and edulcorate it, and melt it, and so by this means may I get it. Well (let me tell you) that neither will this way fadge, for these Metals, and especially ♂ and ♃ are too terrestrial, and admit not of such a separation, though there should be in the aforesaid Metals, abundance of Corporeal ☉ and ☽, whereas notwithstanding the greatest part is fluxile, and must be again made fixt and corporeal by solution; for in this work the already pure and fixt ☉ and ☽ may be altered, so as that a Mercurial magnet cannot be able to assume them. As for example, Take you a Metal, as ♂, ♃, or ♀, in which (as is well known) there is Corporeal ☉. Dissolve this in *Aqua-regia*, and precipitate the ☉ by a Lixivium of fixt Salt; boil this precipitate with ☿, and see if that precipitated ☉ will pass into the ☿; you'll find not, for this ☉ hath gotten a Crust (as it were) in its precipitation by the Lixivium; that is, it is environed with a saline Terrestreity, in so much that the ☿ cannot attract the ☉.

Neither likewise can ☿ attract or assume such a silvery Calx as is precipitated out of the solution with salt water, and that by reason of the terrestreity alone, which adheres thereunto by means of the precipitation, by which it is altered and deprived of a pure Metallick form.

The truth hereof may you easily experiment, on this wise. Dissolve a particle of pure ☽ in *Aqua-fortis*, and dissolve the same quantity of pure ☉ in *Aqua-regia*, precipitate the ☽ with salt water, and the ☉ with a Lixivium, so as that the ☽ be precipitated into a white, and the ☉ into a yellow Calx; edulcorate both Calxes apart after the best way that possibly you can, with hot water many times, so long till the edulcorating water be wholly sweet, then weigh these dryed Calxes, and you shall see that the ☽ and ☉ you took, are one fourth part heavier than before the solution of them; and this is to be ascribed to the Salts only, that have adjoined themselves to the Metal in the precipitation, and cannot be thence seperated by edulcoration; and therefore such a silvery Calx yields not (when molten) a pure Lunar body, but a certain Ashy coloured Mass, fluxile and volatile, by reason of the Salts; and this Calx is not changed (or swallowed up) into the ☿ neither before nor after its being molten, nor (after its melting) can it ever be dissolved by *Aqua-fortis* or *Aqua-regia*, which alteration proceeds meerly from the Salts that have adjoined themselves thereto in the precipitation.

Even just so is it with such a golden Calx, which being separated by precipitation out of the *Aqua-regia* with a Lixivium, will not have ingress into ☿, by reason of the impurities that accompany it; and therefore this golden Calx (when it is made hot) kindles, and vehemently operateth upon it self, and this is meerly from the Salts.

From hence it is clearly evident that the Calx of ☽ precipitated by Salt, and the Calx of ☉ by a Lixivium, have not any communion with ☿, how then can such a Calx, which is (now) at first forced out from many terrestrial parts, and imperfect Metals, and separated from them, have a greater communion therewithal, have ingress thereinto, and conjoin it self therewith by digesting. Other wayes therefore must be taken, by which you may extract the volatile and fixt Gold, that lies hidden in ♂, ♃, ♄, or ♀: Now many there be who do in vain search into those things which they know not the nature of, and so walk in darkness like one that hath already fallen into a Pit.

But if you come to know such a menstruum or dissolvent, which is an enemy to ☉ or ☽, and yet nevertheless doth plainly dissolve ♂, ♃, ♀, and ♄, then the spiritual ☉ that lies hidden, will manifestly appear corporeally and visibly, and will pass into the *Mercurial* Magnet.

Besides, this dissolvent must likewise be of such a nature, as that (when in the solution or digestion of the imperfect metals, it makes the spiritual and volatile Gold corporeal, and casts it off from it (as I may say) by antipathy in the form of a powder) this powder may not be environed with any crustiness as abovesaid, but that both the Calx of ☽ and of ☉ may have their natural metallick splendor, whereto the ☿ may adhere, and may attract unto it self whatsoever the dissolvent separates by the continual digestion.

Farther, this Dissolvent must be of such a nature as not to be so sharp as to dissove the ☿ for then the work would not succeed; indeed it is scarcely necessary to make use of the ☿, to receive into it the spiritual and fixt Gold which is separated in the digestion fixation and separation of the Volatile ☉ of the Metals; for when it is once evacuated it will never again occupy (or seize upon) its impure body; yet notwithstanding this chiefly is done for this reason, *viz.* that the spiritual ☉ & ☽ in the imperfect metals may be the more willingly made Corporeal, when it finds a fitting subject wherein it may lie hidden and rest. Besides too, this spirituall ☉ and ☽ of the Metals, is indued with such virtues, as that it tingeth some part of the ☿ into ☉ and ☽, when it hath thereinto entred, whereby it yields the more profit.

Thus much likewise are ye to know, that this labour does not only proceed in the moist way, but also in the dry; but yet far easier in the moist than in the dry way; yet in the (dry way) a greater profit is gotten in a shorter time. For like as to one measure of Milk are required 1, 2, 3 or 4 spoonfuls of Salt, that so the Cheese (or Curd) may be separated from the water (or whey), but there needs not the quantity of one spoonful of the Spirit, which is much stronger than the bare Salt: Even so stands the case with Metalline operations; for by how much the greater and more powerful the Agent or Contrary is, so much the sooner and stronger doth it perfect its operations. Hence it is, that where the Agent must be yet more strongly active (as in the dry way, it must of necessity be where the strong fire adds virtue and vigour to the Agent) it being consequently more contrary (or powerful) the separation is sooner perfected. For example, Let us see how it is with Milk, where 10 or 20 drops of Spirit of Salt separate some cold Milk, there will need but half the quantity only when the Milk is boil'd or otherwise heated; even so is it with our Agent, whereby we make the Volatile Gold in the more vile or meaner Metals, corporeal and visible; it operates far more strongly in the dry way, than in the moist way; for in the dry way, the external fire aideth our fire, and hereupon finisheth its operation so much the sooner; but in the dry way must another Magnet be made use of.

Thus much let suffice touching the particular washing or external purgation of the viler Metals; as concerning the internal, central, universal washing, by which the interiour Soul of ☉ and ☽ is extracted for the Tincture, I do not as yet (certain) know any thing thereof, nor desire I to know such abstruse and hidden things: content I am with such things as God of his meer grace hath bestowed upon unworthy me, and if God shall so please, so far to profit mankind either by mine or any others help, he will also present an occasion of laying hold thereon (*viz.* on the Tincture) for all good things come from God.

Now in this action (or operation) is required an oculat inspection, such great things cannot be understood by Books or Writings, and he that desires to excel in these (operations) let him take it in good part, that (I say) he ought frequently to here me as a master, and to see me labouring about these things, which otherwise he will never learn, for the common Alchymists are plainly ignorant of this work; yea the Ancient Philosophers did hide it as a secret, the most they could, that so it might not be trodden under foot by Swine.

But whereas I do so clearly set down these things, otherwise than ever any before hath done, the consideration of the time

(or

(or age) requires it, and beſt of all known it is to God, why he now delivers theſe things to be divulged. Forasmuch as mention hath been made in the aforegoing treatiſe of Spiritual ☉, which might be extracted, together with the corporeal, and ſome or other would perhaps very willingly know what is to be underſtood by the name of ſpiritual ☉; I think it not much amiſs a little more largely to explain theſe things for the ſake of the Ignorant.

Every Spiritual thing is inviſible, and void of a palpable body; but now if a body be given thereunto, in which that ſpirit may be made corporeal and viſible, then the ſpirit is not any more a ſpirit, but is changed into a body; if therefore the Spirits are good, they do likewiſe make good Bodies, and ſo on the contrary. For all the Philoſophers tell us, that the Spirit or Soul in Iron and Copper is more noble than in ☉ it ſelf, becauſe the body which it dwells in is groſs, terreſtrial, and impure.

The caſe then ſtanding thus, it is no wonder that if theſe ſpirits are ſeparated by art and force, and expelled from ſuch groſe bodies, and joined to other purer ſubjects, they then produce ſome good thing. Would not the other Beaſts reverence the Aſs clad in a Lions skin, as if he were their King, and this mearly by reaſon of his skin; though inwardly he were an Aſs? If ſo be any man be but cloathed in ſilken rayment, and go gawdily; do not every body put off their hats to him, and honour him, though inwardly he haply is a thief or a knave; and ſo on the contrary, if a moſt honeſt and moſt learned man go in tattered apparel, or at leaſt in mean rayment, is he not rejected, and deſpiſed by all. From hence it ſufficiently appears how ſiniſterly the common people judge of all things, and neglect the inſide, and only look to the outſide ſhew. 'Tis the external Shape, according as 'tis good or bad, that makes a man eſteemed by the vulgar either good or bad, comtemptible or honorable, though his nature (or education) poſſeſſeth other properties.

The like is to be underſtood, concerning the contemptible Metals, *Mars* and *Venus*, which according to the report of all the Philoſophers have more Tincture in them than *Sol* it ſelf hath; but yet by reaſon of the groſſneſs of their bodies are they rejected: now therefore, by how much better the means or way is by which this noble Spirit is extracted, and added to the pure bodies, ſo much the better is the product.

When therefore the groſs bodies of ♂ and ♀ are artificially broken, and the ſpirit diſſolved, and thence forced out, it ſeeks it ſelf another body wherein it may dwell and be at reſt. Therefore when we do by art diſturb (as I may ſay) the groſs bodies of *Mars*, *Venus*, *Jupiter*, or *Saturn*, and diſſolve the pure Soul, and expel it by antipathy, out of its impure houſes, and contemptible garments, and ſet before it a pure ☿, it poſſeſſeth it, and ſo aſſumeth another nobler body than it had before, and which then is ☉ and ☽, according as 'tis managed. This is my opinion, and after the ſame manner is the thing to be underſtood concerning Spiritual Gold.

But what buſineſs have we here with the Spiritual ☉ of Metals? Let us be content with the Corporeal, and leave the Spiritual to the Philoſophers, to make the Tincture with. But forasmuch as upon the occaſion of my teaching the means of extracting Corporeal ☉, I could not leave the ſpeaking of the Spiritual wholly untoucht, I made alſo ſome kind of mention of the ſame; and it will be beneficial to ſome or other, who till they do underſtand my meaning, may be content with the Corporeal ☉. But ſuch as have open and attentive Ears to conſider what my drift is in this diſcourſe, my doctrine will be more profitable unto them, than either *Sol* or *Luna*.

There is yet one thing more to be added. In ſome places they are wont to reduce the *Sol* and *Luna* into a powder with ☿, that ſo the Corporeal ☉ and ☽ may be ſeparated and extracted from the Stone (or Ore); and this is no new or unheard of thing.

But this is more rare (or ſeldomer uſed): a Metal which hath not as yet arrived to his due maturity but is as yet conjoined with his firſtens, and conſequently it flies away in the melting, and neither yields ☉ nor ☽, when it (*viz.* ſuch a Metal) is commixt with ☿ ſalt and vinegar, and let lie to act upon each other for ſome days, it comes to paſs that the Mercury attracts the immature, Spiritual ☉ and ☽, and makes it corporeal and fixt, ſo as it may thenceforward be molten. If then the Spiritual ☉ and ☽ doth ſo eaſily enter into the ☿, and make it Corporeal, it is yet much more facile to be done by my way, which is effected by the help of more ſtrong (or powerful) inſtruments, than by bare ☿ only, and Salt and vinegar, with which they mix the Metal with the ☿, nor can they poſſibly do ſo much as my ſecret menſtruum which penetrateth all things.

When now the Matter, together with the Salt and Vinegar is duly ſeparated from the ☿ by the help of fair water, they paſs the Mercury through a skin of Leather, which is again ſerviceable for the ſame uſes; but that of it which adheres to the ☽, is thence ſeparated in an Iron Retort, then is tried the weight of that which is ſeparated, and as much as there wanteth of the weight of the ☿, ſo much of ☽ do they receive in its ſtead, which is a thing well worthy thenoting, and deſerves a farther inquiry, and is not here ſet down in vain.

Let not any one deſpiſe theſe few things which I heve here adjoined, for they compriſe in them moſt great myſteries; yea and greater than moſt will believe.

Neither let any one imagine that I will preſently communicate this moſt noble Secret (which clearly ſhines in the dark) to every ſtranger; no, no ſuch matter; I will (God permitting) ſhew theſe things to my honeſt friends, that ſo it may not periſh together with me; but however I will well think on that much uſed Proverb, *Fide, ſed cui vide*; Truſt, but ſee whom you truſt.

The *Farnnerianiſts* have given me this document; many there have been who have come unto me and declared the miſerable ſtate they were in, that what by the Wars, and by other misfortunes, they have loſt their Goods, and have begged me for the love of God, to ſuccour them, by communicating to them ſome operation, whereby they might ſuſtain their lives, promiſing that they would requite this kindneſs by their earneſt prayers unto God in my behalf.

Theſe and ſuch like words have ſometimes moved me that I have given ſome ſecret to one or other, and have beſtowed on them an overplus too; yet I obliged ſome of them, that they ſhould convert it ſolely to their own uſe, and not communicate it to others without my privity, which thing they promiſed largely enough. But as ſoon as they have been gone from me, they have preſently ſold thoſe ſecrets of mine to others, and which is more, to my Enemies. Now when by reaſon of their ignorance, they did not know how to inſtitute the operation aright, they falſely affirmed, that they bought this Art of me at a price, and that they have been cheated; whereas they well know, that it was pure affection induced me to beſtow theſe things upon them without any reward.

Theſe and ſuch other like ἀνλίδωρα (or Gift-hinderers) have deterred me from communicating any thing to others for the future; and this I would have every one to conſider, and not trouble me with either Letters or Viſits.

Yet nevertheleſs I will communicate ſtore of my ſecrets unto my Friends, that ſo they may not clearly periſh with me, nor be thrown to my Enemies, and ſwiniſh men.

I have done as much as in me lay, nor will I omit to do more where I ſhall ſee a grateful mind; in the next place I will (for the ſervice of my Friends) treat about and ſhew in the fourth part of the *Proſperity of* Germany, the Secrets of *Saturn*, by what means any one that is but a little verſed in managing the fire, may ſeek (or make) ſome Country fellows, his tributaries, who may pay him an appointed tribute every week, after the Example of Kings and Princes, who beſtow upon their faithful ſervants (that deſerve well of the Country by their valour againſt the Enemies) Kingly gifts as whole Cityes, Towns, Villages, and manySubjects as an inheritance, of whom they may afterwads receive Tribute and live very abundantly or plentifully.

Now by how much the more Country-men there are that be Subject to a noble man, ſo much the richer is he ſuppoſed to be, for they pay the more tribute. And the more Ploughs the Countryman hath a going, the greater is the tribute he pays his Lord, which thing the governance of States or Common-weals induceth, as being a juſt thing.

Now after the ſame manner as theſe things are in uſe in political governments, are they alſo in Alchimy, for it doth likewiſe when we have for ſome time faithfully ſerved under her, beſtow on us tributary Country men (as 'twere) by way of recompence, from whence we may have Food and Rayment.

The more Fields and Ploughs that we give to theſe country-folks, the more Tribute do they pay. Neither do theſe forſake their Maſters, for they are ſhut up in a ſtall, and when their bellies are filled with Coals, and that they are ſafe from the Rain (or Weather) they are contented, and do perform the buſineſſes that are impoſed upon them.

By how many more the Ploughs are which we give unto them (though one Country-man can hardly manage above two or three, ſo much the more do they give.

Such Country-men as theſe doth the true Alchimy diſtribute amongſt her Servants, whereby they may thenceforward lead a quiet Life.

If God ſhall vouchſafe me life and leiſure yet a while longer, I have purpoſed with my ſelf to bring moſt mighty benefits unto my Country.

In the mean while, let theſe things be accepted in good part, Thoſe ſame tributary Country-men may be ſhewn my Friends, together with ſundry other profitable Inventions, in my laboratory.

THE

THE

FOURTH PART

OF THE

Prosperity of GERMANY.

In which are revealed many excellent, usefull Secrets, and such as are serviceable to the Country: and withall, several Preparations of efficacious Cates extracted out of the Metals, and appointed to Physical uses; as also various Confections of Golden Potions. To which is also adjoyned a small Treatise, which maketh mention of my Laboratory; in the which there shall be taught and demonstrated (for the publick good and benefit of Mankind) wonderfull Secrets, and unto every body most profitable, but hitherto unknown.

The PREFACE to the Friendly READER.

ALthough I promised, above a year ago, in the Preface to that Book which I published of the Nature of Salts, *that (besides Salt) I would likewise adjoyn some Broth and sugared Sawces and Seasonings to the other Meats disht out upon the Table: yet notwithstanding such as are searchers after good Arts, would not in any case allow me so much time as to prepare those Sawces; and being prepared, to dish them forth upon the Table: but earnestly requested this boon onely,* viz. *that I would not forget to furnish the said Table with Cheese and Butter. The satisfying of whose request, I confess my self very ready to yield unto, nor doe I find any other obstacle, save onely the scautness of time, which I am constrained to imploy about other affairs more necessary.*

But however, seeing it is esteemed a very praise-worthy action in a Man, by diffusing his kindnesses in many places to benefit many, I have deemed it a thing well worth while, to adjoyn (setting aside other things) unto the afore-disht-out Meats those promised Sawces, with Butter and Cheese, in to boot; but yet, with as much brevity as conveniently may be.

Had a longer space of time been permitted me, I would have clarified the Sugar better, and made the Sawces more savory, which the hasty posting away of time hath hindered the performance of.

Besides, forasmuch as I have promised a Fourth Part of the Prosperity of Germany, *together with a discloſing of excellent metallick Medicines, it hath seemed good unto me (for the fulfilling of my promise) to publish these my most efficacious Sawces under the Title of the Fourth Part of* the Prosperity of Germany; *and the rather, because I have not time sufficient for the description and detection of other Secrets.*

Now by how much the viler and more contemptible cloathing these present Arcana's do come abroad in, so much the greater and more noble virtues do they hide under their sordid or despicable rayment. I was of the mind, I confess, to have kept yet longer by me this Fourth Part, that so (being sent abroad to publick view in a more convenient season, it mought have been more adorned with Secrets of greater moment afore its being exhibited to every ones view. And amongst those Secrets,

one eminent one, is the Concentration of Gold and Silver, and their reduction into such a form and figure, as that it cannot at all be known by our Enemies (who sometimes rush in upon us unlookt for, (which [sore affliction] God (of his mercy) keep us from.) And so by this means may it come to pass, that such kind of Bodies being thus hidden under an unknown Garment, will not be robb'd and taken away.

And whereas I have demonstrated in the foregoing Third Part, by what means great Treasures of Gold and Silver may easily be gotten in all places throughout all Germany, *by the help of my Inventions; I make no question, (nor indeed can it otherwise be) but that such as are diligent House-holders will listen unto my sayings, and put in practise many of those things, especially seeing I will both counsel and assist them, as much as in me lyes.*

If now the searching after so great Treasures be [not] too securely and negligently handled, it will undoubtedly come to pass, that our Country will (by such a notable Medium, and such great Treasure) be rendred even wholly invincible. History maketh mention, that the Ægyptians *(by their skill in the Meliorating of Metals) enjoyed such vast riches, and so great a power, as that they cast from off their necks the Yoak of the* Roman *Monarchy, even untill that time in which their Books comprising the Art were burnt by the Emperour* Diocletian, *whereby they were enforced to be subject to the Empire of* Rome. *For the most noble Art of Printing Books was in those days unknown, and their Sciences were wont to be written in Parchment with great labour and much cost; and undoubtedly they were not throughly stored with such kind of Books, whereby the* Romans *did the easilier get them into their hands and burn them.*

Now when once a Writing is committed to the Press, it may be printed off in an almost-infinite Number, for a Printer will doe more in one day, than a vast multitude of Scribes would be able to write. And being it is so, who could possibly be able to scrape together out of all the places of a whole Country such a multitude of Books, thereby to root them out in these our times, and by burning annihilate them, as the Romans *did.*

This one thing I here say, viz. *Did I but know and find that those things which I have hitherto published, would not onely be acceptable, but be also put in use and practise, it would be as a spur unto me to stir me up to adjoyn to what is already done, more and greater Secrets. Meanwhile let what is at present offered be well accepted, and what is promised, be patiently expected.*

Of the word Sawce, *and what is meant thereby.*

I Have obliged my self by promise, to adjoyn unto those my Meats which I have hitherto disht out upon the Table, some good Sawce and Pickle; which Meats, seeing they appertain not unto the plain common ways, but belong to a very excellent Skill or Science; it is altogether needfull, that the Sawces be correspondent thereunto, and that even they as well as the meats themselves, be by reason of their savourines, gratefull unto the Palate. Now therefore as in the Feasts of great men, the Pickles are not set on the Table afore the Guests have fill'd themselves with Flesh and Fish, and so allayed their hunger, but are set afore them (afterwards) as so many Vehicles to drill down the Wine with the greater delectation, for such Pickles do for the most part communicate a sweeter (or toothsomer) tast to all kind of Fruits, Seeds, and Spices, and Sugar: So likewise must I, in the making and dishing out such Sawces for this Feast of mine, mind onely this business, *viz.* to take care of providing my self of the best Sugar, and choice Spices; and these are extractable onely out of the Metals; *Saturn* affording Sugar, and *Sol* and *Lune* yielding most sweet Spiceines.

But afore I dish out my Pickles, I have thought good to set afore them a sweet Broth or Seasoning, [together] with Butter and Cheese, that haply one or other of my Guests are minded to dip a piece of Roast-meat therein, or else to tast of my Butter and Cheese, whereby they may with the greater delight tast the sweetnes of the following Sawces.

And although I was minded to exhibit in this place some excellent and efficacious Metallick Sawces: yet notwithstanding I could not chuse but first present you with a fore runner as 'twere, signifying unto you, how that by the help of Salt good Broths and Sawces may be made out of the Vegetables, and Sawces, serving for the bettering of Cheese and Butter made out of Animals: that so my Treatise of the Nature of Salts may not be at all defective, and that every one may see what a most noble and most excellent Creature Salt is, which is capable of exalting the Animals, Vegetables and Minerals to a far more worthy degree by so excellent a Melioration of them.

Salt and Vinegar are commonly reputed to be the best Sawce, and 'tis most truly spoken: For amongst all the Sawces and Seasonings put unto Meats, Salt and Vinegar bear the bell; now the Vinegar is for the most part made of Wine, Fruits, Ale, Honey: But as for Salt, if it be turned by distillation and rectification into a sweet and acid Spirit, it becomes a sweet and strong Vinegar, and to be preferred before all others: so that there's no need at all of the Vinegar of Wine, Ale, Honey, and Fruits. We will therefore shew unto such as are desirous of sweet or savoury Sawces and Picklings needfull for Flesh and Fish, and of well tasted Cheese and Butter, the way of preparing the same by the help of Salt; whereby a Man may make himself for his own Kitchin use or Cookery, various Sawces as him listeth. And having shewn this, we will proceed on to the description of metallick Sawces.

He that is desirous of a good Sawce or Pickle fit for Flesh and Fish, will not find any thing that is more fit or proper than a well-prepared and rectifi-

ed

ed Spirit of Salt, the which he may prepare with whatsoever Herbs and Spices he pleaseth, according as is agreeable to his Palate.

For example, Like as otherwise most acceptable Broaths or Sawces are wont to be made with Wine, Vinegar, Pepper, and other Spices, and are put unto the Boiled or Baked Flesh or Fish in the same Dish, or set by the same in little Sawcers, that so all those Meats may leave the more gratefull taste upon the Palate: Even so may the same be effected with Spirit of Salt, and that far more commodiously, and to better profit than if Wine or Vinegar were made use of to the confection of those well tasted Sawces. But it is my Spirit of Salt I here speak of, (which being prepared according to my prescription, is of a most delicate pleasantness,) and not of that which is most an end sold in the Apothecaries Shops, and in other such like places, and is for the most part ill prepared, and not at all rectified, and consequently by its ungratefull sharp and harsh taste, it provokes to Vomit, if it be taken into the Stomach; 'Tis likewise of a yellowish colour, and with its sharp constriction draws up the Tongue, whereas it should be more clear and transparent than Fountain Water, and by the pleasantness of its acidity excell the Juices of Apples, Grapes, or Limons. And being furnished with such a sweet or pleasant Juice of Salt, I need not any Wine, Vinegar, or other sharp Juices of Grapes, Limons, Rasp Berries, Sorrel, and the like, to give a pleasant and savoury taste unto my Flesh or Fish: for it may be done far better with this good Spirit of Salt, than with Wine or Vinegar: For, that Spirit of Salt serves instead of them all, nor is it at all subject to corrupt as other Juices are, but conserves its sweet and pleasant essence without any decay. But if you would make use thereof singly or alone, then must a little Water or Sugar be mixed therewith, that the acidity or sharpness thereof may be a little allayed, and thus may it serve instead of a Sawce to be added to either baked or boiled Flesh or Fish. But now if a man be minded to add green Herbs for alterations sake of the taste, such as are Parsly, Garden Cresses, Spanish Pepper, and the like; he may beat or shred them small and moisten them with Spirit of Salt allayed with Water, and so put them instead of a cold Sawce to Flesh and Fish. But if now the Sawce is to be poured warm to the Fish and Flesh, then must a little Butter be thereto used, and that on this wise following. Take some pure and clean Water, and make it somewhat sharper (with good Spirit of Salt) then strong Wine, Vinegar, put thereunto some good Salt Butter or Fresh, at your pleasure; and likewise such Spice as (besides Pepper, Ginger, Nutmeg, and such like) you list to add, as also Salt if need be; put it in a little Earthen Glazed Pot, and not in a Copper or Iron Vessel, for they are altogether unfit for this Operation; set the Pot over a few Coals and heat it gently to melt the Butter, then stir it throughly about without ceasing, with a Wooden Spoon, and then being molten it assumes to it self the saline Vinegar, and the Sawce becomes thickish, the which must be then poured out to the boild and seasoned Flesh or Fish. But if green Herbs, as Chervil, Parsly, Cresses, *Piperitis* or Spanish Pepper, and such like are to be adjoyned thereunto, you may bruise or chop them small, and then put them into the Pot unto your hot Broath or Sawce, and mix them well together, and then presently pour out your Sawce to the Flesh or Fish, for by this means the Herbs retain their taste and greenness, and so delight the Eyes with their lovely aspect, and please the Palate with their pleasant taste, which would not be if they boiled much with the Liquour, for then they would lose both their subtile taste and green colour. Moreover, you are warily to observe in this thing, that this Broath or Sawce be not let lie upon the Coals too long, and so the *Acetum* separate it self again from the Butter; which to prevent, there may be mixt with the Sawce one, two, or three yelks of Eggs, which being well stirred with the same makes it the thicker, and better to stick on to the sopping when you take it out of the Dish where the Flesh or Fish is.

Such Sawces do give the Fish either boiled or fried, a most acceptable taste, and probably if some Sugar be thereto added it would do very well for Flesh too. But yet, sharp Juices or Broaths are better and more agreeable for Fish. Now after this manner may every one make his own Sawce as he listeth, and render the same with some Herbs and Spices, the more savoury unto his Palate; and consequently needs not either Wine or Vinegar, nor any other acid things.

If any one has but any pure and clean Spirit of Salt at hand, he may (by the addition of certain Herbs and Spices) prepare his Sawce as best likes him, and make it far more pleasant and delightsome than if it were made with Wine, Vinegar, or Ale-Vinegar, nor can you get these every where neither. But the Spirit of Salt may be prepared and so had every where, and therefore on that account too is it deservedly to be preferred before all other seasonings.

Now in the Winter Season, when green Herbs are not to be gotten, the pounded Roots of Spanish Pepper may serve, or Mustard Powder reduced with Sugar and Spirit of Salt into hot and cold Sawces. Nor would I have any one to be so bold [and foolish] as to contemn these my Sawces afore he hath tasted of the same; for I doubt not but that if he once comes to taste the delightsome pleasantness of the same, he will prefer them afore all other, and will give the Vinegar of Salt its due honour.

And now to give an experiment, taken out of the Treasury of Salt, unto those that are delighted with the taste of good Butter and Cheese; let them listen unto those things which here follow. If thou art desirous to prepare a durable Cheese of Cows Milk, and such Cheese as hath all the tokens of a good Cheese, *viz.* such as is weighty, compact, close without Eyes, and putrifying Holes, void of sliminess and bad smell, thou may'st be a Master of thy desire by observing the following Operation.

Take of Cows Milk, Sheeps or Goats Milk, or of either of these which thou hast at hand, as much as thou pleasest, or as much as is sufficient, (but amongst these Milks, Goats Milk is the best, Sheeps next, and Cow Milk inferiour to the other two both in goodness and excellency:) Heat it at the Fire, and pour it out into a wooden Vessel. (*N. B.* Iron and Copper Vessels are not to be used in this way) and reduce the Milk into a Curd by the pouring on of Spirit of Salt. Now one Spoonfull of this Spirit is enough to curdle ten measures of Milk. This done, and the Milk and Spirit of Salt having been well stirred about with a wooden Ladle and curdled, put the same into Hair Strainers or in very clean Linnen ones, that so the Whey may drain out and be separated, then gather up the ends of your Strainer,

ner, and lay thereon heavy weights and ſqueeze out all the wheyiſh moiſture. Then take your Cheeſe out of theſe Strainers, and put it into wooden Veſſels, and there break it into ſmall bits or pieces; which being thus broken, ſprinkle ſome Salt, and ſome of your pure Spirit of Salt too thereupon, and mix all well together with a wooden Ladle or with your hands well cleanſed: Being thus mixed, fill your Veſſels or Cheeſe Fats [which let be] greater and leſſer [as need is,] and ſqueeze and compreſs the matter well in, as they are wont to do in making of Cheeſes. Then expoſe them to the warm Air, and dry them, and it will give you compact and durable Cheeſes, not unlike to thoſe they call Parmeſant, and ſuch as will be void of Eyes, and of fœtid and putrid Holes, Slimyneſs, and ſuch like defects uſually incident to the common Cheeſes, nay they never are obnoxious to thoſe faults.

The reaſon is, becauſe the firſt Coagulation or Congelation of the Milk is made by the help of pure Spirit of Salt, which defends from all putrefaction, and not by the help of the fœtid putrid Rennet, from which nothing can proceed but Rottenneſs and Worms.

Then farther, the Spirit of Salt being together with [Crude] Salt ſprinkled thereupon (after the ſqueezing out of the Whey) doth in an eſpecial manner reſiſt all that putrefaction that is wont to be in Cheeſes, and condenſeth the Cheeſes, and impedes any fermentation, which dilateth the ſaid Cheeſes and makes them ſpongious and porous; and by thus condenſing them, it makes them remain ſafe and free from all putrefaction.

Such Cheeſe therefore as is brought to this perfection, doth well deſerve the preheminence above the reſt, and is extolled by the praiſe of thoſe Ancient Verſes, *viz.*

(*dalen*,
Good Cheeſe muſt neither *Argus* be, *Largus* nor *Mag-Methuſelah*, nor *Habbacuck*, nor *Lazarus*, [Amen.]

That is, it muſt not be eyed like *Argus*, nor tough like *Largus*, nor hairy and crying like *Magdalen*, nor hoary like *Methuſalem*, nor light like *Habbacuck*, nor full of ſtinking holes and rotten ſores like *Lazarus*: which defects if Cheeſe wanteth, it well merits the title of goodneſs: and ſuch are thoſe Cheeſes which are made by the help of the Spirit of Salt; do but make ſuch a Cheeſe and try whether or no it will not be of a more pleaſing reliſh than all others are.

Such Cheeſes are never corrupted, they never become tenacious, limber, full of holes, and worms. The Spirit of Salt being poured into the holes of Sheep Milk Cheeſe, or Cow Milk Cheeſe, doth either kill all the Worms or cauſe them to get packing, it contracteth the holes, and turns the bad Cheeſes into good ones, and this my ſelf have tried.

Thus friendly Reader, haſt thou learned how to make a fit Sawce for Fiſh and Fleſh, and likewiſe good and durable Cheeſe; it now remains that we teach thee how alſo to make good Butter.

If you are deſirous of making good Butter by the help of Spirit of Salt, and ſuch as is dainty, pure and yellow, and of a moſt delicate taſt, and ſuch as will not eaſily contract a ranck taſt, you may obtain your deſire by proceeding on this wiſe. Take off the Cream from good Cow Milk, and make it into Butter, afore it be any thing mouldy, or of an unpleaſant taſt, and ſeparate the Butter-milk according to the uſual cuſtom, then put the Butter in a wooden Veſſel, and waſh it ſo long in pure cold Salt Water, untill there be no more Wheyiſhneſs left, and that the Salt Water do come off thencefrom, as clear as it was at firſt putting on, and that the Butter appears ſufficiently clean, which waſh it once agen, on this wiſe following. Diſſolve in pure and rectified Spirit of Salt, as much Salt as it will diſſolve in the cold: And herewithall waſh your Butter anew, yet ſeveral times, and work it well with that Spirit, and by thus proceeding will it abſume the reſidue of the Wheyiſhneſs which is the cauſe and riſe of rankneſs, and which common Salt Water could not remove. This done, the Butter is to be ſeaſoned with common Salt according to the uſual manner, and thus will it abide perfectly good for a long time. But now the big Sea Salt is accounted the fitteſt for this purpoſe, which being a little heated red hot in the Fire, comes to be of a very delicate whiteneſs, and doth the eaſier admit of reduction into fine Powder, and is better than that which is boiled up in Iron, or Leaden Pans or Cauldrons.

N. B. But he that can get ſuch a pure ſort of Salt of a ſexangular ſhape like a Dye, as is prepared in my Laboratory, he may uſe that, as being by far the purer. As for the Veſſel it ſelf whereinto the Butter, prepared and cleaned after the aforementioned manner, is to be put, it muſt be ordered on this wiſe following. You muſt get you a new Oaken Barrel, and ſo ſteep it in ſtrong Salt Water, not the common [Sea Water,] as that it may well imbibe the Salt into this Veſſel muſt the Butter, waſht as aforeſaid, be preſt and thruſt in ſo tight and cloſe, that there may not be any hole or gaping place left therein; but you muſt leave two Fingers breadth in the Barrel at top of the Butter, which is to be filled up with Spirit of Salt, glutted with good and pure Salt diſſolved therein, that ſo the Butter may be well covered over, and all Air being excluded, it may keep fine and ſavoury a long time. Now when you would Diſh out ſome of this Butter on the Table, you muſt take it out of your Tub with a clean Wooden Spoon, and not an Iron one, and waſh the ſame in pure and clear Water afore you eat it, if you would not have it retain the ſharpneſs of the Spirit of Salt.

Well, here is yet a better way ſtill, *viz.* Take new Butter and let it melt very gently over the Coals, and it will be covered over with much frothy Cheeſyneſs, let that froth be neatly ſcummed off; which being ſo done, it will look in the Pot like to a pure and clear Oil, pour it out very clearly into another Veſſel, that the ſediment at the bottom may abide behind. This Butter when 'tis cold looks juſt like yellow Wax, but yet is it a little ſofter than it ought to be, and therefore it muſt be well wrought its due time with Spirit of Salt impregnated with new Salt, that it may obtain the hardneſs of common Butter, and then be ſalted, and barrel'd up, and kept for uſe, which will be far better than the common Butter. For although this purging it by the Fire takes from it all its Cheeſyneſs, from which it had its hardneſs; yet notwithſtanding the Spirit of Salt gives unto it a far different and much better hardneſs, and cauſeth it to excell all other ſorts in goodneſs and long keeping.

Theſe things was I willing to take out of my Kitchin and ſet afore you, namely Sawce, Cheeſe, and Butter of good and exquiſite taſt, which if they pleaſe not the Palate of ſome or other, I would have him

even

even forbear to use them. It is not without some weighty cause that I have done these things, which I well know will undoubtedly undergo the perverse Censures of Spies and Mockers, who probably will say, what Womanish Toys, and Childrens Baubles doth *Glauber* here Tattle about, making himself a Laughing Stock to the Women, and Female Sex, who will say of him, that by his teaching to make Butter and Cheese, he hath thrust his Sickle into the Womens Harvest. VVell, let them prate as pleaseth them, Geese are not wont to utter ought else but a Goose like Gagling. For my part I minded nothing else but to have this Treatise be a meer Woman's Work, and Boys Play, [but yet] it will reveal to the Ignorant more good, than [is attainable] by the perverse instructions of all such Authours whose Writings are Spinn'd out to that height of subtility as to exceed every ones Capacity.

'Tis not every one that will easily apprehend those [Knacks] which I teach and reveal under this Cheese-making Trade, and these Kitchin Operations; nor indeed doth it much matter that they should understand. God will open the Eyes of such as he shall judge worthy of such great gifts, and will conceal and hide the same from the Proud and Wicked Crew.

Having thus finished this Cheese and Butter-making: Let us in Gods Name enter upon another Work of Women, and Boys Play, which Kitchin-like Labour, and Cheese and Butter-making, is meerly metallick and doth far excell in excellency and nobility the hitherto described Operations, although it be performed by the help of the self same Salt. For without Salt no imperfect Metal can be really bettered, the very title of the Art it self witnessing as much, which being stiled Alchymy, signifies no other thing than a melting of Salt: but yet I do not not tell what kind of Salt is here to be understood, [or, that any kind of Salt is here meant] but thus much onely do I averr, that the transmutations of the Inferiour Metals must be effected by Salt.

Now then, forasmuch as this Treatise of mine depends on a former, intituled of the nature of Salts, as being an overplus; so it is likewise altogether necessary, that instead of Fruit and Sugar, I use Salts and Metals about the preparation of these my Sawces.

And whereas the making of the Sawces [or Sweet-meats] with Sugar, doth not onely belong to the meaner Sex, but also to the more noble, and yet nevertheless the Operation it self is nothing else but a meer washing and boiling, and a true Womens Work, we will therefore in our description bring the same upon the Stage under the Title of the Work of Women, and Play of Children.

If we rightly look upon the Work of VVomen, and compare our metallick labour therewithall, there presents it self unto us, a very notable agreeableness betwixt them. The VVomens VVork is to boil and wash, and when they are about to boil, they set their Pots over the Fire, and having washt their Flesh, they strow thereon some Salt and Spices, and boil the same in the said Pots with VVater, VVine, or Vinegar, till it be tender, and become fit to be eaten. They likewise feed the Fire they boil withall by putting VVood thereon, whereby the heat may be kept up, and no impediment may betide their VVork: And this is the way and method observed by the Female Sex in their boiling.

But as to their washing off the filth from their Cloaths, they are wont in the first place to pour hot Warer thereupon thereby to wash off the more gross part of the Dirt: and then they use a sharp Lee, or some Sope, or even both together to take away the remainder of the filth, and to wash out all the Spots and Dirt, then do they agen wash off the Sope and Lee with fair and hot Water: But as for the odour that the Sope leaves, and which by no washing how much or how oft soever it be done can be carried off, to get that off I say they are wont to lay their Linnen out in the open Field, and sprinkle and moisten it with pure Water, which being dried by the Sun, Air, and Wind, they do agen repeat the same labour, untill all the stinking smell of the Sope be drawn forth by the Sun and the Air, and a better and more wholsome Odour come in its room. Then at last they dry them at the Air and Sun, and being dry, they fold them up and put them in their Chests and Trunks, and keep them for their use.

Just so do we deal with Metals, when we wash off their defilements, and do by boiling turn them into wholsome Food or Medicaments; but yet we do not use common Vinegar, common Salt, and common Spices, but mineral or metallick subjects, as also a duplicate Fire, *viz.* one of them is a secret, philosophical, moist, cold, and vaporous Fire; and the other is the elementary and common Fire, by which we stir up the former Philosophical Fire to display its virtues, and render it powerfull and efficacious.

The elementary Fire we make with Wood, Coles, or Oil: The universal Agent, or Philosophical, Cold, Moist, Digesting, Penetrating, Mundifying, Bettering, and not Burning, but Conserving, and vaporous Fire, we seek for in Salt, and leave the Operation to the vivifying Sun and Air; which being well done, we obtain wonderfull Plants, and most efficacious Food, or Sawce for our Life.

And forasmuch as my purpose here is, to treat of such metallick and medicinal Sawces, I will here in God's name adjoyn some of them, which being as so many samplers or patterns, every one may at his pleasure imitate in composing and making of the like. And he will here find a way of confecting some good Medicament, as clearly and evidently demonstrated by me as was lawfull for me to do, nor was it in my power to discover the same more perspicuously: And therefore I beseech every one to take in good part what is here presented, and to forbear to trouble me for the time to come with needless questions.

So then, seeing I am about to treat in this place of metallick Sawces, it is also behovefull to have a metallick Sugar and Spice, and this, *Saturn* will afford us in the steed of the common [Sugar] by whose help we reduce *Sol* and *Lune* as being most excellent Spices, into most effectual Medicines.

Nor would I have it seem strange to any one that I use Lead here instead of Sugar, for the inmost juice of Lead, doth exceedingly out-go the sweetness of any Sugar, which thing *Isaac Holland* doth very evidently testifie in his Treatise of *Saturn*. The Chymists do frequently extract a sweet Salt out of Lead, with distilled Vinegar, and call it the Sugar of Lead, and do very well know and find that there is such a sweetness in Lead as is not in any other Metal beside. From it therefore will we prepare our Sugar to make our metallick Sawces withall, as follows.

Take of Lead-aſhes one, two, three, or more pounds, which put in a ſtrong well glazed Earthen Pot, then pour thereupon ſome Wine or Ale, Vinegar, or Vinegar of Honey, as much as may over top it an hands breadth. Set your Pot upon the Coals and make the Vinegar boil.

N. B. The Aſhes are to be unceſſantly ſtirred, in the boiling with a wooden *Spatula*, leſt they gather into one entire ſolid Maſs: After that the Vinegar has boiled for about half an hour, and is become yellow, and as ſweet as Sugar, you muſt decant it from the Aſhes, and pour on more, and agen boil it, and extract more ſweetneſs, and this labour muſt you repeat ſo often untill the Vinegar can extract no more ſweetneſs; then having put all theſe Vinegars together, pour them gently off from the Fæces that ſettle in the bottom of the Veſſel, and being thus ſeparated, filter the ſame through Cap Paper or by a filter, that ſo the Liquors may be very clear, and may give you by ſeparation, that ſweetneſs of the Lead which they hold up in them.

Into theſe clear Vinegars, therefore being put in a Glaſs Veſſel, pour thereinto (by little and little) as much rectified Spirit of Salt, that ſo the yellow Vinegar may be turned into a white Milk, and may by little and little ſettle to the bottom like curdled Cheeſe, from which the Vinegar being now become agen clear is to be removed by decanting; then put the Saturnine Cheeſe in ſome ſtrong Linnen Cloath and tie it hard up, and ſqueeze out the reſidue of the moiſture, and ſo dry it and lay it by for uſe. It is a moſt tender Powder, of a bright ſnowy colour, and void of all taſt; for in the precipitation, all the ſweetneſs being introverted by the Spirit of Salt, hath hidden it ſelf within, which doth again afterwards (when that maſs ſhall be reduced into a Sawce) ſhew it ſelf, and diſcovers its former taſt, as we ſhall hear anon.

I would have the friendly Reader know, that I am not minded to produce here many and divers Operations, for I am ſtraitned in my time, which ſtops me from giving you a more prolix and circumſtantial deſcription: I do onely propoſe ſome few, and leave every one to his fancy to make the reſt of the Sawces or Medicaments, according to the ways here preſcribed, according to his likeing, and that as many as he will, and out of ſuch ſubjects as beſt pleaſeth him.

But that I may contract theſe things concerning my Sawces into a narrow room, I ſuppoſe it is well enough known, that Sawces and Junkets are diſht out in the ſecond courſe for this end, either to cloſe up and ſtrengthen the Stomach, or that if a ſudling ſtorm be at hand it may drill the readilier down into the Stomack by theſe kinds of Vehicles.

But yet my purpoſe is not directed to this end as to teach the making of ſuch banqueting Diſhes in this place, as may allure Wine into the Stomach by ſuch an unprofitable Prodigality, and ſo detriment the Body it ſelf too. No, but the main drift of my Sawces ſhould rather be this, *viz.* to remove that evil which is ſtirred up in the Body of Man, by the common Junkets and the overmuch guzling in of Wine, and to ſtrengthen the Stomach, Heart, Brain, and other Members of the Body, to heal the parts that are hurt, and in particular, to reſtore them to their former health: And finally, to be as a kind of guide and manuduction to lead on the Ingeny of Men in ſuch wiſe, as that they may by an eaſier way arrive unto the Knowledge of the univerſal Medicine.

To begin therefore, I confeſs that of [all] fruits preſerved with Sugar, none have a more gratefull taſt on my Palate than Bar-berries, and Ribes, or St. *John*'s Grapes as they call them; which fruits, preſerved up with Sugar, do not onely get the Stomach an Appetite, but do withall allay Thirſt, and do extinguiſh all the internal heat ſtirred up and kindled by overmuch drinking: The like metallick Sawce or Junket ſhalt thou prepare on this wiſe.

Buy ſome Steel filings of the Needle-makers, and take thereof as much as you pleaſe, diſſolve them in rectified Spirt of Salt, which Solution will be green, and be of a ſweetiſh taſt; abſtract the inſipid Phlegm, inſipid I ſay, for although it be a very ſtrong Spirit of Salt that is poured upon the Iron, yet nevertheleſs no Spirit comes off, but onely an inſipid Phlegm in the abſtraction and diſtillation, and the Irons retains all the acidity of the Salt, and remains a red, ſweetiſh, aſtringent Juice.

Take of this, and of the Saturnine Powder which we taught you the making of but now, of each alike weight, and put them into a well coated Retort, and the *Saccharum Saturni* will preſently drink up the Juice of the Steel. Put the Retort in a Veſſel fill'd with Sand, and augment the Fire by little and little that all the inſipid Phlegm may be wholly drawn off. When 'tis all come off, and that acid drops begin to come, then muſt you apply thereunto a Glaſs Receiver, and the Fire is to be encreaſed by degrees untill the Retort be throughly red hot, which muſt continue ſo about an hour, or half an hour a leaſt. By this means, the Spirits of the Salt which were in the Steel, do almoſt wholly come over into the Receiver, and do carry over with them [the Spirits] of the *Saccharum Saturni*, and oil of *Mars*, in the form of a red ſublimate, which ſettles it ſelf in the neck of the Retort, which ſublimate when the Retort is cold and broken you muſt take out of its Neck, and keep it from the Air, for in the Air it will diſſolve into a red, ſweet, and Aſtringent Oil, of no ſmall virtues in Medicine and Alchymy. In the bottom of the Retort you will find a molten Maſs, reſembling *Lapis Hæmatitis*, which being ſeparated from all defilements, will give you a red, brittle, fuſile Stone, and in ſome ſort aſtringent, of great virtues in Medicine, and without doubt in Alchymy too, if it were but firſt made conſtantly to abide in the Fire. And even this too, muſt you keep from the Air, for it is ſtill impregnated with the Salts, and therefore is eaſily reſolved.

Now when you would make uſe of this Stone in Medicine, break a little bit thereof into ſmall Powder (for it is no harder than other Salt, and therefore doth eaſily admit of grinding to Powder.) This Powder heals both internal and external Wounds and Ulcers, being adminiſtred in the quantity of two, three, four, five, ſix, or more Grains, according to the age and condition of the Sick, and being taken in a convenient and proper Vehicle, it is highly Sanative and a ſtopper of Bloud. Being applied externally to Wounds, it wonderfully forwards healing; hinders all Symptoms, and fundamentally dries, and cures all Ulcers and Fiſtulaes, if uſed outwardly and inwardly too.

It doth moſt ſafely and moſt certainly help all the overflowing of the Menſes in Women, and is ſo excellent a Medicament in the *Dyſentery*, *Lientery*, and other *Fluxes* of the Belly, that its like is not to be found.

Thus

Thus have we that true and genuine *Hæmatitis* of the Ancient Phyſicians, of which they have written ſo many things, but what through the careleſneſs of the Phyſicians that ſucceded them, and what through the length of time it became wholly loſt, inſtead of which there hath been hitherto uſed the inſoluble and hard Stone of Iron.

The Ancients impoſed upon their more noble Medicaments, Names deduced from ſimilitudes or reſemblances, as may be ſeen in this our living *Hæmatatis*, and in the dead *Hæmatatis* of the common Phyſicians, which is call'd for at the Apothecaries, and adminiſtred to ſtop Bloud withall; But yet it is nothing elſe ſave the Stone of Iron, and ſuch Oar as is very rich and abounding with this Metal, the fragments of which appears [either] in the form of ſpear-like Stria's or Streeks, or like a cleft ſtone. This our live *Hæmatitis* is of the ſame form, but ſoluble, and is of a very pleaſant and aſtringent ſweetneſs, and containeth moſt efficacious virtues for the allaying of all bloody Fluxes both outward and inward. Now that common and well-known *Hæmatitis* doth not poſſeſs any more virtues than that Iron Scinder-duſt which the Smiths ſmite off at the Anvil, doth. And as for that red Sublimate which aſcended up in the neck of the Retort, it is twice ſtronger in ſubduing the afore-mentioned diſeaſes, but it is not of ſo ſweet a Taſt as is the Stone it ſelf, which reſided in the bottom of the Retort. And being externally applied in cleanſing and mundifying old Fiſtulous Ulcers, it works much ſtronger than this our *Hæmatitis* (which is more pleaſantly adminiſtrable in internal defects) doth. But whoever he be that knows how (by many Solutions and Coagulations) to make this Stone conſtant in the fire, will obtain a far more excellent Medicament: concerning which, we will ſpeak more in the end of this Treatiſe.

This now is ſuch a Sawce or Junket, as every good Phyſician and Chyrurgeon hath juſt cauſe moſt highly to eſteem in all Fluxes and Sores, both old and new, if he would obtain that repute which he thirſteth after; for it is endued with great Virtues, whereas on the contrary, the Juyce of Sloes, the common *Hæmatitis*, and *Crocus martis*, are, in compariſon of this, to be accounted of as meer dead Medicaments. I could tell you of more virtues that are in the red Sublimate, and this in an eſpecial manner, *viz.* that without being either bound on, or inwardly taken, but ſympathetically and at a diſtance, it is able to cure any iſſues of Blood whatever. But I ſhall doe better to paſs theſe things over in ſilence, becauſe to the greateſt part of unskilfull Men, they will not onely ſeem wonderfull, but impoſſible likewiſe. However, I commend to every ones acceptation this ſo excellent a Medicament, for all internal and external Iſſues of Blood, in all wounds and hurts, as alſo in all the obſtructions of the Spleen, Liver, and other members of the body.

After ſuch a manner as this, may any one eaſily turn all the Metals into Sugars, and into moſt excellent Medicaments. But foraſmuch as the Metals are not all of them indifferently fit to be adminiſtred inwardly to the ſick, I will make mention of Gold and Silver onely as being the beſt of all, and paſs by the others, and will teach the preparation of yet more Sawces and Junkets; Copper, Tin, and Argent-[*vive*] are ſomewhat cruder bodies, and require greater care and diligence, to have the Title of good Medicaments. We will therefore let them paſs, as having Gold and Silver at hand, which are more ripe.

The manner of Preparing a good Sawce or Junket out of Silver, which helpeth the Diſtempers and Diſeaſes of the Brain.

THE skilfull Chymical Phyſicians have aſſigned Silver for a Medicament for the Brain, which Aſſignment of theirs I acquieſce in, and doe here preſent you with ſuch a Sawce or Junket as is of moſt eſpecial uſe for the ſuccouring of the Brain.

Take of common *Aqua Fortis* (ſuch as is commonly uſed about the diſſolution of Silver) one pound: In two ounces of which you muſt diſſolve one ounce of pure Silver; Diſſolve likewiſe one ounce of Lead by it ſelf: Put both Solutions together in a glaſs with a wide mouth; and being thus mixt, pour thereupon as much rectified Spirit of Salt as is ſufficient for the precipitation of both the Metals. Pour off the clear water from the precipitated Metals, and pour upon them ſome freſh water, and ſtir them well about; which done, and the precipitated Calx ſettled to the bottom, the water is to be again decanted off, and more freſh water poured thereon: and this Labour is to be ſo often repeated, untill that precipitated Powder be void of all Acrimony: then put it in a pure linnen Cloth placed in a Funnel, that ſo the remaining moiſture may drain from it. Then tie the cloth very firm, and ſqueeſe out, in two balls (or ſqueeſings) all the reſidue of the moiſture out of that ſilvery Cheeſe, and lay the ſame upon Cap-paper, and that will drink up all the reſt of the moiſture, and will ſoon dry your Cheeſe. This Cheeſe (or precipitated Powder) is to be put into a well coated Glaſs-retort, and to be forced with a gentle fire of Sand, that ſo all the ſuperfluous moiſture may be ſeparated. Then, at laſt, the Fire being augmented, will force out part of the Silver and Lead in the form of white Flores, aſcending up in the neck of the Retort. Now when the Retort hath been thus kept red-hot for one hour, let the fire go out of its own accord, and take out the cold Retort, and break it, and you will find in the bottom of the ſame a white and ſweet Stone, which will melt (upon a red-hot Plate of Metal) like Wax, and penetrate the ſame, and is volatile like *Argent-vive*. Two, three, four, five Grains, even to eight or ten, of this Stone ground into a Powder, being adminiſtred (reſpect being had to the Patient's age and ſickneſs) yield a moſt preſent comfort in the diſeaſes of the Head and Brain, and ſo are thoſe white Flores wont to doe likewiſe: but in Chymical operations they are of eminent uſe. Now although this Stone be it ſelf of a fugacious nature, yet notwitſtanding in progreſs of time it makes *Mercury*, together with it ſelf, conſtant in the fire; of which thing I have elſewhere already mentioned in my Writings, ſo that I need not ſay any more thereof in this place.

However, I cannot omit to tell you, that, although, otherwiſe, there is no familiarity at all betwixt Silver, and Lead, and Salt, yet nevertheleſs theſe three may be ſo prepared as (by a certain mixtion) not to refuſe each others ſociety. Hence it comes to paſs, that if the Salt be rightly fitted for this operation, it puts forth more powerfull virtues, and for that reaſon doth the Silver ſuffer the more, and doth by ſo much the ſooner attain to a conſtancy in the fire; and ſo 'tis evident, that the name of Alchymy or fuſing of Salt, was not impoſed on this Art for nothing.

For

For by the help of Salt, are the Metals to be molten and meliorated, which thing you may take notice of.

Another Sawce or Junket made of Gold and Silver.

TAke ſome pure Silver, and diſſolve it in *Aqua Fortis*, and precipitate it with Spirit of Salt, and free it from its Acrimony with common water, and ſqueeſe out the water, and lay your matter upon cap-paper to dry, and deal with it in all reſpects as we ſpake afore in the Proceſs of *Saturn*. Of this Calx take three parts, and one part of Gold diſſolved in the Oil of Salt; and firſt put your Silver Calx into a ſtrong Glaſs-retort, which muſt be well coated, then pour thereto your yellow Solution of Gold. Place the Retort in Sand, and, firſt, force out your Spirit of Salt, in which forcing out, the Calx of the Silver will retain with it ſelf the Gold; and of them both will be made a purple Stone, inclining ſomewhat to redneſs, fuſile, and volatile. But the Oil of the Salt will carry up with it ſomething of the Gold and Silver into the neck of the Retort; which, together with the aforeſaid Stone, you ſhall take out of the broken Retort; but yet you muſt keep each apart, for a medicament of great moment: [both] which (if they were turned (by Solution and Coagulation) into a fix Ruby,) would doubtleſly perform their work, in the metallick Operations, with greater benefit and profit.

So have you here, briefly deſcribed, the third Junket, which, ſhould it be deſcribed with all its Circumſtances, the Proceſs it ſelf would in good ſooth be more prolix and tedious than is fitting. And foraſmuch as my Writings may ſeem unto many ſufficiently tedious, 'tis but fit that I aim at brevity here in this place; though (on the other hand) they will ſeem (I well know) too ſhort and brief unto others. But *Jupiter* himſelf pleaſeth not all alike. And the birth-day of him who can ſatisfie all, is yet to come; for he is not as yet born. For behave thy ſelf as thou wilt in thy actions, either in briefly delivering thy ſelf, or in uttering thy mind in a longer diſcourſe, thou ſhalt not at any rate fulfill the expectation and deſire of all men. I doe therefore here diſh out this Junket, and commit the care of eating the ſame to the Gueſts. Every one that will, may more accurately weigh and conſider of the ſame, that ſo he may come to find, how great the Efficacy and Utility of this Proceſs is, though delivered ſo very briefly.

Another Junket or Sawce, viz. *A Confection of a Mineral* Alkermes.

THere is in the Apothecaries ſhops a Confection made of the Berry or Grains of *Kermes*, known by the name of *Confectio Alkermes*; in which compoſition, there are added to the ſaid Berries ſome Pearls done into Powder, and Leaf-Gold, and Amber-greaſe, and other ſuch-like corroborating Simples. This medicament being confected with Sugar, is lookt on as the chiefeſt amongſt all thoſe Medicines which are wont to be adminiſtred for ſtrengthening the Heart, and it merits the praiſe aſcribed to it. But now inſtead of the Leaves of Gold, (which cannot be digeſted or concocted by the ſtomach, and are therefore carried forth with the Excrements without any operation,) I will ſubſtitute another Gold, which being made ſuitable, and accommodated unto nature, ſhall be able to put forth its virtues, and ſupply the place of foliated Gold, in the Confection of Alkermes.

And if any one be ſo minded, he may omit even the grains or the berry it ſelf (for they are not to be had every-where) and make uſe of this Juyce of Gold, which I am about to teach in this place, and mix it with Sugar and other Powders that are ſtrengtheners of the Heart. For this Golden Confection of a purple Colour, doth moſt notably ſtrengthen the Heart by its corroborative virtue, and the Gold it ſelf gives a far more excellent purple or ſcarlet Colour than the Grains of that berry doe, which are brought us from *Mompelier*. The way of preparing the ſaid Gold, is as follows.

Diſſolve the Calx of *Sol*, or of Gold, in ſtrong Spirit of Salt, and pour upon the Solution ſome three or four parts of water more than the Solution is, that ſo the Acrimony of the Spirit of Salt may be ſomewhat allayed. Being thus prepared, put thereinto a bit of Tin, and ſuch as hath no Lead commixt therewith, which ſaid Tin, the allayed Spirit of Salt will ſeize upon, and diſſolve part thereof. And being alſo debilitated thereby, it will let fall all the Gold that it contained, in the form of a purple Powder, adhering partly on to the Tin, and part will be of its own natural colour, and ſettle to the bottom, but as ſubtile as the Atoms that fly about in the Sun-beams, and reſembling little ſtars. When therefore the whole body of the Gold is precipitated into a moſt delicate and fine Powder, out of the Spirit of Salt, which will now be clear and bright: Pour off the Spirit, and take the Tin out from the Golden Powder, and waſh the Powder with clean and pure water, that ſo none of the Spirit of Salt may be therein diſcerned; and being now thus prepared, it may be uſed inſtead of Gold about the Confection of Alkermes.

Moreover, if you are ſo minded, you may take ſome pure Sugar-candy, and make it up into a ſyrup with weak Spirit of Salt, and then put thereunto this Golden Powder with a little Amber-greaſe and ſome Powder of Pearls, and ſo make full as good, nay a better Confection than that common *Confectio Alkermes* is; becauſe a greater corroborating of the powers of the Heart, and a delicater purple Colour cannot be found in any other thing than in Gold. If now you operate aright, it cannot otherwiſe be but you muſt needs attain to this purple and golden Confection.

N. B. The Tin muſt be very pure and clean, for by how much the whiter it is, and the acuter ſound it has, ſo much the fitter is it for this work. And in the Compoſition it ſelf you may uſe this following weight or meaſure.

Take of the Calx of Gold one Lot [or half ounce] and diſſolve it in three or four Lots of ſtrong rectified Spirit of Salt: Pour unto the Solution twelve or fifteen Lots of pure water; then to all this, put two Lots of Tin, and ſet the Glaſs that the Solution is in, upon hot Sand, and heat it ſcalding-hot, but let it not boil. When it hath thus ſtood for one or two hours, all the Gold will be turned into Powder, of a Purple and Gold-like hue, and ſettle to the bottom. Then having poured out the Water, and ſeparated the Tin, ſeparate all the Acrimony from the Powder by ſeveral waſhings, and ſo will you have it fitted for the Confection. This done, take twelve Lots of Sugar-candy, and one Lot of rectified Spirit of Salt, and as much pure fair water as is ſufficient to reduce the Sugar into a thick Syrup; Hereto

add

add one Lot of that purple and tender golden Powder, and it will tinge all the Sugar with a Purple or Scarlet-colour. Then add likewise thereunto, two Lots of Pearls made into fine Powder, and one Quintula (about two drams and an half) of Amber-grease, mix them well together and set it by for use, as being a most efficacious Confection. And if you please, you may add to the former ingredients other strengthning and refreshing Powders. The Dose of this Confection is from 3, 6, 9, 12, 15, to 20 Grains, according as the persons are. It corroborates the Heart, Brain, and the whole Body, and doth likewise (by reason of the Spirit of Salt) allay thirst, and stirs up the appetite to food.

And thus much may suffice this time about Sawces or Junkets. It now remains that we likewise search after some select and harmless Purges out of the Metals too, and adjoyn them to the former. When in feastings (or merry-meetings) the Guests are wont to drink Healths to their Lords, and tope off many Cups, and store of Glasses full of strong Wine, it cannot possibly be, but that their Stomachs must be stufft with tenacious and clammy humours, and the Head much oppressed with Catthars, and the Bowels fill'd with store of wind. Now here cannot be a better and more profitable way of succouring these Stomachs and Heads, thus beset with so many tenacious humours, and of helping the whole body thus corrupted by so often repeated draughts, than by a purgative Medicine, which by expelling all the evil and offensive humours opens all the passages of the Body, and again brings the so necessary respiration. We will therefore present you here with three such purging Medicaments, and those very good ones. One is of Antimony; The second of Silver and Antimony; And the third of Gold and Antimony: Each of which, by it self, doth far exceed the other purging Medicaments made of the Vegetables.

For Metals do penetrate the Body far better, and do perform their Operations with less hazard than the Vegetables do, most of which abound with a resinous clammines, which doth often stick to the Bowels, and cause great gripings, which is not to be feared at all from metallick purgative Medicines: which (upon this account) are to be preferred before those that are prepared of the Vegetables; nor do I contemn these Vegetable Purges, for they are good, and may be made use of, where better are not at hand.

Therefore, forasmuch as I have in my time, made trial of many such Medicaments, and have in very deed found, that metallick Purges do excel the Vegetable ones both in pleasantnes and efficacy, and are far safer; I could not but commend the same above all other Purges to such as come after me, but yet leaving every one at his pleasure to make use of either these or them.

A Purge of Saturn.

Dissolve two ounces of Lead in pure *Aqua Fortis*, and pour upon the Solution one ounce of Butter of Antimony, that so they may be precipitated together into a white *Coagulum* or Curd, whereto you must put a good quantity of fair water, and stir it very well about, that it may imbibe the Spirit of Salt which was in the Butter.

Then pour off this water, and put on more, and repeat this labour so long, untill all the sharpnes be washt out of the precipitated Powder. This white Powder being dried is a most excellent Purge, educing all evil and hurtfull humours out of the Body without danger, and being administred from one Grain to ten, according as the Patient is, doth work downwards, especially when it is given in a lesser Dose. But if there be need of vomiting too, then the Dose may be encreased, especially unto those that can brook vomiting, and cast with ease. It may be used without danger as a good and safe Purge, in all such Diseases as purgative Medicaments are, and may be administred.

A Purge of Lune.

Dissolve two ounces of pure Silver in four ounces of *Aqua Fortis*, and pour upon this Solution one ounce of the Butter of Antimony, which together with the Silver will go into a white Curd, as we said but now of the Lead in the preceeding Process. Wash this Powder with common water, and dry it and administer it in the same Dose as the Saturnine Powder is to be given; and it will perform its part in all Diseases, but especially in those of the Head.

N. B. The Butter of Antimony must be made of the *Regulus* of Antimony, with rectified Spirit of Salt, and not with *Mercury* sublimate, as the common custom is.

Purging Gold.

In the first place, you must make a most strong Spirit of Niter thus, *viz.* put equal parts of calcined Allum and good Salt-peter into a well coated Retort, out of which is to be drawn (leisurely and by degrees into a very large Receiver luted on to the neck of the Retort) a Spirit, which will make the Receiver look red. All the Spirit being distilled, let the Fire go out of its own accord, and leave on the Receiver so long till all the Spirits are setled, and that the Receiver be become clear agen: Macerate the Lute, which joyned the Receiver on to the Retort, with water, and have an especial care when you take off the Receiver, that none of the Lute fall into the Spirit. Put the Spirit in a strong Glass, and shut it up well with Wax, that it may not exhale, for it is very strong, and is red as Bloud, because it had no water put unto it in the Receiver.

Pour two ounces of this strong Spirit upon one ounce of the Butter of Antimony, and it will presently pass into a red Solution, whereto put one ounce of pure Gold that it may be dissolved, which Solution will be redder than Bloud. Then pour in thereupon some common fair water, and the Antimony and the Gold will precipitate into a Purple Powder, which is to be washt well with water, and so dried.

Its Dose is from one, two Grains to six, (according as the Age and Party is,) it may be given in Wine, Ale, Water, or any other Liquor, which may be as a Vehicle unto it. It works without any danger, and doth safely and pleasantly (beyond all other Purges) drive out all offending Humours out of the Body of Man.

Aurum Diaphoreticum, *or Sweating Gold.*

If no water be poured upon the just-now-spoken of red Solution, thereby to precipitate the same, but

that that ſtrong Spirit of Niter be drawn off by a Retort, it then takes from the Antimony its purging and vomiting power and makes it Diaphorical. Nor needs the Purple Powder, when it's taken out of the Glaſs, any waſhing at all, becauſe being adminiſtred in two, three, four, five, ſix, or ten Grains Doſe it may be ſafely taken, and it provokes Sweat. It is therefore very profitable in all the Diſeaſes that are to be expelled by Sweat; yea in the Leaproſie, Gout, Dropſie, French-pox, Plague, Scurvey, and in all Feavers doth it play its part even to admiration, for (by reaſon of the Gold which it contains in it) it doth both provoke Sweat, and ſtrengthen the powers of the Body.

The former Powder or purging Gold, being mixt with an equal weight of purging *Lune*, or purging *Saturn*, and molten in a Crucible, turns into a red Stone or Glaſs, of which, little Tablets or Pellets ſomewhat bigger than a Pea may be again caſt or molten, and kept for uſe. And now when there's need of purging, let one of thoſe Tablets be put into ſome ſpoonfulls of Wine and lie therein all night, and let the Wine be drunk off in the morning following, juſt after the ſelf ſame manner as other purges are wont to be adminiſtred. For there is ſo much virtue extracted by the Wine out of the glazen Tablet as to give ſeveral Stools. If one Tablet or Pellet be not ſufficient, then may a ſecond, or a third, or more be adjoyned thereunto, and ſo left all night in the Wine, that ſo the Wine may work more effectually if need requires. The Tablets or Pellets remain good a long time, and may be many times applied to the ſelf ſame uſe.

But if any one ſhould be deſirous of performing this labour even yet better, he may get a little Pot or Cup to be made for him of white Earth, and and may have it glazed both inſide and outſide with this ſame Glaſs; for two or three Spoonfulls of Wine infuſed for a night in ſuch a Cup, and drunk off next morning, are capable of purging you even as doth the other.

Theſe are the effects of theſe purges in Medicine. They likewiſe do ſome good in Alchymy, if all three of them, *viz.* the Saturnine, the Lunar, and the Solar are reduced by melting into a Glaſs: this Glaſs being Philoſophically cemented ſomewhat of the Silver, Lead, and Antimony will be meliorated, and turned into Gold by the Gold.

Now for a Farewell, take this which follows. If the God *Appollo* the Inventer of Medicine, would beſtow his light upon any one, and by his hot Beams melt the waxen Wings of the untamed, flying, and (to his Father *Dedalus*) diſobedient Son *Icarus*, (and flying out of the Iſle of *Creet*, over the *Icarian* Sea,) that ſo he might fall down into the ſweet and ſulphureous Sea of the Sun, and may remain drowned therein: Then from this dead Body (which is not wont to be ſubdued by any other means) may a moſt excellent Medicine be prepared. For what way ſoever he is handled by otherwiſe, whether he be turned into a white ſublimate, or be reduced into a yellow or red precipitate, he is notwithſtanding always corroſive; and brings more hurt than good, and therefore may very deſervedly be eſchewed.

Or if we did but know the way of fixing it without any corroſivity, by thoſe three principal Columes of all Medicine, namely Vitriol, Sulphur, and Antimony, he would undoubtedly be adminiſtrable without any fear, and be withall capable of performing great matters. For then he would not ſtir up and cauſe ſo many purgations, and ſuch vehement Salivations, and other hurtfull ſymptoms as uſually comes to paſs, but would bring a moſt ſpeedy help to the Sick by his gentle operation by Sweat and Urine, and get the Phyſician a moſt eminent praiſe.

This I would have every one know, that Sulphur has a power of killing all Corroſives, and reducing them to a ſweetneſs, whether it be done by the dry way or by the moiſt. And of all Sulphurs, a Vegetable Sulphur is the fitteſt, which being freed from its inflamable nature, is capable of reducing [any] Corroſives, though never ſo great, unto a ſweetneſs in one hours ſpace. Nay more, any Metal being firſt diſſolved in ſuch like Corroſives, doth together with the ſame become a ſweet Medicament: And ſo when Gold is diſſolved in Spirit of Salt, and Silver, Tin, Copper, Iron, and Lead are diſſoved in *Aqua Fortis*, and that that Corroſive Diſſolvent is tranſmuted by a ſweet Sulphur, it ſo comes to paſs that the Metal together with the Corroſive is made a Medicament, and becomes potable. Such potable liquor of the Metals, (but eſpecially of Gold and Silver,) and void of all Corroſivity, will you meet withall in my Medical-ſhop; which liquor, as well thoſe of Silver, and Copper, as that of Gold, are red. The Liquor of Gold may be uſed inſtead of *Aurum Potabile*, and it guilds Quickſilver and the other Metals with a golden Colour, like as the Silver-liquor guilds *Mercury*, and Silver [or Copper, probably] with a Silver Hue; and the Coppery-liquor guilds *Mercury* and Iron with a Coppery Colour.

N. B. Aurora being inflamed with the love of *Jupiter*, and withdrawing him together with her ſelf into Heaven, if both of them be again thruſt down headlong by the other Gods into the Salt-Sea, they come forth out of this Bath, ſo delicate and ſo white, that ſhe reſembles the fairneſs of *Diana*; and he, the comlineſs of *Apollo*: but not as yet conſtant in the Fire. But when the time of bathing is over, *Mars* coming to the Sea Shore, draws both of them out upon a dry Iſland called *Irony*, from Iron; where they are yet once more waſht by *Vulcan*, (who makes uſe of *Saturns* help) in a dry Bath, who waſheth off the Defilements far more accurately than the Salt Sea could, for he leaves not off waſhing and purging them, untill all the Defilements are ſeparated from both their Bodies, and that they be made like unto *Diana* and *Apollo*, in Conſtancy and comelineſs.

Mars ſeeing that his Siſter *Venus*, and Brother *Jupiter* did come forth out of the Salt Sea with ſo lovely a fairneſs, leapt thereinto himſelf, that ſo by ſpending ſome time in waſhing, he might rinſe off thoſe black Defilements from his black Body. But there was ſuch ſtore of filth waſht off, as made all the Sea green and ſweet, and it hid [or ſwallowed up] *Mars* himſelf, being now much diminiſhed, inſomuch that he could never have eſcaped out of that Sea, had not *Sol*, out of meer pity on him, dried up the water of the Sea, for old limping *Saturn* to come unto him, and to take poor wretched him out of the Dirt and Mire, which he alſo did.

But becauſe there was ſuch a deal of Mire and Filth as that this (ſlim) lame, (hopping Fellow) could not get out agen, he even there ſtuck faſt with *Mars*, and ſo loſt his Life. Of the dead Bodies of theſe two, *viz.* of *Mars* and *Saturn*, *Vulcan* did at length

length make one Head having two Faces, or a double Countenance, one resembling *Apolo*, the other *Diana*; and upon this account was the name of double-visaged *Janus* bestowed upon it by *Vulcan*.

By these few and short Operations and Processes, may any one make and devise many more such like. I am not at this time, for my part, minded to busie and trouble my self about any more tedious a description of such matters, for I guess that in what I have already said and disclosed to the unthankfull, I have too much exceeded my bounds. Every one may choose to himself those things which he shall deem most profitable, and forbear to despise that which he shall not be capable of apprehending the meaning of.

'Tis a usual Proverb, *That a Cup of generous Wine must accompany Dainty Delicates.*

Because therefore we have in the three precedent Sawces or Junkets, presented you with fine savoury Cates, it is but fitting that we accompany the same with three dainty draughts, and those drawn out of the best of Metals too, namely out of Gold and Silver, because the Cates or Sawces themselves were composed of the same. Our Ancient Predecessors called those Drinks of old time *Nectar*, or the drink of the Gods, which in our days are known by the names of potable Gold, and potable Silver.

Concerning these two, do many of *Ignoramus* his Fraternity babble many Stories, and falsly boast that no true potable Gold can be prepared, or be in Being without the Philosophers Stone. This conclusion of theirs is clearly untrue, for a Man may easily make Gold and Silver potable, though he hath not any knowledge at all of the universal Medicine, which is to be thus understood, *viz.* when the Gold and Silver either alone or conjoyned, are dissolved in a sweet and not Corrosive *Menstruum*, and rendred fit to be administred to the Sick in Water, Ale, Wine, or any other Liquor. For those kind of Solutions may be taken for a simple potable Gold and Silver.

But now for any one to dissolve Gold in that corroding *Aqua Regis*, or Silver in *Aqua Fortis*, and then to imagine that he hath potable Gold and Silver, he is altogether in an Errour. Potable indeed they are, because they may be drunk like other Liquors: But forasmuch as those kind of Solutions do corrode all things, and bring extream Detriment, they are justly rejected, and the rather because being poured into Wine or Ale, they defile and thicken the same; which, no true potable Gold dissolved in a Not-corrosive *Menstruum*, will do, but when 't is mixt with Wine, Ale, or Water, it remains bright and clear. Besides too, true potable Gold must be of such a property, as to have no visible corporal Gold producible thereout of, and yet notwithstanding, be able to indue the meaner Metals, yea and *Mercury* it self with a golden nature, if they be therein boiled, or to coagulate and transmute them into Gold by the dry way in a Crucible, whether it be done with profit or without profit [it matters not.] Now this tinging virtue comes not from corporeal and dead Gold, but from a spiritual living and tinging Gold.

If therefore the common and corroding solution of Gold, cannot be accounted for a true *Aurum Potabile*, and that the spiritual and tinging Gold, which is dissolved without any corrosiveness should not come under this Title neither, whence I pray should it be sought for, and where should it be inquired after. I confess, I do easily perswade my self, that as for the first Ens of Gold if we did but know how to wash and purge it in such wise, as that being turned into a bloud-red liquor, it would admit of Distillation by an Alembick or a Retort, we should have a better potable Gold. But where shall we find such an Artificer, as can teach us the way of preparing such a potable Gold? 'Tis therefore our best way to content our selves with such Medicaments as we have at hand, so long untill God bestoweth better upon us. This likewise I believe, that if we did but know such an Artifice as to wash and purge Mercury, in such sort as that it might pass into a ponderous and sweet Water, and if we could so adjoyn some pure Gold thereunto instead of a ferment that they might lift up [or sublime] themselves together, and again become constant and fix: that then, from them would arise a red and soluble Carbuncle, or true potable Gold. But these are onely my simple thoughts and conceptions, no dispraise to those suppositions which other men have entertained concerning this matter. So likewise if spiritual Gold, and the spiritual Sulphur of the Vine be conjoyned by the help of Salt, they give a good potable Gold, which contains in it Gold potentially, but not actually or palpably, as may be seen in my Treatise of the true *Aurum Potabile*, which being clear like Water, and a bright or fair potable Gold, I do adjoyn to my Cates or Sawces instead of White-wine.

But even as White-wine the longer it is kept, the yellower it grows, so likewise white *Aurum Potabile* doth not retain its whiteness above two or three months, but becomes more and more yellow, and is at length turned into a redness, but still retains its tinging faculty. He therefore that shall not be well pleased with the taste of [my] Wine or potable Gold, let him tarry till being more old they become yellow or red, for then they are of a pleasanter taste, as having (through long Process of time) lost their Sulphureous Taste.

But as touching the manner of making that potable Gold, as also all other unpleasant, fugacious, and unripe metallick Potions, pleasant, ripe, fix, and sweet Liquors, that shall be revealed afterwards.

Furthermore, I do here serve out instead of a good drink, the golden-coloured Soul, or my Tincture made of Niter, of which I have spoken in the second part of my Spagyrical Dispensatory. It is of as much virtue in Medicine as that potable Gold is, which I made mention of but now, but performs nothing in Alchymy or in the Transmutation of Metals; but what it would do if it were made fix and constant in the Fire, I do not as yet know, for I have not as yet brought it to that pass. But how it may be made fix shall be presently shown. This very Tincture in the degree it is at present in, produceth great effects in Medicine, yea and greater too than those which I published about it, in the second part of my Spagyrical Dispensatory. It is of a delightfull Taste to the Palate, it removes the obstructions of the Liver, Lungs, and Spleen, it provokes Urine, expels the Stone, prohibits Obstructions with the Excrements, it may be most safely used by old and young, yea even by those whose strength is much debilitated, and it is wont to afford them present help; it wonderfully Corroborates, and makes all Animals, Minerals, and Vegetables fruitfull, and this will easily appear so to be, if you do but take some Vegetable Seed and macerate in the same, and then put in the Earth, it grows far spee-

dier

dier and ripens much ſooner than other Seeds are wont to do.

I have ſometimes macerated Wheat, Barly, Peaſe, and the Seeds of ſuch like Corn in this Liquor for a night, and being thus ſteeped, have ſown it in pure Sand, and they have grown ripe far ſooner than thoſe which have been planted in good and fat Earth: which is ſuch a thing, as hath made many Men extreamly to wonder, when they ſaw Corn grow in bare Sand without any other Earth or Dung, and be able to arrive to ſuch perfect maturity.

Many other Salts there are of no great coſt, and ſuch as are to be had in vaſt quantity, with which, Corn being macerated and ſown in barren Lands, and in ſuch as are not dunged doth come to perfect maturity; and this I have tried not onely once, but oftentimes; and have alſo purpoſed (if God pleaſe) to bring it into publick uſe, in theſe United Provinces: to which end, the moſt Supreme Orders, General and Provincial, have granted me a Priviledge (or Patent) for many years; whereby it is forbidden to ſow or plant barren, ſandy Grounds and undunged, after this kind of way, without my conſent. The main Baſis of the knack lies in Sea-ſalt, which may be plentifully had in theſe places, and be eaſily prepared and made uſe of (to fatten lean and dry Grounds with) inſtead of Dung.

But amongſt all ſuch-like Medicaments, the Tincture of Nitre bears away the Bell, for it cauſeth many Stalks to ſpring up out of one Grane, and to yield fruit, a thouſand fold. Nor doth it onely make the Vegetables fruitfull, but Men too, and the terreſtrial Animals, and even the Birds themſelves that live in the Air. And by the ſame reaſon alſo may it be brought to paſs, that even the Metals may be multiplied by the help thereof, as we ſhall declare anon, in what follows.

Both theſe Wines or efficacious Drinks doe very well ſuit with the metallick Sawces or Junkets, they heat the Body, help the concoction of the Stomach, corroborate the Spirits, give good Nouriſhment, drive forth out of the Body the ſuperfluous Excrements, in a due manner by Stool and Urine, they cauſe Chearfulneſs, beſtow a proſperous Health, give a comely Look, and change the Complexions into the Sanguine and beſt Complexion; in the accompliſhment of all which things, that pure and golden coloured Tincture of Niter excells.

And here I muſt make a little digreſſion, and ſet ſomewhat more clearly afore your Eyes, the four primary Complexions; from which the other mixt ones do ariſe, according as a Man partakes the more of this or that Complexion.

Therefore as touching the Complexions, the Ancient Phyſicians judged thereof according to the form and colour of the Hair, and were of this Opinion, that the Sanguine Complexion which of all others is the pureſt, produceth red Hairs and a white Skin full of ſmall and bright Pores, ſuch Men being indued with hot and moiſt Bloud, and of a ſound Conſtitution are diligent, learned, pious, prone to Venery, Ingenious, Chearfull, and for the moſt part long liv'd, but are ſubject to hot Diſeaſes, as Feavers, the Plague, and the like; and do in their nature reſemble the Sun, amongſt the Planets, and Gold amongſt the Metals.

The *Cholerick* have very black Hair, a yellowiſh Skin, and their Bloud is hot and dry, and they are wrathfull, quarrelſome, ſtrong, bold, Warriours, addicted to Whoredoms, ſubtle, wicked, falſe, mercileſs, rejoycing at others harms, as is wont to be in War. They are tormented with raging Feavers, as alſo with the overflowing of the Gall, and they are of the nature of *Mars* and *Venus* amongſt the Planets; and of Iron and Copper amongſt the Metals.

The Hairs of the *Melancholy* Complexion are for the moſt part betwixt a white and black colour, and their Skin is white. They are of a cold and dry nature, quiet, laborious, muſing, induſtrious, ſincere, pious, and mercifull, inclined rather to weeping then laughter, if they hear of any miſchances, they aim at Juſtice, and fear God without Hypocriſie, or eſteem of Men. They are ſubject to all kinds of Diſeaſes, are afflicted with a debility of their Limbs, and are compared to *Saturn* and *Jupiter* amongſt the Planets, and to Lead and Tin amongſt the Metals.

The nature and property of the *Phlegmatick* is moiſt and cold, the Hair and Skin white, the Wit dull, a dreaming ſleepy quality, negligent, carefull of nothing, obſtinate, envious, ſlow, and groſs, and unteachable, the Body conſiſts of thick or homely Limbs, and is wont to be troubled with the Scab, Ulcers, and cold Feavers. 'Mongſt the Planets the Moon, and 'mongſt the Metals, Silver, are ſuppoſed not much to differ from their Diſpoſition.

Theſe are the marks (as is believed) of the Complexions in Men and Beaſts. But yet you are to know, that one [ſingle] Complexion doth very rarely bear abſolute ſway in any Man, but they are for the moſt part mixt, and ſo the denomination is given according to the predominant Complexion.

A Man that conſiſts of a ſanguine and phlegmatick property, is as it were double complexioned, and both the colour and denomination are divided, ſo that from red and white, yellow hairs ariſe, and the Men themſelves are of a good, temperate and fruitfull nature; and thus is it to be underſtood of other Commixtions.

But foraſmuch as a pure and ſanguine complexion is eſteemed the beſt and wholſomeſt, the Ancient Phyſicians in their Cures were wont to call the ſuperfluity of any phlegmatick ſcabby perſon, Phlegm and watery Blood: [the ſuperfluity] of the Melancholick, ſad and irkſome cogitations [or penſive dumps:] and [the ſuperfluity] of Cholerick, a mad raging brain. Now of this Phlegmatick, Melancholy, or Cholerick [perſon] do we make a Sanguine one, that is, a Man of a ſound and pure blood. Upon this account have they aſcribed this property unto their Univerſal Medicine, *viz.* that it does not onely change all the imperfect complexions of Men, as the Cholerick, Melancholy, and Phlegmatick into the Sanguine; but doth alſo tranſmute all the imperfect, unripe, groſs, and volatile Metals into pure Gold. For if a Medicine be of ſo much virtue as to convert all the Complexions into the Sanguine one, it will neceſſarily tranſmute all the imperfect Metals likewiſe, as *Saturn*, *Jupiter*, *Mars*, *Venus*, *Mercury* and *Lune* into *Sol* or Gold.

Now foraſmuch as I have often found by the frequent Experiments that I have made, that my ſaid Medicine, or Tincture of Nitre is wont to colour all kinds of Hair, as white, brown, black, (black I ſay, which may ſeem impoſſible unto many, but nevertheleſs is very true; for to dye white Hair with a yellow colour is a thing commonly known, but to tinge black Hair with a yellow or red colour, is a great ſecret) and even all other colours, none excepted, with a golden colour; and this it does while it

it is as yet of an unripe and flying nature: Upon this account I dare perswade my self, that if it were but brought to a fix and constant nature, it could not possibly be, but that it would bestow upon the imperfect Metals, a golden nature and perfection. But by reason of its too tender a nature, which is extreamly impatient of a Fire of Coals, I pondered upon the business more accurately, and perceived, that it is indeed a thing possible to be done, although that hitherto I never had a convenient time of perfecting of the same. And as concerning the manner how it may be done, I cannot but out of Christian Love, discover the same to my Neighbour.

During the time that I considered not the Words of the Angel in the Sepulchre of Christ, saying, *Why seek ye the Living among the Dead?* and therefore search'd about in filthy Sepulchres, in which I could not find the Life. God at length vouchsafed to look upon me with his gratious and mercifull Eyes, and brought me into the right way, insomuch that leaving the Sepulchres and Monuments or Tombs of the Dead, I began to look for Life amongst the Living, and not amongst the Dead.

God onely is the alone and eternal Life, who bestoweth upon us the so much desirable *Sun*, (as being the Servant of God) by the help of the Air. Let us boil, roast, bake, and labour as much, and in what manner soever we please; yet shall we never find any livelinesse, save from the Sun, the Servant, Minister, or instrument of the Omnipotent God. [For, else] we [doe but] prepare us Medicaments destitute of virtues, of fine out-side Colours, but within, dead and full of poison, because from things wanting life, no help can be expected.

Forasmuch therefore, as we gave not life unto our own selves, neither can we defend the same against death without that one onely life coming unto us from above: it is very expedient, that, omitting the stinking dung, we betake our selves to the pure and living fountain of God, as being the Centre of all life; and doe seek for life, from the Sun, as being the great master of all the created Palace [or World.] The way of effecting this, will I reveal unto you in a few words.

If we accurately weigh with the utmost of our discretions this whole business, we clearly see it afore our Eyes, that there is no other life to be any-where found, besides that universal life which God hath implanted in the *Sun*, and which the *Sun* sends down unto us by the help of the Air. Let any one make trial, what way soever it likes him, and he shall find this most true.

If you would putrefie an Herb or Animal in a shut glass, so that the Air cannot penetrate [into it,] there will indeed be Magots generated, but they will want life so long, untill the glass being opened, they receive life and motion from the Air. If you put Herbs, or the Flesh of living Creatures chopt or bruised in a glass, and shut it close, and keep the glass for a while in hot Horse-dung, or else in warm water, there will Vermine [or Maggots] be indeed generated, but yet void of life, which (the glass being opened) will begin to stir of themselves; and so having gotten life, creep out, and become greater, and will get other forms or shapes. Place likewise in a warm place, some little Barrel half full of Wine, and let the bung-hole be open, that it may putrefie and begin to wax sowre; The ascending vapour will gather it self about the said Bung hole into a tenacious matter, which will yield small little vermine [or Mites,] much like those which are engendred in Cheese; and which at length will, by reason of the Air, live and creep forth. If you put a Cover over the hole, all these little Mites will again dye, because they are deprived of the Air from which Life doth proceed. Then the Cover being again taken off, and the Air admitted, they doe agen creep; and following after the Air, endeavour to get out of the Barrel: out of which, if they doe but stay some hours onely, and feel the full Air, they attain to another form, and get wings and fly away, which cannot be done without the Air, seeing that without it they can have no life.

Let such Earth as hath Seeds sown therein be so covered over, as that the Air cannot penetrate into it; which being shut out, nothing will be brought forth: or let it be some Plant, which hath already sprouted up out of the earth; if you doe but take the Air therefrom, it will cease growing and plainly wither and come to nought.

From whence it is clearly evident, that the rise of all Life is to be imputed to the Air, which very Life it self, the Sun hath first wrought in the Air, and Art knows how to extract the same again thereout of, by a certain Magnetical way, and make it visible, palpable, and sensible.

But all the Air is not meer life, but contains this same life dispersed, or dilated in it, like a great deal of water containing in it but little Salt, it self being visible, but the Salt which is therein, invisible. And just so is the life dispersed in the bodies of Men, and other Animals, and, being invisible, hath its habitation in the blood, so that, without it, the whole body would be immovable and remain dead. Now when either a Man, or any other living Creature is conversant in the open Air, he attracteth to himself by his breathing, (by a certain Sympathetical power and property) as much Air as is requisite for the Heart, (which is the Center, Receptacle, or House of the Life) for the nourishment of the spiritual Life, and as for the residue, and unprofitable part, it casts it away by the Antipathetical virtue and property of the out-blowing (breath or) expiration. So that no Man, no Animal, no Herb, no Mineral, can possibly enjoy a living and growing faculty, if this food of Life were withdrawn therefrom. Which seeing it is so, and cannot be otherwise, it doth necessarily follow, that the true universal Medicine cannot be prepared in any shut up (or close) Vessels as is commonly done. Do but look I pray upon the Birth and Generation of Salt-peter, the Body of which is nothing else but the essential Salt of the Vegetables, Animals, or Minerals, which attracteth to it self the Fire out of the Air, as is well known. Therefore, whereas all Salts are wont to be turned (by the help of the Fire and Air) into burning and live Salt-peter, and that no body can bring the same to pass without Air: we should by good right learn from thence thus much, *viz.* to endeavour to make our Medicaments too, alive by the Air. For a Medicine that is destitute of life will subdue and destroy a Disease even just as much as common Salt will overturn a Mountain, and throw it out of its place, without being animated as it were by the Air, and transmuted into burning and living Salt-peter. Truly therefore and by experience do I say, that all the faculty of growth, all Transplantation, and every life owes its birth to the Air, and without it do they all become dead and so remain.

The Air receives [its] vital food from the Sun, and the Sun derives its Original from God, the Center and Beginning of every Life. And therefore when we are desirous of extracting that vital food out of the Air by the help of Art, and of reducing it into a visible body, it is behoovefull and expedient, that we expose thereunto a certain Magnet, which may draw the same unto it self, and be by little and little augmented therewithall, and may grow both in quantity and virtue, even as an Herb out of the Earth; or as an Animal gets it self growth and encrease by meat and drink, and adds to it self an augmentation of strength and greatness, and at length associates it self unto [or couples with] its like, and multiplieth its kind.

Man himself doth without intermission attract to himself the Air, by the help of his Lungs; but the Heart retains onely the vital food thereof, and rejecteth all the rest like so much excrement. The Body it self also doth daily assume food and sustenance by the Mouth, but the Stomach transmits the nutriment that is separated thereout of, to the Liver, to be reduced into blood and flesh: but the Excrements, as the Dung, Urine, Sweat, and the like, it banisheth out of the body by the usual passages. Thus likewise stands the case with our Medicament. According as the Magnet is, that we expose to the said Air, so accordingly doth it attract its like out of the said Air, whereby it may get to it self, Life, Virtue, and Power. But it cannot possibly be, that it should extract that virtue and faculty simply pure and clean; No, but it gets to it self also a certain, unprofitable, and watery Essence, which is associated unto that [virtue,] which acqueity doth again go off, as a superfluous Excrement, and must necessarily bestow the Life onely upon the Magnet, that it may be therewithall encreased and strengthened. If I desire to have a Vegetable, then must I sow a Vegetable Seed; or such a Magnet is to be placed there, as may associate or adjoyn unto it self its like out of the Air. If you would have an Animal, then an Animal Seed, or Animal Magnet is to be used. But if that which I seek is to be more pure, and more constant [or lasting:] a purer Magnet must necessarily be exposed; for like doth always seek its like; love, o'ercome, and conserve it: according to the testimony of the Ancient Wise men, *Nature rejoyceth with Nature: Nature overcomes Nature: Nature retains Nature.*

And therefore seeing our purpose tends to this, namely, to extract the invisible faculty of Life, the power and virtue of the Sun out of the Air; to concentrate it, and make it corporeal, visible, and palpable; It behooves us to provide our selves with a fitting Seed or Magnet, which may earnestly attract, overcome, and hold the same. Now such Magnets are pure Gold, and the most pure Soul of Salt-peter, both of them being the true off-spring of the vivifying Sun.

Because therefore like desires its like, loves, and seeks after it, a poisonous Magnet must not be exposed [to attract] a vital food: For as is the nature of the Magnet, so likewise doth it attract good or evil out of the Air. It is a thing that Husbandmen are well acquainted withall, namely, that Wheat produceth nothing else but Wheat, and from Tares do Tares arise. If the Seed or Magnet be aureous and pure, it will also acquire to it self pure and golden Virtues, and be encreased by them.

The manner of so placing the Magnets, that (by Solutions and Coagulations) they may receive the Astral and vivifying Rays of the Sun, and may render them visible, corporeal, palpable, and durable in the Fire.

YOU must get made some flat and strong glass Dishes or Platters, in which you must put your Magnet the thickness of half a fingers breadth, and expose it moist to the Sun, that the unprofitable humidity may vanish by evaporation. Which done, (and in the Summer-time it will be done in a few hours, especially if there were not too much of the Golden Liquor put into the Dishes) expose the same Dishes, which contain in them the [thus] dried Salt, in the night-time, open to the cold and moist Lunar Beams, that the Salt may by its magnetick virtue associate unto it self from the Air, the Water, which carries in it the universal food of the Air, and consequently may be dissolved. This Solution is to be agen set out in the day-time to the Sun-beams, which will again dry up the unprofitable moisture, and leave in the Salt, that vivifying and golden Seed, which it contracted in the cold Night and Air, together with the humidity, which is void of any virtue. The Salt being freed by the Sun from its superfluous moisture, must be again exposed at Night to the Lunar beams, that it may again imbibe the Astral virtues, and may be agen dissolved in the imbibed water, that, being the next day, as the day afore, exposed to the Sun, it may be animated anew with those same virtues: These exposings by turns [to the *Sun* and *Moon*,] must be so long and so often repeated, untill the said Magnet, (after its being dried at the day-time in the Sun) will, at the night-time, hardly admit of any moisture from the Air, and that being dry and put upon a red-hot Plate, it readily melts without fume. For then may it be applied to use, as being a constant and fix Medicament.

This interchangeable Solution and Coagulation must be repeated some hundreds of times, and every Solution and Coagulation is to be accounted for a Philosophical day.

If now in the Summer-season the heat of the Sun be not strong enough in our Countries for the effecting of this operation, the said heat may be concentred by Glasses, or metallick Instruments, and be made more efficacious, that the Coagulation may be ripened [or hastned.] But in defect of such Instruments, and want of the heat of the Sun, which is frequently over-cast with store of Clouds, you may easily forward the Coagulation with our Common Fire, and that too with a more unfailable and speedier operation than that is, wherein the drying up by the Solar heat is always to be waited for. And although this operation, which is performed in the *Sun*, is to be accounted of as far the better, yet notwithstanding the *Sun* doth operate together with our Common Fire after an invisible manner, when we cannot make use of the *Sun* it self. For wheresoever the Air is, there also is to be found the invisible *Sun*, and the occult virtue and power of life. He that can have the opportunity of using the *Sun* in this operation, needs not any other Fire. But the using of our Common Fire requireth a peculiar Iron Furnace, whereon the Dishes or Basons are to be placed to dry. But yet the heat must not be underneath, and strike at the bottom of the said Basons, but

but it must be such as may strike the heat downwards at top of the matter onely, and may gently and by little and little consume the humidity: For else there would be hazard of the Liquors boiling over, and of being lost, if the heat should be placed under the bottom of the Dishes. The Iron Furnace may be made of Iron Plates, resembling Arched work, [or Oven like] and be placed within a Stone Furnace, and have a Door fitted thereunto, that so neither Dust nor Ashes may fly thereinto, and by this way will the Salts be dried in two or three hours time. And now, that you may not need to wait till the night approacheth, you may have a wooden Box or Chest made, and covered over at the top, but pierced full of holes all round about the sides, which (with the Basons placed therein) may in the Winter-season be set abroad to the cold Air, and in the Summer-time may be placed in some moist Cellar, that so the Salts may attract from the Air the food of Life. For in all places of the World doth the Air contain in it (though in one place more plentifully, and better, than in another) that occult faculty and virtue of Life, without which, neither Men nor Animals are able to live. But by how much purer the Air shall be, so much the purer and more excellent is the acquired Medicine. As for the Transmutation of Metals, it matters not much what Air it is that you get, for every sort of Air is fit for this operation. We doe in this place manifest onely the way of fixing it: Now every one knows that a pure and clean Air is better than a gross and an impure one, and that the heat of the Sun is better than the heat of Coles, or of a Lamp.

Thomas Aquinas writes, that God with his Angels cannot want our fire, and therefore is he reproved by *Paracelsus*, because he saith that God cannot want the Elementary fire. Alas, Good man, he did not so accurately weigh this matter, for this proposition tends onely to this end, namely, to set afore our eyes the purity of the Fire necessary for the Coction of our Medicine. From whence it is sufficiently manifest, that a Medicament will be so much the better, by how much the purer the Fire shall be. For a gross Air begets a gross Blood. But in this operation, the Air is the Meat and Drink of our Golden Salt, but the Water or Phlegm is to be driven away by heat, it being a superfluous Excrement adhering on to that Air. Now in those manifold Solutions and Coagulations, the Magnet doth always retain some good thing, and encreaseth both in weight and virtue, and attaineth a constancy: like as Men and other Animals are encreased with Meat and Drink, and doe grow in stature, and multiply themselves. The whole work therefore of making this kingly Medicament by the help of the secret Solar fire, doth consist in a good, pure, and golden Magnet, and afterwards in a true Solution and Coagulation: Which if it be too speedy and strong, the over-much heat will burn up and consume the attracted food of Life. If therefore a Medium be not used, it so happens, as 'tis wont to be in any Earth that is too moist, and therefore not [capable of] bearing fruit. So that nothing is more necessary than to have a due regard of mediocrity, not onely in the Solution, but in the Coagulation likewise.

And this is that way by which the Solution done in the Air, and the Coagulation made in the Sun, doe reduce the Mercurial water, and the Minerals prepared with Salt into fusile and tinging Stones; which thing the Common fire will never perform in a glass closed up, and without the Air.

Note this, and believe it, and doe it, and thou wilt find what thou hast believed, come to pass.

Supper being ended, and the Drinking-bout over, 'tis time for the Guests to go to Bed, unto whom the custom of some is to present a closing Cup, made of good and profitable Herbs, 'mongst which, such as are more bitter, are for the most part in greatest esteem, because they close up the mouth of the Stomach, and beget a quiet Sleep.

Now to parallel this Custom, I will here set one down, for those that are desirous of such like bitter Potions, and such an one as they may prepare according to their pleasure, and apply to use.

Take of common *Aqua Fortis*, which you must rectifie by a Cucurbit, or by a Retort, that it may be bright and clear. Dissolve therein, by boiling in hot Sand, as much cupellated Silver as it will dissolve; but you are to note here, that there must not be any Copper at all in the Silver, for it would spoil the Medicament. Into the Solution pour strong and well rectified Spirit of *Sal-Armoniack*, so long till the *Aqua Fortis* makes no more Ebullition. When all the tissing and noise is over, there will be about the half part of the Silver precipitated, and settled to the bottom, and will be of an ashy colour. Place the Glass in Sand, put Fire thereunder, and boil the precipitated Silver with the *Menstruum*, in which boiling there will separate yet more Silver out of the *Menstruum*, and the residue will remain dissolved up in the *Menstruum*, which is to be filtered through Cap-paper, and then to be evaporated by little and little in Sand, that all the humidity may be abstracted.

N. B. The *Aqua Fortis* and Spirit of *Sal-Armoniack*, turn into a liquid and volatile Salt, and have lost their corroding property, which Salt hath introverted the Silver, and drawn its bitterness forth, insomuch that both Salts are converted into one bitter and green Salt. This Salt must be dissolved, filtered, and purified by pouring Water thereon, and again drawing it off; and being hereby rendred more pure, it resolves it self in the cold Air into a green and bitter Liquor, one drop of which is able to make a whole Cupfull of Wine bitter. And this Wine being drunk is profitable to the Stomach, causeth quiet Sleep, dissipates Windiness, and keeps the Belly Soluble.

N. B. This Salt guilds over Glasses, and other glazed Vessels with Silver, nor does it vanish away but remains constant. It likewise performs other considerable effects in Alchymy, as may be seen in my other Writings, but especially in the second part of my Furnaces, of the last Edition. And thus do I leave the Guests to their rest, that they may Sleep even till broad Day-light.

The Sun being up, and some of the Guests being very droughty or thirsty with their Yesternight Surfeiting, and being tormented with overmuch Heat; they endeavour to extinguish this Inflammation of the Liver, with cold Fountain Water, or with small Beer, or with hungry and sharpning Wine. Others send to the Apothecaries for some Syrup of Roses, or Violets, and mix that with Fountain Water, and so drink it off. But the burning hot Liver is presently smitten with a sudden horrour, the Stomach is refrigerated, and beset with clammy Humours, and most an end the Limbs are debilitated, the Skin becomes Scabby and cold Feavers possess the Stomach.

Instead

Inſtead therefore of ſuch like drink, I will here ſubſtitute a far better cooling Potion, which ſhall not hinder the health, as thoſe do, but be profitable to the ſame.

Take one pound of Spirit of Salt, not of that yellow, unrectified Spirit that is ſold in the Shops, but of our well rectified Spirit; wherein diſſolve as much Tartar as it will aſſociate unto it ſelf in a gentle boiling; filter the Solution through Cap-paper, that ſo all the Fœces which were in the Tartar, may abide in the Paper, and the Spirit of Salt it ſelf together with the [diſſolved] Tartar may paſs through, bright and clear; if the Solution ſtands long in a cold place, part of the Tartar will ſhoot into Cryſtals, and part thereof will remain mixt with the Spirit of Salt, and give it a gratefull vinous Acidity. If you uſe white Tartar then the ſaid Spirit will remain white, red Tartar tingeth the ſame with the colour of a Ruby. *N. B.* The Spirit of Salt is of ſuch a nature, as that it makes all colours more fair. You may therefore uſe red Tartar to make this Potion withall, becauſe of the lovelineſs of the colour, wherewith it tingeth the Spirit of Salt, for as to the virtues and efficacy of them, there is no difference to be found between them.

This Tartarized Spirit of Salt is very ſweet, and taſts like an acid Wine, ſome drops of which, being drunk in cold Fountain Water, will not at all hurt the Liver: nor will it onely allay the droughtineſs and thirſt, but alſo ſtir up in the Stomach an Appetite to meat and drink. And therefore I do commend this Tartarized Spirit of Salr, beyond all other thirſt-allaying Remedies, and it may be taken ſafely and pleaſantly, both *Summer* and *Winter*, becauſe the unripe and acid Wines being drunk with Fountain Water and Sugar, do refrigerate the Stomach, and load it with tenacious humours, and weaken the Appetite, and hinder digeſtion.

Moſt profitable therefore is this our Spirit unto thoſe, who daily drinking much Ale, may always mix a little of the ſame with their Ale. For it makes the Ale to taſt like an acidiſh Wine, it allays thirſt, ſo that there will not need ſuch a guzling in of ſo great a quantity of thick Ale, it diſcuſſeth Wind, expells Urine, hinders the generation of the Stone in the Bladder and Reins, and if it be already generated it diſſolves and conſumes the ſame, and by little and little drives out the ſame with the Urine. Being adminiſtred to ſuch as are troubled with the Feaver, Gout, Stone, and Scurvy, and that in all their drink, it is a pleaſant and profitable Remedy. Concerning the uſe of which, you may find more ſpoken in my Treatiſe, intituled, *The Conſolation of Sailors.*

Now beſides all this, there is yet one thing more that I ſhall here admoniſh you of; namely, that by the Spirit of Salts help may a Remedy be adminiſtred to many more hurtfull diſorders, but eſpecially in the ſtead of thoſe ſharpiſh Waters, unto which, Men are wont to come from far and undertake long Journeys, loſing their moſt pretious time and Money, neglecting their Calling, their Houſhold Affairs, their Wife and Children, upon the bare hope of recovering their former Health: Whereas notwithſtanding, the Spirit of Salt well prepared with Tartar, and having a little Steel Powder put thereinto, will perform the very ſame effect as the Calibeat Waters are wont to do, and ſo they may avoid the loſs of ſo much expences, and of their pretious time; and thus every one may diſcharge and follow his own Calling and Domeſtick Affairs, and yet for all that, be cured by the help of the Tartarized and Chalibeat Spirit of Salt which openeth the Obſtructions of the Liver and Spleen.

But what ſhall I ſay much for? Some haply there are that go the more willingly to thoſe Waters every year for other reaſons. Such as have old chiding Wives at Home, that take it very ill if their Huſbands do but ſtir out of Doors, and are continually a plaguing them with Scoldings and ill Words, have not theſe think you great reaſon to ſeek ſome Diverſion?

Young Women alſo love to viſit theſe Waters and Baths, who meeting not with ſo much heat in their feeble and aged Husbands, as to beget them with Child, betake themſelves to thoſe Waters and Baths, where at all times they meet with active ſtrong Companions, full of ſtrength and Metal, who without doubt do frequent the ſaid places, for this very end, namely, to apply warm ſuppoſitories to thoſe cold Women, and uterine emplaſters to make them Fruitfull, and to take away Sterility. Such kind of Dames being reſtored to their former health, and returned Home, their Husbands find (after ſome few Months) how effectual the uſe of thoſe Waters have been upon their Wives.

Beſides, it moſt an end happens that the Maſter and Miſtreſs being abſent, the Houſhold Affairs are very awkwardly adminiſtred and managed by the Children, the Men-ſervants, and Maid ſervants; and that common *German* Proverb doth uſually take place; *The Cat being out of the way, The Mice upon the Shelves do play.* The truth of this is ſufficiently teſtified by frequent Examples. And therefore it is much better to drink theſe acid Waters at Home, whereby both Money and Time is ſpared, and many evils prevented. And thus much may ſuffice to have been ſaid concerning a refrigerating Drink.

And now, ſeeing we have at hand good Cheeſe and Butter, good Sawces or Cates, and delicate Drink, can we not be here with content? Verily in my Judgment here's enough diſht out for one Banquet. But ſome may ſay, in very good time! *Glauber* [indeed] does not onely teach us the preparation of good Meats, but likewiſe of Cheeſe, Butter, Sawces, [or Junkets,] and pretious Wine, but yet tells us not from whence the Milk to make the Cheeſe and Butter withall is to be had, nor whence the Sugar and Spices for the Cates, and the Grapes needfull to make the Wine with, are to be gotten? What benefit have we by knowing how to make Cheeſe and Butter, and yet want Cows to yield us Milk? To ſatisfie theſe, we will demonſtrate unto them, that even both the Milk it ſelf, and the precious Spices, and moſt excellent Grapes are all attainable by the help of Salt.

In my Treatiſe called *Miraculum Mundi*, as likewiſe in that called *The continuation of the ſame*, and in that Book, *of the nature of Salts*, I have clearly enough ſhown, that all the faculty of the Growth and Nouriſhment of all growing and movable Creatures doth take its riſe and original out of Salt alone, and that the correction or melioration, not onely of Vegetables and Animals, but even of the Minerals too, is to be ſought for from the ſame.

But foraſmuch as this bettering of the Metals meets with but little credit and is very hardly believed and underſtood, (nay 'tis plainly thought a thing impoſſible to be effected,) I could not chooſe but manifeſt and demonſtrate the truth of the ſame unto the whole World; namely, that like as the Metals

are

are in long process of time maturated by Salt in the Bowels of the Earth: Even so may the same be likewise maturated, mundified, and amended out of the Earth, by Salt, by the help and benefit of Art; not onely by the moist way, but also by the dry, and that with one Fire, in one Furnace, and with one Servant, whom I will in this place call *The Countryman paying his yearly Rent.* When his belly is continually fill'd with Coles, his Plows never cease going, so that weekly, monthly and yearly he is able to pay his master the due hire, namely Gold and Silver, wherewith all things necessary for houshold expences may be gotten.

And although this Countryman, which I will here describe, be not that [great] Country-Farmer, which I have mentioned in the *Third Part of the Prosperity of Germany:* yet notwithstanding he is a little one, and one that will discover so much unto the ignorant as to cause them to believe that the things which I speak of are possible to be done, and that there is a yet richer and better Countryman. But this here is to be accounted as a small Cow, and which will however supply you with Milk, Butter and Cheese, for necessary uses, if not with Sugar, Spices, and Wine too, to be set out upon the Table. If this Country fellow be too little and small for any one, he may even provide himself of a better, and learn by the consideration of this, by what means such Countrymen are to be nourished, that so the Rent may be gotten from him in its due time.

A. *The little Country Tenant with one Plow.* B. *The Countryman with three Plows.* C. *The Countryman's Cap.* D. *His three Plows.* E. *The Registers to govern the Fire by.* F. *The Glass set in with his Alembick and Receiver.* G. *The Door to shut the Crate.* H. *The Ash-hole.* I. *A Basket of Coals.* [See the Fig. before the 3d. p. of *the Prosperity of Germ.* noted with pag 76.]

In the first place you must prepare you some pounds of good Spirit of Salt, after the way which I prescribed with Vitriol, without which it will effect nothing, for out of this [Vitriol] it doth in the preparation carry over with it the spiritual Gold, or ringing Spirit, which said [spiritual Gold] is, in the performing of the operation, fixed, together with that spiritual Gold, which lyes hidden in the inferior Metals, and so becomes manifest.

Then (in the next place) you must build you a Furnace, which is called by the Chymists the *slow Henry*, or *dull Harry*, but I call it *The little Country Farmer* or *yearly Renter:* you may build it, I say, of what bigness you please; or for Example sake, the Tower which holds the Coles may be about Man-heighth, and about one Cubit broad in the inside, but so, that the top part and bottom part be narrower, and the middle part wider. To this Tower you must adjoyn two or three Furnaces, which are here called the Countryman's Plows, and in which the Vessels are to be placed, which hold the Metals that are to be maturated by the Spirit of Salt, and which have a continual heat, whereby the never-ceasing coction is holpen from the Tower that contains the Coles. Now see that you make all things cleverly and well proportioned, whereby that the Fire may be well and commodiously governed, and may be conserved for twenty four hours at least, without any looking too or medling with, as may be seen by the now described Figure.

The Vessel, in which the Spirit of Salt, with the Metal, is to be exercised (or laboured) with a daily Coction, must be made of such matter as doth not flie with the heat of the Fire, nor is not eaten with the sharpness of the Spirit, (but) such as may be seen in my Laboratory, and will for the most part dure and hold the Spirit of Salt a whole year without breaking.

All things being ready and fitted, the Countrymans Belly is to be filled with Coals up to the Neck, and his Head covered with a Cap, that the Fire may not find any out-let, save by the lower holes, through which, the heat may find an entrance into the adjoined Furnaces; and as for the Vessels, they are to be filled with the Spirit of Salt, and with Metals fitted for this Operation, and to be covered with their Alembicks, that the Spirits which ascend in the boiling may be received and conserved. When all the Spirits of the Salt are come over, they are to be again returned back upon the dried matter in the Cucurbit, and are to be agen drawn off by distillation. This operation and cohobation being often repeated, doth ripen and fix the spiritual Silver and Gold, whereby it becomes Corporeal: But yet the Spirit of Salt alone is not able to give Gold, but ripens Silver onely, but by the addition of other Salts, it will give Gold too. And even for the fixation of Silver, common Salt may be also added to the Spirit of Salt, that so the Spirit of the Salt may be made strong in the digestion; yea and in time so very strong, as to fume even in the cold Air, and therefore a little water may be also added besides the Salt

Hence it comes to pass, that in one days digestion six pounds of Spirit of Salt will give seven pounds of the same; unto which, if you again add one pound of Water, and one pound of Salt, you shall have eight pound of Spirit of Salt: which by the addition of another pound of Salt, and one pound of Water more, it may be farther augmented; insomuch that the Spirit of Salt, by a continually-repeated addition of Water and Salt, gets a perpetual encrease, and the Metal is so far from being at all hindred in its maturation, as that it is daily ripened more and more. For the Agent and Patient are continually encreased, and become bettered both in quantity and quality, which verily is a most excellent work, and never so manifestly described by any body as by my self.

But that I may be yet better understood by every one, I will here adjoyn a way which every one may imitate, and which teacheth how, by the Spirit of Salt alone affording not Gold but Silver, the said operation may be instituted with Copper.

You must take care to have a Vessel made either bigger or lesser, of such matter as the Spirit of Salt cannot spoil or prey upon; And pour thereinto as many pounds of the Spirit of Salt as it will well hold, and as many pounds as there be [of Spirit,] so many ounces of Copper-plate must you put in, and to them add twice as many ounces of Salt, so that to one ounce of Copper there may be two ounces of Salt. The Spirit of Salt being drawn off even till the Copper and Salt be dry, it will be stronger and more in quantity, because, from the adjoyned Salt, it hath acquired to it self an encrease and greater Virtues. Pour this Spirit agen upon the Copper, which in the first distillation was wholly dissolved up; and boil the Spirit of Salt over the fire, that the Copper, together with the Salt, which was not carried over by the Spirit in the first distillation, may be again dissolved.

The Furnace being cool'd, Take the glass out of the Sand, and pass the Spirit of Salt with the dissolved Copper through Cap-paper, and wash the white

Calx that remains in the Paper with water, dry it, and melt it with a fix Lixivial Salt, and you ſhall find as much pure Silver, nay, even ſomewhat more than the Copper had in it by its own nature. Put the green filtred Solution agen into the Cucurbit, being firſt well waſh't; of which, if there be ſix pounds, add thereunto one pound of Salt, and half a pound of Water, that ſo there may be ſeven pounds and an half, provided the Cucurbit will contain ſo many pounds, if not, then put the leſs matter therein. Then being placed in Sand, draw off the Spirit of Salt from the added Salt, even to dryneſs, and as much increaſe as you find it have above ſix pounds, lay it by, and add as much water to theſe remaining ſix pounds, which you muſt again put upon the dry matter in the Cucurbit, and then agen diſtill it off till the ſaid matter be dry, and repeat the ſame Operation again by pouring on and diſtilling off. If the Spirit of Salt be augmented in quantity one pound, then put more Salt into the Cucurbit, and agen augment the ſix pounds of Spirit of Salt by the addition of Water, and repeat the pourings on, and drawings off after the aforeſaid manner, always removing at each Diſtillation, the increaſe that is over and above ſix pound: and renewing the appoſition of more Salt, after that the former is drawn off, untill you ſhall have gotten in the fifth, ſixth, ſeventh, eighth, or tenth Diſtillation as much Spirit as you at firſt took, to begin your Diſtillation, [which was ſix pound.] Now all the operation conſiſteth in this knack, namely, that you ſo operate, as that nothing flies away in fume, for all the encreaſe ariſeth from the Salt and Water which you added thereunto. When you have gained thus much, you may (without adding any more new Salt) pour on the Spirit of Salt ſeveral times upon the Salt which is left remaining in the Cucurbit, and agen draw it off ſo often thencefrom, untill it hath brought over with it ſelf almoſt all that Salt. Which [Salt] being almoſt wholly changed by the Spirit of Salt that was poured into the Cucurbit, Diſſolve up the remaining Maſs of the Copper and Salt, and the Sand being cold, take out your Cucurbit, Filter the Spirit through Cap-paper, and waſh the white Powder left in the Paper, and dry it, and melt it as afore with a Lixivial Salt, and you ſhall have as much pure Silver as the Spirit of Salt was able to fix, of the Copper, in ſuch a time. Then put this green Spirit of Salt into the Cucurbit together with more new Salt, and repeat the ſaid labours ten or twelve times, and the Spirit of Salt will be always encreaſed and rendred more ſtrong, and the Copper will agen yield forth Silver.

This Labour, you may at your pleaſure, continue as long as you liſt, for you will always get ſome Silver, and have an encreaſe of Spirit. For both the Agent, *viz.* the Spirit of Salt, and the Patient, *viz.* the Copper doe encreaſe both as to quantity and quality.

But it may be demanded, Whence that Silver comes? That which gave forth it ſelf the firſt time we impute not unto the Spirit of Salt, as if by it made, no! but we ſay that it was in the Copper before, and was melted out of the Oar, together with the Copper, for this may well be. For there's no Copper to be found which does not hold ſome Silver hidden in its belly: and though the Refiners have as accurately ſeparated it as they could, yet nevertheleſs we doe conclude that that firſt Silver ſeparated in the firſt Operation, was what was left of the Oar in the Copper, and remained unſeparated by the Melters [or Refiners] therefrom, and was not made by the Spirit of Salt, but onely ſeparated. And the Spirit of Salt being in its nature an enemy to Silver, does not diſſolve it. But whence then did that come, which offered it ſelf unto us the ſecond, third, and fourth time; whereas in the firſt Solution, all the Silver was clearly taken out, and none at all left therein, but was all of it ſeparated by filtration? What ſhall we here ſay, or indeed how ſhall we dare ſay otherwiſe, but that we believe and confeſs, that the Spirit of Salt did by its operation make the ſame of the Copper. Nor is there any reaſon why this ſhould ſeem ſo very ſtrange unto us, foraſmuch as yearly, in the Earth, all Copper is naturally turned by Salt into Silver, and not onely Copper, but all the other Metals were at firſt, Salts: not ſuch indeed as we uſe about our Cookery in the Kitchins, but ſuch as are impregnated by the Sulphureous Stars [or Conſtellations.]

But foraſmuch as we doe at preſent treat onely of Copper, we doe not therefore meddle with the reſt of the Metals: for very rarely is Copper digged out of the Earth but it hath Vitriol therein, or, in defect of Vitriol, a Sulphur ſalted with a vitriolate Salt. For any ſort of Sulphur being burnt, and its fatneſs flaming, the ſharp Salt is releaſed, and paſſeth away in fume, reſembling the taſt, of the fiery Oil of Vitriol, and is captivated [or caught] in the great Alembick under which the Sulphur is burnt. This ſharp Oil ſupplies the place of an Agent as to the Minera's or Oars, in the Veins of the Earth; and doth more and more ripen the Minerals and Metals, but exceeding ſlowly: for Nature doth ſcarce attain to that limit in a thouſand Years, which Art doth in a few Months time. For there are no impediments to obſtruct the operativeneſs of our Agent, ſuch as are the Stones, Flints, Sands, and various Earths which frequently occur, and are much abounding in the bowels of the [Metallick] Veins: inſomuch that it can diſcharge its Operations freely, and without any Impediment at all: and beſides too, we uſe our external fire by which we help this our Agent, and ſtrengthen its virtues, and keep it in a continual action.

By all this diſcourſe may every one ſee, that when we ſpeak of ripening Silver out of Copper by the Operations of the Spirit of Salt, it is not contrary to nature, but altogether agreeable with the ſame. But now we doe not ſay that any one will ſuddenly bebome rich by this Labour, done with the Spirit of Salt and Copper, but we have deſcribed this Operation in this place, for this end, namely, that hereby the poſſibility of the thing may be learned, and that there may be good ground to believe, that even this too is moſt true, *viz.* when we write that by ſuch or ſuch an Agent, corroborated or fortified with ſuch or ſuch Subjects, and placed in ſuch-like Digeſtions, Gold may be extracted as well as Silver out of the meaner Metals, which how little ſoever there be of, may notwithſtanding prove profitable. For having once made onely ſome pounds of Spirit of Salt, you will not need to make any more anew, for in the digeſtion and maturation of the Metals, it will daily encreaſe, and that in a plentifull manner, and that too without any conſiderable coſts, ſeeing that the Salt it ſelf, which is to be added, is likewiſe cheap enough. If you make your Cucurbit of pure Silver, (for the Spirit of Salt will not work upon that) and digeſt your matters therein, you need not

not then stand in fear of the breaking of Glasses: Besides too, you may always let such a made Vessel lie in the Furnace, and assoon as ever the Spirit is drawn off, you may presently put it on agen, nor is there any need of your waiting so long, and ceasing from the work till the Vessel cool. If therefore a Tower to put the Coals in (as afore) be added to that Furnace, or Furnaces, then is it a true Countrey Farmer, or Tenant, for the sustaining of whom, there will need no other charge but that of Coals, and yet notwithstanding he gives you a perpetual gain without labour, cost, and trouble. Nay more, if we do but rightly weigh the business, we shall find that the daily encrease of the Spirit of Salt in these labours, is easily sold for more Money than the Coals will cost, so that all that Gold and Silver which is gotten out of the Metals, doth offer it self unto us for nothing. Besides, such kind of Metals may be taken for this Operation as are wont to yield more Silver and Gold than Copper, and the plentifulness thereof will be yet more, if several such kinds of Metals are joyned together and so dissolved, and digested, in which operation they better one another by a mutual action; for one supplies what another wants, and likewise from another, are those superfluities which it has in it, taken therefrom: so that (as we said afore) the mutual melioration of those Metals may be set on foot and promoted, as it were without any cost, and by a very little labour.

Whosoever he be therefore that has the knowledge and experience of the nature and property of the Metals, which they are, that have a correspondency with each other, and that love to better each the other; and is not ignorant what Agent is agreeable to Gold; such a one I say as this is, will commit unto his Countrey Tenant the care of Weekly and Monthly paying the due Rent, and will be able by this means to serve God his Creator without wicked Usury; to do good unto his Neighbour, to extricate himself out of that Diabolical Fellowship, of the impious and the great crew of evil Men; and to lead his Life in Tranquillity and Quietude; which verily is a great and singular gift of God, unto any one that can arrive unto such a knowledge.

But yet no Man hath any reason to perswade himself, should he be a Master of this Art and Science [here shewn,] that he shall be able daily to separate great heaps of Gold out of the more imperfect Metals, whereby he may be enabled to lead a vicious Life. No, for my endeavour shall (in the first place) be, not to make any wicked Man partaker of this Art.

And secondly, the whole business consisteth in the blessing of God, as we find it Written, *Paul hath planted, and Apollo Watered, but God hath given his Blessing*: For without this Blessing, all our Labour is but in vain: And this the Prophet *David* doth likewise testifie, saying, *In vain do ye rise up early, and being loaden with many cares, go to Bed late, and eat your Bread with troubles: For unto them whom God is favourable doth he bestow his gifts even while they are Asleep.* Moreover St. *Paul* saith, *It is not of him that wills, nor of him that runs, but of God that sheweth mercy.* And therefore a wicked Man, though he should possess so great a thing, yet would he not do any good upon it, if he wanteth Gods Blessing. Besides, I do not here bring forth my little Countryman upon the Stage, as if he could help any one unto huge Treasures; no, but onely as one that can bestow so much as may suffice, honestly to live. Unless haply a Man should light upon rich Veins and metalline Oars, which should abound with much corporeal Gold, and so by this means should yield great Treasures. Now so much cannot be lookt for, from such Metals as have in them but a spiritual Gold onely, unless the true weight be found, and that there be gotten the knowledge of those Metals which have a great affinity with each other, and which being joined together yield forth Gold. Otherwise you must not expect ought else from this Operation save an honest and moderate profit.

But now, as touching what Metals they are that have such affinity, and what the true proportion of the weight is, no body hath any reason to enquire of me, for I do not as yet profess my self an expert and absolute Artist in this matter, for sometimes I have a very gainfull success of my trials that I make, and sometimes agen I get less.

I was willing therefore to shew the way here, of ripening the meaner Metals by the help of Salt, and that too in a manner without any costs: which way of so doing being by me laid open, may suffice for this time, nor did ever any reveal it before me (I speak it without boasting) or produce it unto publick view in so open a manifestation as I have done.

And now if this separation should be used about the fixed Gold onely which lies hidden in the Oars and Metals, yet mought great profit be thereby gotten in all places; for there is no place in the World in which there are not to be found such Earth, Sand, and Stones as contain in them corporeal Gold, which may be extracted by the afore prescribed way without any costs at all. But here is to be observed that those things which I have written, and clearly demonstrated concerning such separatory Operations in the third part of the Prosperity of *Germany*, are to be agen read over, and well lookt into.

Moreover, this is also to be known, that this maturation if instituted by the dry way, brings more profit than if done by the moist way; for in the dry way the Agent is more holpen than in the moist way, in which there is always plenty of moisture. But however, both ways namely the dry way, and the moist may be done with one and the same Fire, nor will the cost be any more than if the moist way were made use of alone by it self.

For that Tower wherein the Coals are, and which is to keep the Spirit of Salt in perpetual digestion, and to heat the adjoined Furnaces, is always bright hot at the Grate, upon which [grate] if a cementing Vessel filled with Salt and Metals be placed, there will then be even thence as much profit as by an adjoined Furnace, and so by the Fire of one Furnace, and by the self same labour and cost is a double Operation performed, and a continual rent may be expected from the double Countryman.

You must likewise note, that there is a great difference of Salts, and that one Salt is more fit for this labour, and another for that; but by how much greater the Acrimony is, that the Salt abounds withall, so much the more potent an Agent it is: insomuch that it is of great concernment for a Man to know how to concentrate the moist Fire or Agent, concerning which Concentration there is no need of mentioning any thing in this place; forasmuch as I suppose that these things which are at present spoken are sufficient enough.

Moreover I would have the Son of Art know, that the Salt of the *Macrocosm* or of the Ocean, which we have taught the making the Spirit of, is nothing

nothing at all ſo efficacious as that which is gotten out of the *Microcoſm*: For whatſoever things are found to be in the *Microcoſm* or greater World, the ſame are likewiſe in the *Macrocoſm* or leſſer World, namely, Man. But it is not my purpoſe to diſcourſe farther of this thing in this place, but will (God ſo permitting) treat more at large of the ſame, if I come to write ſomewhat of the nature and ſignature of the greater World. For hereby great myſteries may be learned, which omitting to ſpeak more of, I keep cloſe to Salt and ſay, that that Salt which comes out of the Ocean or Sea of Man, or of ſome other Animal, that is, which is voided out of the Bladder, is far more fit for the Tranſmutation of Metals, than that which is gotten out of the Sea, as being the Bladder of the great Animal.

The Ancients have called the World the great Animal, and very rightly, for in its Center it hath a fiery heart by which (as being the great Animal) it moves it ſelf, and conſerves its life, as ſhall be ſpoken of in another place if God ſhall permit, for according to the common Proverb, *Man propoſeth and God diſpoſeth.*

Morien was not ignorant that *Arcana's* of great moment lie hidden in Urine, but hath manifeſtly ſignified it. For when he had prepared the Tincture for King *Calid*, he wrote upon the Veſſel in which it was, theſe words, *He that carries all things with him, needs not any other's help.* And having ſo done, he ſilently betook himſelf unto his Cell. But he had ſaid before unto the King, In thee O King! the Medicine is, by which words, he meant Urine. For out of Man's Urine may a fix Stone be made, which ſhall be manifeſted in other places.

Furthermore this likewiſe is to be here known, that it is a moſt notable and a true experiment and artifice in Alchymy, that is, in the true melting of Salt, when the Agent of Salt, and the Patient, or Metal, are ſo thoroughly conjoined and mixed, as that the Agent is diſperſt throughout the Patient, that ſo the Patient may ſuffer the more, and conſequently that that Patient Metal may be the ſooner ripened and fixed. When a Flock of Sheep being in the Fold, ſee the Woolf coming, they are indeed all terribly affrighted, but are not all bitten and torn, and ſo a part of them feel the hurt and the other part remain free. But if the Woolf ſeizeth upon the Sheep in the open Field, and that the Sheep are ſcattered far and wide ſo that they cannot poſſibly flock together, they will certainly ſuffer more grievouſly.

For Example ſake, when I would meliorate Lead by means of Salt, whether by the moiſt way by Spirit of Salt or by the dry way by dry Salts, if now I cannot radically conjoin the ſaid Salts and Lead together, I do but little to purpoſe, becauſe Lead and Silver, unleſs prepared by ſingular Ingeny and Skill, are not touched upon by Salt and its Spirit, and ſo ſuffering but ſuperficially onely they are able to reſiſt a long time. But being radically united unto Salt by the benefit of Art, ſo as that they cannot be diſtinguiſht from each other, then they ſuffer in all their parts and die, which death is their melioration and life. He that deſires to arrive at this Goal, muſt riſe betimes, and uſe a moſt notable diligence, for ſloathfulneſs hedgeth up the way of coming thereunto: Even I my ſelf am no perfect Artificer, but wait upon the Omnipotent God, expecting what he will pleaſe to beſtow upon me for time to come, and I live content with my preſent enjoyments. Thus likewiſe let another do.

But if now *Saturn* is to be uſed after another way and to ſerve inſtead of Earth to receive and multiply the metallick Seed, there's no need of diſſolving it in Salts, but it will be better to have it onely ſwell or puſt up in them, and keep in ſuch a poſiture as Earth is, conſerving the Seed ſown therein, in a moderate humidity and in the temperate heat of the Sun, which way is alſo a good one and commodious for the production of good metallick Fruits, and that by the help of Salt, as the following Proceſs ſhews, under this title, namely,

The Fire and Azoth *waſh* Laton.

SOME of the Philoſophers have called their Patient *Laton*, and their Agent *Azoth*. But what ſubject that is which they meant by the name of *Laton* there are many Opinions of Authours concerning it, in whoſe Writings may be ſeen, that the greateſt part of them do intend thereby *Saturn*, but yet not the vulgar: and even ſo is it too concerning their *Azoth*, or Vinegar, that being likewiſe diverſly accepted. But be it as it will, yet this is certain, that even in the common *Saturn* do many abſtruſe ſecrets lie hidden, (to ſay nothing of the more myſterious *Saturn*, did we but know how to get it out.)

All Philoſophers do ſuppoſe, that the Heart in *Saturn* is better than that in Gold it ſelf, and for that reaſon do they call Lead a Leaprous Gold, and ſay, that if it could be mundified by a true waſhing, ſome great matter would proceed thereout of. Many Men have very much buſied themſelves about this waſhing, but yet have not attained unto ought elſe, ſave that they have brought the *Saturn* into a white, fugacious, and liquid Body, concerning which labour I have made mention in this Treatiſe of metallick Cates and Sawces, and alſo in the third Part of the Proſperity of *Germany*.

In my judgment, the common *Saturn* is a commodious Earth, for the reception of a metallick Seed, and for bringing the ſame unto multiplicaton; Witneſs *Paracelſus* himſelf who tells us, that *Saturn* may be compared to the Earth, for all ſuch things as it ſeizeth on it makes like it ſelf, and turns them into Earth, *viz.* in the common Fire, for *Paracelſus* here intends that.

But now, if ſome metallick Seed be ſown in *Saturn*, as being a commodious metallick Earth, and that ſuch an Earth and ſuch a Seed be moiſtned with a due metallick Water, and be expoſed to the fruit producing and vivifying Sun, the earth together with the Seed, doth by reaſon of the moiſtning cauſed by the pouring on, or affuſion of the mineral Water, ſwell up, and become porous, and receives and conſerves the Water, ſo that the ripening Sun cannot dry up the Earth, and conſequently burn up the Seed. And by how much the oftner the Earth is moiſtned with the mineral Water, and the Sun expelleth the ſaid humidity, ſo much the ſpeedier doth the Seed ripen, and attain to his maturity.

For like as the Husband-man when he is about to ſow this Corn, chooſeth ſuch a ground, as contains a fat and tenacious mould, which may not be waſht away with the Rain, nor ſuffer the due nouriſhment to be withdrawn from the Seed; for if the Seed be ſown in Sand, a little Rain can eaſily waſh away the Sand and Seed, and impede the faculty of growth,

growth, which in a fat and tenacious Soil is not wont to happen. For the Water or Rain should but onely moisten the Earth, that it may not be too closely compreſt, but become porous and admit of the Rains penetrating unto the Seed: which when so, then is there hopes of the Seeds sprouting, in such a fat Earth which swells up by means of the Water, and of bringing forth its Fruit.

Even just after the same manner are the metallick Seeds to be sown, and ripened; and for Example sake, let us take the vulgar and common *Saturn*, (well mundified) for that Earth, into which we will sow such a Seed as having a great affinity with *Saturn*, loves to be augmented therein, whereby it may bring forth fruit. And like as the Seed of any Animal requires an Animal Matrix, as a Field or Earth to be multiplied in, and hath not any affinity with the common Earth: Even so likewise doth a metallick Seed require a metallick Earth, Matrix, or Ground, wherein it may germinate and be multiplied.

Now this multiplication is on such wise made, as is done in the Animals, by the conjunction of Male and Female, one performing the office of the Agent, and the other of the Patient. So then, we will make some trial in this Process which is here annexed, not for the intent of getting great Treasures thereby, but for the sake of searching into, and getting the knowledge of Nature; we will take the Male in the room of the Seed, and the Female instead of the Ground or Field, and we will try whether or no the Seed will admit of multiplication.

Let us therefore take the common *Saturn* for the Feminine Matrix, and Antimony of the Male-like-seed, which we will sow into its own Matrix, as Husbandmen are wont to do. I do not gain-say but that there are other Seeds, and probably better to be found to be implanted in *Saturn*, than Antimony is: But yet here I content my self with this of Antimony, as having an intention of onely shewing at this present, by what way it may appear that a metallick Seed may be brought to a faculty or possibility of growth in the Saturnine Earth. And upon this account for Demonstrations sake of this Labour, was I willing to use Antimony, it being a masculine Seed of a Saturnine kind. For common *Saturn* is usually accounted for the true first Ens of *Lune*, and Antimony for the true first Ens of *Sol*, and they are in very deed found so to be. For you shall not find any Lead without Silver, nor any Antimony without Gold; so that I strongly perswade my self that from those two, there cannot arise ought else but what is good and profitable, did we but know how legitimately to compound and handle them. And although I do not profess my self to know many things, yet will I simply tell you my opinion, concerning the way which I suppose such a Commixtion and Maturation may be effected by.

A Philosopher saith thus,

By Gold and Silver you will nothing do,
Unless you use their first Ens thereunto.

The first Entities of both these are Lead and Antimony, the latter of which, (*viz.* Antimony,) is not to be admitted in that impure state that we find it in, unto the former, as unto its Bride or Spouse, but must first be washed in a hot and sharp Lixivial Bath, that it may thereby attain to a delicate silvery whiteness, and shine like a Star in the Firmament; which Antimony thus purged, is called by *Paracelsus*, the signed Star.

But yet I would not have any one to think, that I do here mean the common stellate *Regulus* of *Mars*, which would be dissolved in Spirit of Salt, and would separate it self from the Lead, which ought not to be: But that signed Star must be so prepared, as not to admit of being dissolved in Spirit of Salt, for else it will not serve for this Work. It must be so concreted as if it were so many thin Shells (one within another,) and so very hard as to be able to cut Glass, and to strike Fire out of a Flint. This signed Star being so washt, is to be sown into its own Matrix, and by the solar Heat and fruitfull Rain, to be promoted and enforced unto growth.

Take of the thus prepared masculine Seed, or signed Star, [A] parts, and of the feminine kind, [B] parts, melt the signed Star in a pure Crucible, unto which being molten cast the Woman in, which being cast in, there is presently made a sweet Conjunction and Commixtion of them both in that infernal Heat, in which they familiarly couple together.

The Mass being commixt, is to be poured out of the Crucible through wet Brooms into cold water, and is to be reduced into Grains, and so the masculine Seed or Husband will be legitimately and duely mixt with its Earth or Ground, or Wife: which Earth together with the Seed which it contains is to be put into a firm Vessel, which fears not the violent corrosion of the Spirit of Salt, but in such a quantity as that scarcely a tenth part of the Vessel may be filled therewithall: Then must there be put thereon as much mineral Water, namely pure Spirit of Salt, as the Cucurbit can bear, and Fire is to be put thereunder, whereby the Spirit of Salt is to be again drawn off, by which Operation, the Earth together with the included Seed will day by day be refresh-ed, be moistned and swell up, by reason of the Spirit of Salt, no otherwise than as if you should moisten some dry and as it were parched Earth, with Water. For the *Saturn* is not dissolved by the Spirit of Salt, but onely swells up, and becomes foliated, and yet remains whole or entire, nor is it much unlike unto lovely lookt Talk, which shines with a delicate whiteness: and therefore the Philosophers say, sow your Gold in white foliated Earth. Without doubt they meant not common Gold, for then they would not have said, our Gold, but would have simply said onely Gold, had they not intended a peculiar Gold, or first Ens of Gold.

N. B. I cannot by any means omit to give you thus much notice, namely, He that cannot hit upon the manner of preparing the said signed Star, may endeavour the making of common *Saturn* aureous, particularly after this manner, as follows. Extract with Spirit of Salt out of the Oars or Veins and metallick fugacious Earths, the spiritual Gold that lies hidden therein, and extract or draw off this Spirit thus impregnated with Gold from *Saturn*, which Spirit may by this means be all agen had, and be used about new extractions. And as for the Gold which the Spirit extracted, that the *Saturn* hath imbibed, and indues it self thereby with a golden nature; which if you imbue or moisten with many such extractions, that goldenness will, as I may so term it, grow up or increase in each cohobation, and the Spirit of Salt it self will become augmented.

If now the *Saturn* be imbued with a ſufficient Portion of ſpiritual Gold, it muſt be reduced by X, or Alkalies, that ſo the ſpiritual Gold may be made corporeal, which will exhibit it ſelf pure unto you, after that the *Saturn* ſhall be driven away on the Teſt. But yet there is no need of doing this, ſeeing it will be better to granulate the *Saturn*, and by thoſe repeated cohobations to draw off the Spirit of Salt agen, being each time impregnated with that ſpiritual Gold, and ſo by this means will you enrich your *Saturn* with the greater plenty of Gold. And being ſo enriched it muſt be reduced by a fixing X, in my ſecret Crucible, which neither ſuffers any thing to go away in fume, nor to run out; in which reduction the ſpiritual Gold and the fugacious *Saturn* it ſelf are fixed, ſo that both Gold and Silver are found on the Teſt with great profit, this labour requiring no other coſts ſave thoſe of the Fire.

This Operation which ſeparates fugacious and fix Gold out of the Oars and Stones, is far better than that which is made by the Solutions of *Lune* and *Saturn*, deſcribed at large in the third part of the Proſperity of *Germany*. For here, we do not need either *Aq. Fortis* or Vinegar for the Solution of *Saturn* or *Lune*, neither need we the ſame to get the extracted Gold out of the Spirit of Salt, but being free from that labour and coſts, we [onely] draw off from *Saturn*, that Spirit which hath extracted the Gold, which [*Saturn*] attracts and holds the volatile and fix Gold that was in the extraction, inſomuch that there is not requiſite to this labour of drawing off the extractions from *Saturn*, any thing elſe ſave onely Coals and Fire. Add hereunto alſo, the gainfull encreaſe which daily comes in by the addition of Salt and Water, by which the Spirit of Salt is day by day augmented without any coſts.

N. B. When the Spirit of Salt becomes too ſtrong by reaſon of the Salt put thereto, that Water wherewith the Oar is waſht, after the firſt extraction of the Spirit of Salt, [or after it hath firſt been extracted with Spirit of Salt] may be made uſe of [and put thereto] inſtead of common Water. For it is ſomewhat ſouriſh, and hath likewiſe a golden nature.

N. B. Praiſe God, and forget not the Poor, ſeeing thou art ſufficiently informed and taught by what means thou maiſt get great Treaſures.

The things I here write, are not for this end, namely, to teach others how to make great heaps of Gold, but onely to ſhew them a way of attaining to a good Medicament, and withall, of knowing and perceiving by the ſame labour, that the melioration of the Metals is altogether poſſible and certain.

Whoever he be that could attain ſo far as to bring Antimony and Lead, as being the firſt Ens of Gold and Silver, into a certain Diſſolvent, ſo as that the one would not precipitate the other; then at length would he have entrance upon the right way, which leadeth unto great things, like as alſo Gold and Silver being diſſolved in one and the ſame *Menſtruum* gives beginning to things of great moment. I dare affirm therefore, that he that can reduce Gold and Silver, or Antimony and Lead, with Salt, into an agreement, hath opened a moſt ſtrong Gate which leads unto a great Treaſure; for then the Patient muſt ſuffer even unto death, and muſt die, out of whoſe dead Body, new and living Bodies do afterwards come forth.

Although I have often told you in my Writings that Gold has no greater enemy than combuſtible Sulphur, and that nothing is more inimicitious to Silver than Salt, and nothing more diſpleaſing to *Mercury* than a ſtrong *Lixivium*, and that amongſt theſe contraries there is a perpetual Antipathy ſo long, untill they are conſtrained by Art and Skill to become friends and mutually to embrace each other: yet notwithſtanding, this will not be ſo eaſily feſible by every prating Boaſter, and that makes a great noiſe by his lofty vapouring ſpeeches; no, but for the ſake of theſe very Men, are ſuch great *Arcana's* juſtly and deſervedly wrapt up in darkneſs, and indeed 'tis fit they ſhould ſo be.

Moreover if there be required a great ſuffering, 'tis neceſſary that both the Gold and Silver, as being Male and Female, ſhould ſuffer together and not barely the one or the other apart: for hereby this Regeneration will be made ſo much the nobler and the more magnificent. For Example, make a Circle, and cut or divide it with Diameters croſswiſe [or at right Angles through the Center] ſo that the extreams of the Diameters which divide themſelves in the middle or central point of the croſs may touch the Circle, and that of thoſe four extreams [or Semi-diameters] one may touch above, and the other beneath, and the other twain may reach, one to the right ſide, and t'other to the left. Place the Gold in the uppermoſt extream marked with the letter A, and his enemy, namely Sulphur, in the lower extream, which the letter C, demonſtrates. In like manner place Silver on the left ſide of the Gold, at the letter B, and its enemy, *viz.* Salt on the right ſide marked D, and you will ſee how averſly theſe enemies behold each the other. The *Sol* looking about him eſpies his capital enemy, Sulphur, directly oppoſite unto him, and hath *Lune* at his left ſide, and Salt at his right; and very willingly would he enter into friendſhip with *Lune*, and Salt which are joyned at his ſide, if they but would, or indeed could. But he honours not his capital enemy Sulphur, with ſo much as a look. The *Lune* placed by the ſide of the Sun, does not permit the Salt to joyn it ſelf with the Gold. For when the Salt is with the *Sol*, it clearly hinders the *Lune* from aſſociating it ſelf with the ſame. Nor can it poſſibly be that Salt, *Lune* and Gold ſhould enter into a thorough familiarity. Thus too is it with *Lune*, who hath her capital enemy diametrically oppoſite unto her, and very willingly would ſhe enter into friendſhip with both her neighbours, *viz.* *Sol* and Sulphur, if they were not ſuch great enemies (to each other,) and refuſed this familiarity. For if *Lune* aſſociates unto her ſelf the Sun, then Sulphur denies to come into the ſociety. If ſhe admits the Sulphur as her companion then, then *Sol* is excluded, as abominating the friendſhip with his enemy Sulphur. Much leſs therefore can *Lune* be the companion of them both together. *See the Fig. in the Book of Dialog.*

But now if the Gods pleaſe, that theſe four capital enemies, ſhould unite in one ſociable amity, and that wonderfull regenerations ſhould ariſe from this new familiarity, (then) do they command *Vulcan* to heat in the Fire this Circle comprizing thoſe four capital enemies, thus conſtituted in the four aforeſaid extreams, and caſting ſuch hatefull looks upon each other, and yet not knowing how to eſcape out of the Circle, and to preſs them together more and more with his Hammer by little and little, untill all four being driven into one maſs, do come together into one body, which body doth then obtain a power of reconciling all enemies, and of effecting great matters.

By

By this here spoken may any one easily conjecture, what great suffering there is in this Conjunction, and what great streights do afflict these enemies, when each of them must thus against their will enter into friendship with his capital enemy. Verily we find them to be such sufferings as have not their like again, and therefore do they produce to light, such great and such wonderfull regenerations. Now whatsoever it be that is exercised in but a small suffering, the same doth admit of but small emendation.

The greater the suffering, the greater the melioration, so that that affliction which brings with it even death it self, brings with it also so much the more noble and magnificent Regeneration and Resurrection. He that suffers not in this World, shall not have the Crown put upon him after his Resurrection. By how much the greater and more innocent the suffering and affliction of this life is, so much the greater, and fairer a Crown may be expected in the other World.

The Grape is prest so long, till it be rid of all its juice, this juice doth indeed bring a sweet and pleasant delightsomness unto mortal man, but the Grape it self which the juice is prest out of, ceaseth to be a Grape, and perisheth through defect of juice, and passeth into nothing. But unto the noble Vine, hath God given this benefit, that it yearly bears not barely one but many Grapes together: All which being pluckt off, it doth nevertheless produce the following year no fewer, but rather more Grapes; and still remains a blessed and fruitfull Vine, because it is furnisht with roots and fertile Boughs. On the contrary, they that have devoured the good and sweet juice themselves, remain always hungry and thirsty, and that for this reason, because they guzle down the juice too new and fresh, whereby their Bellies swell, and they receive no nutriment therefrom.

This is a thing certain and undoubted, that the bodies of the Metals become by suffering and dying far more excellent and more noble. He therefore that knows that the patient is to be subjected unto its own agent, and doth also understand by what way they are to be conjoined, will never labour in vain, but will reap the wished reward of his pains.

When the agent doth touch onely the superficies of the patient, and penetrates not into its heart or root, there will verily be but a very little good done, save onely this, *viz.* That the Agent being afore rendred aureous, is able to give unto its patient also a golden nature, and to bring the same to an aureous degree, and to bestow upon it the perfection of Gold: but that melioration which is done onely by it self proceeds on very slowly.

As concerning the manner of enduing the Spirit of Salt with an aureous nature, that so it may the sooner render its patient a partaker of golden virtues, we have spoken of that already, and demonstrated it clearly enough; he that does not understand, we cannot help him any other way.

N. B. When the Eagle, the Servant of *Jupiter*, hath with his beak and talons pluckt out the coagulated beams of the Sun out of the Cliffs and Rocks, and brings them unto *Jupiter*, he is so very bountifull, that he sends down the same unto us by the Rain, which is of so much efficacy, as that all the Herbs upon which it falls are bettered, and the martial, venereal, saturnine, *Lunar* and mercurial Herbs do put on the golden nature of the Sun; so efficacious is the golden Rain of *Jupiter*, if the Eagle hath first brought unto him the coagulated rays of the Sun.

And that I may be the better understood, and that it may be known, that the Melioration of Metals may be accomplished by a dry Agent, full as well, yea and better, and more profitably than by a moist Agent; I have judged it a thing worth while to adjoyn the following Process under the Title of *the Great Country Farmer.*

And let the studious Artist know, that the amending of the Metals by the dry way, by the operation of dry Salt, is far more easie, and may likewise be dispatcht in a greater quantity, than is wont to be done by the moist way: and that there is nothing required to this operation save Salt and Coals, be the Metals that are to be fixed, even what they will.

For Example, if a man be desirous to fix *Saturn*, or to procure unto it a Silvery nature, there needs not pure Lead be taken for this work, seeing he may have the Oar or Vein thereof for much less price; and indeed there is some that is a wild and sulphureous Oar, which yields not, in the melting, any good Lead, and may be had in great plenty in some places of *Germany* that I know of, for a very small price, or rather for none at all. Such a wild Oar of Lead as this is, which yields neither good Lead, nor is fit for the Potters to glaze their Pots withall, by reason of its hard fusion, doe I chuse for my operation, not onely because it costs less than other such Oars of Lead doe, but for this reason too, because it hath store of Sulphur, and fit enough for fixation.

This Vein or Oar doe I bring into small Powder, and mix as much Salt thereto as need requires, then cast it in upon the Coals, in such a Furnace as I have described to make store of Spirit of Salt in: The Salt and the Sulphur exercising their vehement or powerfull virtues upon the Lead, causeth it to be afflicted with terrible dolours, insomuch that part thereof ascendeth on high [or sublimeth] with part of the Salt, and betakes it self into Receivers fitted on for that purpose. In which sublimation, the Salt and the Lead ascend in a spiritual manner, and contrary to their will, suffer spiritually, and so are constrained to enter into friendship, finding a place of quietude in those cold Receivers, and there setling together. The residue of the Oar, and part of the Salt being burnt up, and emitting no more flores, but falling down through the Grate like Ashes, more new or fresh Coals must be put into the Furnace, and new matter must be thrown thereupon, as afore; and this Labour is to be continued so long, as it shall please any one to follow it. Now by this, the *Saturn* is far more vehemently afflicted, than in the moist way by the Spirit of Salt; And if unto the Oven [or Receiver] receiving the fume, and in which the flowers of the Salt and Lead settle, there shall be applied yet several Receivers, there will then be therein caught store of Spirit of Salt, which being rectified, may be agen made use of in the moist way. The flowers being taken out of the Oven or Receiver into which the fume goes, are to be agen thrown in upon the live Coals in the Furnace, that they may suffer anew and be sublimed. After that they are all sublimed again on this wise, they are to be agen taken out of the Oven, and be cast in upon the live Coals; and must be afflicted with these Labours so often repeated, untill they become fix and ascend no more, but fall down into the Ashes. Which being washt, will yield a Salt profitable for many things, and will quit all the costs which have been laid out upon

upon Lead, Salt, and Coals; ſo that the Spirit of Salt which is gotten, and that which is amended in the Lead Oar by the Salt, coſt nothing. The Aſhes being waſht are to be reduced, in a Furnace, by blaſt, and be ſo often tormented, till a good portion of Silver be gotten by this operation, which the elaborated matter, being purged by a due ſeparation upon the Teſts, will give. And ſo ſhall you have Gold and Silver by the benefit of this operation, by which [operation] we have manifeſted unto you the *Great Country Farmer paying his yearly Rent.*

Now like as *Saturn* is dealt withall in this operation, even ſo are the other Metals wont to be handled too; but yet you muſt obſerve the Regiment of the fire, which, according to the diverſity of the Metals, muſt alſo be diverſly adminiſtred. And even the Commixtion it ſelf requires good heeding, as being a buſineſs of no ſmall moment.

Moreover, in this operation you muſt alſo note, That one Salt is more fit for this operation than another is; for by how the ſharper nature they have, ſo much the more commodious and profitable doe they ſhew themſelves to be. So Common Salt ſublimed, as is done in this Labour, will operate far ſtronger than Common Salt it ſelf unſublimed. Beſides, there are Salts to be found which work yet far more powerfully, yea ſo ſtrongly, as that they need not the help of an external fire, but doe produce their effects even in the cold. The operation of which, in the moiſt way, if any be deſirous to promote and ſtrengthen by an external fire, he may ſo doe, in a Lamp-Furnace, and free himſelf of the charge of Coals, and be exempt from that frequent Labour by which the Fire is to be maintained.

Some moiſt Fires are of ſuch great virtues, as that they need not any Lamp-fire, but a ſmall golden thread or wire in burning Spirit of Wine is capable of adminiſtring heat ſufficient.

And the burning Spirit, if made of Leaves, Graſs, rotten Fruit, or Corn, and Grape-ſtones or husks will be but of ſmall coſts, or in a manner none at all. Now a pound of ſuch Spirit being placed with a Golden wiek in a convenient Lamp will ſuffice for three or four days, and give heat enough. But yet nevertheleſs, that moiſt fire doth ripen its Metal without the help of any external fire at all, and yields its profit, but then it requires a longer ſpace of time.

Put caſe therefore, that I make my moiſt fire ſo ſtrong as to be able to perform its office in the cold, and that it needs not any external fire: And if I were to make a fire, it would needs require one Ducket's charge: If now, ſtanding any-where, it yields me two Golden Duckets out of the maturated Metal, it would doe well enough, and abundantly recompence the labour and coſts expended. For there's nothing wanting of the Metal [you took to ripen] ſave that which is changed into Gold and Silver.

And foraſmuch as I can ſet by many ſuch Veſſels, and thoſe great ones too, there's no doubt to be made, but that my gain will be the greater, and that with very little labour. For now, at firſt, the labour of preparing the moiſt fire, is in a manner no labour at all, for in three or four days may be ſo much made as is ſufficient for the maturating of a great deal of Metal. For this fire may be compared to a Seed, which being ſown in the Earth afore Winter, doth in the Summer-ſeaſon produce ſtore of Fruit, and fit to be reaped.

And though this maturation proceeds on exceeding ſlowly, and excludes all haſt, yet it brings with it this benefit, namely, that it requireth no other labour in the Winter-time, but to be onely once laid by, and the perfecting thereof muſt be committed to God and Time.

There are various and divers ſuch cold Fires, that promote the maturation of the Metals, and may be gotten out of divers Subjects, namely, out of Tartar, Urine, Hairs of Animals, Horns, Calx-vive, Soot, the Blood of Animals, the Feathers of Birds, the Bones of Horſes, Oxen, and other Beaſts, out of which ſuch a fire is very difficultly prepared, one of them, here reckoned up, excepted, out of which the ſaid fire may by an eaſie labour and buſineſs be made, and without coſts. It is therefore a great gift of God, and an eſpecial grace from our Creator, if he maketh us poſſeſſors of ſuch a Country Farmer, which being ſuſtained without any coſts, doth notwithſtanding very largely pay his yearly Rent. To God therefore are unceſſant thanks to be returned for ſo great a benefit.

But we have ſaid enough of theſe moiſt and dry Metal-ripening Fires; what way ſoever any one is minded to chuſe, that way may he follow, for it lyes in his own free choice. If he chance to err, let him not lay the blame upon me, who out of a good mind have undertaken theſe labours of writing, but cannot thruſt the chewed meat into any ones mouth. I will by God's permiſſion ſhow the wonders of God to ſome friends this next Summer, that ſo ſuch as come after us may likewiſe have occaſion of praiſing God, and of giving him thanks.

But even as the common Earth, when it is moiſtned with often ſhowers, and now and then freed of them by the heat of the Sun, retains in it ſelf a fruitfull Salt, and doth neceſſarily acquire a fertility: So likewiſe our Earth doth not onely daily encreaſe in goodneſs, but in weight too, and becomes more ponderous: but you muſt not think that this heavineſs or weight proceeds from the Spirit of Salt's inſinuating it ſelf into the porous Earth, no: For if the ſaid Maſs ſhould be but onely eight days time in the digeſtion, and the Spirit of Salt be [then] waſht off, yet would it be encreaſed a quarter part; which ponderoſity comes indeed from the Spirit of Salt, out of which the *Saturn* draws ſomething unto it ſelf for nutritious ſake, as the Common Earth does out of the ſhowres of Rain, and becomes more weighty.

For if there were no occult and nitrous virtue in the Rain, it would conduce but little to fertility; and if there were no ſpiritual and aſtral Gold, or ſpiritual and aſtral Sun in Salt, the immature Metals could not be ripened by the ſame. By how much the oftner therefore, a good Spirit of Salt is drawn off from the *Saturnine* Earth, and *Saturnine* Seed, ſo much the ſooner alſo doth that Seed arrive unto its full ripeneſs. For at every turn [of drawing off] ſomething of the good part of the Spirit of Salt remains behind, attracted by the Earth and Seed, from which the melioration and augmentation doe ariſe: as may be ſeen in the Vegetable Seeds which ſprout forth out of the Earth, and are encreaſed by the help of Rain.

The poſſibility of theſe things I have ſeen, but have not hitherto brought the ſaid matters to a full maturity, or to ſpeak more rightly, I have not finiſhed the whole operation. He that is minded to make a thorough trial, may ſo doe: and if he miſſeth the effect of his endeavours, let him not blame me, for I doe not aim at drilling on any one by my perſwaſions,

sions, to bestow his charges on an uncertain thing. But I mention these things that so the nature of Metals as also of Salts may be known, and that (by the help of this knowledge) the Writings of the Philosophers may be the better understood. For the labour here proposed avoucheth the truth of those Operations which the Philosophers call their Calcination, Dealbation, Incineration, Ascention, Descention, Cohobation, Inceration, Distillation, Sublimation, Volatilization, Maturation, Fixation, and say that all these and the like Chymical Operations may be made in one Vessel, with one Fire, in one Furnace, without any change of the Labours, Vessels, or Fire.

For the Philosophers have described their greatest secrets and *Arcana's* parabolically, and in Riddles, but especially the Poets, as *Ovid*, *Virgil*, and many others, who are very hard to be understood by those that have not the knowledge of the nature of Metals, which being once known and understood, renders the meaning of the Poets easie. For the Poets were wont to impose one while such a name upon such a Metal, another time another name upon another Metal, which custom of theirs, he that does not heedfully mark will easily fall into an errour, and miss the apprehension of their meaning.

For Example, in one place they call Copper *Venus*, in another, the Wife of *Mars*, in another, the Sister and Wife of *Jupiter*. And so deal they with Silver too, one while they call it *Lune*, by and by *Diana* or *Jana*, another time *Vesta*. *Apollo* is by them stiled one while *Sol*, then *Phœbus*, then *Latons*, so that it is exceeding necessary, for those that are desirous to learn ought out of their Writings, to be well acquainted with those different names and Appellations. And although the Poets do account all the Metals for the Sons of *Saturn*, yet do they sub-distinguish them and stile them, *Saturn*, *Jupiter*, *Venus*, &c.

The common Lead is *Saturn*, and so is Antimony, *Saturn*, *Bismute*, *Tutia*, *Lapis Calaminaris*, the Ashy Colour, Yellow, White, and red *Magnesia* are termed by the name of *Saturn*: The white *Marcasite* and *Zink* are deemed to be of the Family or Pedegree of *Jupiter*: *Orichalcum* or white and red Copper, are stiled by the name of *Venus*. But according as *Venus* is impregnated, and according as the Copper is white or red, so hath it its name. The red Copper is as yet a Virgin. Forasmuch therefore as the Poets have committed unto Writing the Transmutation of the Metals under the Cover, and vail of Fables, and have made mention of *Saturn*, *Jupiter*, *Mars* and *Venus*; it can never possibly be, that he who knows not this different distinction can understand their meaning. And for an Example hereof, consider but the Fable of *Diana* and *Apollo*, brought forth at one Birth by *Latona*, who was gotten with Child by lying with *Jupiter*, and was driven into exile by jealous *Juno*, and having a long time suffered Persecution by the biting Serpent *Python*, and being driven to flye through all the Countries of the World, did at last after many grievous labours and troubles pass over the tempestuous Sea into the Island *Ortygia*, and betook her self to her Sister *Asteria*, by whom she was received, and begat these Twins, *viz.* *Diana* and *Apollo*.

Who will be able to apprehend the meaning of this Fable, save he that well understands the nature of the Metals? Verily no body will so much as dream of or smell out ought of those Mysteries, unless he shall meet with such like Histories in his metalline labours, and then at length will he understand what the meaning of the Philosophers is. But for Example sake, let us take two Metals which have an affinity with each other, namely *Jupiter* and *Venus*, these I joyn together, that so the Woman may be impregnated with the masculine Seed. *Latona* therefore being great with Child, I cast her forth into exile, that she may be continually persecuted by the biting Serpent *Python*, untill she flies through the Salt and stormy Sea, into the Island *Ortygia*, to her Sister *Asteria*, dwelling in the Island *Ortygia*, and there bring forth the fair *Diana* and *Apollo*. Now these things are easily understood, were but the genuine Appellations substituted in the room of such strange terms, of which thing I have onely some knowledge, but do not profess my self a perfect Interpreter. Yet methinks I cannot choose but say somewhat. The venemous Serpent *Python* is a sirname of *Appollo*, for he is produced by the efficacy of the Sun, and is that corrosive Salt which doth so long afflict and torment the impregnated *Latona* all over the dry part of the World, untill she betakes her self by the Sea, that is, by that strong Salt Water, unto her Sister, that is, unto pure *Venus*, and precipitates her self, and brings forth the fruits of *Jupiter*, namely, *Diana* and *Apollo* together. The Poet doth here mind both the moist and the dry way together, when the Metal is wrought with a due Cement, and made fix it is [then] dissolved with the Salt Water of the Sea, and pure Plates of *Venus* are put into it thus dissolved, that so the pure Metal may draw unto it self her impregnated Sister, who brings together with her Gold and Silver, which having been so long hidden in its body doth now manifest it self.

It is indeed the better to fix the Metals by Cements, and so to render their fugacious Gold and Silver compact, which may be as well done in the moist way by sharp Waters and moist Fires. But if the Metals, legitimately impregnated, do first pass through a dry and burning hot Fire, and are afterwards yet once more transmitted through the moist and cold Fires, then *Pluto* sends the mundified Soul out of *Purgatory* unto *Neptune*, by whom it is carried into Paradise, where it doth afterwards remain safe and free from all danger of the Serpent.

Upon occasion of the aforesaid Fable, and particular Transmutation of the inferiour Metals, this is to be yet more observed, that every *Jupiter* is not fit to impregnate *Latona*, but that onely which is yet living, efficacious, young, and full of Seed is able to impregnate *Latona*. For *Latona* carried with her no more but the Seed onely of *Jupiter* into the Island *Ortygia*, and left behind her all the body of *Jupiter*.

Moreover this is to be considered, that *Latona* did bring forth *Diana* first, in the Bosom or Lap of *Venus*, that is, of the Midwife, but *Diana*, presently after she was Born, performed the office of a Midwife in receiving her Brother *Apollo* in her Lap, which thing is sufficiently manifest unto those who have laboured (though but little) in the Metals. For should the Nativity of *Apollo* have preceeded, *Venus* could not have received him, for which reason *Diana* ought to come forth first, that so she might the more commodiously receive *Apollo* from *Latona*. I know not how by any means it may be proposed more clearly.

Every one that does but know the nature of the Metals doth well understand, that when Gold and Silver are spiritually dissolved in one Water, and that plates [of *Mars* probably] are put in to the Solution of the Gold and Silver, neither of those Metals will adhere to the Plates. But if the Plates of Copper are put into that Bath, he shall presently see that all the Silver that was in the Water will adjoyn it self thereunto. And now, after that the Silver is thus precipitated and sticks on to the Copper, the Gold will likewise fall down out of the Solution, and apply it self to the Silver; which labour I have more at large handled in the third part of the Prosperity of *Germany*. It could not therefore otherwise be, but that *Latona* must first bring forth *Diana*, and *Apollo* afterwards, seeing that *Venus* the Sister of *Latona* could be helpfull onely in the bringing forth of *Diana*. It was therefore necessary that *Diana* her self should be an assistant in the Birth of her Brother *Apollo*, for otherwise he could not have been Born.

My time admits not of producing any more such similitudes in this place. We will defer them till some other time, namely, for the Edition of the Work of *Saturn*, wherein shall be taught how the most vile, and most abject Metals are to be maturated by the benefit of Salts, whereby they may in a particular way yield forth Gold and Silver.

But forasmuch as I cannot divine, what impediments may put a stop to the edition of the work of *Saturn*, and that in this very Treatise here is often mention made of *Saturn*. It cannot I think be any ways hurtfull, if some good thing be yet farther adjoyned. And such things as are here manifested of *Saturn*, it will not be needfull agen to mention them in other places, seeing there doth yet still remain matter enough for to fill a whole Book of the Secrets of *Saturn*. And there lie such wonderfull Secrets under the vile and dirty Garment of *Saturn*, as being manifested, would exeeed all the belief of unskilfull Men. For he is not onely an expert Fisher in Fishing Pearls out of the Salt Sea, but is withall an expert Hunter, in driving the Wild Beast out of his green Grove or Cops, and of catching him in his Nets, as we have told you in the foregoing third part of the Prosperity of *Germany*.

Nay, he is a bathing Gentleman of singular skill, who by his bathing and washing his Children, adorneth them with the comelines of *Diana* and *Apollo*. When he is alone, he serves onely for *Apollo* and *Diana* to wash off their accidental impurities and defilements, that so they may recover their natural fairnes. The other Metals can't brook his so over sharp and rigid bathing, but are rather suffocated and killed therein, than become more fair and more pure. But if *Saturn* shall have first washt himself even unto the highest whitenes, in a Bath of common Salt, he is not then so austere and severe, but prepares for his Children a far more tolerable Bath, which being agreeable [or proportionable] to their Weaknes and Sickness, renders them all fairer and more pure. His greatest virtue consists in his Water which doth both particularly and universally free the Metals of all their defilements. I have often had a particular experience [hereof,] and yet daily can (God be praised) shew and teach the same unto others. But I cannot do any such thing in an universal way, and inform others as to that; nor do I vainly brag of so great a matter, though I have my thoughts as touching the manner how this thing may be effected. Nay the more I conceived about that matter, the lesser would I boast of the same.

Verily it is a great shame to boast of that thing, of which thou hast not even the smallest knowledge, or at least dost not know any thing else, but what thou hast drawn in, by the reading of other Writers. 'Tis a common proverb, *That those Cows which Bellow, or Low overmuch, are said to yield the least Milk*, and that this is a thing true, yea most true, experience it self doth testifie.

The Chymical Art is become at present so common, that almost every body, after he hath but viewed over one or two Chymical Books, (though he never moved his hands to the Work, nor understands so much as the Chymical Terms themselves) is nevertheless wont impudently and lyingly to boast of the knowledge of the universal Medicine. Nay thou shalt see some to proceed on to that heighth of boldnes, as even to write Books of so great a Secret, and to dare promise the Revelation of the same unto others, and yet for all this know nothing at all, and have not so much as any the meanest foundation, but rely solely upon that knowledge, which (being as we said afore, drawn out of other Writers) causeth in them a most uncertain hope, of a thing most extreamly obscure.

He that is not a stranger unto, nor ignorant of metallick affairs, can easily discern the Lyers from the true Writers, and can judge who are true, and who false. Such as do know somewhat are not wont to make a bragging noise of their skill. On the contrary, those Brethren of Ignorance do offer unto every one that most secret miracle of Art and Nature, namely, the universal Medicine, which thing a true Philosopher neither ever did, nor ever will do. But as for the revealing of the particular washings, purgations, and meliorations of the Metals, whereby Gold and Silver are to be extracted, if any one doth know these things and discloseth them, and desires not to bury his Talent in the Earth, he does well.

Neither would any one be endammaged by such a discovery though those particular *Arcana's* should be known even unto all Men, and that every body could effect such Operations; for nothing could redound from them but great gain throughout all the World.

But these things here mentioned may sufficiently serve for an evident and manifest admonition for every one to beware of the Books of such Writers, (but why do I say Writers? they are rather Collectors and Describers, who after the manner of Botchers do patch up new Books out of old cast Garments) and to give no credit at all unto them as containing nothing of truth in them, and to think that those kind of Men betake themselves to this Book-patching Trade, meerly to get their Bread by.

Some such Men have I known, that provide not either for their Food or Rayment any other way, than by the sale of such false Philosophical Books, which they have from the Printers to sell to others, receiving a certain price for their labour, which they bestow in profering them to Sale. O miserable Philosopher! Who doth not know so much as to get his Food at Home in his own House, but is constrained to shift after it by the bare selling of such kind of Books. Let this here spoken be as a warning. If need required, and occasion were, I would not fear to divulge their names too; who having not any the least knowledge of nature, do nevertheless dare to offer the Revelation and Confection

of

of the great universal unto others, and cast such a great blemish of reproach upon the most noble Chymical Art, as makes it much contemned, whereas a more noble and more excellent Art cannot be found. I'le not censure any, but yet it would become the magistrate to examine those great Philosophers, whether or no they were actually and in very deed skill'd in that great universal, (which they boast so wonderfully of, and write Books of such great moment, and promise to teach others too, as if they excelled even *Hermes* himself in the knowledge of the Art) and if in the proof or tryal they gave good satisfaction, and confirmed the truth of their Writings by a real and true melioration of the Metals, then to honour, defend, and protect them, as rare and singular Philosophers. But if they know nothing nor could perform ought of their pretended Art, the magistrates would not do unjustly if they punished such men, and made them exemplary, seeing too that they endeavour to asperse and backbite other honest men, who are endued with the skill and knowledge of such great things, with lying reproaches. A good Gardener being wont to gather good Honey out of the Bee hive which he has in his Garden, if he finds a Nest of Wasps or Hornets any where near, built in some hollow Tree, and that they steal away the Honey from his Bees, he right worthily destroys such a Nest, and roots out of his Garden those Thieves and Robbers of his Honey, that so for the future they may not detriment them any more.

Were but one or two of those Fellows handled in such a manner the rest would be deterred and would not so easily promise others by their deceitfull Writings, the making of the Philosophers Stone, which they are so extreamly ignorant of. Certain it is therefore, that no true Philosopher, were he a partaker of the great universal, will indifferently offer the same unto all Men, and calumniate (without any cause given) those that are so innocent (and who have forgotten more than others have learned) and publickly bespatter them with most false Lyes before the whole World, to the great detriment of the Persons so abused.

But to return to my purpose, and to shew in this place yet another very considerable *Arcanum* of *Saturn*, you must know, that I have already published divers great secrets in this fourth and third preceeding part, but cursorily onely, because I have not as yet attained to the one half part of their most great utility, and I was willing onely to shew what things mought be done.

But forasmuch as I have fortified their use with good and sharp Weapons, and that one or other sometime lighting thereupon by chance, and reaping great profit therefrom, may possibly judge that he is no ways at all bound or beholding unto me for the same; I was willing for the better information, and instruction sake, to adjoyn these few things, which are very weighty and considerable.

In divers places of the foregoing third part, and of this fourth part too, I have the preparation of the *Mercury* of *Saturn* and *Lune*, that is, I have shewn how *Saturn* and *Lune* may be reduced out of their Solutions, by the help of Salt, into a Snow like, fusile, fugacious, pure and dry Water; which Waters are by me called the *Mercuries* of *Saturn* and *Lune*, by reason of their fusile and volatile nature: They are metallick Waters not wetting the hands, and yet by reason of their form do they bear the name of Water, because being put into a Crucible, and molten with a small Fire, they are pellucid and transparent like unto Fountain Water, insomuch that they may be seen through even to the very bottom: But yet the Water of *Saturn* is of a more transparent clarity than the Water of *Lune* is.

But forasmuch as our main scope in this place is to make some mention of the use of the Saturnine Water, we will let pass other matters, and declare some of the virtues of the said wonderfull Water in the melioration of the Metals.

Let the lover of Art therefore know, that the Saturnine Water doth display its virtues in washing the Metals that are to be amended. For if any imperfect Metal, as Iron, or Tin, or Copper, be adjoyned thereunto, and held in such a Vessel, as in which, that Water cannot by means of its fugaciousness vanish away, nor through its subtile and penetrating power run out, and that it be digested for a while in such a Vessel, this Saturnine Bath seizeth upon, washeth, and purgeth the Metal, and transmuteth it into a better and more pure Metal, but yet with no great profit, for it onely shews the possibility.

But yet if some tinging Species be adjoyned thereunto, it does not onely make a pure washing, but likewise exalteth and tingeth the same, according as the tendency of the adjoyned subject is, either unto a white or a red Tincture. But what those Species are, there's no need of discloſing them to every one. 'Tis sufficient that I have laid open the Water, and the use thereof in the washing of the Metals.

But that the Saturnine Bath may the sooner and readier seize upon the Metals, and wash them, it is the best way, to add one third part of the Mercurial Water of *Lune*, to the Mercurial Water of *Saturn*: which Waters do very readily conjoyn, and each help the other in the washing, and do also tinge, according as the property of that Tincture is, which is adjoyned thereunto. I will for Example sake adjoyn the manner, which shall both shew the possibility of the thing, and administer occasion of farther search.

Dissolve one ounce of pure Silver in *Aq. Fortis*, and three ounces of common Lead, in more *Aq. Fortis*, mix both the Solutions together, and precipitate them, either with common Salt Water, or with Spirit of Salt, which is all a case. Pour off the *Aq. Fortis* from the *Coagulum*, after its being settled to the bottom, which said *Coagulum*, you need not wash with Rain Water, for this Work, but press the liquor onely through a thick Cloath and so free it of its humidity; this done, dry this metallick Cheese by the Fire, and you shall have a Bath very fit to wash *Venus*, *Mars*, and *Jupiter*. And now when you are minded to try whether or no the success will fadge well, divide your Bath into three parts, and wash those three Metals on the following manner.

N. B. Let no Body take it in evil part, that I here silently pass over my secret bathing Laver, serving to wash the Metals in, and not permitting the Water it self to go away in fume: He that is minded to try this Operation, may for the first time make use of Crucibles, which, although they may bring some loss by letting go part of the Saturnine Bath, yet notwithstanding they will demonstrate the success of the business, and the loss by them caused may afterwards be prevented by due *Mediums*. The manner of using the Bath aforesaid, is as followeth. Take

Take of the filings of pure Iron, Copper or Tin one part, mix it with three parts of our dry Bath, and put the matter thus mixt into an earthen Veſſel, which hath the compactneſs of Glaſs, ſuch as thoſe are, which are made at *Siburg* near *Colen*, at *Bamberg* in *Franconia*, and at *Waldenburg*, near *Caſſela* in *Haſſia*, and in other places of *Germany*. (*N. B.* The common Veſſels and Crucibles cannot retain this Water, but it penetrates through them like Oil.) Heat your Veſſel ſo hot as to cauſe the Water together with the Metals to melt and flow well, in which liquefaction, part indeed of the water will paſs away in fume, but this loſs may be eaſily prevented.

When therefore your Metal hath been thus boild for about one quarter of an hour, part of the ſame will be found waſht and turned into good Silver: nor muſt you thus underſtand me as if the Silver in the ſaid Water were onely precipitated by the Metal, and that no part of the Metal it ſelf underwent any Tranſmutation. For albeit that that Silver which was added to the Saturnine Water be precipitated by the adjoyned Metal, and returns into its former Body, yet nevertheleſs there is more Silver gotten than was added to the Water. For that Saturnine Bath while it is occcupied about the diſſolution of the Metal, doth by the efficacy and Operation of the adjoyned *Lune*, exalt and tinge part of the Metal to an higher degree.

But although this labour does not promiſe any golden Mountains, it is here put for this end onely, namely, that the poſſibility of the thing may be learned hereby: yet notwithſtanding, if any one did but know how to adjoyn to this Saturnine Water, a golden Ferment, inſtead of a ſilvery one, it could not otherwiſe be but that he would get no contemptible gain and profit: yet if the ſame Operation be ſo inſtituted with a white Ferment, as that not any the leaſt part thereof may go away in fume, and be loſt of the Bath, it will bring no loſs. *N. B.* Neither is it always needfull that the Ferments of pure Metals be adjoyned to this Saturnine Bath, for I think that apt Minerals may be found, which may be adhibited in the room of aureous and argenteous Ferments. Nay more, I do likewiſe think that ſuch ſubjects may be adjoyned to this Saturnine Mercurial Water, as may be therein fixed into white and red Tinctures; the thing it ſelf I have not as yet tried, nor do I profeſs my ſelf ſo great a Maſter, for I propoſe to my ſelf this onely end in my Writing, namely, to ſhew unto ſuch as are deſirous after tranſmutations, the way of arriving unto the truth it ſelf. For it will be far eaſier for every one that ſearcheth into the buſineſs more thoroughly, and that maketh more accurate tryals, to find out far greater things, yea much more than he could ever believe. More ſuch Woman-like Waſhings, and more Boys Plays ſhall (God willing) be manifeſted in my Work of *Saturn*.

But now this Saturnine dry Bath may be prepared much eaſier, on this wiſe following; chooſe you out ſuch an Oar or *Minera* of Lead, which is very pure and clean, and hath not either Iron, or Copper, or any other Metal admixt therewithall: (*N. B.* If Silver be likewiſe in the Oar, it rather profits than hinders, but the ſaid Oar muſt not have much earth mixt in it, and that which is on to it muſt be taken from it by waſhing off the ſame with fair Water.) One, two, three, or more pounds of this leaden Oar thus waſht, muſt be put into a ſtrong Cucurbit, and ſo many pounds of Spirit of Salt muſt be (put on and) drawn off thencefrom, which Spirit of Salt, as being a moiſt and Philoſophical Fire, will reduce the pure Oar of Lead, which it toucheth every where and in all places of the ſame, into a bright, Snowy, eaſily Meltable, and fugacious Calx, which is to be well waſht with Water and be dried: This is that metallick Bath, and that dry Water of the Ancients, which wets not the hands, and which is able to perform admirable things in the Metals.

But that this Philoſophical and moiſt Calcination of the Oar of Lead, may be accompliſhed without any coſts, ſome Salt Water muſt be poured upon the Spirit of Salt, in the Cucurbit, that the Salt may aſcend together with the Spirit, and may augment the ſame with ſo great a quantity of Spirit, as may quit the coſts of the Oar and Fire, and yield you the dry Saturnine Bath for nothing, which ſaid Bath may be employed various ways about the waſhings and emendations of the Metals. For out of the Oars which never underwent the burning by the Fire, and were never as yet deprived of their growing faculty, this Bath thus prepared is to be preferred far afore that, which is made of the molten Metal.

I do here open to the ſtudious of Art, the Gate that leads unto moſt great ſecrets, which were never ſo clearly manifeſted by any Man. It muſt neceſſarily therefore be, that either God muſt put a ſtop, or that the Operator or Labourer himſelf muſt be of a ſtupid and ſimple capacity, if he cannot learn from theſe inſtructions, as much as to live in quietude, and ſo furniſh himſelf with Food and Rayment.

If therefore God ſhall vouchſafe his Bleſſing unto thee in the uſe of this ſecret, then give unto him, the beſtower of all good things, thy utmoſt thanks, and be not unmindfull of the Poor. Suſtain thy life by the works of thy hands, and let thy light ſhine before the blind, neither bury the ſame enviouſly in the Earth. Do good to every one, that it may be diſcerned and appear what Tree thou art. Entertain not too great an opinion of thy ſelf, but remember that thou art a Man and mai'ſt err and fail. Give no body occaſion of quarrelling and brawling. If an unjuſt conflict be brought upon thee, commit thy ſelf wholly unto God, and he will ſuccour thee. Give place to the greater, and ſpare the leſſer, God will defend thee and ſuppreſs thine Enemies.

The Heathen Philoſophers accounted the Prophet *Ezekiel* as a clowniſh Philoſopher, becauſe he wrote ſo very clearly of the Divine Myſteries. For they took it very untowardly, that he was not ſo envious, as to involve ſuch great Myſteries in ſilence, but wrote ſo openly of the ſame.

He that will now-a-days make it his deſign to wind himſelf out of the crew of Sophiſters, and ſuch kind of Philoſophers that putteth together hurtfull Books, conſiſting of fine Spun, and ſeducing words onely meerly for their own gain, and without any profitable information at all in them; he I ſay that would free himſelf from ſuch, overcome them, and bear away the prize, muſt imitate that countrey-man, who on a time entring into a Fencing-School at *Norimberg* did behold the Fencers artificially combate together ſo ſtrongly and ſo long, untill all the others being tired, and forſaking the Stage, there remained but onely one as ſole victor; who, with a diſdainfull look, contemning all the reſt, aſſured himſelf of the victory.

Being

Being therefore about taking up the Prize-Money there deposited, out steps the Countryman, saying, you shall not have the reward, except you beat me too off the Stage: Fight therefore he must with the Countryman, or forsake the prize; but promising himself an assured Victory, he exerciseth his most curious and artificial postures, which he had learned in the fencing School, thereby to make a speedy dispatch with the Countryman, supposing that the Countryman would be frighted, and laying down his Weapons, quit the Stage. The Countryman being no ways scared stood very quiet (as confiding in his own strength) so long, till the Fencer approaching nearer with his oblique Flourishes, made as 'twere a Wheel afore his Nose, whom the Countryman struck all along, with such a smart blow as made the Hair of his Head flye off, and the Bloud run about his Ears. So artificial a Combatant as this being or'ethrown, he was asked by that plain Countrey Fellow, whether or no he would yet once more try the fortune of the Play, but he would no more prove the Countrey down-right blows of a Non-Citizen, but left both the Money and Honour of the Victory to the Countryman, who being asked how he durst adventure upon so artificial and experienced a Fencer, and could so o'recome him, he replied, that he perceived the Fencer used may oblique Skippings, but was no strong Man: and therefore I opposed my strength to his artifical Flourishes, and so with one blow struck him down. By this History it is evident, that that finely Spun, and sophistical prating of the Schools, makes nothing to the purpose but a certain experience, and an infallible knowledge of things both is and so remains the sole Mistress.

For the sake of these that are lovers of divine and natural Miracles, 'tis expedient that I yet farther manifest some certain secrets of Salt, which are hitherto altogether unknown, and shall be shewn unto my Friends in my Laboraory. Nor do I at all doubt, but that some few will be found who will easily understand these things, and look on them as things credible. But I matter not, whether they credit me who speak the very truth or not. It sufficeth me that I can, not onely perform the things I say, but likewise shew them to Friends, whereby they may be able to reap some benefit and profit therefrom.

Salt may be so introverted by the Operation of the Fire, as that it shall lose its sharp properties, and acquire a sweetness, and be brought by the help of other Vegetables and of Water, unto Fermentation, and so yield a good and sweet burning Spirit, a clear, sweet, and strong white Ale, conserving its taste for many years; various drinks, not unlike in taste to the Wine made of Honey and Fruits of Trees, strong and clear Vinegar, and white Tartar, fully as profitable for such Operations, as the common and natural Tartar of Wine is wont to be used about, and may be with those others [afore mentioned] prepared with small charges.

The Air and Fire do in a short time transmute Salt, into true natural Salt-peter, which is no small profit.

The Fire doth likewise very easily endow common Salt with such kind of properties, as render it capable of fatning and dunging barren Fields, Vines, Fruit Trees, Hops, and all other Garden Herbs as well as Sheeps or Beasts Dung.

Salt is also so changed by the Fire in few hours time, as to put on a magnetick nature, and attract the moisture and water out of the Air, and to retain it with it self a long while, and therefore is not easily dried up by the Sun. Corn, as Oats, Barley, Rye, Wheat, Pease, Beans, and other Seeds being steeped in such a Salt for a Night, do by means thereof, grow up the speedier out of the Earth. It is very profitable therefore in the Summer Season, wherein there's scarcity of Rain, and especially in sandy Grounds, because it holds the Rain Water a good while, so that it is not so easily dried up by the Sun. Besides, too, that Salt is of such attracting virtues as that one ounce thereof, being put in some little Glass to two ounces of Water, hardens all this Water, in the likeness of Salt, so as that you may carry the same about you in a Paper; whereas there were two parts of Water to one of Salt.

This Salt abounds with yet many other wonderfull virtues, some of which I have declared in my Treatise, *of the Nature of Salts*, stiling it by the name of *Sal Mirabilis*, and that not without good cause. It is of the form of Salt-peter, and is void of all Acrimony, it is a little bitterish to the tast, and is of a Balsamick Nature. For being rub'd on Beef or other such like Flesh, it keeps the same, though exposed to the open Air, from being infested with Magots, and from being corrupted: And therefore it is an efficacious subject, with which as being a most efficacious Balsom, dead Bodies are conserved from corruption. It converts all things put into it, in long process of time, into an hard Stone, and abounds with many other wondrous virtues, which (for certain causes,) I pass by in silence at this time. *Paracelsus* calls it *Sal Enixum*, but I *Sal Mirabilis*.

Nor ought it to seem at all wonderfull, that common Salt doth so easily obtain by the Operation of the Fire, a better and sweeter quality. I do in very deed affirm, that not onely the common Kitchin Salt, but even those too, which are of a most biting corrosivity, as *Aqua Fortis*, *Aqua Regia*, Oil of Salt, of Sulphur, and of Vitriol, may by a certain sweet Vegetable, (without the addition of any contrary Salt) be brought to such a pass in three hours time, as that a Man cannot perceive the least Corrosion at all in them. Nay more, if this very Salt hath dissolved up any Metals, it does not part with them, but holds them still: so that the corrosive Solution of Gold which is made with Oil of Salt, becomes a sweet liquor, which likewise comes so to pass, with the Solutions of Silver, and of the other Metals: so that by this way excellent Medicaments may most easily be made out of Metals.

New Wines being fermented with such a Salt, do change their Tartar into sweet Wine, and become clear in a months time, and suddenly have both the taste and odour as old Wines usually have. Certainly it is a secret of very great concernment, when by reason of the coldness of the Air, the Wines cannot attain unto their due maturity. *N. B.* There appertains to this fermentation, a singular and excellent Artifice, by which the Wines and other drinks are promoted to a speedy and strong fermentation, insomuch that the Wine boils in the Vessel, though the Vessel should be set out to the Snow and Ice in the coldest time of Winter: whereby the Wines must needs be made better, stronger, and sweeter. It is a very artificial invention, hitherto concealed by me, but now I am minded to reveal the same unto my Friends.

By the ſame Salt too, Wine, Ale, Metheglin, and other drinks may be in ſhort time turned into good and ſharp Vinegar without the help of the Sun, or of a warm Stove.

If therefore any one needs for his Operations any diſtilled Vinegar, he may even diſtill it in wooden Veſſels, without any ſparkle of Fire, onely in the Air, by the proper efficacy of the liquors themſelves, and by the help of the Air: and this in ſuch wiſe, as that a whole Barrel of diſtilled Vinegar will not coſt ſo much as one Token, the Barrels or Veſſels excepted, which verily is a moſt Artificial Diſtillation.

Thus likewiſe by the ſame means may a ſweet burning Spirit be diſtilled out of Ale, Wine, and other the like Liquors.

Any common Wine may be rendred ſo ſtrong by the help of a certain ſweet Salt and artificial fermentation, as that it cannot be drunk becauſe of its ſtrength. Some Pots full onely thereof, being poured into a Barrel full of ſmall Wine, will make the ſame ſo ſtrong, as to equalize it with generous Wine. He that is ſo minded may add ſome ſweet Spices in the fermentation, and ſo make it the more ſweet, more efficacious, and more wholſome, and ſo a little quantity thereof being poured into another Barrel will make all the Wine therein contained become ſweet and good.

Out of common Salt may eaſily be made good Allum and Vitriol, no leſs uſefull for the Dyers than the natural are.

It is likewiſe a thing eaſily feaſible, and that too in few hours ſpace, to turn the ſame into a fiery nature, and make it have the ſame property as the Salt made of Wood Aſhes, and of the burnt Lees of Wine and ſuch like, and as Pot Aſhes have, and may ſerve for the Soap Boilers and be applied to the ſame uſes that thoſe Salts are uſed for.

Moreover, ſtore of ſweet Spirit of Salt may be gotten with ſmall charges out of common Salt, ſerving not onely for the preparation of many excellent Medicaments, but alſo for the maturation of the meaner and unripe Metals, as we ſaid afore.

Theſe and the like wonderfull things, yea and very many ſuch effects incredible to the unskilfull doth that contemptible and common Salt produce, to the exceeding benefit and profit of mankind: which excellent things I neither would nor could (for the honour of God, the giver of all good things, and for the ſake and profit of mankind) any longer conceal. But ſome or other may object and ſay, if by the help of common Salt, ſuch great things may be effected, why do not you prefer the ſame before Salt-peter, which you have ſo exceedingly praiſed in the third Part of the Proſperity of *Germany*, and have conſtituted it the Monarch as it were of the whole World: whereas notwithſtanding it is ſo venemous a Dragon as is wont to devour all things. Can't theſe two Salts I pray, namely the common and Salt-peter, divide the Government of the World between them, and bear ſway and command both together.

To ſuch I anſwer, that although that common Salt be the producer of many wonderfull effects, yet muſt it needs give place unto Salt-peter, which being inflamed and on Fire is wont to overturn huge Mountains, and blow them up into the Air, which thing ſeeing common Salt cannot do, 'tis but fitting and right that it ſhould be dignified with ſo great a Title. However, being by the Operation of the Fire and Air made equal unto Salt-peter, and performing the ſame effects, it may then worthily be graced as Salt-peter is with the Title of Monarcy.

The effects which I have attributed to common Salt and Salt-peter, I can every hour ſhew, in very deed, to be moſt true. Ill therefore do they do, that bark againſt me for ſaying that Salt-peter is a univerſal Diſſolvent, and that endeavour by their tatling reproaches to obſtruct the truth.

Why do they not produce ſome better thing, ſeeing they will not admit of this univerſal Diſſolvent? ſuch Men as theſe do nothing elſe but bewray their own fooliſhneſs, and kick againſt the Pricks.

Had they ever done ought, or ſet their hands to work, for the ſake of ſearching throughly into nature, they would never ſo boldly contemn, and reject that, which they never as yet underſtood. They behave themſelves very baſely, and clearly diſcover unto all Men's view, that they have ſuckt in their uncertain and fooliſh Opinions, by the bare reading and hearing of uncertain and dubious Writers, whoſe meaning notwithſtanding they underſtand not; for my part I remain conſtant in my Opinion, and ſay, that Salt-peter is an univerſal Diſſolvent, and is able to diſſolve all the things in the whole World, if it be made uſe of in three forms or ſhapes. Whatſoever the acid Spirit thereof, or the Eagle with its ſharp Claws cannot effect, its fixed Salt, or the fiery Lyon will accompliſh: and whatſoever is impoſſible to be done by theſe two, the Griffon which hath its riſe from the Eagle and Lyon, will artificially perform.

N. B. The acid Spirit of Niter doth not diſſolve ſulphureous ſubjects, but mercurials onely: Contrarywiſe, the fix Niter doth not ſeize upon mercurial ſubjects, but ſulphureous ones; but the flame of Salt-peter performs both: which verily is wonderfull, that things ſo unlike ſhould in ſome few hours time be extracted out of one and the ſame ſubject. For the corroſive Spirit prepared out of Salt-peter by Diſtillation, and likewiſe the fix Salt, are moſt bitter enemies to each other, which ruinating and flaying one another, and being dead, return agen unto that which they were afore, and partakes of both natures; which the Ancient Philoſopers do clearly point out unto us by the Griffon, which is headed and winged like an Eagle, and the hinder part of its Body like a Lyon, as we have mentioned more at large in the foregoing third part of the Proſperity of *Germany*.

Upon him that rightly underſtands this ancient Fable of the Griffon, Lion, and Eagle, doth the Sun ſhine, for he will get no ſmall profit to himſelf thencefrom. Whatſoever the Corroſive Eagle diſſolves and tears a-pieces, that the fix and fiery Lion precipitates. And whatſoever the Lion devours, that the Eagle doth agen ſnatch from him: but they kill each the other, of whoſe dead bodies the Griffon exiſts, which hath the body of the Eagle and Lion. By how much the oftner this labour is repeated, ſo much the more potent and ſtronger doth the Griffon come to be, [eſpecially] if both the Eagle and the Lion have filled themſelves with food and are grown fat; or by how much the bigger the Eagle and the Lion are grown, by ſuch Subjects as are agreeable unto them, afore their mutual fighting; the Griffon doth alſo become of magnitude proportionable.

Once every day therefore may ſuch a conflict, ſlaughter, revivification, and tranſmutation of theſe two fighting and capital Enemies, *viz.* the Eagle and Lion,

Lion into the Griffon be made. But if you would have it profitable, then muſt *Vulcan* ſharpen *Saturn*'s Sythe, by which he may divide the Griffon [in twain,] and may turn whatever proceeded from the Eagle, into the Eagle again; and may tranſmute that which aroſe from the Lion into the Lion agen. When the dominion of the Griffon is divided, and that the Eagle bears ſway onely over his birds, and the Lion onely over his beaſts, like two Kings, then all is well, and there's no war. But if once the Eagle endeavours to ſnatch away from the Lion his prey, then ariſeth a great war, and of ſo long a continuance, till they have ſlain each the other, of whoſe bodies the Gods doe make the Griffon. But when the Griffon becomes too diſdainfull, and affecteth Tyranny, and deſigns to bear rule over birds and beaſts together, he is agen divided by *Vulcan*, by the perſwaſion of old *Saturn*, that ſo he may return by a reiterated tranſmutation into the Eagle and Lion: which wheel [or rotation] of reciprocal tranſmutation doth never reſt, but converts it ſelf [or turns it ſelf round] in a perpetual courſe for Man's puniſhment, as long as it ſhall pleaſe the moſt high God, who, at laſt, will put an end to all fightings, ſlaughter, and contention, that afflict this world: at which time all the Eagles and Lions which ever were in the world, ſhall be turned into the Great Griffon, which will rend and overthrow the whole Earth.

This time all pious Souls doe expect and wait for with ardent deſire, and many ſighs, that they may be at laſt freed from the talons of the Eagles, which rend all things a pieces, and from the claws of the roaring Lions, and enjoy everlaſting peace and quietude.

Thus much may ſuffice to have been ſpoken of Salt-peter at this time, which, how it may be prepared very plentifully, and with great profit, out of the Salts of Vegetables, Animals, and Minerals, I have already declared in the foregoing third Part of *the Proſperity of Germany*. He now that dreams of ſo managing his affairs as to reap benefit and profit to himſelf thenceſrom, may inquire into the buſineſs by a more accurate meditation and ſearch. Yet let him know, That Salt-peter may be very eaſily made of many vile Subjects, which may be every where had: of which Salt, if you have plenty, you cannot want other things. For not onely moſt excellent Medicaments againſt all kinds of Diſeaſes may be made with Salt-peter, as likewiſe the growing faculty of Fruits ſpringing out of the Earth, be promoted, as of Corn, Wine, and ſuch like things neceſſary for the ſuſtaining of the life of Man; but alſo pure good Gold may very eaſily, but with great profit, be gotten out of the imperfect Metals.

Seeing then, that by means thereof, a man may be ſupplied with firm health, food, and rayment, and with Gold and Silver, what other thing is there, I pray, that he can want? That which I have ſo often ſaid, I doe here repeat and affirm, That there is not in the whole World any ſubject that can compare with Salt-peter, much leſs be preferred before it.

Such a noble, yea ſo kingly a Subject therefore as this is, well deſerves to be moſt highly honoured by us, and to be ſearcht into by the utmoſt of our endeavours, becauſe of the ſo great benefits it beſtows upon Mankind. We will therefore proclaim and pronounce Salt-peter to be the Monarch of the whole World, though all its and my enemies, who endeavour to beſpatter our honour and repute with the brands of infamy, doe even burſt for malice.

O moſt fooliſh men, with how vain a hope doe ye expect the Lion and Monarch from the North, as the *Jews* doe their Meſſiah, who came above 1600 years ago. The Lion of the North, and the Monarch of the World is even at this time preſent, and hath always been, but yet hath been known but by a few; the full and perfect revelation of which, God alone knows. I doe verily think the time is now at hand; Theſe things which are known unto us concerning him, are all of them but particulars, and very few too. But if the ſaid Northern Lion ſhall find out and dig forth the treaſures which lye hidden in the Mountains, then will he at laſt exhibit his power to be ſeen, and ſhew himſelf to be the Monarch of the whole World.

Salt-peter is that great and fire-ſpitting Dragon, the keeper of the Golden Apples, and that venomous Baſilisk which kills all things with his looks. If he be but fixt and made conſtant in the fire, then is he that Salamander living in the fire, and that Phœnix the bird of the Sun, which having gathered pure Gold out of the Sand, uſeth it to the making of her neſt, and arriving to its utmoſt old age, burns her ſelf; out of whoſe Aſhes other Phœnix's are produced.

He that deſires to know more of the Griffon, Phœnix, Dragon, Baſilisk, and Salamander, all which doe exceedingly thirſt after Gold, and dig it out of the Earth and keep it, may read *Pliny*, and other the ancient Writers of natural things; as alſo *Ambroſius Calepine*'s Dictionary of eight Languages, and of the laſt Edition.

The Concluſion.

THeſe (O friendly Reader) are the things which I was willing to publiſh at this time for the Countries good; Had I had more time and opportunity, I would have added more profitable ſecrets, and ſuch too as are of no ſmall moment. If I find that theſe here written are acceptable, I will in a ſubjoyned Appendix make a clearer interpretation of ſuch obſcure places as may be herein met with.

N. B. I would have the friendly Reader here know, that although I have written theſe Four Parts of *the Proſperity of Germany* clear enough, above my other [Writings] [or more clear than the others] yet notwithſtanding I have reſerved for my ſelf and my friends ſomewhat amongſt all the Proceſſes, and ways of operation, ſo that I know how to effect the preparations of Salt-peter, and to make uſe of its various properties, in extracting Gold and Silver out of the Oars, and in the melioration of the imperfect Metals, and tranſmuting them into Gold and Silver much eaſier, and far more compendiouſly, and with much leſs coſts.

The things which I have written, I have written for every one, Friends and Foes together; The other, and thoſe better Secrets, I have reſerved to my ſelf and my friends. This ſhall now (God willing) be my chiefeſt care, that my Laboratory, in which the truth of the whole buſineſs ſhall be ſhown unto my friends, may be fitted up and made ready. In the mean time, the Princes and Noble men, whoſe territories ſuch metallick treaſures are in, and cannot be extracted by the help of common fuſion, may conſider, whether or no it will be agreeable to their minds to make uſe of theſe my Artificial, and not vulgar Operations in extracting the Gold and Silver by

by Salt and Salt-peter out of ſuch-like auriferous ſubjects. If it ſhall ſeem unto them a thing worth while, to inſtitute ſuch operations for the profit of their Countries, they may ſend unto me a fit perſon, and one that knows how to deal in the fire, and one that is of a ſilent diſpoſition, and of good education, who may learn the very work it ſelf in my Laboratory.

But they that are Lords of ſuch places as doe not contain in them thoſe auriferous Minera's or Oars, and can nevertheleſs get ſtore of them from the bordering Countries, and are deſirous of amending them, and uſing them for their profit, we deny not to ſhew and diſcloſe the Art unto them too, (the perſons always conſidered,) namely that artificial and moiſt Extraction of the volatile and fix Gold, not onely out of Minerals, Stones, Sand, and Clay, but likewiſe out of the already-molten Metals themſelves, as Lead, Tin, Iron, and Copper; in which Metals, there is often times hidden much Gold and Silver, which admits not of being extracted by the common melting Fire; but is eaſily drawn thereout of, by the maturation and ſeparation that is cauſed by Salt and Salt-peter, and ſo brought to common uſe.

All theſe things we will not be loth to make friends partakers of, as likewiſe of other rare and artificial inventions, and ſuch as are profitable to all kinds of men, none excepted; which are ſuch things as will bring much profit to my Country, and ſhall be ſhewn in my Laboratory, publickly, and privately unto friends: but with this proviſo, namely, if the ſaid friends will faithfully promiſe unto me, that they will with a faithfuil ſilence conceal thoſe ſecrets which they ſhall ſee and learn from me, and improve the ſame, onely to the honour of God, to the comfort of the ſick, to the help and ſuccour of poor Widows and Orphans, and to the defence of the Truth; and not uſe them to Diabolical diſdain, and deteſtable pride, and other fooleries and vanities.

The End of the Fourth Part of the Proſperity of Germany.

THE FIFTH PART OF THE Proſperity of GERMANY.

Clearly and Solidly demonſtrating, and as it were ſhewing with the Fingers, what Alchymy is, and what benefit may by the help thereof, be gotten every where, and in moſt places of *Germany*. Written and Publiſhed to the Honour of God the giver of all good things, primarily; and to the Honour of all the great ones of the Country; and for the Health, Profit, and Aſſiſtance againſt Forreign Invaſions, of all their Inhabitants that are by due right and obedience ſubject unto them.

LIKE as the weighty command of God injoyns all Children to love their Parents, and to ſubmit themſelves unto them, with a due obedience in all lawfull and equitable things, and to yield them due fidelity: Even ſo likewiſe doth he require from every ſubject a due obedience to their particular Magiſtrates, that they moſt willingly obey them (with a faithfull obſervance, as being the Fathers of the Countrey, and to whom they are tied by all right of Fidelity) in all ſuch things as paſs not beyond the boundaries of equity, and withall it behoves each ſuch ſubject to communicate any thing whatſoever that is requiſite for their ſafety and defence, and for the repelling and beating off the Enemies.

The conſideration of this dutifull ſervice, which binds every Subject to his Magiſtrate, ſtirred me up (ſeeing that greivous and ſudden Fire which almoſt deſtroyed all the Kingdom of *Poland*, and therefore fearing, leſt by dilating it ſelf it ſhould alſo detri-

ment

ment our Countrey) to take care in publishing, some four years ago, a little Book intituled the first Part of the Prosperity of *Germany*. I therein taught, by what means the vast plenty of Corn and Wine might be so concentrated as to be easily preserved and kept, and so be made serviceable for the common good, and of exceeding profit, in future calamitous times.

I likewise shewed the way and manner of some other Arts, and such as are most usefull for the common good of the Countrey, 'mongst which, that discovery of making Salt-peter out of old and rotten Wood, (from which may a vast quantity thereof be had) is none of the meanest.

I have also bethought my self of another way of pleasuring my Countrey with no small benefit afore I die, and thus I intend it.

First of all, I would have the whole World know by this small Work or Treatise, that I have a mind to demonstrate the most profitable and principal secrets which I have treated of (partly openly or plainly, and partly obscurely or more darkly) in those four parts of the Prosperity of *Germany*, and that both to the high and low in my publick and private Laboratory, afore this year is run about. To this end, I have already the chiefest and most necessary Utensils at hand, and when all the necessary provision is gotten together and made ready, those said *Arcanums* which will be so exceedingly profitable to the Countrey, shall be visibly demonstrated to such as the chiefest Magistrates shall make choise of, and to other honest Citizens and Men of the Countrey. And amongst these *Arcana's* which are of such great benefit, the three following ones are the most principal.

The first is, the making of good Salt-peter out of contemptible, and every where obvious subjects.

The second is, how by the help of this Salt-peter, easily and copiously to extract the fugitive, and the fixt Gold and Silver and Copper out of the *Minera's* or Oars, with a great deal of profit and mighty advantage, and that without any melting or fusion by Fire.

The third is this, the truth and certainty of Alchymy shall be shown, and it shall be proved, that it is not any vain dream, deceitfull Phantasie or Fallacy, as the greatest part and number of its haters and *Ignoramus's* have hitherto slanderously reported; but that it is a most true Artifice, and of wondrous consequence, by the help of which, (it making use of Fire and Salt,) all contemptible Minerals and Metals, and which are of no great gain, as *Lead, Iron, Tin, Bismuth, Cobolt, Zink, Lap Calaminaris, Marchasites*, all other fugacious Minerals may be so fixed and ripened, as that much and true and constant Gold and Silver may be extracted out of them with small costs, but abundance of profit.

These three secrets verily are in my judgment of great moment and therefore are worthy for the great ones, and Princes, and other Fathers of the common Weal to be made partakers thereof by revealing the same unto them.

I have deemed it worth while, in a few words to illustrate the incredible utility thencefrom arising, that any one that hath but any reason may perceive it.

And first, as concerning Salt-peter, the whole World knows what profitable and needfull a subject it is. There can never be so great a quantity thereof prepared, but it may not onely be applied to necessary uses but also to such as bring a great deal of profit. I forbear to speak of its most great use and exceeding profit in making Gun-powder, which no Kingdoms, no Common-wealths can want to defend their Countrey withall, and drive off their Enemies.

And if there were no need of it for this thing, yet would it be of mighty moment, and bring in abundance of profit by extracting Gold and Silver out of the poorer Oars which will not bear the charges of melting, and now there will never be so much Gold and Silver, as that it will not be of any profit to a Countrey.

Nay more, if there were no want of Gun-powder, nor of Gold nor Silver, (which time when 'twill come, and how it should come, for my part I cannot see) yet (having Peter) we cannot be in want of Bread; and how great soever the plenty is of Wine, and Corn, and Fruits, yet there is never wont to be too much. Corn and Seeds being macerated with Salt peter afore they are sown, and the Roots of Vines and Trees being moistned with a very little of its liquor, do not onely grow more plenteously, but also produce more plenty of Fruits, and such as ripen far sooner, and are of a sweeter Taste, than if they were dung'd with that stinking Beasts Dung liquor. If then, Salt-peter be a subject so excellent, as that we can by no means want it, and that it may so easily be prepared out of Wood and Stones in plenty; if above all other things it makes the Earth fruitfull, if it can extract plenty of true Gold and Silver out of the contemptible Sand and Flints, what can we desire more from it, unless it be a sound and healthfull Body, whereby we may in fulness of health quietly and peaceably enjoy such great benefits vouchsafed us by God? But now this very same Salt being justly called the wonder of the World can bestow upon us, this very health we speak of.

I do affirm that Alchymy it self, or the Transmutation of the lesser, or meaner Metals into the greater or more noble, and into Gold and Silver, is not a vain dreaming dotage, and an opinion void of reason, but is the very truth it self, and confirmed by many experiments; the demonstration of which, I do, God willing, this Summer not rashly but advisedly set about shewing it by publick and evident experiments, and its use for the good of the Country.

Now then, forasmuch as the Countrey is every where sufficiently stored with Iron, Lead, Salt and other mineral matters, and such like contemptible subjects, and yet notwithstanding there is not at present any profit arising thereby; verily it cannot be, but that in a few years time (if such melting Houses were in all places made) Men would be rendred Masters of great Treasures. Who knows what God will do, and whether or no it may not so come to pass, that it may be said of the great ones of [our] Countrey as is mentioned in Holy Writ concerning *Solomon*. And he made Silver as plentifull as the Stones that lie in the Streets, *&c.*

But that I may yet more open the Eyes of the Studious after all, and show them, by what means all these things may come to pass, and fall out true, I do hereby assure him, that there's no need of taking those Metals for this Fusion, that are already pure enough as Iron, Lead, Tin, and already fit to be imployed about Mans use; no, those common and sulphureous leaden *Minera's* or Oars which are found to be uncapable of yielding profitable and venal or

ſellable Lead, are well enough for this Fuſion and operation we ſpeak of; and ſo likewiſe thoſe Irony and Coppery Oars, out of which (ſeeing they admit not by nature of any fuſion or melting) mallable fuſile Copper or Iron cannot be extracted. For this Operation of ours needs not Copper, Iron or Lead to work upon, as being content with thoſe poor ſort of Oars, and with the bare Salt which the Earth is every where well repleniſhed withall, ſo that there's no cauſe to fear that there will ever be a want of any matter for ſuch an Operation.

But what need I ſpeak much of theſe unknown, and ſo very profoundly hidden ſecrets of nature, ſeeing I have openly enough taught already, in the ſecond part of the *Miraculum Mundi*, by what means, pure and natural Gold may be gotten out of every Herb. This very thing I publickly demonſtrated in my Laboratory above a year ago, in the preſence of moſt learned Men, Profeſſors, Doctours of Phyſick, and other Men both noble and ignoble, as their Teſtimonies, which are [under] hand affirm.

But there's no need of that, foraſmuch as the manner it ſelf of the Operation is publiſhed in Print, and manifeſted to every one, and there can hardly paſs over one years ſpace, but that even a thouſand Men or more may imitate the Operation and ſearch into the truth it ſelf of the buſineſs.

But that the well minded Reader may have a little more light, and may himſelf ſee what foundations the work I have undertaken is built upon, I have judged it altogether neceſſary in a few words to ſet afore your Eyes, what Alchymy it ſelf is, and whether or no it has any foundation in Nature and Art. For if ſo be any ingenious Man gives an Herb, an Animal, or a Man any name, certainly he does it not raſhly and without any ground, but well knows and underſtands for what cauſe he intitles any thing by ſuch or ſuch a name, and it is chiefly done on this account that by ſuch aſſumed names the nature of the Herb, Animal, or Man, and its properties might be known. A few Examples will illuſtrate it the more.

What reaſon have the Phyſicians and Philoſophers of old to call the Herb St. *Johnſwort*, *perforata?* Becauſe its leaves are full of ſmall holes, and it is ſo ſigned by nature, to ſhew, that it has eminent virtues [and peculiarly appointed] to take away and cure external and internal ſtabs and wounds of the Body, and this is confirmed by experience. Why are ſome Herbs called *Saxifragers?* becauſe their nature is, to cleave aſſunder and break through great heaps of Stones in their growing up, and to penetrate through old Walls, by the growth of their hard roots. Their Seeds likewiſe are like unto the ſmalleſt Sand and after a ſort ſtonyiſh and do break the ſtony matter in the Reins and Bladder of Man's Body and bring it forth. So a Serpent hath its denomination from creeping, becauſe it wants Feet, and creeps and crawls along on the Earth.

A Shoemaker hath his title from his making and ſewing of Shoes. A Black-ſmith is not wont to be called a Gold-ſmith, becauſe he works not on Gold but on Iron, and he hath his denomination from Iron, which he is occupied about.

The ſame is to be underſtood of the word Alchymy, which denoteth no other thing ſave a Fuſion and liquefaction of Salt, and ſo it teacheth us, what cauſe it was for, that the Ancients called the Tranſmutation of Metals Alchymy; *viz.* becauſe of the fuſing or melting of Salt, without which, no particular Tranſmutation of the viler Metals can be perfected and accompliſhed. Therefore it was not an unadviſed and raſh action that the Ancient Philoſophers did when they put the title of Alchymy on the Tranſmutation of Metals, but as a Gold-ſmith is ſo called from the Gold, which he is a Labourer in, ſo is it with this.

The name therefore doth openly point out the matter tranſmuting the baſer Metals into the more noble, *viz.* Salt, which being as an univerſal Agent does not onely maturate and bring to due perfection the Metals generated in the Bowels of the Earth by a natural Operation, but it alſo does the ſame out of the Earth by the Operation of Art, Salt alone, and Fire alone are ſufficient for the maturation and tranſmutation of the unripe Metals. For Salt (as being the Agent) is driven or forced as 'twere by the Fire to diſplay its virtues upon the Metals and by exerciſing its power, to render them better and more noble, as *Paracelſus* openly witneſſeth in his *Cælum Philoſophorum*, ſaying, that the Corporal mixtion of metals though commixt a long time and kept ſo in Fuſion, is neither wont to give, (nor indeed can contribute ſo much as ought to their Tranſmutation. But if ſo be the metals are to be perfected by any amending, they are to be conjoyned in a ſpiritual commixtion, and ſo they come to their hoped-for amendment; and this is very agreeable to the truth, and evidently ſignifies, that without a ſaline agent and fire, there is no way of attaining to a particular tranſmutation and bettering in the metals. *Elias* the Prophet, whoſe name inverted yields the word *Saliæ* [or Salts,] did not work his moſt great miracles afore he came into *Zarpath*, or *Sarepta*, that is, into the melting Houſe [or fuſing Work-ſhop] where he filled the poor Widows Oil Veſſels, that ſo ſhe might have wherewith to live in a time of ſcarcity. For as long as the terreſtrial Salts do lie hid in barren and ſtoney Mountains, in which there grows nothing but *Juniper* Buſhes, and are [there] nouriſhed by the Stars, they cannot ſhew forth their wonders, but they are wont then to diſcloſe them when they come into the melting Houſes. Even ſo is it with Salt, when it comes into the melting Shop, it doth effect ſo much as not onely to fill the Oil Barrels but the Cellars and Barns too, and that plentifully, but eſpecially when the due [or ſuitable] Salts *Elias* and *Eliſa* do come together, and *Elias* is carried in his fiery Chariot into Heaven, and ſundred from *Eliſa* and doth ſend down a double portion of his Spirit upon *Eliſa* his Companion; by which, *Eliſa* being ſtrengthned and acquiring more ſtrength than it had afore, is made fit for greater and more powerfull Operations.

But amongſt thoſe moſt great miracles, this was an eminent one, that after the departure of *Eliſa* the Prophet out of this life, there was another dead Man thrown into his Sepulchre who by the touch of his Bones was reſtored to life.

Therefore, like as this miracle did ſupernaturally happen by the divine power: Even ſo [doth it come to paſs] naturally, by the virtues of our *Sal Mirabilis* corroborated with a double Spirit, which doth not onely reſtore a dead [body] and Wood turned by the Fire into Charcoal, when it is caſt into the Sepulchre, that is into the Earthen Pot or Crucible to the white Bones of our *Sal Mirabilis*, and bring it (in the ſpace of one quarter of an hour) unto its former viridity and life, and with this very green Liquor of the Wood may other half dead Trees, as alſo

so other things be restored to viridity, and increase, and their former fertility, more than by any thing else: But also, even various dead insects, if they be put to our *Sal Mirabilis* can recover life again. And although that this may seem a new unheard of, and incredible thing, yea a meer Paradox to any one, yet is it as true as truth it self; the true way of which Operation I will (God willing) describe and shew clearly in the first Century of my general Appendix.

But although that these wonderfull Operations of my *Sal Mirabilis* may seem such, as to be never capable of being effected yet, to all such as know its Composition, 'tis a thing very easily accomplished. Nor can it be but that the divine wonders should be still more and more laid open by the help of my *Sal Mirabilis*, and be exceedingly sown abroad, and made known to such as are ignorant. Which being done, the World will conceive a far other guess Opinion of Alchymy, and judge otherwise thereof than hitherto it has done.

But that such as are admirers of the divine and natural wonders, may clearly see how large an extent those things I have hitherto discovered, are of, I cannot omit the adding of the solar Work or Smaragdine Table of *Hermes*, the Father of all the Philosophers, the which being in my judgment accommodated to this discourse of mine I will illustrate.

But to summ up all I will say, I have here briefly declared, that if a Spirit be elevated or sublimed from a true Salt by the help of a strong Fire, or be drawn from out of its Body, and be again returned to the same own fixed Body left behind and be restored to it in a due manner; that fix Salt, gets double the strength and virtue it had, (as hath been shown concerning my *Sal Mirabilis*) and does perform things wonderfull; which *Hermes* and *Basil Valentine* have hinted unto us in these next ensuing expressions.

Hitherto belongs the small Circular Figure, noted Pag. 19. *at the beginning of the third Part of the Prosperity of* Germany.

The Smaragdine Table of Hermes, *&c.*

[See it at the end of the First Part of *Miraculum Mundi.*]

The Ænigma of Brother Basil Valentine.

THere is a Stone, of all others the least precious, out of which is extracted a fugitive [or volatile] Fire, and out of this Fire is the Stone it self made, it is of colour white and red and yet is it no Stone. In this Stone doth nature operate, and produceth a Limpid or clear Fountain, which choaketh in the Waters and swallows up his own fixed Father, untill at length a Soul be given [or restored] him, and [his] fugitive Mother be made like [him] in the Kingdom. Likewise this Stone brings power and great strength, it exceeds the Sun in Age, [its] fugitive Mother [is] prepared by *Vulcan* and [its] Father [was] begotten by the Spirit. Likewise the Soul, Body, and Spirit consist or abide in two, out of which, all things are; these things are of one, and is one thing, conjoyning the fix and the fugitive. They are two, and three, and one, and if thou art ignorant of this, thou will be frustrated and deprived of the effect of the Art.

Adam is placed in a Bath, in which *Venus* finds her like, now this Bath was prepared by that old Dragon, when he had lost his strength and power. But now this is nothing else (saith a Philosopher) but a duplicate *Mercury*. In this is its name hidden, which is to be sought after with all diligence and continual labour.

The Event proves the Actions.

IT seemed unto me very expedient to set down here in this place, these few, but exceeding weighty words of *Hermes* and Brother *Basil*, because they do so notably square with this Work of mine which I have here described. And therefore I do here again affirm what I have often said, *viz.* That he who knows Salts well, but especially Niter and Vitriol, and knows how to conjoyn them, is well skilled in Medicine and Alchymy, and sufficiently enough understands that the Smaragdine Table of *Hermes* is Vitriol, an excellent Smaragd or Emrald, and that Niter is (according as *Paracelsus* and *Basil Valentine* have at large described) the Kingly Infant of the Sun, with whose descriptions we at present content our selves. I will make a more prolix mention of the same in my Centuries, those things that I have adjoyned here I could not, for certain reasons let slip and pass by.

Now by these few words it is manifest, what virtues Salts are endowed withall, and what miraculous effects they shew, when they are cast into the melting Fire, *viz.* Such Salts as are corroborated with a double Spirit poured down from above. These Salts (I say) are wont not onely to fill the poor Widows Oil Vessels, but even the Cellars and Barns with Wine and Corn.

But I would not that any should interpret it amiss, in that I make some kind of Comparison 'twixt the wonderfull virtues of Salts, and the miracles of the Holy Prophets: For verily the thing it self admits it, and by such Comparisons, the natural light is greatly strengthned, which thing we shall speak more at large of elsewhere.

Whosoever he be that well knows the nature and properties of Salts, and is something skilled in the management of the Fire, he will hereby easily learn thus much, as easily to perceive that there is such a thing, as a profitable transmution of the more vile Metals into the more noble ones.

But there are requisite to this Operation manual Arts, peculiar Furnaces, and singular Commixtions of Metals, the knowledge of all which, he must have that desires beneficially to employ himself in these Operations. The whole Operation with all the appurtenances requisite, and all the things thereto appertaining, shall (if God please) be exposed to be seen in my Laboratory this Summer. As my Writings lately published, and the Labours performed in my Laboratory the last year, do sufficiently enough testifie that I have both publickly and privately demonstrated and manifested the truth of the chiefest secrets which I have mentioned in my Writings. And as for what remained of being done the last year, this present Book promiseth the demonstration of, this Summer. What Writer alive, did ever endeavour the demonstration of the truth of his Writings by most evident experiments? None at all save *Glauber*.

There-

Therefore I doubt not but that ſeeing this little Book offers the Countrey ſuch great benefits and Commodity, there will not onely be ſome of the Vulgar ſort, but alſo many of the Noble ones [or Magiſtrates] be found, to whom the reading of the ſame will not be a tedious thing.

And now I return again to ſpeak of Alchymy, openly diſcloſing my Opinion concerning it, and firmly averring, that Salts onely have power to waſh, maturate, and perfect the unripe Metals.

But ſome or other may here ſay, if Alchymy be the fuſing of Salt, by what means can it poſſibly ever be, that Gold and Silver ſhould be gotten out of Salt by melting? If there were Gold in it, cannot it be gotten forth eaſier than by melting in the Fire? I anſwer, you are not ſo to underſtand it, as if huge heaps of Gold could be gotten by a bare fuſing and melting of Salt. No! no ſuch matter. But when the Metals have Salts adjoyned to them in a due manner, and ſo undergo a melting Fire, they do (in that fuſing) diſplay their virtues upon the Metals, and do ſo bring them to a maturity as to yield forth Gold and Silver. For Salts are the univerſal ripening Agents, both in the dry and in the moiſt way, as is clearly evident from the third and fourth part of the Proſperity of *Germany*, ſo that there needs no more to be ſpoken as to this.

But yet, that theſe things may not ſeem new, or altogether abſurd, I ſay, that in all Salts there lies hidden ſpiritual Gold, but yet it cannot be extracted from them without the addition of the Metals. For all the things that are, are generated, encreaſed, and ſuſtained by the Sun, (and amongſt theſe may be reckoned up the ſmalleſt Vegetable) do contain the fugacious beams of the Sun hidden in them, which ſaid beams may by the benefit of Art be made corporeal and fixt. This I taught and demonſtrated more prolixly in the ſecond part of my *Miraculum Mundi*. I will teach the ſame in the firſt Century of my general Appendix, which ſaid Appendix ſhall illuſtrate all my Writings with more clear notes; and I will evidently ſhow the way, by which true and natural Gold is to be gotten (by the benefit of a certain precipitating matter, out of Sea Salt, both by the dry and by the moiſt way. This Operation brings not any conſiderable profit, but doth in very truth ſhow the poſſibility of the thing. But he who knows the way of conjoyning true and due [or proper] Metals with legitimate [or ſuitable] Salts, and of handling them in a due and true way of Fuſion, will get Gold and Silver out of all the imperfect Metals, and that with no ſmall profit; and this ſhall be demonſtrated in my Laboratory this preſent Summer by God's help.

And for the more evident proof hereof, it ſeems worth while to adjoyn a Story out of the Journal of *William Litgou* of *England*, [rather *Scotland*] who Journying through *Italy*, teſtifies that he ſaw in *Trapundia*, a City in *Sicilia*, much Gold excocted or drawn out of Sea Salt; which thing, ſeeing it agrees with my Opinion, and confirms what I ſay, I will add the words of the Authour himſelf as they are in *Latin*.

" The fourth City of *Sicily*, is *Trapundia*, ſcituate
" in the Weſt-ſide, and oppoſite to the City *Biſerta*,
" ſeated on the *Barbarian* Coaſt of *Africa*, which
" yields pure Gold, which is exported by the Mer-
" chants into *Italy*, *Venice*, *Dalmatia*, and *Greece*.
" It is excocted in ſome Artificially made Salt-pits
" by the more vehement beams of the Sun, which
" Pits are filled and emptied every month. Now
" the Salt here on the Sea-ſhore, has a colour like
" the redneſs of a Ruby, or Corral: The City is al-
" moſt the one half of it imployed about working
" thereupon. The Gold it ſelf being purged is diſ-
" tributed throughout the whole Chriſtian World.

Theſe are the words of the ſaid Authour, I know nothing of the certainty of the thing it ſelf, he that is deſirous to find out the truth of this Relation may eaſily do it. As for my ſelf, I eaſily credit this Relation, becauſe of the Mount *Ætna* which always is burning in that Iſland, and becauſe of the Sulphur too, which all the Land of *Sicily* abounds withall. And verily it ſeems a thing altogether likely, that when the Inhabitants of this Iſland upon the Sea-ſhore, make Salt of the Sea Water for their neceſſary uſe, by digging Pits in the Earth after the manner of all thoſe hot Countries, and letting in the Sea Water, and that the warm beams of the Sun ſeparate [or any of] the unprofitable ſweet [or inſipid] Water, in Vapour, and that that Water of Salt is endued with a notable ſharpneſs; it extracts the Sulphur out of the Earth which is there in plenty every where, and it renders this [Sulphur] by the help of the heat of the Sun, conſtant, corporal and fixt, ſo as that it can be afterwards molten in a melting Furnace into Gold. If now the moſt hot beams of the Sun, and Salt Water can change common earthly Sulphur into Gold, why may not the ſame be done alſo by the benefit of Fire, Salt, and Art.

That all Gold is at firſt naturally generated of a pure Sulphur in the Earth, no body will indeed deny. That any Sulphur may by the help of Fire and Salt be fixed and changed into natural Gold, daily experience witneſſeth, not onely in my own Laboratory, but in my Diſciples Laboratories too, the which, viſibly demonſtrates, and even by manual Operation confirms the truth of thoſe things which I have mentioned in the ſecond part of my *Miraculum Mundi*, hereabouts.

That which is mentioned in the old Hymn of the Ancient Church-Fathers, *viz.* who made Gold of Rods or Twigs, and Gems of Stones, ſeems to the ignorant altogether as Paradoxal, new, and incredible: and from which 'tis gathered that St. *John* the Evangeliſt made Gold of Sticks of Wood, and Gems of common Stones: I can in a few words demonſtrate that both are true.

Diſſolve common Sulphur, or any Vegetable in common Salt, this Solution will make the Sulphur of a red colour. Keep this Solution for at leaſt one hours ſpace in the Fire, you ſhall find a little of the Sulphur changed into Gold; to the red Salt, adjoyn the Calx of *Saturn*, melt them by Fuſion into one Body, and reduce the Lead by a Cupel, you ſhall find a grain of Gold, it yields indeed no profit but demonſtrates the certainty and poſſibility of Art. But if any one ſhall be skilled in managing this Operation in great quantity (as ſhall be done this Summer in my Laboratory) he will not complain of loſs, but will always get profit.

But let this ſuffice as to the making Gold out of any Wood, or any Herb, by the help of Fire and Salt.

Let us now ſee by what means Stones of manifold colours may be made by the help of Salt, out of Wood or any Herb. Adjoyn to the red Salt made of Wood, a little Powder of white Flints, put them in

in a Crucible, and melt them in the Fire, that they may become a red Glass, resembling almost the colour of a Ruby; if you keep them longer in the melting, the red colour will be changed into a green, and have the likeness of an Emrald: After this, comes a sky-colour, resembling a Saphir, then follows a yellow, not unlike a Jacynth: then in a longer continuance of Fire, it becomes black and like an Agath. Indeed these Stones are no harder than common Glass, but as to their colours and beauty do exactly resemble the precious natural Stones.

These two *Arcanum's* indeed do as to the outside view seem not very excellent, but yet I believe, the well minded Reader, to whom I offer them as a pledge or Love-token for to remember me by, will not think them (seeing they teach the extracting of Gold out of any Wood or Vegetable, and how by white Flints to make Stones of several colours) of so small a moment or value, as they appear here to be, but will believe that he has a foundation laid open for him, to arrive to greater secrets.

As concerning these kind of wonderfull things, and Transmutations hitherto unknown to the World, and changing things into more noble and better Species, I will treat more at large in the ten Centuries, in which, my Writings shall be declared with more evident and clearer Explications, to which I refer the well minded Reader, concluding this Book with those Verses of *Ovid*.

Jamque opus exegi, quod nec Jovis ira, nec Ignis,
Nec poterit ferrum, nec edax abolere vetustas.

And now, a work I finisht have, of which, Jove's *wrath,*
or flame,
Or Sword, or all devouring time can ne'er raze out the
name.

An APPENDIX TO THE FIFTH PART OF THE Prosperity of GERMANY.

Clearly and perspicuously revealing and declaring, (for the benefit and profit's sake of the whole Countrey) by what means those three *Arcana's* promised in the said fifth part are to be advantageously effected. Together with an adjoyned Explication of some obscurer places which are not so clearly disclosed in the third and fourth parts of the Prosperity of *Germany*, as likewise in the first Century.

Friendly Reader,

I *doubt not, but it will seem a wonder to many, that* Arcana's *of so great moment and so much utility should be laid open by me, in so perspicuous and evident a description, as for every one thoroughly to know them.*

However, any Body may easily perswade himself that I have not so done without weighty causes, which to reckon up here at present, I judge it not so altogether necessary, but that it will be more commodious to refer it to some other convenient time. The chiefest and which is the most over-swaying reason amongst all the rest, is this, viz. *the perverseness of some abusive Men, not onely endeavouring to make my Writings envied* [*or hated*] *by Men of common rank, but also by the great ones, by their lying reproachfull slaunders; and especially most falsely averring, that those three* Arcana's *which I promised in the Fifth Part of the Prosperity of* Germany, *are of no profit,*

and therefore cannot be effected with any advantage, and that I my self ſought after nothing elſe by promiſing their diſcovery, ſave onely by impoſing them upon [*or ſelling them unto*] *others to ſcrape ſome Monies together. Now foraſmuch as this is the property of Slanders, to be admitted far eaſilier and readilier than the truth it ſelf, and that for this reaſon many have diverted their minds from the truth of this thing by buſying them about theſe Calumnies, and ſo have not known how the caſe ſtands; but (on the contrary) ſeeing I am conſcious of mine own Innocency, and am far wide of thoſe Crimes ſo falſely charged on me, I have judged it moſt juſt and moſt highly neceſſary, not to ſuffer thoſe moſt falſe Accuſations to reſt upon me, but to ſhew the contrary to the Eyes of the whole World, and by demonſtrating and diſcloſing the very truth it ſelf, to recover my honour ſo perfidiouſly and treacherouſly ſnatcht from me; the which could not poſſibly be done by any better way than this.*

Neceſſity therefore required the Work it ſelf to ſpeak, and to defend its own ſelf, which indeed is a true and genuine defence, and way of ſtopping the ſhameleſs and lying Mouths of all reproachfull Slanderers. God will in time recompence ſuch falſe Mens moſt wicked Works, whereby they have exceedingly injured me. Mean while every one may apply theſe moſt profitable inventions to their uſe, and undertake the doing one or other of the Operations whereby they may reap ſome benefit, which I wiſh them from my Soul.

Nor do I doubt, but that a very many Men will, by following the Doctrine by me preſcribed, and inſiſting upon the foot-ſteps of my Writings, which are founded on the truth, as being a ſure Foundation, get themſelves no ſmall profit; *whileſt they quietly and peaceably enjoy the gainfull practiſing on my* Arcana's: *And eſpecially of that moſt eaſie ſecret, by which, fugacious and volatile Gold is extracted out of all kinds of Flints, (every where plentifully offering themſelves, and ſo by the help of Lead, is rendred Corporeal. Which Work verily is ſuch, as that one Man doth no ways damnifie another by, but may rather help and profit him. Therefore do I at preſent affirm to every body with that truth which God loves, and will defend, that all the following Operations which I manifeſt in the publiſhing this little Treatiſe, have been wrought by me not once onely but often times, and have been ſhown to many others, ſo that no body has any reaſon to doubt hereof, nor need he be ſollicitous about any other thing but how wiſely to manage, the Operation, and to be diligent about his labours. But if it ſhould ſo fall out as that a Man ſhould commit an errour or two, which may eaſily happen, let him not aſcribe the errours he commits, to the Art it ſelf, and thereupon to accuſe it of falſity, but let him rather inquire into the occaſions and reaſons of his own errours, and without doubt by ſuch enquiries will he attain his end, and get the hoped for fruit: in which thing, my firſt and ſecond Century will by an eaſie Manuduction help him.*

Theſe are the things which for the truths ſake and to witneſs it, was I willing to produce. And I do hereby ſignifie to every one that now my publick Laboratory is at an end, and ſhall remain ſhut for time to come, which I was willing every one ſhould know.

[*The firſt*] *Operation ſhewing the way of reducing any Lead, or any Vein of Lead by the help of common Salt,* [*and*] *by Coals, into Aſhes, in the Furnace called* Stichoſen, *that ſo the Gold and Silver may be extracted with profit.*

TAKE of Lead or a Leaden Vein two parts, and of common Salt one part. The Lead Oar is to be ground in a Mill, and ſo are they to be commixt, and by little and little thrown with a Shovel upon the Coals in the Furnace, ſerving to make Aſhes, and which has Pipes or Chimnyes fitted thereunto to receive the fume and the aſcending Flores. That molten part of Metal and Salt which falls through the Grate is to be again taken up with your Shovel, and caſt in upon the Coals untill the whole Metal, or all that metallick Vein ſhall be turned into Aſhes. Then farther, all the burnt matter, is to be freed by divers waſhings from all the defilements, and the remaining Aſhes of the Metal or Metallick Vein, is to be reduced into a Metal in a Furnace which the *Germans* call *Stichofen*. Theſe incinerations and reductions are to be ſo often and ſo long repeated, untill you find (by making trial with ſome little piece) that your Lead is now fitted to be handled or wrought on in the Hearths or Furnaces by the Fire of Separation. For then in the Hearths or Teſts it is changed into Litharge, whereby it may the more commodiouſly yield forth the Gold and Silver, which by the Fire and Salt are therein maturated.

N. B. But you are here to obſerve that the leaden Oars can indeed be commixed with the Salt, and ſo thrown in upon the Coals: But now Lead admits not of being ſo dealt withall, for it is not mixable with the Salt, and therefore it requires that the Salt be firſt caſt in upon the Coals, and then muſt it be thrown in afterwards at top of it. And this way is to be obſerved and ſo often repeated and ſo long, always throwing in, firſt the Salt then the Lead, till the Lead being turned into aſhes, hath wholly loſt its metallick Fuſion. The ſaid aſhes are to be waſht with Water and reduced in the Furnace, on ſuch wiſe as we ſpake of but now.

N. B. Other leſſer Metals may be added to the Lead or to the leaden Vein or Oar, and ſo be reduced into Aſhes together, as Tin, Iron or Copper. But yet theſe leaden Oars are more advantageous and profitable if they are taken alone, as being more fit for this kind of labour, ſeeing they have already in them Iron and Copper, and yield not any good and vendible Lead, by reaſon of their wild nature, and ſo there's no need of burning up Copper and Tin which are already vendible.

N. B. Whileſt

N. B. Whileſt this Incineration is done, many Metallick Flores does aſcend up into the Receptacles appointed for the ſume to go up in, and which are adjoyned to the Furnace, which (if need be) may be taken out, and by waſhings be freed from the Salt which aſcended together with them, and by Reduction be reſtored or reduced to their former body: and will yield Lead which contains in it Silver, and is to be converted into Litharge like other Lead, that the Silver may be ſeparated therefrom.

This likewiſe is heedfully to be obſerved in the other *Minera's* or Oars turned into Aſhes, that afore their Reduction, they be thoroughly waſht from all the Salt, and the light filths or defilements are to be well ſeparated from the metalline body; for if this be neglected, the Salt being forced with the ſtrong blaſt of the Bellows would carry off the Metal together with it ſelf, and the Aſhes of the Coals would hinder the Fuſion of the Metal it ſelf, and reduce the ſame into *Scoria's*.

As concerning the Reduction it ſelf, this is well to be regarded, that the Fire muſt be kindled in the Furnace at leaſt two hours afore the Aſhes of the Oars that are to be reduced, are to be put in, that ſo the Furnace may be thoroughly bright-hot within; for if it be not through fiery-hot, the Caſt in *Minera's* melt not, and being not molten they lie in the Fire, and hinder the blaſt of the Bellows, and ſpoil the Operation it ſelf.

Theſe labours therefore require a skilfull Artificer, and one verſed in ſuch Operations, for they are not ſo very Facile as they ſeem to many, to appear to be.

Then farther, this is likewiſe to be noted, that if the *Minera's* or Oars that you take to this Operation are full of Sulphur, and that that Sulphur is not wholly taken away by torrifying [or calcining them] it will by its fierceneſs reduce in the melting the body of the good Metal into *Scoria's*, and inſtead of Metal preſent you with Droſs. And this is that Incineration and Reduction which I have ſhowed in my Laboratory, both to Friends and Enemies; But yet I have (ſince that time) found out a far eaſier way of doing this labour, by the help of which, one Man will do more in one day, than he could otherwiſe in eight days. But becauſe this way is not as yet made common, it ſeems not convenient in my Opinion to divulge it here; for as much as I have determined with my ſelf in this preſent Appendix to diſcloſe onely thoſe things which I expoſed to be ſeen in my Laboratory by others.

By what means Gold, Silver, yea and Copper too, may with great profit be extracted out of the poor Metallick Veins by the moiſt way, and which cannot quit the coſts of doing it by Fire.

FIrſt of all, the metallick Earths are to be made red hot, and to be quenched in cold Water, that ſo being made brittle they may be ground in a Mill. If Sulphur beadmixt in them, then muſt they by a foregoing fireing be freed from the ſame, becauſe the Sulphur hinders the *Aqua Fortis*, from duely diſſolving thoſe Oars. Being now thus prepared, they are to be put into the ſtronger Glaſſes, or into Earthen Cucurbits made of the beſt Clay, and the following Water is to be poured upon them, and is to cover them over three fingers breadth. The Cucurbit being filled with theſe matters is to be ſet in a Caſe [or Pot] full of Sand, and prepared for this uſe, and all the Water is to be drawn therefrom by Diſtillation: which is not onely all of it again recovered, but withall doth get it ſelf an encreaſe or augmentation from the Salt-peter or the Salt, ſo that there aſcends more Water by Diſtillation than was poured on.

The Oars are to be taken out of the Cucurbit, (or Cucurbits, if there were more Pots uſed) and being taken forth you muſt pour common Water thereupon to extract the remaining Salt thereout of, in the which Salt is found the Gold and the Silver that was in the Oars.

N. B. This is to be obſerved in this labour, that all the Spirits are not to be drawn off from the Oars even to the dry Salt; and this not onely to ſhun the dammage that might happen by breaking the Glaſſes, but alſo for this reaſon, *viz.* that there may be left behind with the Salt a little Acrimony, becauſe of ſome Salts which eaſily paſs into Salt-peter when ſome *Aqua Fortis* is drawn off them. And albeit that *Aqua Fortis* will eaſily turn the whole Body of Kitchin Salt into Salt-peter, yet notwithſtanding 'mongſt all the Salts one Salt admits of a ſpeedier, another of a ſlow Tranſmutation, according as it is more or leſs akin in its nature unto Salt-peter.

And therefore to prevent this errour, ſome humidity is to be left with the Oars. For when all the Spirits are drawn off, and the Salt is turned into Salt-peter, the Water would not be ſharp enough to hold up the Gold that is extracted, when the Solution is made, for the Water would diſſolve barely the Salt-peter, and leave the Gold remaining behind with the Oar.

If this errour ſhould chance to be committed, the Salt-peter is to be extracted out of the Oars with the Water, and more new Salt muſt be poured on upon the ſame Oars together with the *Aqua Regis* that was drawn off by Diſtillation; that ſo this *Aqua Regis* having been once abſtracted may not afterwards tranſmute all the Salt thereto added into Salt-peter. For by how much the oftner the *Aqua Fortis* is drawn off from the Salt, ſo much the leſs is the Salt turned by it into Salt-peter, and at length, it will come to ſuch a paſs as to remain juſt as it was afore the abſtraction [of the ſo oft drawn off Spirit.] For this is the nature of *Aqua Fortis*, *viz.* to tranſmute half its weight of Salt into Salt-peter at the firſt time; the ſecond time it tranſmutes but a fourth part; the third time much leſs: and at length will trauſmute none at all; but puts on the nature of Spirit of Salt: which notwithſtanding is moſt fit to extract Gold and Copper withall out of the Oars *in infinitum*, if Salt be thereto added, out of which, it is wont to get it ſelf a perpetual encreaſe (and be) like other Spirit of Salt.

Now then, to prevent this inconvenience, the *Aqua Fortis* may be left off for altogether, and thoſe Minerals and Metallick Earths may be extracted with the Spirit of Salt onely, and Salt added thereunto: onely obſerving this thing in the Diſtillation, *viz.* that ſome of the humidity be left behind with the Oars whereby they may be the eaſilier taken out of the Glaſſes.

Moreover this is to be likewiſe known, that Gold, Silver, and Copper may be extracted out of their Oars or Earths even without *Aqua Fortis* or Spirit of Salt, if onely Salt or Salt-peter be but added. For if ſome Oil of Vitriol or of Sulphur be poured upon the Water of Salt-peter, or that the Water of Salt be acuated therewithall, it becomes ſtrong enough to extract Gold, and after the extraction and diſtilling the Phlegm

Phlegm off, there follows by diſtilling a pleaſant Spirit of Salt, or from Salt-peter a good *Aqua Fortis*. This labour therefore is more gainfull and leſs troubleſome, than if *Aqua Fortis* or Spirit of Salt were uſed thereunto.

There are other eaſier and more compendious ways of extracting Gold, Silver and Copper out of their Earths, which, ſeeing they have not been as yet ſhown in my Laboratory, I ſhall ſilently paſs them by at preſent and that not without reaſon. But yet there is frequent mention made of the like [Operations] in my firſt Century, in which he who has an earneſt deſire to know more of thoſe kind of ways, may make enquiry.

The Preparation of ſutable and proper Waters to extract Gold, Silver and Copper out of poor Oars.

TAKE of Salt-peter one part, of common *Aqua Fortis* two parts; theſe being joyned together, extract Silver and alſo Copper. But to extract Gold out of its Oars or Minerals, there muſt be taken one part of common Salt, and four parts of *Aqua Fortis*. One pound of Salt, and four of *Aqua Fortis*, make four pounds and ½ of *Aqua Regia*, the other half pound of Salt ſtays behind with the Metallick Veins or Oars in the bottom of the Cucurbit, and contains the Gold that was in them, and is to be extracted with common Water.

The way of getting out the Gold and Silver out of the waſht-out Salts by precipitation, and of reducing them to their peculiar bodies without detriment or loſs.

IF it be Water of Salt-peter and hath Silver in it, the Water of Salt being poured in, precipitates the Silver to the bottom. But if Water of Salt, and has Gold in it, the Gold is precipitated by pouring on a *Lixivium* which hath in it a little liquour of Flints. And now this Water it ſelf thus mixt by pouring (other precipitating liquors on it) yields (by decoction) moſt excellent Salt-peter. And the *Aqua Fortis* and *Aqua Regis*, which aſcended by Diſtillation, are fit to make new extractions of Gold, Silver, and Copper out of their Earths; and by iterated extractions (by the Salts and Waters thereto added) do they get a perpetual encreaſe, inſomuch that in theſe extractions of Gold, Silver, and Copper, there are not required at all any other expences ſave thoſe few, beſtowed on firing. Therefore in the beginning of this Work there is not required ought elſe but one onely pound of *Aqua Fortis*, becauſe in the progreſs of the Work it proceeds on to an infinite encreaſe, yea, enough for the extraction of many thouſands of pounds.

(Hence is it that this Work is an unheard of Operation, and doth almoſt exceed all belief, and from which there muſt an immenſe gain of neceſſity accrew, becauſe Gold, Silver, and Copper may by this means be extracted out of their poor Metallick Earths without coſts.

There remains yet one thing which is to be heedfully regarded in the precipitation of the Gold and Silver. A common *Lixivium* cannot precipitate all the Gold out of the *Aqua Regis*, and therefore I bad you add to the *Lixivium* ſome liquor of Flints, and this will alſo appear in my firſt Century.

Therefore it behoves every one, clearly to ſee whether or no he makes uſe of true and genuine Liquor of Flints in his Operation, that ſo he may not inſtead of it, uſe a bare ſimple *Lixivium* onely, and ſo commit a great errour, as it hath happened to ſome as I have been told.

But he that can't make true and good liquor of Flints, or elſe has it not at hand, may ſubſtitute in its ſteed, common Spirit of Urine prepared in a Copper ſtill, which together with the ſaid liquor precipitates all the Gold out of the *Aqua Regis*.

N. B. But this Gold thus precipitated by Spirit of Urine, fulminates like Gun-powder, unleſs it be burnt with commom Brimſtone afore the Reduction, and that this fulminating faculty be taken away from it, which inconvenience the liquour of Flints is not wont to bring.

N. B. If there ſhould be much Zink, Iron, or *Lapis Calaminaris* in the Oars of Gold or Silver, the *Aqua Fortis* or *Aqua Regis* would not all aſcend by the Diſtillation, nor get increaſe; but ſome part thereof would ſtay with thoſe Metallick Earths, and with the *Lapis Calaminaris*, *&c.* and by adhering thereunto be concentrated: but yet there would not be any loſs by that, for by the pouring on a Lixivium of Wood-aſhes, may it be turned into good Salt-peter, of as much value as may eaſily recompence the charges of the *Aq. Fortis*, or *Aq. Regia*.

Beſides, you are likewiſe to obſerve this, that if there ſhould be Copper admixt in the Oars of the Gold and Silver, the *Aq. Fortis* would extract the Copper too, as well as the Silver.

But now the neareſt way of ſeparating theſe two Metals from each other, is this, Let Spirit of Salt be poured to the *Aq. Fortis*, and it will precipitate all the Silver out of the *Aq. Fortis*, down to the bottom, and the Copper will be left in the water; which if you put ſome Iron into, it will ſtick to the Iron, and by this means be gotten out of the water.

This water now, after the Metals are withdrawn from it, is fit to make new Salt-peter with, and by addition of Vitriol to yield a new *Aq. Fortis* by diſtillation.

Alkali Salts do in the Fuſing bring the precipitated Silver to its former body, which otherwiſe is very fugacious.

The Copper is turned into excellent Verdigreaſe. And ſo the Oars of Copper, though never ſo poor, may be extracted, and that with no ſmall benefit: Becauſe the Verdigreaſe made of the bare Copper is twice the price of the molten Copper it ſelf.

The manner of making good Salt-peter in plenty, out of Kitchin-Salt and Calx-vive.

TAke the Stones of Lime, which have been thorowly changed or reduced into Powder by the Air, four parts: of Kitchin Salt, or Common Salt, one part, [by weight, and not by meaſure] whether pure or impure [it matters not:] and of this mixture is a thickiſh paſte to be made by moiſtning it with Urine, or, in want of that, with Water; which is to be made up into a Pile with Wood, and ſo may it be made *Stratum ſuper ſtratum*, of what bigneſs you pleaſe: and it may be done in a Furnace made for that purpoſe, or elſe in the open Field abroad in the Air. But you muſt beware in the building up of this Pile, that the maſs of Salt and *Calx vive* be not too thick laid, and too much; but it would be better to make it up in balls or pellets, that ſo they may be well fired by the flame, which muſt penetrate everywhere through the pervious heap or pile: which cannot

not be, if the mass be spread too broad, and so stop up the passages of the flame.

The heap being made as big as you are minded to have it, the fire must be put under, and so long fed, till all the wood is burnt, and the balls themselves have been red-hot, a whole hour at least: that the Acrimony of the Salt may in so great a heat be changed by the *Calx-vive*, and get it self a milder nature, and consequently be so much the easier transmuted into Salt-peter.

N. B. The Salt that is on this wise transmured, is most fit for dunging Lands, and to be used instead of the common beasts dung, as I have at large taught long ago in many places of my Writings.

This is the preparation of turning Salt into Salt-peter, which Artifice, if any be minded to work about, it is necessary for him to order his Operation this following way.

The manner of making Salt-peter out of this prepared Salt.

FIrst of all, this introverted Salt must be exposed to the open Air, and beams of the Sun; but yet so, as that the heap may not be moistned by the Rain, and it must lie in its heap the heighth of some three or four Feet; the which heap is to be wetted either with Man's pis or Beasts; or if there be not enough of this to be had, then with bare water onely, that so the pellets or balls lying quietly for some days, may be dissolved and be mixed with the rest of the matter.

Now when the warm Air hath consumed all the humidity, and dried up the heap, the aforesaid moistning is to be repeated; which being again consumed, and the heap dried, the labour of repeated moistnings and exsiccations is to be so long continued, as long as necessity requireth: For in long progress of time is the Salt-peter generated, which must be washed out with water, and by decoction be reduced into Stria's or Crystals.

This generation of Salt-peter proceeds indeed slowly on, but yet it brings a great profit. For if once the Salt-peter be but generated in such an heap of Salt, and the reliques left after the washing out of the Peter be again put to the same heap, there will new Salt-peter be generated in process of time: so that new Salt-peter will every year offer it self to be washt out of the heap: and this work may be continued without end.

But he that would have some Salt-peter from this inverted Salt in a shorter tract of time, let him know, that the Seed or Ferment of Salt-peter must be added unto the said heap, that so this same Seed may get augmentation from the Salt, and encrease and grow, like as an herb is wont to grow in a fat and saline Earth. For all things have their Seeds, and doe draw their Encrease out of other Salts. The Seed of Salt-peter is volatile, as is its acid Spirit: its Root is fixed Niter; which being implanted in all sharp Salts, doth beget Salt-peter in a most plentifull manner, and such as is very good, or even better than that which ariseth out of those acid Salts and Alcalies.

We doe not here show this propagation of fix Salt-peter by acid Salts, because it is described in the following Labour and Operation.

Therefore like as any Vegetable may be propagated and multiplied not onely by the help of its Seed, but even of its Root too; Even just so is it with Salt-peter, for it admits of propagation and multiplication by the means both of its Seed and of its Root, as other Herbs doe.

As concerning the Seed of Salt-peter, it is very easily preparable by those who deal in metallick separations and extractions by the moist way. For if Gold be separated from Silver by *Aq. Fortis*; or that Gold and Silver be by it extracted out of their Oars, this very operation hath already abundantly recompenced the charges laid out thereon, and so it offers it self without any costs, and as it were *Gratis*.

And now, if I pour this water on, instead of common Water, upon the inverted Salt, it does not onely become good Salt-peter, but doth also yield (as being the Seed of true Salt-peter) an hundred fold encrease, after the manner of the Seed of all Vegetables, and doth the same as they do. And by how much the more of this Nitrous Seed is sown in the Earth, so much the more Salt peter, and so much the sooner too is generated. For when a Gardener doth sow his Seed sparingly, he must necessarily have but a thin harvest: and so on the contrary is it to be understood of a plentifull harvest. And if now there should be any one that should upbraid the Gardener with the slowness of his Seed, because it produceth not Buds, nor Stalks, nor Flowers, nor Fruits in a few days space, would not he say that he cannot compell nature, for it reserves to it self its due time, and its natural course?

The very same would I have you understand here concerning Salt-peter: if haply my Enemies, those most ignorant Sheepsheads, would object against me, that seeing the Salt-peter doth not presently, in a few days, grow or spring forth from its seed sown, therefore that seed was not true nor good, or that it is altogether impossible that Salt-peter should be generated so plenteously out of Common Salt: I answer such, as the Gardener does, 'Tis necessary to allow Nature her own appointed time.

But that it may evidently appear, that this my planting of Salt-peter, and that this augmentation may be far more evidently demonstrated, than that of any Vegetable seed; the business may be tried for confirmation sake in a small Experiment, afore you set about a more laborious and prolix exercise, and to prevent your fears of attempting it in vain.

Take the Salt prepared with the *Calx-vive* three pound, and put each a-part in several Earthen Vessels. Take likewise of the Water of Salt-peter already used (as being the Seed of Salt-peter) one ounce, two ounces, and four ounces: with the one ounce of that *Aq. Fortis* commix as much Common water as may serve to moisten one pound of the aforesaid inverted Salt: Then to the two ounces of the same *Aq. Fortis*, adjoyn likewise as much water as may serve to moisten the other pound of Salt with: And so doe with the other four ounces, and therewithall moisten the third pound: Set those three Pots, containing the three several pounds of the said prepared Salt, at the heat of the Sun, but so, as that the Rain may not come, and wash off all the Salt. All the moisture being consumed by the Solar heat, moisten your matters in your pots with Rain water onely, so often, as the drying needs the watering it. When two or three months are over, take out each pound separately by washing it out of the matters in each pot, and you shall find a vast difference, and shall see that that one pound of Salt which had those four ounces of Nitrous seed in it will be all transmuted into Salt-peter, save a few feces: But that pound

which had two ounces of the ſaid Seed poured upon it, will contain a leſſer portion of Salt-peter; and the other which had but one ounce onely will have the leaſt portion. Moreover, if you pour thoſe Salt-waters you waſht out, and which are not yet turned into Salt-peter, upon the feces again, and ſo dry it as afore, and beſtow yet other three months on theſe exſiccations and moiſtnings, and then again boil the Salt-peter out of the Salt, it will be much encreaſed and bettered; and ſo you will have ſo much the greater encreaſe of Salt, by how much the longer you ſhall have proſecuted this Labour. Such Experiments doe demonſtrate, that by how much the more Seed there is ſcwn in a fat and ſalt Earth, ſo much the more plentifull encreaſe of the Seed is to be expected.

But thoſe deriding mockers and perſecutors of Art and Truth may here object and ſay, that the Salt-peter ariſeth from the Salt-peter water onely that was put thereunto, and not from the Salt it ſelf? But I anſwer, That that uſed *Aq. Fortis* is indeed the Seed of Salt-peter, but can never recover the Nature of Salt-peter without the help of ſome fix body: Like as the Seed of an herb cannot become an herb, unleſs it be caſt into a moiſt and ſalt Earth, from thence doth it get its body, and ſo is encreaſed.

Verily I willingly confeſs, that the Spirit of Nitre may be reduced to the former nature of Salt peter, by aſſuming it ſelf a body out of all the fix Salts. But yet, as far as I have hitherto known, by my manifold inquiries and inveſtigations a long time, I could not find any other Salt (ſave the following) by the help of which, thoſe Waters uſed about metalline Waſhings, may be ſooner and better tranſmuted into Salt-peter, like as this, and the following Salts doe: And therefore I doe commend it as of the beſt rank for the making of Salt-peter. The manner of preparing good ſalt Nitre out of the extracted Oars is already revealed in the firſt Century, and therefore needs no ſuperfluous repetition here.

Another Preparation of Salt for the making of Salt-peter.

TAke Common Salt one part, and of a ſulphureous Oar, whch the *Germans* call *Schewelkies*, two or three parts, if they contain leſs Sulphur: But if they have Vitriol in them too, then muſt you take equal parts of both. Grind the ſulphureous Mineral in a Mill, mix it with the Salt, and heat it red-hot by well torrifying or calcining them for two hours (in Furnaces ſerving for ſuch a work,) either upon a Grate, or elſe without a Grate, upon Hearths; that ſo, during this Candefaction, the Sulphur may have ingreſs into the Salt, and may alter it. This Salt being waſht out of the ſulphureous Minera with water, and boiled till a skin gathers at top of the water, it ſhoots into long Stria's or Cryſtals, like Salt-peeter, and taſts like it, but falls into Powder in a warmiſh Air. If it be burnt and prepared by putting *Calx-vive* thereto, after the way afore going, it is convertible into good Salt-peter, but ſooner and in a ſhorter time. If the Minera's you uſe have Copper in them, or any other Metal, yet nevertheleſs may they be gotten out thence by fuſion, for there will be nothing loſt in this operation but the Sulphur; and this muſt have been driven away by burning it, however, if you would have any of the Metal out of the Minera.

N. B. The *Caput mortuum* out of which the Spirit of Salt by the addition of the Vitriol is extracted, yields ſuch a like Salt, and very fit to make Salt-peter withall. There are alſo ſeveral other ways, which yield no ſmall plenty of ſuch Salts, and that in a manner without any coſts, eſpecially if the help of Stone-coals be thereto uſed. Beſides too; this you are to be adviſed of, that (ſeeing the Salt is to be burnt with the *Calx-vive*) one Calx is better than another, for ſome Lime ſtones are more apt for the making of Salt-peter, but primarily thoſe, which when you touch your tongue with, doe yield a fiery taſt; with which ſort, the Lime made of Sea-ſhells doth not compare as to goodneſs.

By what means the Root of Salt-peter is to be implanted in acid Salts, ſo as to be thereby augmented, like as the Root of a Vegetable, being tranſplanted, gets an increaſe from the ſaltneſs of the Earth.

EVen as we have demonſtrated in the foregoing diſcourſe, that the acid Spirit of Nitre is the ſeed of Salt-peter, and doth encreaſe it ſelf out of *Alkali* Salts like as an Herb doth out of the Earth: Even ſo by the ſame reaſon, fix Salt-peter, which is the root of Salt-peter, admits of tranſplantation, yet not by fixed Salts, like as the ſharp Spirit does, but by ſharp Salts, whereto it is to be united by implantation: For, two Acidities, and two Alkalies, cannot produce any new Eſſence, but two Contraries doe always produce a third. The acid Salt, which is of the meaneſt acidity, and which doth eaſilieſt admit of being tranſmuted into Salt-peter, is the common Kitchin-Salt, which we taught the way but even now of inverting by the Minera's of Sulphur. And if that ſuch proviſion cannot be had to prepare it by, the very Kitchin-ſalt it ſelf being taken both in the moiſt and in the dry way, would perform the ſame, as I have already ſhown in other places of my Writings. And as for the making of fix Nitre, you may meet with the way of doing that too and agen in my other Writings, and eſpecially in that place where I have treated of the dry ſeparation of waſhing of Metals, *viz.* when ſulphureous and Antimonial Metals are waſhed by Nitre.

The way of preparing Spirit of Salt, neceſſary for the Extracting of Gold and Copper out of their Oars; as likewiſe of making good Salt-peter of the matter left after the diſtillation is finiſhed.

MIX with two parts of Vitriol or Allum, one part of Kitchin-ſalt, and throw in this mixture upon hot burning Coals, the Spirits of which are to be taken in great Leaden Ciſterns inſtead of Receivers. This operation (beſides the ſalt Spirit it gives) yields alſo ſharp Flores. If any ſhall provide himſelf with double Leaden Ciſterns, and ſhall make the Outer one to hold in it the leſſer Ciſtern, and ſo fill this outer one with cold water, he ſhall obtain more plenty of Spirits by reaſon of this better refrigeration. But ſuch Ciſterns requires a great deal of Lead; for verily even thoſe three alone which I had in my Laboratory contained a thouſand and forty pounds of ſheet Lead.

There may be other kinds of Receivers applied to this uſe, which, to reckon up, would be too tedious in this Book.

The

The matter remaining after the Distillation may be ground in a Mill, and one part thereof mixt with two parts of *Calx-vive*; and so balls are to be made thereof, and to be put upon wood and burnt, as we shewed afore, that so they may be transmuted into Salt-peter.

But besides all these, there hath been a far better and more compendious incineration, and bettering of the lesser and more imperfect Metals shown and demonstrated to my friends, in my Laboratory, which requires not so many Circumstances and Labours, as the foregoing more prolix operation, which is performed by throwing Common Salt upon the Coals, does: For it is to be done in a peculiar Furnace, and with purer Salts; and being wrought about a greater work, yields very considerable profit: so that it impregnates Silver and Lead with Gold, with twenty four hours easie labour, and renders them worth the labour of separation.

In like manner, Copper may by the help of such Labours be very much amended, and gets no small portion of Silver, if it be added: so that with a little fire and a very few expences, every sort of Copper, though it has endured the fire scarce twenty four hours, is wont to be so much bettered, as to shew in the Touchstone the marks of two, three, and sometimes six Lots, according as it has been diligently and circumspectly handled. Hence comes it to pass, that by vile and every-where obvious Subjects any Silver and Lead may be maturated by little and little into Gold, and so may Copper it self be ripened without any detriment into good Silver, by a few repeated Labours. Now these operations requiring but small costs, and but a few labours to accomplish it, may be exercised without intermission, and bring vast profit. These inventions are such as never were as yet thought on by any, and so never at any time saw the Light. But now they that saw and learned, in my Laboratory, the great incineration, did not all of them see this Labour and Artifice, and apprehend its use, but such of them onely that stayed out constant, even to the end of the whole Demonstration in my Laboratory. And as for such as too soon forsook their Master and the School, they are (and indeed very deservedly) altogether ignorant of this operation. For should they have been masters of this *Arcanum* too, they would verily have detrimented me more, which God of his mercy prevented, and hereby provided, that all [my Arcana's] should not fall altogether into mine Enemies hands. The Furnace which I used about the said Incineration and Melioration of Metals, is as yet in my Laboratory, and will haply there remain all this *Winter*. But as for mine own part, I have determined with my self to leave off Chymical Labours, communicating them to others, with whom this more compendious bettering of the Metals will be yet longer to be seen. Therefore all the whole Drove of my Enemies, though never so big, will not at all be able to oppress the truth, what mad attempts soever they make against it. For although one or another of them hath theevishly stole from me my Secrets, yet presently the Divine goodness hath largely supplied me with others. I have now laid a sure Foundation in Alchymy, and have kindled a Light for both Friends and Enemies, which will very hardly be extinguisht as long as the World endures.

But now, that some little knowledge may be had of this more compendious Incineration, and bettering of Metals, *viz.* of Iron, Copper, Tin and Lead into Silver, and of *Lune* into Gold; I say that it is to be done in a twofold manner. The first is, when the Metals are destroyed either with common, or else with prepared and moist Chymical Fires, and converted out of their own Metallick being into an Earthy nature and Essence, are imbibed with spiritual Salts, and burnt by a close Cementation, so as by their mutual efficacy and actings upon each other, to amend themselves, and afterwards by reduction and separation to yield forth Silver and Gold with profit. And this Labour admits of being exercised in as great a quantity and plenty as any one pleaseth, and is clearly void of tedious troublesomeness, and great expences, for one onely person may discharge this Operation in one onely Chimny, and that with no small quantity of matter too. Nay more, (and which is of greater moment) if any one shall in this operation make use of such Salts as they call Graduating Salts, which are easie to be got, and cost almost nothing, he will get far greater profit, especially if he shall put Copper-plates to be burnt with the Metals reduced by the said Cementation into ashes, which said Plates, those Graduating Spirits will penetrate wholly and throughout, and in this penetration, better them, and bring them unto a more noble degree, so as to give on the Test, Silver impregnated with Gold. Nor is it necessary that those Copper-plates be separated by Lead in the secret Pot, so to get the Gold and Silver made in them, by the said operation, though they have already gotten a meanly-white Colour. 'Tis better and more profitable to put them yet again in some new Cementations, and urge them more with the violence of the Fire, and they will be enriched with a greater access of Gold and Silver, then afterwards are they to be separated by adding a due [quantity of] Lead, which is [thus] done, when the Lead containing the Gold and Silver, together with the Copper, are melted together into a great Cake, these are to be put in the Furnace, which the *Germans* call *Seigerofen*, that so the Lead melting may flow down, and in flowing or running down may carry away with it all the Silver and Gold that was in the Copper. By this Artifice is the Copper conserved, and is to be a-new made into Plates, and to be used about new Labours, and be again enriched with Gold and Silver by Cementation.

N. B. There is not at all any need of any peculiar Lead for this separation of the Copper, forasmuch as that Lead may be used thereabouts which is molten out of the Powders of the Cement, and already contains in it Gold and Silver, which Metals are conserved by one and the same work in the labour of Separation, and are already gotten by the Gradatory Cements out of the Minerals, and the more imperfect Metals.

And this now is my more compendious Incineration and Cementation of the imperfect Metals, to make them better and more perfect. This Operation have I shown to some Friends in my Laboratory, which will moreover be in many places exercised with profit. And now any one may easily foresee and guess, what shame mine Enemies, (who with their Diabolical Clamours and Calumnies, say my Writings are unprofitable and all over full of Lyes,) must at length be confounded withall, and how basely they have behaved themselves. Nor verily is it to be doubted but that there will be such frequent exercise and so familiar a practice of Alchymy (which is an Art that produceth infinite benefits) throughout

out all *Europe*, that even abundance of Work-men [or Tradeſmen] will leave their Trades, and many Countrey-men leave their Plows, and ſet themſelves about Alchymy, and by the Aſſiſtance of my Writings get themſelves Food and Rayment in an eaſier and pleaſanter way, even out of the contemptible Sand, and abject Stones. Whereupon it will of neceſſity follow, that in all thoſe places where now poverty is rife, plenty of Gold and Silver will again come in ſight. Theſe are new fruits which God beſtoweth in this Age. And every one that gets ſo far as to obtain theſe fruits, let him have regard to the poor and needy, and not forget his Benefactours from whom ſuch things proceeded leſt he pull upon himſelf the wrath and anger of God.

Moreover, there were ſome other *Arcana's* ocularly demonſtrated in my Laboratory, during the ſhewing of thoſe meer prolix ſecrets, the reckoning up of which here I judge needleſs. Some of them are of no ſmall concernment, which by the ſame Siniſter or unlucky miſhap fell into the hands of mine Enemies, and will without all doubt be by them manifeſted. For that very reaſon will I my ſelf reveal ſome, in my ſecond Century (God permitting) that it may not be concealed from any one, what excellent ſecrets I have diſcloſed for the uſe of mankind.

'Mongſt other *Arcana's*, this is none of the meaneſt, which, [*viz.*] teacheth to extract Copper, (by Waters of almoſt no coſt or charges, out of poor Oars of Copper which are every where obvious, and are not rich enough to defray the charges neceſſary for a melting Fire,) and bring it to uſe, and that in great quantity, and ſo eaſily as that without queſtion the poor Countrey-men that can very hardly ſuſtain themſelves, their Wives and Children, will for the time to come ſet about ſuch an Operation, and get ſuch *Minera's* or Oars, or even the *Scorias* of them, to extract the Copper out of them and ſell it, and ſo provide themſelves Food and Rayment againſt a ſharp Winter, whereas otherwiſe they muſt live miſerably in want and poverty. The Operation it ſelf is this.

How Copper may eaſily and very profitably be extracted and made corporeal (without any melting or fuſion) by a certain Water of very ſmall expences.

THere are two ſorts of Oars or Veins of Copper met withall, ſome are mixt with Sulphur, and refuſe extracting with *Aqua Fortis*; inſomuch that you muſt firſt remove the Sulphur from them by roſting as it were and burning them, afore that Salts or ſharp Waters can diſplay their virtues upon them. Now that roaſting (or calcining) then, is to be done on Hearths by the flame of Wood, on which, that metalline matter broken into Powder, is to be unceſſantly ſtirred with Iron Inſtruments, ſo long till it emits no more ſulphureous ſtinch: This done, they admit of extraction with *Aqua Fortis*.

Other *Minera's* or Oars which have no Sulphur admixt with them, need not this calcining, for they are to be onely heated red hot in the Fire and quencht, with Water and ſo broken to pieces, and then are they made fit for extraction.

But all ſharp Waters which diſſolve Copper may be uſed to extract the Copper out of poor coppery Oars, and that with profit, when the Waters are of no great coſts, but are to be had for a very little charges. Such are an *Acetum* or Vinegar of Corn, *Acetum* of Woods, which any Countryman may get eaſily and in great quantity; alſo, Water of common Salt, Water of the Lees of Wine, out of which aduſt Wine (or Brandy) or Spirit of Wine is prepared, and which elſe are caſt away. Theſe two latter are of the meaneſt price, and may therefore be eaſieſt of all gotten. The Operation it ſelf is this.

The Oars being reduced into Powder muſt be put into ſmall and low (Copper) Pans, about the thickneſs of a Span, for if they ſhould lie too thick or compact, they would more hardly be ſtirred with a wooden Stick: Upon them thus lying in the Pans, pour that acid Water the heighth of a Span or at leaſt a hands breadth above the matters; then put Fire under the Pans, let it boil ſtrongly, and let the matter be unceſſantly ſtirred, that ſo the Water coming to it in every part, it may extract all the Copper the more eaſily. When this Water has boiled one or two hours, and ſo gotten a moſt green colour, and that it can diſſolve no more Copper, it muſt be poured out, and more put on, and be on ſuch wiſe boiled ſo long till it hath gotten the ſame colour. Now this pouring on is to be repeated with new Water ſo often and ſo long till it imbibes (or extracts) no more greenneſs, which is a ſign that all the Copper is extracted out of the Oars.

N. B. If there ſhould be but little Copper in the Oars, the firſt Water will extract all the Copper, and ſo there will not need the pouring on any other Water. Nay more, it ſometimes happens that even the firſt Water would attract more Copper if the Oars had had more of the ſame. Therefore the Copper is not to be precipitated out of that Water which hath not extracted Copper enough, but is to be reſerved and poured upon new Oars, that it may be thoroughly impregnated with Copper, and ſo the precipitation with Iron may not be uſed in vain. For by how much the more Copper, the Waters ſhall be extracted (or held up in them) ſo much the greater is the gain, and ſo much the leſs Water is required to this Work.

It is a thing eaſie to be underſtood by him that ſhall thoroughly ſearch into this Operation, and manage it with due diligence, ſo as to commit no errour.

N. B. If you have ſtore of theſe green Waters, put in ſome old Iron for one or two nights, and you ſhall get out the Copper that will adhere unto it like filed Copper, and 'twill leave the Water white and clear, which ſaid Water can be uſed no more about this kind of extraction, but may be poured upon *Calx-vive* mixt with Wood-aſhes, and ſo be dried up, by the Air or the Sun, under ſome Roof to keep off Rain, and from this uſed Water, and the *Calx* or Lime is Salt-peter generated in ſuch a manner as I taught afore.

N. B. This Copper which ſticks on to the Iron, is to be freed from all the Saltiſhneſs by waſhing it with common Water, and is to be afterwards dried, and ſo may be uſed in the ſtead of pure Copper, for if molten it nothing at all differs therefrom, if the Operation be but well managed. Nay more, it has in it a moſt notable Commodity, as being more tender and more pure, and more commodious for many Operations than that groſs common Copper is. 'Tis alſo very fit to be converted into moſt excellent Virdigreeſe, if it be moiſtned with ſharp Vinegar and ſet in the heat.

Moreover I have ſhown in my publick Laboratory, by what means Spirit of Salt, *Aqua Fortis*, *Aqua Regis*, and my *Sal Mirabilis* may be eaſily gotten, and

and that in great quantity too, by a Separatory Sulphur, which is nothing else but Oil of Sulphur or of Vitriol, of which I have very clearly treated in the second part of the *Miraculum Mundi*. Likewise how Gold may in one quarter of an hours space be converted by the *Sal Mirabilis* (in a Crucible) into its first matter; or, into a red, transparent, sulphureous, and soluble Stone, which suffers it self to be dissolved by common Water into a most excellent Medicine. This golden Water being poured to the roots of Herbs, makes them to have a golden property, as concerning this thing you may consult my Treatise of the nature of Salts, and the second part of my *Miraculum Mundi*.

Besides, I have shown to some of my Friends, how in the extraction of Gold and Silver out of the poor Oars a Gradatory and withall fixing Spirit may be received, which is able by graduation to perfect (or exalt) any *Argent-vive* into Gold and Silver, according as the extraction has been made either of Gold or Silver Oars.

This so great a secret hath as yet escaped mine enemies hands, and so has that my secret incineration and cementation of Metals, of which they would likewise have been Masters had they waited but yet two or three days longer; for I presently showed such Operations to those that stayed, and unto other honest Spectators.

To these may be also added that notable *Arcanum* of bringing Lead in one quarter of an hours space to such a pass, by means of a graduating Fulmen, without almost any costs, as to be so impregnated with Gold as to be worth the separating.

These and such like *Arcana's* with many most profitable discourses have been seen and heard in my Laboratory, a tedious and needless Repetition of which I willingly omit.

Finally, to mention somewhat by way of addition, 'tis necessary that I say onely thus much, that happily in some short time, the business will so come about that many Men will not for the time to come take on them such a deal of care about the laborious, costly, and uncertain ordering of Mine-pits, but will rather lay hold on and manage (and that with greater profit) such as can be had and gotten better on the outside of the Earth. But especialy there will not be a few who will set about these Cementations of mine for gains sake, for they have many times many lying idle by them, and which yields them no profit, which by this assisting way they will augment, and without doubt it will be effected too by many.

Verily I cannot at all see (as far as I know) whether there can be found any honester and certainer way of sustaining Life in the whole World, than this true melioration of Metals, which brings with it so great a benefit. For even Merchandise it self though it be so very gainfull, yet doth it stick amidst Sins, as firmly as a Nail does in a Wall.

The Services of Lords and great Men are laborious and full of servitude, which many have experienced. And as for War, that snatcheth away abundance of Men by an immature death.

Far better therefore is it to live quietly with one's Family in some poor Cottage, and to feed on a piece of Bread, than to hunt after uncertain Riches by most great dangers. Therefore I doubt not but there will be many found for time to come, who being holpen by my Writings, will more commodiously sustain themselves together with their Wives and Children, than hath been hitherto done. Nor do I at all doubt, but that many will take it very untowardly, that I have so manifestly and so perspicuously revealed all things. For this is often done and daily is it, that I am upon that account reprehended by others, as the following Letter may witness, the like of which I could have here added more had I so listed.

There is no Body can satisfie all. Even *Jupiter* is not the same (or alike acceptable) to all: One is troubled with heat, another is burthened with cold. What things soever I have written, they are clear and evident to such as are skilfull in the Art, and have understanding in the business, and therefore they had rather I had written more darkly. But the unskilfull and ignorant do judge that I have plaid the Sophister in Writing, because they hit not the mark.

But all their judgments and Censures mought be tolerated whatever they be that they pass upon my Writings, did they not by reason of their ignorance, contemn the good things themselves, and say of such things as are most true, that they are Fallacies and Lies: but this needs not seem strange to any, forasmuch as such wicked contemnings proceed from those that by reason of ignorance and blockishness do no better understand the business. But this is plainly diabolical, to be highly benefited by any one, and to be made partaker of such great secrets, and yet afterwards impudently to deny the same and say, that they never had any good thing conferred upon them. The detestable malice and impiety of these Men hath enforced me to manifest in this Appendix, so many excellent secrets, which I would at no time have laid open, had I not been so treacherously deceived by those perfidious Men.

This is the Letter written unto me, of which I made some mention even now.

" THOU hast written too clearly, and again too " manifestly; beware lest God stir not up " against thee another new Farnerian Devil, to punish " thy easiness [or forwardness] of publishing such " Mysteries. For they are not to be profaned by " the ungodly, let not the present corruption of " Men deceive thee, and that blindness [of theirs] " which for the most part ariseth therefrom; for all " wicked Men are not blind, I know many Farners " that are defiled with all kinds of Evil, and yet " are not all of them so blinded as thy Farner is. " Nay, their Wit is so penetrative and so clear-sighted, that should they but read the divine Books " that thou hast published there would not be a secret in all nature, but they would know it; nay " more, they would in a short time perfect that Philosophick Work. Which should it so come to pass, " (the more's the grief) what a many Slaughters, " what Whoredoms, how many ruinings! And what " evils of all sorts would break in upon mankind; of " the which, thou thy self (though innocent) would'st " be the cause. I know that the detestable Calumnies of the impious Farner enforced thee to publish them, for he every where reported and to all, " that thou wert ignorant of them. But my most " dear Sir, what is your knowledge as a thing of nothing, unless another likewise knows that you " know it? God knows that thou knowest, for he " gave thee thy knowledge. Thine own conscience " also knows it. What? Cannot these two most plenarily bless or make a Wise Man happy? The pleasure " that depends on the Opinion of Men is unhappy. In

" vain do we ſeek after true Felicity without us, if " ſo be its ſolid principle or foundation ſhould be " within us. What matters it, if Men think thee to " be leſs learned than thou art, as long as the very " light it ſelf of nature ſhines unto thee? I would to " God that I could once accompliſh that, which, by " thy divine Books it is moſt certainly manifeſt unto " me, thou haſt perfected, and let all Men believe " me to be a moſt ſtupid Fellow; I wiſh not thus, " as if I did at all doubt of the truth of any Work. " For though I ſhould have perfected the whole " work an hundred times, I could ſcarce be more " certain of the truth thereof [than now.] He that " knows the way of concentrating Fire, and of uni- " ting the terreſtrial Sun to this concentrated Fire, " and the *Arcana's* of Fermentations doubts not, nor " ſeeks after any thing more. I may boldly ſay, " that ſeeing nature doth perform whatever ſhe has " a mind unto, by theſe three, it muſt neceſſarily " be, that it ſhould do ſome moſt eminent thing. " But if I could but once have finiſhed the Work it " ſelf amidſt thoſe thouſand of buſineſſes that have " hitherto withheld me, and kept me off from the " Operation, I ſhould have been long ago able to " wind my ſelf out of the intricacies of this preſent " Age, and wholly devoted my ſelf unto God, and " to the moſt holy Philoſophy. I beſeech thee there- " fore my [dear] Maſter, and entreat thee by God " and by the moſt laudable charity thou oweſt " thy Neighbours, to write more obſcurely for the " time to come, nay, and if it may be, to wrap " over the Books thou haſt already publiſhed with " ſome new cloudings, leſt that celeſtial treaſure " fall into the hands of the unworthy, and ſo be- " come hurtfull to pious Men. Pardon Sir the li- " berty of my complaint, for there is no other " cauſe thereof ſave piety to God, and a Zeal to the " moſt Learned, moſt upright Man, and one that " too well deſerves from ungratefull mankind. And " albeit thou knoweſt not me, yet canſt thou not be " unknown to the Curious, ſeeing thou haſt Written " ſuch wonderfull things. Nor can there be any " one that ſhall but once have read over thy Books, " but he will be highly obliged unto thee, if he has " but any light of Juſtice [or Righteouſneſs] re- " maining in him, *&c.*

Many ſuch like Letters as theſe, have been oft-times ſent me from learned and skilfull Men, tending to this end, to warn me not to publiſh ſuch excellent ſecrets for the time to come. Yet nevertheleſs, amongſt thoſe that are rendred partaker of ſuch, there are ſome who (although the Operation it ſelf has been ſometimes manually ſhowed them very perſpicuouſly and clearly,) are notwithſtanding ſo ſottiſh and ignorant, as that they cannot imitate the aforeſhown Operation. But ſome there are alſo that are come to ſuch an heighth of Treachery, as that (being either ſeduced by their own falſe malice, or drawn away with the deſire of profit,) they deny even the truth, certainty and ſtability of that very thing themſelves have manually experienced, and dare to ſay it is falſe, this verily is an aſtoniſhing and deteſtably malicious wickedneſs, and juſtly and deſervedly gives every one an occaſion to ſhun ſuch deviliſh Men more than a Dog or Snake.

I *Glauber* may juſtly and deſervedly be compared with a burning Candle, by ſerving others, am I conſumed; have not I by the publiſhing ſuch very excellent Writings kindled a clear and new light to the whole World, and added and conſumed mine own peculiar Oil, and that in vain too, as reaping no recompence proceeding from a gratefull mind?

An Explanation of ſome obſcure places which are to be met withall in the Third and Fourth Part of the Proſperity of Germany, *and in the firſt Century.*

In the Third Part of the Proſperity of *Germany.*

IN the Operation which teacheth to extract Gold and Silver with profit, out of all Oars or Metallick Earths, in Page 360, A. *ſignifies* Lapis Calaminaris.

Page 361. A. *is once met withall there, and ſignifies the ſame* Lapis Calaminaris.

In Page 370, *the ſame Letter* A, *once put, ſignifies the ſame* Lapis Calaminaris.

In Page 370. b. *where we treat of the Waters uſed about Waſhing or Edulcoration, and ſhow their uſe, the Letter* B *ſignifies pieces of Cloth, and the Letter* C. *the ſhells of Eggs, and all Cockle-ſhells and Muſcle-ſhells, [or Shell-fiſh] of all kinds, in the water and out of the water: but the Letter* D. *denotes the Feces or Lees of Wine.*

In the ſame Page, the Letter E. *ſhows or ſignifies Egg-ſhells, and the Shells of all Shell-fiſh.*

The Letter F. *ſignifies Stones and Lime.*

In Page 371. a. *the Letter* G. *ſignifies Oil of Vitriol.*

In the Fourth Part of the Proſperity of *Germany.*

In Page 397. b. *the Letter* A. *ſignifies one part, and* B. *three parts.*

In Page 398. a. *by the firſt* X. *is underſtood* Alkalies, *and by the other* X. *is meant a fixt Salt, helping on Liquefaction or Fuſion.*

Here follow ſome profitable Operations, and which appertain to the Extraction of Metallick Earths; they are indeed treated of, or publiſhed in the firſt Century; but becauſe of the omitting of ſome words, they are hard to be underſtood: which, foraſmuch as they compriſe the things that primarily concern the Extraction of Gold and Silver, it ſeemed to me a matter worth the while to inſert the ſame in this Appendix, the which (as I hope) will not be unacceptable to thoſe that ſearch after ſuch great Secrets.

31. *By what means volatile Gold is to be compendiouſly extracted by the moiſt way, out of coloured Flints, red Talk, Granates, Sand, Clay, and ſuch-like Oars or Minerals, and made corporeal.*

FIrſt of all, ſuch Minerals are to be heated red-hot in the Fire, and be quenched, then ground with Mill-ſtones, and are to be put in Stone-Pots, or *Waldenburg*-Pots, or *Colein*-Pots, that in them they may be moiſtned with pouring *Aqua Regia* thereupon. Theſe Pots you muſt put Coals about, and heat them well. The Minera's being together with the *Aqua Regia* well heated, there muſt be poured thereupon ſo much Common warm water, as will ſuffice to waſh off the *Aqua Regia*. Being on this wiſe

wise moistned, they are to be put into great Pots made of good Potters Earth, having a many little holes in the bottom, over which is some Cap-paper to be spread, that nothing of the Oars fall out through the holes, but the water onely may distill down. After that all the first water is run out, you must pour on more hot water, and these pourings on are to be so often repeated, till the water tasts on more saltish, for then it has carried off with it the *Aqua Regia* that contained the Gold in it.

N. B. The Pots are to be set upon a Bench or Dresser that hath holes in it, so that the [Waters] may pass through the bottoms by the holes, and Vessels may be set there-under.

N. B. The Minerals may also be put in Barrels, having a double bottom, such as those Barrels are in which they use to wash out the Salt-peter with Common water out of the Earth. And now after the same manner are the pourings on of Common water to be so long continued till there is no more saltishness perceived.

N. B. Albeit that there is no more tast of saltness discernable, yet nevertheless some of the Salt doth as yet abide with them, [*viz.* with the Oars] and which is to be turned into Salt-peter, on this wise following.

32. *How good Salt-peter is to be made with profit even out of these Oars.*

MIX these Minera's that are thus deprived of their Gold with an equal weight of *Calx-vive* and Wood-ashes, then heap them up in a heap under some Shed or Pent-house, and moisten them for half a year, or for an whole year by repeated pourings on, of either Man's pis or Beasts, as often as (after the drying up of the moisture) need requires. In want of Pis you may use Common water. By this means the *Aqua Regia*, which was not thoroughly washt off with the warm water, and so remained behind in the Oars, will, by the assistance of Urine, or even of Rain-water, convert the Salt in the *Calx-vive* into good Salt-peter, which is to be washt off like other Salt-peters, and be reduced into Stria's or Crystals. The remaining matter being freed of the Salt peter by washing it off, may be again put under the same Shed or Roof, to keep off the Rain, and be exposed to the Air and Solar heat, and be moistned with Urine, and it will in its season again yield Salt-peter, and will even keep doing the same for many following years, if it be dealt withall on the like manner. And so even the very *Aqua Fortis* it self, which remained behind in the Oars, will bring its benefit. The reason of this manner of Salt-peter making is this, because the *Aqua Fortis*, or Spirit of Nitre, is as it were the seed of Salt-peter, and is of this nature, *viz.* when it is put among other Salts, (like as when some Vegetable seed is sown in the Earth,) it augments it self thereby, and is multiplied, even as the Seeds of Herbs are wont to doe. And haply, hence came that old Proverb, of *sowing Salt*, which the unskilfull and ignorant mock at, saying, How can it be possibly done, that Salt should be sown and multiplied, seeing the Rain can dissolve it and wash it away? These fooliish ones did not know either what Salt was to be sown, or how. Evident it is, that even this is the sentence and opinion of the ancient Philosophers, that even Salt may be sown and multiplied in the manner of Vegetables.

N. B. Out of the extracted Oars or Minerals being conjoyned with *Calx-vive* and Wood-ashes, may Salt-peter be made, in a few days space, by moistning the matters with pouring on, even barely Common water, and so drying it up again: but then there will not be such a quantity, as when more continued and more frequent pourings on of Urine have preceded.

N. B. It is likewise a thing possible to be done, to make good Salt-peter even in one days space, with the Waters used about the Edulcoration [or washing of the Oars] if they be poured upon *Calx-vive* so long till all the noise [or tissing ceaseth] which is made in the Solution. And thus out of the sharp water of Salt-peter, and the fix Salt in the *Calx-vive* is presently generated Salt-peter, shooting into long and delicate Crystals, after that the superfluous moisture shall have been thence drawn off in a Copper-pan. The remaining Salt-peter water must be again boiled in a Copper even to the appearance of a thin skin, and then be set in the cold to shoot more Salt-peter; these Labours are you to go on withall untill all the Salt-peter be boil'd out.

I think now that I have written and delivered all things perspicuously and clearly: He that cannot comprehend them, must even let them alone as an Ass must the Harp.

As concerning the sharp Waters which are used about the Extracting of Gold out of the Minerals or Oars, so as the Gold may not be lost that is in them, but be conserved, and that with profit, there are several ways that offer themselves, amongst which we have thought good to produce these following.

33. *The ways of Reducing volatile and fixt Gold unto a body, out of the Edulcorating Waters (so called) with which the Gold aforesaid hath been Extracted out of the Oars; and also of usefully or profitably improving the said already used Waters themselves.*

HE that desireth to enter upon the best way, may pour into the Solution of the Gold, or into the Water containing the dissolved Gold, a Solution of Silver or Lead, and in such a quantity as he shall guess the Gold is of, that is dissolved in the Water. As for Example.

Suppose there be two or three Lots [Lotones or half Ounces] of Gold in the water, there must then likewise be dissolved so many Lots of Silver or Lead in *Aqua Fortis*, or thereabouts; which Solution is to be (be it more or less) put to the said water, and to be well mixt by a strong shaking it to and fro, till it becomes like Milk. When it shall have settled, it must be shaken again, and those strong agitations must be several times repeated in an hours space. Then all being well settled, the clear water is to be poured off, and the grosser matter is to be put in a Filter, that so all the humidity may by distillation [or filtration] be removed from the dissolved *Lune*, or dissolved Lead, and the Metals themselves may afterwards by reduction be reduced into their pristine body, by such an help as we will presently teach

N. B. If the Silver or the Lead should not have extracted all the Gold out of the Water, or drawn it to themselves, which may easily happen, yet notwithstanding there is not any loss of the same. For, because the *Aqua Regia* being debilitated by pouring plenty of water thereupon is rendred unfit to extract any Oar anew, there may be poured into that edulcorating Water out of which the Gold is already drawn by the Solution of Silver or Lead, a sharp [or strong]

ſtrong] *Lixivium* made of Wood-aſhes and *Calx-vive*, and rendred a little ſharper by a little Liquor of Flints. For the Flints doe precipitate all the Gold out of the Solutions. And now the *Aqua Regia* being kill'd by the *Lixivium*, lets fall every Metal that it has in it, whether it be onely Gold, or Copper, or Iron, in the form of a yellow Powder: This Powder is to be dried, and to be reduced after that manner which I told you but now, that I would teach.

The ſame Gold may likewiſe be gotten out of the *Aqua Regia* (firſt debilitated by Common water) very commodiouſly by a Solution of Mercury or Quickſilver put thereinto; The Mercury abides in the *Aqua Regia*, and the Gold falls to the bottom like a tender fine Powder, which being waſht and made corporeal by reduction will be 24 Carracts fine. And as for getting the Mercury out of the *Aqua Regia*, it is not to be better done than by pouring thereinto a ſharp *Lixivium*, by which the Mercury is conſtrained to fall down to the bottom like a yellow Powder, which is profitable for ſuch-like precipitations. The *Aqua Regia* and the *Lixivium* ſerve for to make Salt peter withall.

The Edulcorating-water out of which all the Metals are already reduced [or precipitated] being boil'd in Coppers, till a skin appear at top, and then pour'd out into other Coppers or wooden Veſſels, yield excellent Salt-peter, fit for the diſtillation of *Aqua Fortis* for a new Operation. He that is skill'd in managing this work, will get as much Salt-peter as will pay the coſts of the *Aqua Fortis*; inſomuch, that the Gold is extracted without any coſts. For five or ſix pound of *Aqua Fortis*, which holds in it two or three pound of diſſolved Salt, and is precipitated with a ſharp *Lixivium* of *Calx-vive* yields about ſome ten pounds of Salt-peter: and this will certainly anſwer the price of the Water or *Aqua Fortis*; and ſo you will have Gold extracted out of the Stones without expence or charges.

34. *Another and better way of getting out the Gold that is Extracted out of the Oars, out of the* Aqua Fortis.

MAke, by Calcination, ſome Aſhes, of one part of Tin, and four parts of Lead, and put them in an Iron-pot, whereto pour the extracted Gold, or the *Aqua Fortis* containing the Gold, boil it and continually ſtir the Calx with an Iron rod, that ſo all the ſharp Spirits may cleave to the Lead and Tin aſhes, and the Phlegm onely may exhale. After that the ſaid Calx of the Metals hath concentrated all the Spirits, and is become wholly dry, let it be taken out, and be caſt upon Coals in a ſecret Melting-pot or Crucible, in which operation the fire forceth out all the Spirits into the Recipient, which are to be again made uſe of for new Extractions. The volatile Gold, and which is mixt with Iron, adheres to the Calx of the Metals, and is to be reduced in the Furnace which the *Germans* call *Stichofen*; whereby the Lead impregnated with the Gold, and exalted by it, is gotten, which by ſeparation yields the Gold and Silver.

N. B. If that Lead ſhould not contain Gold enough as to be worth the while of ſeparating it on the Cupel [or Teſt] it is to be again commixt with Tin, and be reduced into Aſhes, and by this Calx are new Extractions to be Concentrated, that ſo by the ſo many repeated Labours, the Lead is at length made rich enough, and yields (by ſeparation) a good portion of Gold and Silver.

If (in the ſeparating) the matter be turned by the blaſt of Bellows into Litharge, it is not needfull to melt ſuch a deal of Lead on the Teſts, which would require ſo much fire. But however, it is a thing feaſable for the Gold to be gotten out of [or by] the Teſts without melting, which ſhall be taught afterwards.

35. *How an* Aqua Regia *is eaſily acquired for the Extraction of Stones.*

FOraſmuch as Spirit of Salt may be had in great quantity, you need onely diſſolve ſome Salt-peter therein, and this Solution is to be uſed to extract the Minerals withall. For the Spirit of Salt being made ſtronger by the Salt-peter, doth readily and willingly ſeize upon the tender Gold that is in the Stones. And as for the Spirit of Salt, it may be uſed as it comes over in the firſt diſtillation without any rectification.

36. *An eaſier way of getting an* Aqua Regia *uſefull for extraction.*

Becauſe that theſe Operations do always bring forth Silver impregnated with Gold, and that *Aqua Fortis* is requiſite to make the Separation of them; the Solution of Silver may be uſed, and ſo the labour of the aforeſaid incineration be omitted. Into the *Aqua Regia* wherewith you have extracted the Gold, pour in a Solution of Silver, and it will fiſh out the greateſt part of the Gold out of the *Aq. Reg.* and is, [*viz.* the *Aq. Reg.*] to be afterwards made uſe of to a new extraction, and be again diveſted of its extracted Gold by a Solution of Silver. In want of a Solution of Silver. the extract is to be concentrated with the Aſhes of Lead, and you muſt proceed (by driving off the Spirit out of the Aſhes, and by reducing the ſame Aſhes in a Furnace,) after the ſame manner as we taught you but now in our foregoing directions.

N. B. You are here to note, that the *Aq. Fort.* which containeth in it the diſſolved Silver, and is poured into the *Aq. Reg.* or nitrous Spirit of Salt, doth add an encreaſe unto theſe ſame Waters. For the *Aq. Fort.* doth corroborate the Spirit of Salt far better than Salt-peter doth.

37. *How the Silver (wherewith the Gold has been ſeparated out of the* Aq. Regia) *is to be gotten [or reduced] out of its* Calx.

After that the Solution of the Silver being poured into the *Aqua Regia*, hath extracted the greateſt part of the Gold; the *Aqua Regia* is to be poured off clear from the Silver remaining in the bottom, and is to be uſed about new Extractions. But if ſo be it ſhould yet contain Iron in it, it muſt be concentrated by Lead-aſhes. The white Calx of Silver is to be put upon ſome Cloth over a glaſs or ſtone Veſſel, and ſo is to be freed from the remaining *Aqua Regia*, which will drop from it; and by pouring on of warm water, it muſt be altogether rid of the *Aqua Regia*, which as yet adheres thereunto. This done, your Linnen-cloth being ſtrong and three double, the Common water is to be ſqueezed ſtrongly thereout of, and the Calx it ſelf laid by, to dry; which may afterwards be reduced in the Secret Crucible, or be uſed about a Cementation of *Lapis Calaminaris* into Gold and Silver.

38 *How the said* Calx *of Silver is to be reduced without any loss of its weight, and without any Detriment.*

Forasmuch as this white *Calx* of Silver is made so very volatile by the Salts, as that it cannot be reduced at all in the common melting Pots or Crucibles without great Detriment, there is no way of preventing that loss more commodiously than this which follows.

Mix this silvery *Calx* with an equal weight of a *Sal Alkali*, and cast it into the secret red hot Crucible, wider at bottom and narrower at the top, the which you must cover with its Cover made of the Lute of Wisedom. By this means will the *Calx* melt, nor will it lose any thing by fume, nor will it penetrate into the melting Pot or Crucible: and so the Silver impregnated with the Gold will be conserved without hurt, which being granulated the Gold may be separated by *Aq. Fortis:* Now this very Solution of the Silver by the *Aq. Fortis*, may be again used to gather [or separate] more new extracted Gold, and so will afterwards produce the Silver to be reduced the same way we instructed thee, and so give thee a perpetual Separatory Operation of Gold and Silver, which may every where be exercised with a great deal of profit.

39 *Another way teaching to reduce fugacious Silver with greater profit.*

Put upon the Rudder of thy Silvery Ship, the little Fish called *Remora*, that so it may be freed from its speedy flight, and abide quiet. Melt thy said Ship together with the *Remora* that sits on the Rudder in the secret four-square melting Pot, in which melting together, there is not onely recovered all the Silver without any Detriment, but it doth also get an increase of its weight, out of the white Bristles or Fins of the little Fish, and becomes enriched with Gold by its Bloud: so that this Additament yields (in the Reduction) a greater quantity of better Silver than other Additaments do. But as concerning other Commodities or Benefits that this fugacious Silver bestows, it shall (God willing) be taught afterwards.

Thus much was I willing at present to teach and reveal, concerning the extracting of volatile Gold out of Stones and the poorer Oars, and of a successive graduating of Silver into Gold. There shall be more taught elsewhere.

40 *A gainfull extraction out of the poor Oars or Minera's of Silver and Copper, by the moist way.*

These Minerals or Oars are to be dealt with after the same way as we showed above about the Minera's of Gold, *viz.* they are to be heated red hot, quenched, and ground with Mill-stones, and be moistned with *Aqua Fortis*, and to be extracted after the like manner as the Oars or Minera's of Gold are, all the difference being onely in the Waters; for *Aqua Regis* is to be used to extract the Gold with, and *Aqua Fortis* for the extraction of the Silver. If therefore there be the Minera's of Gold and Silver at hand, the Gold is to be extracted by *Aqua Regis*, and the Silver by *Aqua Fortis*; and both the Solutions are to be mixt together, in which mixion the Silver precipitates to the bottom in the *Aqua Regis*, and withall fisheth out the Gold out of the *Aqua Regis*.

Neither is it here any impediment if the Oar of Silver should also contain Copper in it, which will be extracted together with the *Aqua Fortis*. For the Silver and Gold fall down to the bottom, and the Copper abides in the *Aqua Regia*, which is again fit to extract more Gold withall, and may indeed be used as many times as any one shall please. The Copper it self is extracted out of the *Aqua Regis* by Iron Plates, but they tinge the *Aqua Regis* with a yellow colour, and therefore make it altogether unfit for any farther labours of this kind. Better is it therefore to concentrate it upon the Ashes of Lead, that so that spiritual Iron in the *Aqua Regis*, may convert some of the Lead into Gold by Gradation, and the *Aqua Regis* it self having been so often used may be yet again used.

41 *Another far easier way of plentifully extracting Gold and Silver out of the poor Minera's or Oars, Sand and Clay, and the like Minerals without the Fire of melting.*

Fill a Glass Cucurbit, or one made of the best Earth, and excellently well luted a little more than half full, with the Minera, Sand, or Stones containing in them, fugitive and fix Gold, and hereupon pour as much of the following *Menstruum* as is sufficient to moisten them; then presently put on an Alembick (for assoon as ever the dissolving Water is poured on the Oars or Minera's, it presently works and fumes) and draw off therefrom (in Sand) all the humidity by Distillation: that so in the distilling the Gold it self may be dissolved, and the *Aqua Regis* it self may by Distillation be recovered; which is again profitable for a new Operation, as we shall tell you by and by. All the moisture being drawn off, let the Cucurbit cool in the Sand, and then take it out, and put in some Water, that the Minera's and Salt may be softned. Now extract very carefully and diligently, all the Salt out of the Oar, in which said Salt is the Gold that is extracted out of the Oars or Minera's, and boil it up into a red Salt, to which must be added some Litharge, and so must be molten in such Pots as will not break. The Litharge will imbibe all the Gold, which how it is to be separated from the Lead, we will presently teach in the following discourse.

42 *The preparation of the Water necessary to this extraction.*

For the extraction of Gold, Salt is to be dissolved in *Aqua Fortis*, and for the extraction of Silver, you must dissolve Salt-peter in *Aqua Fortis*. With these Waters, of which you may furnish your self with plenty without any great labour, moisten the Oars and then distill them off again from the said Oars, and they will be always fit for such like Operations, insomuch that you need never to make new Waters. Nay more, in all the several Operations and Extractions of the Oars, they will be more and more augmented, so that if thou usest but at first no more than two pounds of the same Waters, they may suffice thee for infinite extractions.

N. B. By this means, all the Gold, how little soever, may be extracted by thee out of all Flints, Sand, and other Minerals without any expences, the Fire onely excepted.

This alſo is expedient for me here to ſhow, that ſometimes there are to be found fugacious Minera's of Gold, and coloured Flints which are ſufficiently rich with Gold, and are painted as 'twere with delicate colours, *viz.* green, sky-colour, and red: but in the heating them red hot, thoſe colours vaniſh, and leave the Flints white. Such as theſe admit not of heating red hot, like as others do, which retain their colours in a red hot Fire. Therefore ſuch muſt be reduced into Powder without any previous heating red hot, and you muſt extract them [as they are] that ſo the volatile Gold may be attracted by the *Aqua Regis*, which ſaid Gold being abſtracted [again] by the Aſhes of Lead commits it ſelf to [or imbibes it ſelf in] the ſaid Aſhes, which are to be reduced by the help of the ſecret Crucible; in which Reduction, the Gold becomes corporeal and admits of being ſeparated from the Lead with profit.

N. B. Such Stones may likewiſe be mixed with the ſharp coagulated Spirits, and theſe [Spirits] may be forced over by a Retort: For ſo, the fugitive Spirits of the Salts carry over with them the Volatile Gold, and make a very excellent Gradatory-water, tranſmuting fugitive Mercury into Gold, with greater profit, than if this very volatile Gold had been made Corporeal with Lead.

This ſecret is none of the leaſt of thoſe which teach the Extraction of Gold out of colour'd Flints or Stones.

Such a volatile Gold may alſo paſs into other Metals by gentle Cementations, and ſo become fix, and will bring no ſmall profit, nay rather a greater benefit than if it were gotten out by fuſion. In ſuch Cementations, the volatile Gold hath time of getting a body with the other Metals, and of acquiring a fixity, and is as it were a golden Seed, which augments it ſelf into Gold, in, or out of the Metallick Earth.

43. *Another Water to Extract Gold and Silver withall.*

For Gold, let Salt; for Silver, let Salt-peter be diſſolved in the Water [or *Aqua Fortis*] and let be thereto added as much Oil of Vitriol as half the Salt is you put. This Water extracteth Gold and Silver out of the poor Minera's Sand and Stones, and requireth the ſame operation as the precedent ones doe. It is likewiſe augmented even to infinity, inſomuch, that Gold and Silver may be extracted out of the poor Mines without Coſts, if you except but the fire.

N. B. Oil of Sulphur does the ſame that Oil of Vitriol doth, and therefore may it ſerve inſtead thereof in ſuch Extractions of Gold and Silver.

44. *Another far eaſier way of plentifully Extracting Gold and Silver out of the poor Minera's or Oars, with very little or in a manner no Coſts at all.*

Mix the Oars or Minera's with their due Waters, and therewithall fill ſmall Pots or Crucibles made of the beſt Earth, which put near one another in a great Iron pot. Put an Alembick upon the Pot, and draw off the Spirits by diſtillation, which [Spirits] will requite all thy diſburſements, and will ſo give thee Gold *Gratis*, which you are to waſh out of the Oars with Water, and get it [or corporifie] by *Saturn*.

45. *Another yet eaſier way.*

Moiſten the Oars with their due Waters, caſt them in by little and little upon the live Coals, and that in ſuch a manner as we taught thee about diſtilling Spirit of Salt. By this Diſtillation the Spirits paſs into the receiving Veſſels, and the Gold and Silver are diſſolved and ſtay behind with the *Sal Mirabilis*, and is to be waſht out of the Oars with Water, and to be molten with *Saturn*. Thus is gotten the Gold and Silver that was in the Minera's or Oars, without any expences, and the Spirits quit all the Coſts.

46. *How Gold and Silver may plentifully be extracted out of Fat Clay.*

Although that the Extraction of Gold and Silver by moiſt waters is a ſordid operation, as was aforeſaid at the beginning, yet is it not done without profit; becauſe the Gold and Silver may be gotten out of the Waters by precipitation, and of the uſed Waters may Salt-peter be made. But now the caſe is far otherwiſe with fat Clay, for that, it being fat, the Spirits hide themſelves therein, that the one half thereof can hardly be recovered, unleſs ſuch an Earth be freed of its fatneſs by heating it red-hot: and this requires ſome labour to effect it.

But ſeeing that in all places of the World, whereſoever any Earth is, there is ſuch a kind of Earth, and that in no ſmall quantity, that contains Gold and Silver: and there hath not as yet been any body that hath endeavour'd to reduce it to any profit, and bring it into uſe, but eſpecially when it contains not in it ſo much Gold and Silver as to defray the charges of ſeparating it by Lead. But I have found out a very eaſie way of doing it with profit, and I think it my duty to diſcloſe that Artifice for the publick good; and it is thus:

Mix ſuch an Earth as contains therein Gold and Silver with the Water of Vitriol, which I have afore deſcribed, and make it up into balls ſomewhat bigger than ones fiſt, which throw orderly and by little and little into my firſt Furnace, or into my ſecond diſtillatory Furnace, and draw off the Spirit by Diſtillation. The diſſolved Gold and Silver remaining in the *Sal-Mirabilis* is to be extracted out of thoſe balls broken ſmall, with warm water, and to be reduced by Lead, after the afore deſcribed manner.

47. *By what Artifice Gold may be plentifully and eaſily extracted out of Granates, Agates, Saphires, Rubies, Sand, or other hard Minerals which ſuffer not themſelves to be tamed neither with Lead, nor with ſharp Waters.*

It is certain that all Granates, what Colour ſoever they are of, or what place ſoever you meet with them in, whether you have them out of Rivers, or waſh them out of Sand or fat Clay, or that you find them in the high Mountains and Rocks; they always contain in them much Gold: but by reaſon of their Glaſſy nature, they cannot by any means be extracted with *Aqua Fortis* or ſtrong Waters, nor can they by reaſon of the hardneſs of their bodies fuſion be molten with Lead. Hence it is, that as hitherto they have never been ſo handled as to have their Gold extracted out of them with profit, and therefore are they neglected as unprofitable, unworthy, abject, and contemptible Minerals, whereas notwithſtanding it is a thing feaſible for a man to enjoy their Gold and Silver with a little labour, and as it were without any trouble. But now what courſe muſt we take to doe this, ſeeing they elude the ſharpeſt powers

powers or efficacy of all strong or sharp Waters, whereby their heart may be penetrated, and Gold may be extracted out of their bowels? I answer; They are to be overcome by Concentrated Spirits, and which are reduced to the form of Salt, as also by a fusile Salt of Lead, and be so divested of the Gold they contain in them, and without this will the victory over them hardly be obtained. For Spirits being reduced to the form of Salt, doe abide the fire most patiently, and perform a double labour; one by their Acrimony, the other by a strong fire, insomuch that nothing can escape their power, and therefore all things are tamed and subdued by them, and doe afterwards readily obey the virtues or power of Saturnine Salt, and yield forth their Gold by fusion.

47. *A Demonstration, above the reach of any Confutation, shewing that more Gold and Silver may be gotten out of the Oars or Minera's of Gold and Silver, by the hitherto prescribed ways, by sharp Waters or Salts, and in a manner without Costs, than is wont to be done by many Expences, and by the fire of Melting.*

I believe it is not unknown to any one that is but a little acquainted with the knowledge of the Minera's of Gold, that the Gold cannot be gotten out of them without the addition of Lead, or the help of some matter rendring the fusion more easie. And now when such Oars contain but little Gold, and contrariwise much Lead, or matters requisite to promote fusion are of necessity to be thereto used, how can it be, that that little portion of Gold or Silver should recompence or defray such great expences? Therefore such poorer Oars have hitherto lain as cast-aways, as being uncapable of bearing the Expences of separation, and so are not put to any use, nor are at all profitable.

But admit that the Oars do contain as much Gold and Silver, as that the Costs of melting may be repaid by them; yet such a fusion, compared with this invention of mine of Extracting Gold and Silver with Waters and Salts, is as if you should compare Water with Wine, or the night with the most brightsome day, which have no comparison.

For, first of all, the common melting of Metals is accompanied with far greater Expences, than that Extraction of mine with Salts, which verily needs but a very little charge. Then farther, it can never be, that all the Gold should be so perfectly Extracted out of the Oars, but that some of the same will abide in the Scoria's; besides, the volatile Gold and Silver, which must necessarily be blown off by the vehement blast of the bellows, and the acuteness of the fire, and so be lost.

Now amongst all the conveniencies that arise from the Extracting of Gold and Silver out of the poor Mines, that is none of the meaneſt, *viz.* that not onely all the fix Gold and Silver are conserved by the Salts, but also the Volatile too, and this latter is made fix and constant in the fire, together with that former fixt part, whereas by the Fusing fire it is all of it lost.

N. B. For the Waters of the Salts doe make the volatile Spirits of Gold and Silver, and which otherwise would vanish away fix and constant; for by a strong blast and force of fire are they rendred yet more fugacious. Hence comes it to pass, that [there is but the] one half part of that Gold extracted by the fire of the usual way of melting, that the Waters of Salts get out of the Oars. Upon this account my Invention doth not onely yield this commodiousness as to get both the fix and volatile Gold and Silver together, without any detriment out of the Oars, but also gets not a little in sparing Coals, (not to mention this, that one man does more in the Extraction of Gold and Silver by Salts, than three men are wont to doe in the common way of Fusion.

By what hath now been said, it is evidently apparent, what a deal of benefit and profit this invention will bring in all places of *Germany*. For this Extraction may be used commodiously and profitably, not onely in all Minera's or Oars both rich and poor ones, but also may be used in Extracting the Gold and Silver out of all colour'd Flints, wherewith all Rivers, Brooks and Fields do abound.

But some or other may haply say here, by what means can it possibly be, that Gold and Silver should be extracted out of the Stones that lie too and agen every where in the Streets? I answer such, that indeed it is very rare to find fix Gold and Silver in such Stones, but yet they have in them a spiritual, unripe and volatile Gold, which is not onely made fix and constant in the extraction made by Salts, but it doth likewise turn some of the Lead it self that is added in the fusing and separating it into its own nature by Graduation. Hence 'tis evident, that in all places of the Terrestrial Globe wheresoever Stones are, good Gold and Silver may be gotten with profit, by a little labour and small costs. Praise and glory be eternally given to the most bountifull Lord God for such Inventions. *Amen.*

These are the Secrets which I publickly demonstrated and divulged [or communicated] in my Laboratory, for the benefit of my Countrey. And I do now again affirm and witness that if even the very bare Letter be observed, no body can err. And if so be that any one should change this or that order, and so think to better the Operations, and should err, let him not lay the fault upon me who have Written the naked truth, but let him blame himself.

I had several other things of no small moment, to have spoken to here at present, the which I shall God willing very suddenly dispatch in my second Century, for the present time does not permit it.

And in the said Century will I declare with a yet clearer and easier manifestation, those Secrets here disclosed, the which could not at present be done because of my too much hast.

And now I wish to all the pious Students after this so great an Art, a large and plenteous blessing from the mercifull Lord God, as to this so very excellent a Work, that the poverty and want of abundance of miserable People may be supplied in many places. Which if it be (as I hope it will) it will exalt the honour and glory of the most high, and will encrease the Prosperity of the Countrey, and withall will check and keep under the most base attempts of mine Enemies. But especially if the counsel that I have proposed in my first Century, (*viz.* that every one may have liberty to exercise such Operations,) takes place. This being granted, it cannot be, but that Gold and Silver and Copper will every where be gotten out of the Earth, with the help of these my Writings, to the great profit and benefit of all the whole Countrey.

And

And ſo I conclude this ſo much haſtned Appendix, wreſted from me occaſionally by perverſe Men. Thoſe things that I have not in ſuch or ſuch a place clearly and evidently enough expreſſed for want of time, I will expreſs God willing in my ſecond Century with a clearer Explanation, and thither do I refer the well-minded Reader.

The End of the Appendix.

THE

SIXTH and Laſt PART

OF THE

Proſperity of GERMANY.

In which the *Arcana's* already revealed in the Fifth Part are not onely illuſtrated with a clearer Elucidation; but alſo ſuch are manifeſted as are moſt highly neceſſary to be known for the Defence of the Country againſt the *Turks*: Together with an evident Demonſtration, adjoyned [ſhewing] That both a particular and univerſal Tranſmutation of the imperfect Metals into more perfect ones by Salt and Fire is moſt true; and withall, by what means any one that is endued with but a mean knowledge in managing the Fire, may experimentally try the truth hereof in four and twenty hours ſpace.

To the Friendly READER, Health.

I Taught in the Firſt Part how the over-abounding quantity of Wine and Corn is to be Concentrated, that it may abide uncorrupt for a very many years, and when neceſſity requires it may be an help to many in need.

In the Second, Third, Fourth and Fifth Parts I taught the Extraction of both fix and unfix Metals, to great profit, and almoſt without any Coſts, out of the bodies of vile, poor Minerals and Metallick Earths, which will not quit the Coſts of a Fuſing-fire, and this to be done by no coſtly Waters; and withall, how to bring them into uſe, which no body afore me ever did. And did not I diſburſe a great deal of Monies in building a convenient Laboratory, in which I produced ſuch moſt profitable things to the view of every one, and demonſtrated them to be true? And what have I reaped for theſe ſo great benefits I have done, but a moſt ungratefull caſting off their remembrance? Have not all the things I have taught been accuſed of falſity and deceit both to the high and low, by thoſe who have ſo audaciouſly dared to deny the Melioration of Metals by Fire and Salt? Theſe have alſo aſſerted, that the making of Salt-peter of Common Salt is altogether impoſſible; and they have affirmed it to be a thing quite contrary unto nature, that Metals ſhould be gotten out of the poorer ſort of Metallick Earths by the help of a Water made of Salt-peter; but yet that even this is moſt certainly true, the Appendix of my Fifth Part, and my Second Century, doe demonſtrate by indubitable Experiments.

And

And albeit that the three said Arcana's *are evidently enough delivered and described, so as even to be palpably felt by the hands of those that know how to manage the Fire, yet notwithstanding they have brought but very little benefit as yet, because that although they are most true, yet are they contemned and disregarded by unskilfull Men, out of meer Envy and most perverse hatred, and doe even yet stick in contempt.*

However, not regarding these [*base dealings*] *and that I may mete them all things in full measure, I have a mind yet farther to detect some secrets, by which there may redound to the Country very notable fruits: And that not onely by converting the many Metallick Earths that contain in them Gold and Silver, and which have not hitherto been profitable to any unto a gainfull and a beneficial use; but also by defending the Country against the most dangerous invasion of the* Turks, *who are the Capital Enemies of the whole Christian World, and that by so strong and efficacious a defence, as never any mortal man did yet contrive the like of.*

As to what belongs to Mineral Treasures, I have exhibited a sufficiently clear and manifest description of them in the second, third, fourth and fifth Part of the Prosperity of Germany, *and also in the Appendix to the fifth Part, and in the second Century. But yet there is nothing so perfect and absolute but that in process of time there may be added and adjoyned thereto some new thing, and somewhat of perfection: Witness my Instrument which I mentioned in the second Century, by the help of which, Gold, Silver and Copper are easily and plentifully extracted out of their Metallick Earths, and that on such wise, as that there are requisite no other Costs but the bare Charges of the fire. And farther, this way would bring no small profit even from those Metallick Earths which are ranked amongst the poorest sort of Oars; if it were well known, and exercised in many places, there would flow thencefrom most mighty profit throughout all* Germany, *and the said Instrument would by its assistance wonderfully promote the same.*

For although I have heretofore publisht several ways of preparing sharp Waters, and of extracting the Metals with them out of the poor Minerals; (and yet even these ways bring no despicable gain) yet they perform not that which is wont to be accomplished by the help of the said Instrument. For this Instrument serves not onely to extract those sharp Waters in a greater quantity, but is also far fitter and more convenient for the Extraction even of the Metals themselves out of their Earths, and for the separation of the Dissolving Menstruum *from the Metals, than those Glass Vessels are, which have been commonly used about this Operation.*

Therefore it much concerns him that employs himself about these kind of Operations, well and thoroughly to know its Use. I made indeed some mention of the same in my Second Century, but yet not so clearly as for any one thoroughly to understand its Use by what I there spake. Therefore I have thought it expedient to give here somewhat a clearer and more perspicuous description of the same, that so I may not seem to be at all wanting in my diligence unto any one, but may be said to have done all things with a due candour and openness.

The Description of the Instrument, serving for the plentifully preparing of Spirits, and for the easie extraction of Metals out of their Oars, without much Cost.

THis Instrument is to be made of good Earth, that can sustain both the Fire and the Spirits; Metals are unprofitable to make it with, because they doe not long resist the Corrosion of the Spirits: But now, that the said Instrument may the longer abide in the Fire, its outside superficies must be fenced with Iron bonds. This Earthen Vessel therefore must be made of such an Earth as abides the violence of the Fire, and resisteth the Corrosivity of the Spirits, so as that it breaks not nor chaps with too much heat, nor be corroded and eaten thorough by the Corroding Spirits. Such Earths there are enough of too and agen in *Germany*. Moreover, this said Instrument may be made greater or lesser, according as you are minded to prepare a greater or lesser quantity of Spirits; But however, it must not be made too big, for then (if it exceeds a due magnitude) it will not abide the fire so well. Therefore is it necessary to have several of these Instruments made, if a man be minded to make at one and the same time a great quantity of Spirits. But if any be minded to set about this Operation so as to have huge quantities of Spirits, it will be his best way to have his Instrument made of Iron plates, such as the Armourers use, and to strengthen them with Iron rods, and so fence it both in the inside and on the outside every-where with Lute or strong Clay. For by this means the Instrument being made of a sufficient bigness for the work you would put it to, will in its inward superficies hold the Corroding Spirits, and in its outward superficies undergo the violence of the fire without detriment, and be far more commodious than so many little Instruments that are made onely of Earth.

Of the Form and Figure of this Instrument.

THE matters out of which the sharp Spirits are to be drawn, are not to be put nakedly in [as I may say] into the Instrument it self, but are to be put in some strong Earthen-pots and so put in, that after the Spirits are distilled off they may be again taken forth, and other Pots fill'd with new matter may be put in, in their room; and this to be so often done as need requires.

And seeing the Salts that are to be distilled are not put naked into the Instrument, but are put in, in Earthen-pots; the Instrument must necessarily be so prepared, as that those Pots may be put in as often as need is, and be again taken forth, when the

Diſtillation is done, and new ones be put in, in their ſtead.

The Inſtrument therefore muſt be of a like bigneſs both above and below, and 'tis no matter to have it much exceed the heighth of your Pots you put in.

One ſide of it muſt have a Door to put in the Pots at, and to take them out again, the which Door muſt be made to ſhut handſomly after your putting in and taking forth.

To the other ſide muſt be fitted a Pipe ſomewhat large, by which the Spirits may have a paſſage forth into the Receiver. And the Inſtrument muſt be on ſuch wiſe placed in the Furnace, as that the Door and Pipe may lie without the ſaid Furnace. To the Pipe muſt be added another Leaden Pipe, twining round like a Serpent, and therefore is by the Chymiſts called a Serpent [or a Worm:] the which muſt be ſet in a Veſſel full of Water, that ſo the Spirits paſſing out may be cooled and be caught in the Recipient.

Of the uſe of the Inſtrument.

WHEN you will diſtill your Spirits, you muſt put thereinto ſo many Pots filled with your prepared Salts as your Inſtrument can hold, then cloſe the Door well, and put Fire in the Furnace. This done, the Spirits will aſcend out of the Pots thus heated in the Inſtrument, and finding no other out-let but by the Pipe and Worm, they will enter into them, and being there cooled will run down into the Receiver. You ſhall know if all the Spirits are forced out of the Salts or not, when they ceaſe to flow out through the Worm into the Recipient. Which when you ſhall perceive, you muſt open your Door and take out the Pots in order, and then put in new, that ſo the Diſtillation may be continued on without any delaying. But now, thoſe Pots that are to be put a new into the Inſtrument, muſt be ſet nigh the Furnace a while, that they may grow hot: for elſe being put in cold, they would not brook the ſudden heat, but chap and break. When all the Spirits are diſtilled off, then you may put in other new Pots in the room of them you took out, and the Operation is to be ſo long and ſo often repeated as need ſhall require, or as any one has a mind to do. The Salts that remain behind in the Pots you take out, are to be moiſtned and macerated with ſome Phlegm or weak Spirit, and they do again, ſometimes emit Spirits by Diſtillation, but yet not in ſuch quantity as at firſt they did.

This is that way of preparing ſharp Waters uſefull for the extractions of Copper and Gold. But as for *Aqua Fortis* requiſite for the extracting of Silver, it cannot be prepared by this ſame Inſtrument, becauſe it will corrode the Worm or Leaden Pipe, if it ſhould paſs through it, which the Spirit of Salt and *Aqua Regis* do not do.

N. B. When therefore you would make an *Aq. Fortis*, you muſt make you another twining Pipe or Worm of ſome other Metal which will not be preyed on by the *Aqua Fortis*, or elſe ſet ſome other Stone Veſſels to the Noſe of the Pipe that goes out of the Furnace.

It is alſo a thing poſſible to be done, to make ſuch ſtrong *Acetum* of Corn and Honey by the addition of ſome Salts, as that it ſhall not onely extract Gold and Silver, but alſo Copper and Lead out of metallick Veins or Earths.

Thus much may at preſent ſuffice to be ſpoken concerning the preparation of ſharp Waters needfull for the extraction of Metals out of the Oars. The preparation [or Operation] it ſelf follows.

How Metals are to be extracted out of their Earths or Oars, by the help of this Inſtrument.

THE preparing or fitting of the Minera's or metallick Earths for extraction, hath been deſcribed in the Appendix of the fifth part, and therefore needs not be repeated here.

But as we there ſhowed, that the roaſted [or calcined] and powdered Oars were to be put into Glaſs or Stone Cucurbits, that ſo they might be moiſtned with the ſharp Waters, and be macerated [ſetting the Cucurbits] in warm Sand; ſo the very ſame thing is to be done here, this onely excepted, that [*viz.*] the earthen Pots ſupply the place of Glaſs and Stone Cucurbits, and the Inſtrument it ſelf in which the extraction is made, performs the office of Sand: After the extraction, the Water impregnated with the extracted Metals is poured off, and the remaining matter it ſelf is waſht by pouring common Water thereupon, after ſuch a manner as hath been preſcribed in the Appendix of the fifth part.

By What means the Metals extracted by the diſſolving Water out of the Oars are to be ſeparated from that ſame ſharp Water without any Detriment, nay rather with an augmentation of the ſaid Water.

WE have taught in the Appendix of the fifth part, that if a Man be not minded to precipitate the Metals out of the Solution by the contraries, *viz.* by Alkalizate Liquors, then there is no commodiouſer and nearer way than that which ſeparates the diſſolving Water from the extracted Metal, by Diſtillation in Glaſs or earthen Veſſels.

If now any one is minded to encreaſe his diſſolving Water in this ſeparation he may be Maſter of his deſire by adding thereto common Salt, and drawing off the Water from it, which ſaid Water will by this means be encreaſed and rendred ſtronger. And now there will come no inconvenience to the Metals themſelves that are held up in that Water, in that ſome Salt remains with them, (no,) for in the reducing them, the ſaid Salt gets them an eaſier and readier Fuſion and Flux.

But yet it is not neceſſary to leave the Salt with the Metals, ſeeing it is better to ſeparate it from the Metals with common Water, and ſo uſe it again to the ſame labours rather than let it be loſt in the melting.

The Reduction of the Metals from which the diſſolving Water is ſeparated.

ALbeit that that Reduction hath been already deſcribed in my ſecond Century, yet I thought it worth while here again to repeat the ſame in a few words.

It is to be done two manner of ways, and that partly in Crucibles, and partly in the melting Furnace which the *Germans* call *Stichofen*. The pure Metals, as the Gold and Silver are wont to be molten and reduced in Crucibles: the Copper may be reduced in the ſaid Furnace, and needs nothing to be added about its Reduction. But for the reducing of Gold and Silver, fix Salts, the Glaſs of Lead, Borax

rax and other additions of that kind, (of which we have made mention in the ſecond Century) may be made uſe of. And as touching the addition of thoſe matters which are wont to be uſed to promote the eaſier Fuſion, this is primarily to be regarded, whether or no the Metals are pure and alone [by themſelves] or elſe have other Metals mixt with them, that (ſo acordingly) convenient additions may be applied. For if the Gold ſhould alſo have Copper or Iron in it, then there cannot be any better thing added than Antimony, which reduceth the Gold by one and the ſame labour [or Operation] and alſo ſeparates the Copper and Iron therefrom, which thing, other ſuch like matters that are uſed to make the Fuſion the eaſier, do not perform. Therefore it is neceſſary that he who would ſet himſelf about ſuch Operations, do well underſtand the Artifice of a metallick Fuſion, and ſo adminiſter or order his labours by adding or taking from, according as the ſubject requires and as is beſt. It is impoſſible to preſcribe ſuch things to any one in ſuch a manner as to make him preſently underſtand, learn, and imitate the ſame.

Some other manual Operations which are needfull to be known in the uſe of this Inſtrument and which may be exerciſed.

FIrſt of all, it would be no ſmall or mean *Compendium*, [or good Contrivance] if this ſame Inſtrument were compoſed of two or three parts, taking for the lowermoſt part a broad Iron Pot, and ſo to ſet on the upper part with its Door and Pipe thereto annexed. And becauſe the bottoms of the Iron Pots do a little bow rounding, and that yet notwithſtanding the Pots you put therein may not ſtand leaning or awry, the bottom is to be made level with calcined Allum, that ſo the Pots put in upon that may ſtand upright. From hence likewiſe ariſeth this Commodity too, that if your Pots ſhould chance to break, and the diſſolvent run out, it would not be ſo loſt but would lodge it ſelf in the burnt Allum, and may eaſily be recovered in the preparation of the ſharp Waters and be applied to uſe.

Secondly, the Inſtrument may likewiſe be ſo prepared, as that the Pots may be put thereinto by taking off the upper part, and then the Pots being put in, the upper part muſt be adjoyned again to the nether part, and [ſo] be again covered with its Cover; for being thus, there needs not the Door in the ſide to put the Pots in by.

N. B. There muſt be ſome Notch or Channel likewiſe fitted to the top of that upper part, which being filled with Sand may receive in it the Cover, and ſo prevent the out-let of the Spirits that way, by means of its tight ſhutting; as we have taught in the ſecond part of the Furnaces. The Inſtrument prepared on this wiſe, will haply be more commodious to many Men, than if it had a Hole or Door in the ſide. But every Man may chooſe either this or the other way, which he pleaſeth.

Thus have I now taught, and opened the uſe of my more ſecret way of eaſily preparing the ſharp Spirits of Salts in great quantity, and the manner of dealing about the Extraction of Metals out of the poorer metallick Earths: Away (I ſay) moſt eaſie to do ſuch great things, and which was never as yet known unto the World.

But yet I doubt not but that the Metals will for the time to come be plentifully and very profitably extracted (and ſo applied to common uſe) by the help of this Artifice and Inſtrument, out of the poorer *Minera's* which contain in them Gold, Silver, and Copper, and which will not quit the coſts of the Fire; and foraſmuch as by the help of this Inſtrument, the ſharp Spirits of Salts may be gotten eaſily and in large quantity, not onely for the Extraction of the Minerals, but alſo for the concentrating of moiſt Fires, and ſeeing that wonderfull things may be done by the help of thoſe Fires; I do therefore commend it to the Studious of Art, as a thing of better eſteem than ordinary, and have ſufficient reaſon of ſo doing. For to omit the ſaying, that thoſe cold Fires do give an excellent Magnet for Water or Ice, they do alſo abound with ſuch virtue as by which they can ripen and better the Metals; the which we will make a larger deſcription of, in what follows.

Beſides too, there may haply be effected far greater matters with thoſe cold Fires, as to the defence of the Countrey againſt the *Turk*, that Capital and Bloud-thirſty Tyrant and Enemy of the Chriſtians, in ſome caſes than with Gun-powder: if ſuch moiſt Fires be caſt into places a prety diſtance off by ſuitable Inſtruments, or be forced out of thoſe leſſer and greater Guns and War-like Canes, they will bring far greater Detriment to the Enemies than Gun-powder is want to do.

By this means, one weak Woman will in ſome caſes be able to repel many armed Men; but this is a thing which ſuch Men as are unskilfull in natural affairs, will deny till it be made manifeſt, and uſed againſt the *Turk*. Therefore I have a mind to ſet aſide all other buſineſſes, and to make thoſe kinds of admirable Fires to the utmoſt of my power in great quantity, foraſmuch as I well and aſſuredly know how great Detriment may be brought upon the *Turks* by the help thereof.

Fires they are which any one may carry about with him like Waters; they will not burn or overthrow Horſe and Man ſooner than any have a mind they ſhall. Nay yet more, if any has a mind to fortifie their Virtues, he may by adding other Fire-breathing matters, make them far more vehement and efficacious, and do far greater matters with them as being much more hurtfull than with thoſe ſimple Fires.

And now ſeeing I have ſo very much commended the concentrated Fires of Salts, to

1. Diligent and provident Maſters of Families, thereby to take away the ſuperfluous watrineſs from their ſmaller Wines, Ales, and other Drinks, and ſo to concentrate them, and carry them (in caſe of neceſſity) into the ſtrong and fenced Cities;

2. To the poor Chymiſts, that they might by them correct and better the Metals and ſo help their own poverty and want:

3. And to the Chriſtian Chieftains of War, and faithfull Rulers of the Countrey, that they may ſtoutly reſiſt the *Turks*, that are the ſworn Enemies of the Chriſtians.

I judge it altogether neceſſary to treat of them ſomewhat more clearly.

By what means and way this threefold uſe of cold Salts may be moſt profitable to the Countrey.

FIrſt of all, the concentrated Spirits of Salt may bring moſt great advantage, by concentrating the poorer ſort of Wines, the which they make better,

ter, as is ſhown in the ſecond Century: when the ſuperfluous Water is removed from them, inſomuch that they do not onely keep their goodneſs conſtant and durable, but may likewiſe be far more commodiouſly and eaſily tranſported out of one place into another, ſo that neceſſity requiring, they may be more eaſily tranſported out of ſuch places as are more remote from Cities and fenced places into the ſtronger holds and fenced Cities, and ſo be conſerved.

It is as yet freſh in every ones Memory how miſerably the caſe ſtood with Men in the foregoing War, which laſted thirty years. If any Farmer had his Cellars full of Wines, and the Soldiers break in to the Countrey, did horribly abuſe the gifts of God, that which they could not conſume by their deteſtable Gluttony, they wickedly ſpilled upon the ground; the Soldiers I ſay, and ſuch Men as profeſt themſelves Chriſtians, and durſt boaſt of the Chriſtian Religion. From hence may it eaſily be conjectured what it would be, if ſuch a multitude of *Turks* ſhould over-run our Countrey, which imminent evil, God of his mercy turn away from us.

In the days of *Noah*, the Men then lived in all ſecurity, and not at all regarded the Preachings and Admonititions of that godly Man, by which he exhorted them unto Repentance for 120 years together, they did Eat, they Drank, Married and gave in Marriage, till the Floud ſwept them all away, and there was no more room for Repentance left, as ſacred Writ teſtifies.

We reade of *Sodom* and *Gomorra*, that the Inhabitants of thoſe Cities being even drown'd in Leachery, did ſo deſpiſe the reproofs and warnings of the godly Man *Lot*, untill a Fire was ſent upon them from the wrath of God and conſumed them.

Who is there that in this Seaſon feareth God, and lives piouſly? He that is the ſtrongeſt oppreſſeth the weaker, nor does at all think on this, that there is one far more powerfull than he himſelf is, who comes when he pleaſeth, and puniſheth ſuch powerfull Oppreſſours. But theſe things, and ſuch warnings of this nature are plainly mockt at.

Did not God ſufficiently enough warn us the laſt year 1660, and ſhewed unto us his wrath, by thoſe dreadfull Tempeſts and Storms, and Earthquakes, wherewith almoſt all *Europe* trembled. Doth he not alſo this very preſent year (1662) ſhew us his ſelf-ſame diſpleaſure? What portends that Comet that was ſeen in the Heaven, any one may eaſily gueſs what it means. Verily it threatens nothing elſe but evil, eſpecially becauſe it extended its Tail contrary to the uſual wont of other Comets, towards the upper part of the Heaven, juſt as if it ſhould ſay, I will ſhow unto the Men, that 'tis not this or that Countrey, this or that Enemy that ſhall chaſtiſe you, but 'tis the King himſelf of all Kings, who is in Heaven, that hath purpoſed to puniſh you for your Wickedneſs; whoſe Rod ye may [yet] divert from you that is ſtretcht out to puniſh you, if you apply your ſelves to him by ſerious Prayers, true Repentance, and unfeigned amendment of your Lives, now whileſt you have time allotted ye to repent in, if ſuch admonitions as theſe can but find entertainment with you. And what I pray will this warm Winter bring upon us, the which being deſtitute of all cold Ice and Snow hath permitted the Trees to flour in the very month of *February*, and the Medows to be clad in Flowers, and ripe Cherries to be ſeen? Without doubt, nothing elſe but all kinds of poyſonous Diſeaſes aud which will ſpeedily kill Men, and with which mankind will be afflicted; and if ſo be that an intenſe cold ſhould yet follow, which may eaſily be, there would doubtleſly follow a great Dearth of Grain and Proviſion by ſpoiling the Wine and Corn, whoſe buddings are already come ſo far forth, as that the cold may eaſily deſtroy them. And now are we not ſufficiently enough admoniſhed by theſe fore-runners and ſigns of the wrath of God coming on us, and hanging over our Heads?

Beſides all this, let us conſider that great Conjunction of all the Planets in *Sagitary*, ſuch as hath never been ſince that time in which all the Planets were in Conjunction in *Aquarius*. And this Conjunction [in *Aquary*] preceded the deluge, which deſtroyed all mankind by the breakings in of the Waters, *Noah* and his onely excepted. But as concerning what that great Conjunction in *Sagitary* the next year 1663 will ſhow us, and bring upon us God knows. *Sagitary* is a martial ſign, and deadly, and portends nothing but Diſſentions, Seditions, and uproars of War; and therefore propheſieth unto us nothing but bloudy Wars, inſomuch that it is much to be feared that this ungratefull World will be conſumed, and blotted out as 'twere by Fire, and the Sword, and the anger of God: which evil, God of his mercy turn away from us. Certainly theſe Conjunctions are not wont to fore-ſigniſie or bring along with them any good. But I heartily wiſh I may prove a Liar in this caſe, though I fear me, that there is more evil coming upon us than will be welcome unto us.

For when God ſheweth us any thing with his Finger, it ſhould be of more concernment unto us than all humane Writings, for they may err. But God never does any thing in vain and without cauſe. Never did there at any time a Comet ſhew it ſelf in the Air but many Calamities ſucceeded it. That old Proverb may very likely prove true, which the Ancients have pronounced, *viz.* that it will come to paſs in the year 1660, that Alchymy will begin to flouriſh, but will bring along with it ſuch changes for [ſome] years following, and ſuch dreadfull changes too, that the third part of Men will periſh with Famine and Peſtilence, the third part will periſh with Fire and Sword, and there will be but a third part onely left.

But yet I would not that you ſhould take or look upon this my prognoſtication on ſuch wiſe as if all theſe things ſhould infallibly come to paſs as I have predicted. No, I was willing onely to open to you my Meditations upon the years to come. For all things are ſeated in Gods power alone, in whoſe hands onely and alone we know our firm helps and aſſiſtance to be ready for us, and therefore do not in the leaſt confide in our own ſtrength and power, which are more vain than are all fading things.

But foraſmuch as there are natural means granted us, of driving away our Enemies, we may well uſe them as far as in us lies, for that it belongs unto every Chriſtian Man, to do his utmoſt to repell with all his power the common Capital Enemy of all Chriſtendom.

And now therefore that I my ſelf may not be found to be the leaſt in defending my Countrey, I have determined to exhibit in this Book the help and aſſiſtance that I can afford, and this is not Money and Wealth which I have not, but by offering ſuch artificial inventions, and diſcloſing them, whereby the Enemies may be valiantly reſiſted. For in all things we ſee, that many times far greater things may be done with Wiſedom and Prudence, than with Strength and Fortitude, and this is clearly evi-

dent

evident in the most efficacious Operations of Gun powder, which produce far greater effects than Mens hands, though never so strong,could ever bring forth.

'Tis well known, that the use of Gun-powder was not always known, but was first found out by a certain Monk in *Germany*, in the year of our Lord 1380, who by chance lighted on the finding of its dreadfull strength. Neither is there any one ignorant, what great Victories they that well knew its use, obtained over their Enemies afore it was made manifest. But when it became publickly known, then it served both Parties, so that neither part had more advantage by it than the other, and then the deciding the Controversie consisted (next the blessing of God) in the multitude of the Men, of which their power was composed, and not in Art. And like as it seemed a meerly incredible thing at first when it was heard of, that a Powder of such mighty force could be made of such vile Subjects, *viz.* Brimstone, and Salt-peter, and Charcoals: Even so will it at first exceed all belief, when it shall be heard say that Waters may be prepared out of such Subjects, which said Waters can doe such wondersull, and so many great things.

It is also reported [or Chronicled] that the said Monk did not search after Gun-powder purposely, but being addicted to Chymistry, and occupied about Operations upon Salt-peter and Sulphur, endeavoured to distill a Water from them. Now these being mixt, and by chance taking fire, he perceived them to break every thing, and rend it into pieces: And hence came that man to know the unheard-of Virtues of Salt-peter and Sulphur, which being so thoroughly contrary to each other, made such great concussions or shakings. The same thing hapned even unto my self, for purposing to make sharp Waters out of Sulphur, Salt-peter, and other Salts fit for my purpose; I perceived in such Operations, that far greater things mought be brought to pass by such firey Waters than could be done by Gun-powder. Nevertheless, I buried these Secrets in great silence, nor manifested I them to any man, though I knew them above these twenty years; fearing this, that should they be known, they might be as Instruments in the hands of the Christians to torment one another with.

But now seeing God hath vouchsafed to bestow a peace upon the whole Christian World, and that the *Turks* doe begin more and more to persecute and vex the Christians by their Tyrannical Persecutions, and endeavour even thoroughly to root them out, as they have already made a beginning in *Hungary* of their detestable attempts, I advised with my friends whether or no it would not be expedient to detect and lay open those Secrets to the Christians, that so they may be used against the *Turks*, and I was advised by these my friends to proceed on in the revealing of them. Upon this account (all other businesses laid aside) I wholly betook my self to this very one thing, to get great store of those kind of firey Waters in readiness, which may be made use of as most substantial bucklers or defence both offensively and defensively against the *Turks*. Now I have done this the more willingly and readily, because they kill no man, but doe onely so far debilitate them, that they may be overcome, and easily taken and made Captives. For were this invention of mine such as would kill men, I would never have at any time produced it in publick, and thus divulged it. And therefore I am even yet of this mind, that that Monk *Barthold* did not well in divulging the preparation and use of Gun-powder, by which such a multitude of Men are destroyed and slain.

But by this Invention of mine, no man is slain, and yet the victory wrested out of the Enemies hands. And the Enemies being taken alive and made Captives, may be constrained to work, and in my opinion may bring more benefit than if they were slain.

I doubt not but that the things I here propound may seem impossible even to the wisest [sort of] men of this World; nor indeed is it to be wondred at if it be so; for they are unheard-of Secrets, and unseen, and so exceed all belief. I dare not here trust my Pen too much, though I could disclose them in a few words, and so, as to bring every one to acknowledge the truth hereof, and to feel it as it were with his hands. But I must deal warily, lest such sharp, and yet not killing, weapons fall into the Enemies hands.

But yet that I may in some sort satisfie the desirous Reader, I doe signifie unto him in brief, that all the whole Art lyes coucht in this knack, that vast quantities of those artificial Waters may be gotten without great Expences; and being prepared, may be afterwards applied to use by some certain secret Instruments both offensively and defensively. For those watry Fires, or firey Waters which I speak of, are of such a burning nature, that neither Men nor Horses whom they touch are able to resist [or endure] them; And yet they doe not kill, unless one be minded to slay others, and then they must have a more peculiar preparation. But as they are by themselves, they kill none, but doe extreamly disturb both Horse and Man, that it makes them even impatient of the pains, and so forceth them upon one another, whereby their order being broken, they ruine themselves. This done, the victory is as it were given into the adverse parties hands, whereby they can without any labour vanquish and take their Enemies Captives. I dare not to say any more hereabouts, this onely I add by way of overplus, that even Women (where Men are wanting) may not onely (by this invention of mine) drive off the Enemies from any fenced place, but they may force them out again out of the place, or o'erwhelm the Company of them that are entred with Stones. Though this seems an incredible thing, yet is it most true, and will without doubt, after it shall come to light, in a short time serve as a most notable defence for the Countrey.

And as touching the easie, and not at all costly preparation of the moist Fires and their due use, together with the Instruments hereto requisite; all this shall be shown and detected to those onely who both can and will use them against the *Turks*. But to others not, and this we were willing to signifie by way of admonition or advice.

This little, but yet exceeding weighty Secret, and which may be used against our Countries Enemies with most notable benefit, I have revealed enough of at this time. Mean while I hope, that even this very year the Enemies of the Christian World will be notably endamaged by it, which God of his grace and mercy grant, that it may be a solace and help to the Christian World so dreadfully persecuted by the *Turk*, even for the honour and glory of his holy Name. *Amen.*

Now follows the third uſe, and that conſiſts in the melioration of the Metals, by which alſo great benefit may redound to the Countrey.

AS for ſuch things as concern the true and indubitable melioration of Metals by Salt and Fire, I have already ſufficiently enough demonſtrated in the fifth part of the Proſperity of *Germany*, and in the Appendix thereunto.

But ſeeing my true demonſtration there made, ſeemed not ſufficiently clear and evident to not a few, and that therefore they have moſt lyingly dared to aver, that there is no ſuch thing as a true tranſmutation of Metals, and that ſuch like Affirmations as theſe are meer fables, meer falſities, and meer dreams: Therefore I could not chooſe but (to ſtop the mouths of ſuch wicked Men, and ſhame them,) to lay open and publiſh an evident and palpable truth.

And this is no great task for me to do, for I was many years ago certain of the truth hereof, and therefore can eaſily ſet it afore the Eyes of others, and that not onely particularly [or a particular tranſmutation] but alſo univerſally, inſomuch that even the blind may ſee and palpably feel, that the tranſmutation of Metals is not an old Wives Fable, but is a certain and firm Science, and what is riſen even from the foundation of nature her ſelf. If now I ſhall prove it to be thus, I have then I hope ſecured my affairs, and have not onely defended the Writings my ſelf have ſent abroad, but withall the moſt true aſſertions of other honeſt Men, and ſo ſhall have evidently demonſtrated thoſe things which to the greateſt part of Men ſeems a thing impoſſible to be done.

Albeit that there are many who have left us the truth in their Writings, yet are they ſo involved in obſcurity, that ſuch as know not the Fundamentals of the Art, can never learn ought of certainty from them. Whence it comes to paſs, that ſo many Men have vainly attempted the Art, and therefore the Art it ſelf hath been mightily deſpiſed.

The Tranſmutation of Metals is not a thing of ſo ſmall a moment (as that eminent Philoſopher *Sandivogius* witneſſeth) in his Preface prefixed to his Writings; where he alſo tells us, that he that obtains the knowledge of the ſame, ſo as to tranſmute any imperfect Metal into a more perfect one, though it be done without benefit, hath met with an open Gate, and entrance leading to greater matters, and this is alſo exceedingly agreeable with the truth. For if any one ſhall take ſome imperfect Metal, and by handling or dealing with it with ſuch or ſuch matters, ſhall find that it is advanced to a golden or ſilvery nature, may more deeply look into the buſineſs with fuller and more accurate Meditations, and [at length] wholly ſearch it out, *viz.* whence that bettering proceeds, and by what means or in what manner his labours are to be contrived.

And now when ſuch an one doth make fix and conſtant, ſuch or ſuch a Metal by the benefit of the Fire, and uſeth no other matter about the Operation but Salt, and doth really find a true melioration of the Metal, certainly he cannot aſcribe it to any other thing but the Fire and Salt: and now whereas he aſſuredly knows, that the melioration of Metals can be perfected by the help of no other thing but of Fire and Salt, he will not need to ſearch for any other, but will rather wholly apply himſelf thereunto, whereby he may moſt commodiouſly deal with the Metals by the means of Fire and Salt, and better them with profit. And if now he be once Maſter of his deſire, he will gain ſufficiently thereby. But if not, he cannot blame the Art but himſelf, who indeed ſees the poſſibility of the Art but hath not (yet) entred in by it, or through it to the great Treaſures it diſcloſeth, ſo as to take to himſelf a due or competent part. But foraſmuch as ſuch happy Men are very ſeldom found, who find the Key that opens the Doors to ſuch Myſteries, I judged it a thing worth while if I did here detect this very Key, and ſhow by what means the Gate (by which the cloſeſt of Arts is made faſt) is wont to be opened. And if now it ſhall pleaſe the Studious Artiſt to enter thereinto, he may with all my heart, and ſo enjoy thoſe Treaſures. I will not paſs the bounds I have intended to obſerve: it is ſufficient for me to have ſhown the right and kingly way, wherein every one may go that liſteth, that ſo he may arrive to his wiſht for end.

But as for the Key that unlocks the Cloſet of Art in true Alchymy, I do confidently affirm, that Salts are ſuch Keys, and eſpecially Salt-peter, and alſo common Salt and Vitriol, each of which is of it ſelf efficacious enough to open the Door which ſhuts the Parlour or Cloſet of Arts in Alchymy. But one Salt joyned with another as is expedient and in convenient wiſe as Art requires, does effect more and ſhow greater power than if it abode alone, and this my Writings do too and agen largely ſhew. But thoſe Salts are in an eſpecial manner more excellent as to power and virtues than others are, thoſe I ſay which being firſt made volatile or ſpiritual are afterwards made corporeal, like as the following example doth evidently demonſtrate.

An evident demonſtration of the poſſibility of tranſmuting the viler Metals by Salt and Fire into more noble ones.

TAKE of Vitriol two parts, and of good Salt-peter one part, mix them well, and being mixt diſtill an *Aqua Fortis* therefrom, with this Water, diſſolve Silver or Lead, and pour into the Solution ſome Spirit of Salt, or elſe ſome common Salt onely diſſolved in Water, that ſo the diſſolved Metals may be turned into white Powder, and precipitate to the bottom of the Veſſel. This done, waſh off the *Aqua Fortis* from the *Calx* of Silver or Lead, with Rain-water, and you ſhall find it to be one quarter part encreaſed, and this augmentation cannot be waſht off with any Water. Now theſe ſaline Spirits do make the *Lune* and *Saturn* ſo very volatile, fuſile, and flying, that they melt in a ſmall heat and penetrate all hard Bodies. Upon this account I called thoſe fugacious and fuſile Metals, by the name of a *Mercury*, which ſaid *Mercury* of *Lune*, or of *Saturn* hath aſſumed to it ſelf onely ſo much of the Salts as it needed, to amend it ſelf in the Fire, when they mutually act upon each other, and the Salt maturates the Metal.

But what courſe ſhall we now take with theſe Metals, ſeeing they are ſo very volatile, that they cannot reſiſt the indifferently ſtrong force of Fire, and therefore go away in fume? And foraſmuch as they abide not the Fire and do not die, by what means can they be amended?

There is no better way to be taken with them here, than (for prevention of their volatility) to add to them ſome metallick body, into which, the fugacious exceeding fuſile, and Salt Metal may hide

it

it self, and so brook the Fire. And amongst these six metallick Bodies, I know not as yet of any better than Tin reduced into Ashes, which is most fit for this Operation, because it is the most unfit or hard to melt of any the *Calx's* of the rest of the Metals.

If therefore you will make experiment of this Operation, adjoyn to one part of the *Mercury* of *Lune* or *Saturn* two parts of the white Ashes of Tin, which being well mixt and put into a Glass Cucurbit well fenced with Lute, set it into Sand, put Fire thereinto by little and little untill the matter in the Glass be well heated; in this darkish red hot heat, leave it so long untill some part of the matter doth ascend by sublimation up into the Alembick placed at top, and up the neck of the Cucurbit. Then you must put on another Alembick, and take out all the sublimate out of the former Alembick, and put it back upon its matter in the Cucurbit, and it is to be again left so long in the Fire, untill there doth again ascend some part by sublimation into the Head. This being taken out of the Head is to be again put into the Cucurbit, and to be added to its own matter, (and to be proceeded with) till again some portion sublimes up out of the matter into the Alembick. Now these labours are to be so often repeated, untill there ascends no more matter up into the Head, and all the matter abides behind in the bottom of the Cucurbit fixt. This being done, a stronger Fire is to be administred, that the Metals may be operated upon by the Salts. For by how much the more and longer they endure the violence of the Salts, so much the better do they grow, which being taken forth and reduced by the adding unto them their due matters and being separated by a Cupel do yield forth a notable encrease of Gold and Silver.

This undoubted Experiment and evident Demonstration, doth (by its evident Operation) clearly and perspicuously teach and prove the melioration and transmutation of the Metals into better and more pure; but if this way seems to any very laborious and full of troubles, I will show him a more compendious way and such as is of less labour, for the sake of searching out the truth.

Fill a Hassiak Crucible (one of the best make) with the self same mixture, *viz.* one part of the *Mercury* of *Saturn*, and two parts of Tin-ashes, and squeeze in the matter thereinto with your Thumb pretty hard, and fit at top of this Pot, another somewhat lesser, so as that they may shut close and tight at their mouths, and one may not fall off from the other, if they be turned (topsie turvy:) Now in this upper Pot, put some Plates of Copper in, afore you place it on the lower one, yet on such wise that in the turning the Pots (up and down) they fall not out of their places. Each Pot likewise is to be well fenced with Lute such as will not chap when it is dried, and yet it may be mended if it should a little cleave by dawbing some more on, and this is done, that no fume at all get out. The Lute being dried, place this double Pot or Crucible in a circular Fire, and augment the Fire more and more, and move it nearer and nearer it untill it be well heated. Then put thereto larger Coals, and cover the Pot all over with them, that it may be every where red hot, in which great heat of the Fire it is to be left some two or three hours. Then being cool, take out and open your Pot, and you shall find the Copper Plates in some sort tinged with a white colour, but yet this colour is not so constant and fix as to abide in the Cupel or on the Test with its Body. Therefore necessity requires that those Plates be dissolved in *Aqua Fortis*, and be precipitated by pouring thereon Salt dissolved in common Water, in which precipitation the Silver *Calx* settles to the bottom. This *Calx* being freed of its Saltness by pouring Water thereon, and being dried, is to be wrapt up in a Plate of Lead, or some sheet Lead made as thin as Paper, and be put on a red hot Test, in which there must be a little Lead in Flux, which may the more readily receive the silvery *Calx* wrapt up in the leaden Paper, and which is volatile, and may hinder it from going away in fume; the Lead being consumed, there will be a grain of Silver abiding on the Test, which being dissolved in *Aqua Fortis*, will let fall some Gold to the bottom. If any of the remaining matter in the Crucible be to be reduced, then boil it with Lead, and let it be reduced into *Scoria's*: out of the *Regulus* will there also remain on the Test a grain of Silver containing Gold in it. But this way brings no profit, as being here taught for this onely end to demonstrate the possibility of the thing. But if you would get any profit by such an Operation, it will be altogether necessary to use such Vessels in which nothing at all may go away in fume, but all the matter may abide together, and may so get a fixity and constancy: and this cannot be done in Crucibles, but it will bring a profitable melioration by the said way.

Some may now demand from whence that Gold and Silver should come? whether out of the Lead or out of the Tin? doubtlesly it comes from both. And therefore seeing the Copper Plates in this Cementation, as likewise the cementing powder it self have put on a golden and silvery nature, can any one doubt that this is a true Transmutation by Fire and Salt? And this is especially manifest even from the Copper Plates, which had nothing at all toucht them, save the saline Spirits ascending up out of the Cementatory Powder, which in the heat of the Fire penetrated the Copper, and amended it in so short a time. Is there any one now so blinded as that he cannot here see, that this bettering the Metals proceeded from Salt and Fire. Certainly no body will be able to heal him that is blinded with such a darkness of his sight, and therefore must he even lie all his lifes time in such obscure mists. For this Operation is set down so clearly and evidently that it may be even felt and perceived with the hands.

N. B. If so be any one is desirous of getting more Gold and Silver by the help of this Operation, he may use the *Mercury* of *Lune* instead of the *Mercury* of Lead, for it will yield far more than *Saturn* will.

I could exhibit no small variety of these kind of Experiments, but that the shortness of time bids me stop, and forbear their description; those that cannot learn ought from these things, greater ones will not be at all usefull unto them. Thus have I a-new evidently demonstrated, that a particular melioration of the Metals is done by, and proceeds from Salt and Fire alone.

An infallible demonstration, that a true tincture or universal Medicine may be made by Salt and Fire, for the melioration of Metals.

Recipe one pound of the *Mercury* of Lead, or rather of *Lune*, of the Ashes of Tin two pounds, mix these matters together and put them into a Glass Retort

Retort coated, and put it in Sand, or rather in an open Fire, and give a Fire by degrees. In this Operation, the Salts inhering in the *Mercury* of *Saturn* or *Lune*, do diſplay or exerciſe their virtues upon *Jupiter*, and ſeize upon it and leave the *Lune* or Lead, and aſcend up into the neck of the Retort like *Mercury* ſublimate, and are very heavy and ponderous, and do very rarely fall down into the Receiver, becauſe they preſently ſettle aſſoon as ever they feel any Refrigeration. Therefore it is needfull that the neck of the Retort be ſomewhat wide, that ſo the *Mercury* ſublimate may meet with ſpace and room enough, and may not by wanting room break the Retort. Now when the Retort has been kept three hours in a red hot heat, which time is requiſite for the *Mercury* ſublimate to aſcend in, then ceaſe from continuing or keeping on your Fire, that ſo it may cool. Then take out the ſublimate out of the neck of the Retort when cold, and you ſhall find about ſome eight Lots 4 Ounces, and proceed with it the way following, as we ſhall by and by tell you.

Mix the Reliques or what is left, with two parts of *Regulus* of Antimony made with Iron, and melt it into a body: Waſh off the *Regulus* and Tin from the Silver with Salt-peter, and you ſhall have your Silver not onely encreaſed by the *Jupiter*, but alſo indued with ſomewhat of a golden nature; as much as the Salts could maturate in ſo ſhort a time, which is indeed a ſpeedy Tranſmutation. But if you uſe *Mercury* of *Saturn*, there will not follow much amendment in ſo ſhort a time. Yet nevertheleſs, that even the truth it ſelf may even by this means be ſearcht out, there may be added a little Lead, and be boiled and reduced into *Scoria's*, in which there will remain a grain of Silver, which will give you information, how much melioration the ſaline Spirits are able to beſtow in three or four hours ſpace.

But this is not the right way of getting profit, for as much as it ſhows onely the poſſibility of the thing.

But if you would have any profit by ſuch an Operation, you muſt get you a Cucurbit for this ſublimation made of good and vitreous or glazefying Earth; and the ſublimed *Mercury* muſt be taken forth of the Alembick, and be again added to the dry matter lying in the bottom of the Cucurbit, and this Operation of ſubliming it muſt be ſo often repeated, till there aſcend up no more, and that all abides fix with the Tin. Then is a ſtronger Fire to be put thereto, and the *Jupiter* and *Saturn* will be maturated by the Salt as we taught afore. And if now any be minded to take that ſame ſublimated matter, as it aſcended in the firſt ſublimation, and would make it fix and conſtant (*per ſe*) in a Glaſs, he would get a Tincture that will in projection tinge with a white and red colour, but yet I never have as yet tried the latter of theſe. However I doubt not, but it may be done. For ſeeing that this ſublimed matter, doth (though it be ſo volatile) penetrate the Plates of Copper, by three or four hours time cementation, and turns ſomewhat of the ſaid Plates into the nature of Gold and Silver by graduation, how much more would it do, if being brought to a due fixity and conſtancy, it ſhould be projected into ſome molten and flowing Metal? For that in ſuch a white ſublimate (principally in that which proceeds from *Lune*) there lies hid alſo an occult redneſs, and may be manifeſted by the Fire, this I ſay, mine Eyes have ſeen, and mine hands have felt, but have not as yet brought the Operation to its compleat end, by reaſon of various lets and want of time.

Farther, by ſuch a ſublimate *Mercury* may likewiſe be wrought various Tranſmutations, which I think not fit to divulge. It is in its nature fugacious and volatile, and yet notwithſtanding doth it in proceſs of time make all other volatile and fugacious matters, ſuch as are Arſenick, Auripigment, Cobolt, and even the moſt flying of all, *viz.* common *Mercury*, fix and conſtant, which effect is to be attributed to the Salt onely. He that knows rightly to manage this Operation, will not labour in vain, but will be rendred a partaker of great ſecrets, which thing I leave to the Sons of Art, as a Teſtament or Will.

But yet that I may kindle ſome little Torch for to guide the deſirous Reader, and may make him more certain of a true Tincture, which this abject *Mercury* ſublimate ſhowing it ſelf in a white colour hides in it, I have thought good, yet farther to add this following way.

Extract out of this ſublimate a running *Mercury*, vivifying and ſeparating it by apt and magnetick ſubjects; and evaporate a little portion or particle thereof, of about the bigneſs of a Pea, in a Silver Spoon; when 'tis all gone, you will find a purple Powder left in the Spoon. If you caſt this Powder upon hot boiling Lead, you will find after its blowing off, a grain of Gold on the Teſt. The Spoon it ſelf will bear the mark of a purple ſpot in that place, in which the *Mercury* went away in fume, and it cannot be blotted or rubbed out, becauſe the *Mercury* hath deeply impreſſed the Tincture in the Spoon.

Now may ſome or other ſay unto me, whence did that little grain of Gold left on the Cupel, and that purple ſpot which tinged the Silver Spoon, proceed, came it from the Lead or from the Tin, or from the Silver, or out of the ſaline Spirits? The greateſt part of Men will ſay it proceeded out of the Lead, Tin, or Silver. But I ſay, that it did indeed come out of the Lead, Tin or Silver, but that the Tincture adjoyned thereunto is for the moſt part the true Soul of Niter, which the *Mercury* took unto it ſelf, and again left it and forſook it aſſoon as ever it was vexed or forced with the Fire. But I doubt not but that if ſuch a *Mercury* impregnated with the Soul of Niter, were fixed and made conſtant in the Fire, it would afford an univerſal Tincture.

I confeſs I have tried many a time this Operation in ſmall Experiments, which ſometimes anſwered not my deſires, what diligence ſoever I uſed thereabouts; but when I attempted it in a greater quantity it never ſucceeded. This thing ſeems to be poſited in the will and pleaſure onely of the Omnipotent God, who will not have thoſe his ſo great Myſteries and Gifts profaned. I have indeed (like unto *Moſes*) ſeen the promiſed Land, but yet I do not know whether or no God will bring me thither in this Life, that ſo I may enjoy thoſe moſt precious Fruits.

And if God ſhould not vouchſafe me that benefit, yet do I willingly reſt content with this, that I have ſeen with mine Eyes, and felt with mine hands the truth of the Art more than once, which Art ſo many thouſands of Men do ſo greedily gape after, but yet not with ſuch good hap and ſucceſs as to find it out or ſee it.

I have I ſay ſeen the truth, but not the Tincture brought to its end or perfection, but yet have I ſeen its beginning which makes me certainly aſſured ſo far, as that I dare to affirm, and confidently aver, that there is in nature ſuch a thing as a true Tincture, and that it may by Gods bleſſing be prepared by an Artiſts hand. I have not yet had ſo much

quiet

quiet and so much time as to undertake this so weighty a Work. Yet now I have a resolution to set aside all worldly cares, solicitudes and businesses, and to attempt and wait upon this kingly Work, and expect what the divine grace will bestow upon me. For we are to look for all good things from above, for else we labour in vain, whatsoever diligence we make use of.

These things I was willing to publish for the Assertion sake of the truth, and to prove that there was in nature a true Tincture, that so it may evidently appear that Metals may be transmuted both universally and particularly. And if by some desperate Men or by a sudden and immature death (which chances God of his mercy graciously keep from me) all the *Mediums* or means of perfecting so great a Work, and finishing it should be cut off from me, yet notwithstanding the truth it self will be able to bear witness to my sayings when I am dead and gone. For I have by me even yet those Silver Plates tinged with Purple Spots, which can at all times witness the truth of those things I have here delivered. For it is an impossible thing that Silver should be tinged with a purple colour without a Tincture. If therefore there is to be found the truth in that white and fugacious sublimate, what I pray would be found in the fix and Fire-abiding red Tincture? Would it not be, that effects of far greater moment would be produced by such a Tincture. The Ancients therefore that desired firmness of health and a long life, bestowed such labours and sweats upon getting a true Medicine for humane and metallick Bodies, and some of them arrived to their wisht-for end, but the greatest part of them were deceived with vain labours, and frustrated of their conceived hopes.

If any Man did certainly know that there were in some places to be found mighty treasures of Gold, Pearls, and Precious Stones, and it were granted every one to search after them for his own proper advantage, what think you, he would be lazy and slow, and would not set himself to seek after them. But if any should so order his search that like a blind Man, he neither knows nor sees what it is he seeks after, or in what place it is to be sought by him, certainly such an one would labour in vain, and lose both his time, pains, and costs; and this usually betides the greatest part of Men, for they spend their labours in vain in their search after this Work, because (like blind Men) they neither know what they are to seek, nor where. But yet 'tis credible that there would not such a multitude of them have stray'd from the truth, had but any one so clearly and perspicuously shown and pointed as it were with the Fingers at the place where the Treasure lyeth hidden, as I have now done.

And although the envious and lying Devil should oppose the truth even with his greatest power, and should most cruelly rage against it, yet notwithstanding he will not be able to shew us any one Man that hath produced and brought the truth forth to the light with greater perspicuity and evidence than *Glauber* hath.

I have therefore yet once more at present shown by a most evident demonstration even before the whole World, and have asserted it for a truth, that not onely the more imperfect Metals do admit of being really transmuted by Salt and Fire into the more perfect ones, but withall, that by them, [*viz.* Fire and Salt] a Tincture may be made.

And now let all mine enemies visible and invisible ones, open and secret ones, what name soever stiled by, come forth and publickly produce the true Transmutation of Metals, with a clearer and more conspicuous manifestation than I have here done. I acquiesce with what I have hitherto spoken; if God shall please I will divulge admirable things in my next third Century. In this little Treatise there are laid open onely four secrets, but yet so clearly and conspicuously that no body hath as yet manifested such and so eminent things with clearer and more perspicuous expressions.

For that first Instrument is clearly enough described, by the help of which, not onely a great plenty of all sharp Spirits may be prepared with very little costs and easie labour, and the four-fold use of these Spirits is able to bring most great profit to the Countrey.

1. All Gold, Silver, and Copper are thereby extracted out of the poorer sort of Oars which *Germany* abounds with every where, and that in a far easier manner than by fusion, and are so brought to a very gainfull improvement, to the great benefit of all *Germany*, the which hath never been hitherto done.

2. Of the said Spirits is made a Water-attracting Magnet, for the bettering of poorer Wines, that so they may keep good, and be the easilier transported out of one place into another, as I have signified in my second Century. It is a secret which offers gain both to the rich and poor, and may be prepared in great plenty.

3. The imperfect Metals are sundry ways bettered by those saline Spirits, of which may be made vast quantities as I have shown in this Work or Book, and this melioration my Writings do variously teach and treat of.

4. By the help of these fiery Spirits of Salts, preparable in mighty plenty, which is a thing commodiously to be done by the Instrument described in this Book, may the *Turks* who are the Enemies of the Christian World be resisted without any Bloud-shed. Concerning these fiery Waters, which being such a notable destruction on the Enemies, this is here to be noted, that immense quantities of them are easily gotten without any Distillation and with very little expences.

For if much be to be effected by them, it is necessarily requisite to have vast quantities of them in readiness, without which, no great matters are in this case to be accomplisht. But as concerning the manner of so greatly endammaging the *Turks* by these moist Waters I cannot so accurately describe the same here, as being a meer stranger to, and ignorant in military affairs. However I will briefly and in few words shaddow out, what way I think it may be done by, *viz.* to resist and mightily endamage the Enemies by them.

First of all, this is the nature and property of these moist Waters. As to outward view they are like Water, and may be handled or dealt with as other common Waters, but their inward virtue is nothing but a meer Fire. And because these moist Waters may be thrown not onely with the hands, but with greater Warlike Engines or Guns a good way off, by artificial Instruments prepared for that purpose; therefore is the use of them manifold, and as necessity requires may they be used several ways for the expulsion and overcoming of the Enemies. We will illustrate our meaning by an example. Suppose I am in a City or Castle besieged by the Enemies, and that I have by me some of those kind of Instruments

which are accommodated to this uſe for the moiſt Fires. If now the Enemy ſhould ſet upon the Trench, Wall, or a Bul-wark, and I were furniſhed with that defenſive Water of mine, ſhould ſtand behind the Wall or Bul-wark in that place which the Enemy ſets upon, he could not poſſibly come at me; for thoſe moiſt Fires may be caſt by the ſaid Inſtruments far without the City, like a fiery ſhowr of Rain, or like a Cloud, which Rain being forced out of but one onely Inſtrument would dilate it ſelf far and wide upon many hundreds of Men, and whatſoever it touched it would hurt and burn like common natural Fire, and it would eſpecially blind their ſight, ſo that the Men would not be able to look up or ſee. If now the Enemies ſhould make their attempt upon any place, and there ſhould be ſhoured down upon them ſuch a fiery Rain, and by hurting their Eye-ſight make them quite blind, how would they be able being blinded to get over the Walls or Bul-warks? I do believe that if they ſhould have gotten over the Walls or Forts, and be made thus blind, they would be heartily glad if they could but get out again and recover their own party. But it would be better to beat them off, and blind them when they come with their Ladders to ſcale the Walls, than to permit them to approach any nearer. But yet if it ſhould ſo happen that the Enemies had gotten even into the City it ſelf, and there were ſome Houſes in the principal places or ſtreets in which the defendants may rally themſelves and that ſuch Houſes were furniſht with ſuch moiſt Fires, and that ſuch fiery ſhowers were ſhot out thence ſo blinding them that they durſt not open their Eyes, what I pray would they be able to do, being blinded and clearly deprived of the uſe of their ſight? Would they not throw away their Arms and ſolely mind the getting the Fire out of their Eyes, and yet it would hardly be ſo done in half a days time, nay if it ſhould touch their Eyes in pretty quantity, it would ſcarſe be quencht in two days time, and if they ſhould go to wipe their Eyes with their hands, then would they make their torments much more intollerable, and would add more Fire to their Eyes, becauſe their hands are likewiſe moiſtned and plagued with that continual ſhour. And now may not ſuch unbidden Gueſts be overwhelmed and ſlain with Stones caſt on them out of the adjoyning Houſes? And may not one ſingle Woman with ſuch a little Inſtrument onely filled with theſe moiſt Fires defend her Houſe againſt an hundred Soldiers. Verily in my opinion there may be made a better defence with ſuch a little Inſtrument that one may carry about with him, than with ten or even an hundred Muſquets. For 100 Muſquets require 100 Men, all which when they have diſcharged their Guns once, and have ſlain ſome ten or twelve Men (and yet it is not wont uſually to happen ſo in ſuch caſes neither) they need ſome time to load their Muſquets again, if they would keep on ſhooting. But this Inſtrument may be uſed even by Women, two or three of whom will haply do more hurt to the Enemy than twenty or thirty, yea haply one hundred Men are able to do with their Muſquets. And if the Women and other weak Men do but blind their Enemies, the armed Men may take them thus blinded Priſoners; that ſo not being killed but made Slaves, they may be ſet to Work and Till the Land, and this would be far more profitable than the killing of them would be. So then, may not an hundred Soldiers by the help of my Inſtruments defend any Fortreſs with greater and more certain defence than a thouſand Men could otherwiſe do. Verily I believe they may. For theſe blinding Fires of mine, or fiery Clouds and Rain being adjoyned to other uſual and cuſtomary military Weapons, will moſt mightily endamage the Enemy, nor will there need ſo many Soldiers, for the Citizens themſelves may uſe the other [cuſtomary] Arms, and the Women and Children may uſe the Inſtruments, whereby they would haply defend themſelves more ſtrongly than if they committed their defence to choſen and regiſtred Souldiers.

For theſe Inſtruments, (by which the moiſt Fires are driven far off upon the Enemies like fiery ſhowers and Clouds of Rain, and that without intermiſſion, and as oft as ever need requires) although they be great, yet a few Men may govern or manage them, ſo that it will be impoſſible for the Enemies to effect any conſiderable enterprize in beſieging any City. But it is needfull to place ſuch Inſtruments that thus ſquirt forth Fire, behind the Walls and Bul-warks, that the Enemies great Ordinance may not hurt or deſtroy them. Verily I cannot ſo very accurately ond compleatly ſhow what [the beſt] way [is] of endamaging the Enemies by the help thereof, for this the practice it ſelf will better ſhew us. I can furniſh forth the Inſtruments themſelves and the moiſt Fires belonging thereunto. I commend the uſe of them unto the Souldiers, who may learn to uſe them as they ſhall find good by experience. I do again repeat what I have hitherto ſo often ſpoken, and I do affirm, that with one ſuch Inſtrument may ſome thouſands of Men be blinded in a moments time, and being blinded what I pray can they then do? If ſo be that others ſhall endeavour to come to help them and fetch them off, they may likewiſe be blinded, nor can they run away, and therefore muſt neceſſarily be taken Priſoners. And this in my judgment may be done in Hoſtile Invaſions and Sieges.

But now whether or no there may be any uſe of ſuch Inſtruments in Battailes and Conflicts with the Enemies, I do not well know, but that a City, Caſtle, or Houſe may be defended by their means, and ſo drive off the Aſſailants, is a thing evident and undoubted. Should there be a thouſand Enemies beſet the Houſe of ſome particular Citizen, yet muſt they depart if onely ſuch a fiery Cloud or Rain (the Doors and Windows being ſhut) ſhould be ſhoured down upon them. For ſo they would be rendred blind and not be able to ſee or find the Door, as it was in *Lots* time, when his Enemies environed his Houſe to have out thoſe two Strangers, they were ſmitten with ſuch blindneſs that they were conſtrained to leave the Houſe, and it was permitted *Lot*, and his, to paſs out of the ſame without any impediment. And is it not lawfull for us to ſmite our Capital Enemies the *Turks* with blindneſs, and to defend our ſelves, our Wives and Children?

God himſelf ſaith, I will encompaſs thoſe that are mine, with a Wall of Fire, and defend them againſt their Enemies. Briefly, this invention of mine, of making ſuch a fiery Miſt or Rain, is an incomparable defence and ſafeguard, the like of which was never as yet known in the World. And now may any one eaſily conjecture what may be done offenſively with this ſame invention. For example, ſuppoſe 'tis neceſſary to take ſuch or ſuch a place from the Enemy, but now there is not time enough left, nor are there Souldiers enough for the enterprize; and therefore ſome Stratagem muſt be uſed to become Maſters of

of one of the Gates at least whereby the Souldiers may be let in.

And now in my judgment some Gate may be sei zed on and that easily by the help of these moist Fires of mine, and 'tis thus, let some Souldier or other fit for such a design, be taught the use of my Fire spiting Instruments, and when he understands it, he may be clad in Countrey Habit, and so let him go to them upon the Guard, and in the Court of Guard-houses in which they be, let him shour in upon them a fiery, Eye-blinding, and forcibly hissing shour. [This done] how can the Guarders possibly resist those that come to the Gate and are ready to enter in? Nay more, the Souldier thus clad may have a Granadoe given him to carry in a Sack, which being filled with those moist Fires, may of its own accord (without any benefit of Gun-powder) leap assunder and fill all the whole room with his blind making Dew, he may throw into those Watch-houses where they keep Guard, and so make all that are there present unfit to fight. And if so be there should be more of those Houses than one, the same Souldier may likewise have more such Granadoes given him, one of which he may throw into each House. Nay farther, if need be, and that you would have it fadge better and have it more certainly succeed, there may be sent several Souldiers with such Fire-breathing Granadoes to several Gates, to o'rewhelm the Watchmen and possess them. For the Watch-men suspecting no evil from one Countrey-man onely, will not cry out Arm, Arm, but let him in without any impediment. Such Fire-breathing Balls or Granadoes may be made of Iron, Copper or Earth, which however, properly are not Fires as long as they feel not the Air, and they then become Fires onely, when any one is so minded to have them such, breaking every thing in their reach like Gun-powder burning, and depriving all such as are present of their sight, and making them Sick. Granadoes made on this manner, and of about the bigness of a Mans Head, do not of their own accord conceive a flame without Air, nor do they flie assunder, or at all operate. But if you would that the Air be let in whereby they may operate, there must be a little Spicket or Tap to be drawn out of the Granadoe, that so the Air entring in may vivifie the Fire that lies in the Ball or Granadoe. Such a Granadoe being thrown into any Watch house, the Watch men will without doubt presently run and take it up and see what it should be, and what end it was thrown in there for; then as they all of them stand round and contemplate upon the novelty, if any of them hap to draw out the Spicket, which without all question they would do, the Air gets in, and the Fire enkindles and breaks that Granadoe thus stuft with that venemous Fire all to pieces, and so will strike them all down together. And may not now the Souldiers in the mean time hasten and break in to that fenced place without any let, and become Masters of the Gate? Verily methinks it should succeed very well. I tell you my thoughts of the business, I never tried the thing it self nor do I ever desire to try. Such as have a desire to try it, and have occasion and opportunity of doing it, may more accurately contemplate thereupon, and so will they find what way they may most conveniently detriment their Enemies most of all by. I have laid the foundation, others must valiantly proceed on and bring the thing to a most usefull Issue. However I do not doubt but that the most part of Men that shall hear me say, that there may be such effects produced by these fiery Waters, that may equal the dreadfull Operations of Gun-powder, will mock at me, and judge it an impossible thing; nor will it be any thing strange they should, because they have not any knowledge of nature.

Before those dreadfull virtues of Gun-powder were known, certainly no body would have believed the same, had they heard it told, that it were a possible thing thing to hurry or throw such a great Ball of Iron, into so far a place with so little Powder. And now it is a thing so very common, that he that will not believe it will be laught at. Even so, those things I have here mentioned of moist Fires will seem extraordinarily wonderfull and absurd to the ignorant, untill they shall see with their Eyes, and feel with their hands, that the *Turks* shall even this very Summer feel it if God permit, and vouchsafe me health so long. If God (I say) shall permit, which I would have you understand, as thus, *viz.* unless the wrath of God shall be so enkindled against the Christians, and shall therefore put a stop, and prevent the accrewing of any benefit, by any help how great soever it be. For when God pleaseth to punish any Countrey with deserved afflictions, certainly no Instruments of defence will at all help or do ought.

These things was I willing to declare at present, to demonstrate in what manner the Enemies power may by such Artificial moist Fires, and a peculiar kind of Granadoes, such things as never were as yet known in the World be broken. There are verily other far greater effects, and which exceed Mans belief, that may be effected by these my newly found-out Fires; and such as are not to be written but to be revealed onely unto those that are truly well Willers to the common Weal, and who study how to destroy the Capital Enemy of all the Christian World. But thus much I add, that by these Artificial, Secret, and unknown burning and flame-conceiving Fires, far greater things may in my judgment be effected at any time whensoever one is minded, than by Gun-powder, for that it operates not afore it be enkindled with the Fire. But my Fires are enkindled and inflamed by the Air, and therefore must necessarily exeed Gun-powder in the production of greater effects, and this time will manifest.

Those common Granadoes being thrown into any City may be covered with wet Hides or Cloaths and be quenched, so as not at all to operate, but it cannot be so with my Instruments. And therefore it is not without cause that I prefer them afore Gun-powder.

'Tis not expedient to make any larger discourse concerning these matters, and to take up any more room by revealing more. I could verily in a few words so disclose these things that every one mought be able palpably to feel, and visibly to see them, and so as that he would assuredly know that far greater things mought be effected by these my Fires than by Gun-powder. They may together with the Gun-powder use these my moist Fires as they think good and as need requires. And I do not question but that hereafter Wars will be waged after another manner than hath hitherto been done, and force must give place to Art. For Art doth sometimes overcome strength. We will illustrate the business by an example.

When any little weak Man Fights with a bigger and stronger than himself, and they have both of them like skill in the use of their Arms, the stronger over Masters the weaker and Conquers him. But

now

now if the little Man be better skilled in the uſe of Weapons than the greater and ſtronger one is, he beats him and becomes the Victour. And when two are of equal Stature and Strength; they ſmite alike forcibly, and beat one another alike, juſt as your Laundreſſes that beat Cloaths with a waſh Beetle, ſo do theſe lay on blows on each other with like meaſure. So among the Ancients did they fight Man to Man, and the ſtrength of the blows prevailed. But when Gun-powder was found out, then a few could kill and put to flight a greater number than themſelves.

And now again 'tis every where known, that Men now a days do again fight with equal hand, as 'twere, neither party having more help [by Art] than the other party hath: ſave that the ſtronger party doth for the moſt part get the Victory, ſo that the Wars in our time conſiſt not in Art, but in the multitude and company of Men. Mean while I firmly hope that if the uſe of my moiſt Fires be but known, there will be another kind of Warfare than now is, by fighting on equal Terms with blows as the Countrey fellows do, and whereby the ſtronger can overmaſter and ſubdue the weaker. But now by the help of Art, the weaker may overcome the ſtronger. And if ſo be that Art and ſtrength concur together they are wont to be moſt efficacious. *David* with his ſling ſhewed the skilfulneſs of his Art, and ſubdued that great *Goliah*, who little expected ſuch a miſchance from ſuch a little Shepherd. And like as *Goliah* mocked at *David* with his Sling, ſo perhaps will the *Turk* have us in deriſion, ſhould we meet him with ſuch Water-throwing Inſtruments. But even as that great *Goliah* was ſmitten down by a Stone of the Shepherd, ſo may the *Turk* be eaſily burnt and radically rooted out by thoſe moiſt Fires, if the Chriſtians will themſelves.

But ſome or other may here object and ſay, ſuppoſe ſome perfidious Chriſtian ſhould happen to flie to the *Turks*, and put ſuch Weapons into their hands, to uſe againſt the Chriſtians agen, what ſhall we do then? [I anſwer,] ſuch [a miſchief] may be prevented by an accurate diligent warineſs, that theſe ſecrets be not revealed to every body, but to ſuch onely as are known, and that have poſſeſſions, Wives, and Children: for ſuch will hardly be allured or corrupted with any reward. Beſides too, the vulgar will not be ſo eaſily apprehenſive of all things hereto requiſite, ſeeing the Art conſiſts not barely in one or two, but in many things [or circumſtances] It cannot therefore be that ſuch inventions ſhould ſo eaſily fall into the Enemies hands, and that for ſeveral cauſes which I forbear to reckon up here. Nay more, if neceſſity ſhould require there mought (by accurate medtiation) a farther inquiſition be made, whereby more ſuch inventions mought be found out. For this may eaſily be effected by Men of a quick piercing Wit, *viz.* by their diligent ſearch to add to what is found out and to better the ſame, for 'twill be a facile thing to do. For nature being ſo moſt exceedingly richly ſtored can never at any time be thoroughly found out. And therefore even I my ſelf do hope in ſome ſhort time greatly to augment [or meliorate] the ſaid Inventions of mine. If God vouchſafe me life, there ſhall be even yet produced by me to light wonderfull things, which will miraculouſly promote the ſafety and happineſs of my Countrey, and eſpecially if I ſhall but find amongſt Men a thankfull remembrance thereof.

Moreover, I doubt not but that abundance of Men will wonder if they ſhall ſee theſe my newly invented Warlike Inſtruments to be publiſhed in Print, which is a thing that I would never do, for I have reſolved to make ſuch onely partakers of the knowledge of the ſame, as ſtand in need thereof.

But becauſe I have conferred with one or two (whom I thought to have born me a loving and friendly mind) about theſe things, and ſpake to them too openly about the very buſineſs it ſelf, they got ſome part of the Art it ſelf, and ſaw the very Inſtruments in the Workmens hands whom I had taken order with about making them, and without doubt perſwaded themſelves that they had the full knowledge of the whole Art. Preſently upon this they were become inviſible and withdrew themſelves, inſomuch that I ſuſpect that thoſe perfidious Men have repaired to the Courts of ſome great Men, to offer and ſell theſe my inventions as if they were their own. Now then to meet with ſuch treacherous perfidiouſneſs, I thought good to publiſh openly ſomewhat concerning theſe matters, that ſo every one may know that whatever Men ſhall ſell ſuch ſecrets as their own, they were not invented by them but by me, and they have fraudulently ſtolen them from me. But I except thoſe here, to whom I have revealed them to this intent, that, *viz.* they may make uſe of them againſt the *Turk*.

And becauſe I can methinks prophetically as it were conjecture that theſe my newly invented military Inſtruments will be deſired and ſought after by a great many both high and low, I judged it a thing worth the while, to take care for the getting ſome of thoſe ſame Inſtruments, and alſo thoſe moiſt Fires thereunto appertaining to be prepared, and ſent into thoſe places, where they may detriment or annoy the *Turks*. For without doubt there may be far ſtronger reſiſtance made with theſe newly invented Inſtruments againſt thoſe our Capital Enemies, than can ever be done with Gun-powder. For Gun-powder is never wont to operate afore it be kindled with the Fire, which kindling and inflamation Water will hinder, and now my moiſt Fires are not at all impeded thereby. And upon this account it is a thing altogether poſſible that a fiery Globe [or Granadoe] may be as well emitted [or be as forcible] out of the deep Waters with [or by] them, as it may with Gun-powder out of the Water, the which ſeems indeed incredible, but yet is very eaſie to him that is endued with the knowledge of theſe things.

There yet reſt a few admonitions to be given, *viz.* that no body paſs his ſentence upon theſe my ſecrets here diſcloſed, with a prejudiced and foreſtalled judgment, unleſs he has a mind to ſlur himſelf with an infamous mark, but let him have patience, till he of his own knowledge perceive the whole Baſis of the buſineſs. Many things there be that lie as yet hidden, which (as Propheſies tell us) muſt be manifeſted before the Worlds end. This time draws nearer and nearer, though ſo few believe it. For my part I am verily of this Opinion, that there is ſuch a wonderfull time at hand, the like of which hath neither been ſeen or heard of from the time of the Floud even to theſe our days. I pray God to Defend the Pious, and to Convert the Wicked, *Amen*.

BEING

A General Appendix to all his hitherto-published Writings.

The which doth not only illustrate all obscure places, as well in his Philosophical and Medicinal as Chymical Writings, and explain those hard places to be understood; but also do so abundantly supply those which are defective, that the learned and the unlearned, the highest and the lowest, and more, the meanest Workman and Husbandman, may sufficiently be able to comprehend that Author hath in all his Writings, written the pure and simple Truth, and hath again brought to light the most noble Art of Alchymy which hath so long lain hid in darkness hitherto; and hath discovered it for the common good of Mankind.

LONDON, Printed in the Year MDCLXXXIX.

THE PREFACE.

Courteous Reader,

THAT *every promiſe becomes a debt, is reported by a common Proverb or By-word, and therefore to ſtand to ones word or promiſe, is a thing which procures a great Ornament or grace no leſs to* Juniors *than to* Seniors. *Since therefore in my Writings I have ingaged my Faith or Credit through the promiſing of ſome little Works, and yet have not been able, by reaſon of the ſcantineſs of time, hitherto to ſatisfie the expectation and deſire of very many, by publiſhing of the ſame; yea ſince greater Diſcommodities and Impediments being caſt in my way, do hinder me from day to day whereby I cannot write more things, although I have nothing more in my deſires than that in ſtanding to my promiſe, I may acquit my credit, and ſet forth the ſaid little Works; to wit, my Vegetable Work, my Work of* Saturn, *my Book of Dialogues or Diſcourſe, the fourth part of my* Spagyrical Pharmacopœa *or Chymical Diſpenſatory, and my admirable little Book of the concentring of the Heaven and Earth: truly they being Treatiſes containing moſt excellent Arcanums or Secrets, and the moſt worthy ones whereof Men can be made partakers, notwithſtanding I am of neceſſity deſtitute of time for the writing of any Treatiſe peculiarly, and for that cauſe I am conſtrained to inſiſt in a nearer path, and for the ſake of promoting the publick good, to ſend forth the ſaid Treatiſes in publick by a leſs labour and trouble. The preſent Treatiſe notified with the Title of an univerſal Cheſt or Cabinet full of Riches, or of a general Appendix of all my Writings hitherto expoſed to the publick view performs this, whereby all things which have been either the more briefly and obſcurely ſpoken in them, are with a more clear or perſpicuous illuſtration explained, or things that have been wholly omitted are ſupplied, and by the ſame endeavour the promiſed Treatiſes are added, yet not in that order wherein they ought otherwiſe to be written down, and the which order here to be obſerved, would adminiſter very much trouble; but wherein all the ſecrets have in proceſs of time been made known unto me, and committed to Paper. But it is free for any one to add according to his own Judgment, Medicinal Secrets unto Medicinal ones, Mineral Secrets unto Mineral ones, Chymical Secrets unto Chymical ones, if it ſhall ſo pleaſe him, and time ſhall alſo permit the ſame, which it in no wiſe permitteth unto me, every one that acquieſceth and is content with theſe things may conſider, if a certain Cook ſhould ſet a Diſh on the Table filled with the beſt Meats, as being deſtitute of time, to put every ſort of Meat in a ſeveral Diſh, whether he could of right be angry with him, or by whiſperingly prating, he could dare to ſay, he was to be blamed as being not skilfull in the affairs of the Kitchin, becauſe collecting ſo many delicate and ſuch dainty Meats into one Diſh, and daring to ſet them on the Table? I ſuppoſe not any one could of right complain of ſuch a deed of any Cook; the Cook deſiring to have it taken in good part, ſuch Meats as he had, ſuch he ſets before them; he that refuſeth to take of them, may uſe his own liberty, and may let thoſe Meats alone, which he is not compelled to receive, even as the Cook alſo may be conſtrained by none in preparing of the ſame according to his own will or judgment.*

Whatſoever Meat doth not pleaſe the Pallate of one, yet will not be ingratefull to the Pallate of another, but on the contrary gratefull, ſeeing one Food is wont to ſavour or reliſh this Man, and another the other, neither is he inordinately affected with the diſdain of confuſed Meats, who taketh of thoſe which reliſh him, and leaveth the reſt for others.

Let every one that blameth theſe Writings do the ſame, not in haſtily taking them in evil part, but in friendly and courteouſly excuſing me that I have not ſent them abroad in a more harmonious order.

They are like unto a certain true and great Cabinet or Cheſt, filled with very many excellent Secrets, being reduced into my knowledge through a ſucceſſive diligent ſearch of thirty years and ſo collected into one heap, that they might either be conſerved for my own or at ſome time be made of publick uſe or ſervice: out of this Cheſt every one ſhall be able to exhauſt thoſe Arcanums *and* Secrets, *which ſhall pleaſe him or ſerve his uſes.*

As to what concerns my ſelf, becauſe I daily behold ſometimes this Man, ſometimes that Man being ſnatched away by death, to be carried forth and committed to the Earth, I may eaſily conclude rationally with my ſelf, that thoſe changes or chances will in a ſhort time happen alſo unto me; I ſhould commit a very grievous offence or errour, that ſo many coſts, labours and troubles, of ſo many and ſo great Secrets being conſumed in vain, I ſhould carry them away with me under ground, and not beſtow them for a common good: I ſhall here perform the office of a good Houſe-holder, or skilfull Houſe-keeper or Steward, who after that he hath made abundant of Proviſion for Winter-cloathing for himſelf, his Wife, Children and whole Family, if he hath as yet plenty of Linnen and Woollen Cloth remaining, he doth not caſt them away, but rather caſts them together into a Cheſt, ſo long to be kept, untill he ſhall obtain an occaſion of adminiſtring them for the uſe of his Neighbour. In the name of the Lord therefore, in making a beginning with the opening of my Cheſt of Treaſures, I will empty it out by little and little by degrees, and will offer it for a common uſe, that out of ſo many Treaſures, every one may convert unto his own uſe, what things he ſhall judge to be profitable unto him; to wit, a Phyſician Medicinal things, and a Chymiſt Chymical things, even as every one ſhall diſcern any thing to be fit for his own uſe, every one of what rank ſoever ſhall find thoſe things wherewith he might be content, ſo indeed that whatſoever he ſhall not meet withall in the firſt, ſecond, or third Century may be found in the reſt, for which things ſake, if ten Centuries ſhall not be ſufficent, I will adjoyn other ten or more, that ſo I may remove from me all thoſe cares, and carefulneſſes wherewith the cuſtody of ſo great Treaſures hath importuned and affected me for ſo many years. Like unto a travelling Woman, who with the greateſt deſire expecteth the hour of her delivery, and who deſireth the beholding of her Fruit, do I deſire that time wherein all things ſhall be printed in Letters. The Almighty God beſtow on me ſo much preſence of mind, health, and ſtrength, and prolong my Life ſo far, that I may finiſh it to his Honour, and the Succour, Comfort and Profit of all Mankind. Amen.

In

THE FIRST CENTURY: OR GLAUBER'S Wealthy Store-House of Treasures.

PART II.

In the Name of the most Holy Trinity I begin to write the First Century of my General Appendix, *or an Exposition of all my Writings hitherto set forth.*

I. *Concerning Fire and Salt, and what Alchymy is.*

ALCHYMY is a Science, and Art of destroying, of purging immature or unripe and impure Metals, by Fire and Salt, and by a singular Artifice, of converting the more pure part into a better form and kind, according to the words of *Paracelsus*, who saith, *Every Something is to be converted into Nothing, and every Nothing into Something.* Also Corruption renders that which is good perfect, the which is to be equally understood of particular and universal Operations.

Nevertheless it is not of necessity that I should here tediously treat of a particular Transmutation of Metals by Fire and Salt, because that hath been already long since performed in the second part of the Miracle of the World, and also in the fifth part of the prosperity of *Germany*.

A Square within a Circle.

II. *A Demonstration whereby it is proved that Fire and Salt are most noble Creatures of God, and that in Fire there lies hid the purest Salt, and in Salt a most efficacious Fire.*

THAT Fire and Salt are most noble Creatures of God I have evidently enough demonstrated in my little work concerning the nature of Salts. But that there is a subtile saltish spirit in any fire, and that between the heat of the Sun, and of our Kitchin fire, as to their saltish spirit, a great difference doth interpose is sufficiently and over sufficiently known. But to comprehend or lay hold of, to concenter such a pure saltish spirit of *Sol*, to render it corporal, palpable or perceivable, and visible, remains hidden and unknown to us by reason of our sins; because God reserves so great mysteries for his own alone, of whom he is honoured and feared: for God himself useth no better similitude than the fire, whereunto the Ancients exhibited divine honour, and by the help of the same, perfected all their Sacrifices: So among the *Caldeans*, Fire, and God are called by one and the same name of *Esch*: and among the *Heathens*, the chief Philosophers, yea *Hermes* himself thought the Sun to be a God, and worshipped it for a God. These things are found expressed by *Mutius* concerning the nature of Gods, and therefore those things are not necessary which may be here repeated. Yet that is well to be noted, that God hath always appeared to his Saints under the shew of fire, and hath talked with them out of it, it being that which is full of the greatest mysteries, yet observed but by a few, as in a peculiar little work concerning the concentration of the Heaven and the Earth I will more plainly and fully declare. I affirm therefore, that it can scarce be, that the admirable, yea incredible nature of fire should be described without the revelatian of the highest or greatest mysteries of God. Therefore it is better that such Secrets are passed by in silence, than that precious pearls should be cast before Swine, who are wont to receive them with laughter, and proclaim that they are nothing but the mere sophisteris of triflers, even as is evidently manifest from the description of *J. H. S.* of the Philosophers Stone, wherein Nature, he saith, makes not use of Glasses, Vessels, Fire, Salt, Urine, and the like in the bowels of the Earth; and the universal *Elixir* may very fitly be prepared by him, who also hath not handled any Chymical La-

bours, or was never buſied about Fire or Salt : Let it ſhame the man of ſuch ſtinking lies, wherewith he endeavours to cover his own ignorance, I on the contrary affirm, that all thoſe that know not how to handle Fire and Salt, do in very deed know nothing, but do give credit unto thoſe things only which they hear, or read in others writings, and alſo for that cauſe are unworthy of the name and title of true Philoſophers ; for true Philoſophy is to be thoroughly or perfectly learned by the help of Fire and Salt alone, the which God willing ſhall be more evidently demonſtrated.

III. *It is moreover demonſtrated, that in all Salts an admirable Fire doth lurk as being laid up therein, through the indeavour whereof very many admirable things may be perfected as well in Medicine as in Alchymy: and alſo that it may be altogether performed, that out of Vitriol the Stone of the ancient Wiſe men, out of Salt Peter a ſpiritual Gold, and an excellent yellow tincture, and out of common Salt the true Pearl of the Philoſophers may be prepared.*

IN all Salts, that a moſt potent Fire doth lurk as being laid up therein, thoſe have beſt known who have the labours of the fire thoroughly viewed and certainly known. For through the efficacy and operation hereof, ſalts are reduced unto a fiery force, or power, or unto a moiſt fire, out of which they before aroſe, after the laying down of their earthlineſs, yet one ſalt draws out one fire far unlike to the fire of another, ſo that this is volatile, the other is fixed, and remaining conſtant in the fire ; another is partly volatile and partly fixed, even as the operation ſhall procure this or the other property unto them, yet all ſuch fiery ſalts may by the benefit of Art be concentred, and made more efficacious than they were made by ſome one diſtillation. For example ſake. If any one beholdeth Vitriol, and conſiders of the nature thereof, he ſhall in very deed certainly find that by the help of, a ſtrong fire, there may be allured or extracted out of it that which was in the beginning, to wit, a fiery ſpirit, which by the aid of external fire, being reduced into a narrow Central room, or Con-centration, draws out that internal fire, uncloathing it ſelf of, or diſplaying ſo great virtues, that it reduceth into a Coal all things which it moiſteneth or encompaſſeth, even like as if it had been burnt up by common Kitchin fire, or by Glaſſes receiving the Sun-beams and burning up all things that are objected againſt it. Concerning theſe fiery ſalts, and the preparation and uſe of them, I being here to deliver a few things, I will take my beginning from the fire of Vitriol, and the preparation of the ſame, the various and manifold uſe whereof ſhall be afterwards explained in its own place.

IV. *Of the Preparation of the Fire of Vitriol.*

RETorts made of the beſt earth do draw out the fire of Vitriol by diſtillation after this manner following.

Common Vitriol is calcined in earthen pots unto a redneſs, and reduced into a powder, it is put into an earthen Retort, and placed in a Furnace, and a great veſſel adjoyned to the neck of the Retort, which is to receive the ſpirits going forth ; the fire is kindled by degrees, and ſo gradually increaſed untill the Retort be brightly red hot, in which degree of fire it is ſo long to be urged untill no white Clouds or little vapoury Miſts do any longer appear. This operation is perfected in 24 hours ſpace at the moſt. But if the Retort ſhall be very large all the Oyl cannot be extracted in the ſpace of 24 hours, but will require a longer time for the operation, which experience it ſelf will determine: after all the Spirits are diſtilled off and ſettled to the bottom of the Receiver, the clay luting which joyned the Receiver to the neck of the Retort is to be mollified with a wet cloth put round about it, and the Receiver taken off, and the ſpirits poured out of it into a glaſs body well coated with Clay, the which (having an Alembick put on) is to be ſet in ſand, that the volatile ſpirit may ſlowly and gently be drawn off, and kept for its uſe afterwards to be taught. Alſo afterwards the phlegm is to be drawn off, and reſerved for its own uſes, becauſe it hath its own peculiar virtues. At length alſo the laſt ſpirit is to be received in a peculiar veſſel, the which, after that it hath ceaſed, and fiery drops do follow, the fire is (by degrees) to be removed, and when the ſand is cold, the gourd is to be taken out, in which (the Alembick or head being taken away) thou ſhalt find a fiery Oyl of a black or ſomewhat reddiſh colour, the which is again to be rectified in an open fire in a Retort well coated, that it may be rendred more fiery and clear.

By this oyl admirable things, and thoſe not only profitable for Phyſicians but alſo for Chymiſts, and other Artificers, are perfected as we ſhall ſtraitway ſee.

There are indeed other ways or means alſo by which this oyl is attained, but this afore taught is the eaſieſt of all, although it require the more time. But if any one ſtand in need of a greater quantity of the ſame, he may procure thoſe greater Cans prepared of the beſt Earth, they being ſo joyned to each other, that the uppermoſt being placed on the fire, the reſt might be placed without the fire, ſo that the lowermoſt may receive the oyl going out by deſcent.

V. *A proof whether this Oyl of Vitriol be well prepared and ſtrong, and fit enough for that operation of which we here treat.*

LET down a quill or ſome ſmall piece of wood into the Oyl, the which, when thou haſt left in it for ſome ſmall time, draw it out ; if it ſhall be burnt unto a Coal the oyl is well prepared, but if not, it is a ſign that ſomewhat of moiſture is as yet therein, which is again to be expelled by fire.

VI. *Another tryal or experiment.*

DIP in the oyl a piece of woollen, linnen, or which is better a piece of cotton cloth extended to the breadth of a finger, and pour on the ſame being taken out and laid down ſome drops of the ſpirit or oyl of Turpentine, the which if being kindled they ſhall conceive a flame it is a ſign that the oyl was well prepared.

VII. *Another further Proof.*

POur into ſome little glaſs ſome ſmall quantity of ſpirit of wine wanting all phlegm, and pour on the ſame ſome drops of this oyl by little and little ; and if the ſpirit of wine kindle and burn all away the oyl is prepared after a due manner.

NB. I admoniſh that every one doth warily handle

dle this operation : for in these two fires , to wit, saltish and sulphureous ones, there is great virtue hidden, the which seems probable but to a few, if it should be manifested unto them, neither that have I consulted or decreed that it should be made known to very many. These few particulars do sufficiently teach after what sort such fires are to be used in Medicine, Alchymy and other Arts; but these experiments are sufficient.

VIII. *Concerning the use of this Fire of Vitriol in Medicine.*

THE use of this fire, as also of the volatile spirit of the same, and of its flegm, thou shalt find described in the second part of my Furnaces, and among other Authours ; so that the repetition thereof is here superfluous, this is onely to be known that this fire being onely besmeared or anointed with a feather on all uncurable and Cancerous or eating Ulcers, kills the Poyson, and causeth that such Ulcers do very easily admit of cure, if so be the Escharre be but first removed by the applying some ointment or emplaister which cures adustion or burning. For this oyl burns up all wild or forreign flesh, and that which (as proud) lifts up it self with an abounding poyson, like unto a certain bright burning Iron, and separates all evil and hurtfull flesh from the good and sound flesh.

IX. *Of the general use of this Oyl in Alchymy.*

BY this mineral fire, all kind of Transmutations of things are perfected, but particularly it exalteth some of the more base metals into a higher degree, and makes them more constant, of which more shall be said in the following Chapters or Treatises.

In the general, some Vegetables, Animal and Mineral subjects, may by the operation of this Oyl be reduced into fixt Medicines, and indeed far more commodiously than by the common fire of Wood or Coals. And moreover which is a far greater thing in this very oyl a fiery Tincture is hidden, and is manifested by the benefit of Art, as Fryer *Basilius*, and other Philosophers do affirm.

X. *Of the use of this fire in other Arts.*

BY the virtues of this invisible, and yet essential fire, all sorts of most profitable matters are performed , the which notwithstanding is not here safe for me to describe, but I am constrained to refer it till another time, it onely in this place seems worthy my labour, briefly to shew that this fire performs all those things which the fire of Coals is otherwise wont to effect.

Truly it is a fire, but it shineth not like the fire of Wood or Coals : But he that will have it to shine, he must needs add unto it a subtile or fine Sulphur, that he may extract or allure forth of it a visible fire.

This fire being defended against the entrance of the Air, remains occult for many thousands of years, and doth not manifest it self, unless any one make it manifest.

Truly it is an admirable fire, and most fit for the effecting of many incredible things, whereof we have spoken many things sufficient for this time.

XI. *An evident demonstration of such a fire lying hid even in the Salt of the Kitchin, and that known to every one.*

AFter that *Plato* and many other Philosophers took notice that nothing endowed with life did consist without Salt,and that dead Carcasses themselves were preserved for a long time from putrefaction by the virtues of the same; they thought and wrote that a certain divine thing lay hid in it. But after what sort this divine and hidden thing is to be made visible, they have not taught. But without doubt, those most wise Philosophers would by this word shew and denote something of a singular excellency.

Because therefore God himself is a fire, and hath never appeared to his Saints in any other shape but that of fire, and besides also all Salts are generated in the moist bowels of the earth from an Astral fire, and on the contrary, a true fire may by the operation of Art be extracted and rendred palpable and visible out of all Salts, it being that which without doubt lay not hid unto them, therefore it is also very likely that those Philosophers have not without a cause of great moment written that a certain Divine or fiery Being did secretly lurk in Salt.

But that they have intimated not any thing to be better, or more noble than that fiery and saltish Spirit may be foreseen by an easie conjecture; for if a certain divine thing shall lie hid in Salt as they write, it shall of necessity follow that that divine spark being freed from all its earthly bonds should be far superiour to all earthly things in beauty, virtues, efficacy and power ; and that next to the eternal God himself it should remain the chiefest and most precious Pearl in the World.

But who shall teach us the manner of separating so precious a Pearl out of the common and Kitchin Salt ? none but God alone, or some good friend ; who can make his friend a partaker of the knowledge received from God ?

But since that very few mortals do seek, love, fear and honour God with sincere hearts, but do much rather cleave fast unto the frail and unjust Mammon , and attribute divine honour unto the same ; its no wonder that God doth reserve those things to himself, or at least doth sparingly bestow on us those things which he abundantly supplyed the Ancients withall from his own bountifull hand : And moreover the same omnipotent Creatour enlightning some fit subject, with a certain spark of nature , grants unto him also so much wit that he knows that by a due silence he is to beware of this wicked dreg or dross of the World. Whence it is no wonder that the light of nature is at this day made known to so few mortals.

But before I treat in many particulars of that precious Pearl of Salt, it seems altogether necessary for me, first to shew the manner and reason of extracting that fire out of Kitchin Salt; the separation whereof can be perfected in no other respect than through the violence of common fire, to wit, whenas the Salt being mixt with a certain earthly matter that it cannot flow, is urged in a retort with a most strong fire, that the more pure part of the Salt, which is nothing else but a sharp spirit , may depart into the Receiver joyned to the Retort , in which sharp and sweet spirit a most efficacious fire lurketh which in manner following is to be extracted and concentred.

XII. *Of*

XII. *Of the preparation of the fire of Salt.*

TAKE of this acid or ſharp ſpirit of Salt, rectifie it out of a Glaſs Retort in ſand; the flegm will come over firſt, which was put in the receiving Veſſel in the firſt Diſtillation to condenſe or collect the ſpirits the more commodiouſly. After that all the flegm is come off, and acid drops begin to come, remove or change your Receiver, and take your ſpirits therein; continue the Diſtillation ſo long untill all the ſpirits be come forth, it being indowed with an acid ſweetneſs, is an effecter of very many operations, which doth bring much profit both in Medicine and Alchymy, as is manifeſt out of diverſe of my writings, and eſpecially out of the 2d. part of my Furnaces, and the comfort of Mariners.

In this ſweet and ſharp ſpirit like Wine there is an infernal fire hidden, which doth equally like Coals burn up all things put into it, like as the fire of wood and coals doth Vegetables and Animals, and it reduceth all things which common fire doth, by calcining them into aſhes, ſuch as are immature metals, tin, lead and the like, which when they are put into it, it burns them up by calcining them into white aſhes.

XIII. *A Concentrating the rectified Spirit of Salt into a moiſt and cold Fire.*

EVery Spirit of Salt conſiſteth of two things, to wit, Fire and Water, which water the fire doth ſo firmly co-knit to it ſelf, that it cannot be wholly ſeparated by any diſtillation or rectifying; but it always adheres to the fire, how often ſoever it be rectified or diſtilled: if any one therefore deſireth by rectifying to ſeparate them he muſt of neceſſity put immature metal-like ſubjects to the Spirit of Salt, the which, by how much the more immature or unripe they are, by ſo much they render the ſpirit of ſalt the purer; ſuch are *Lapis Calaminaris*, *Zink*, and *Iron*, which by reaſon of their moiſt and attracting nature, do draw to them that inviſible fire out of the ſpirit of ſalt, as it were that agent whereof (as to their maturity or perfection) they are neceſſarily deſtitute, and without which fiery agent, a metallick kind of body is able to attain unto no perfection in the earth.

Such metallick ſubjects therefore, the ſpirit of ſalt, they being put into it, aſſaulteth, and as much as it can diſſolves them. This ſolution being diſtilled out of a glaſs retort by ſand, with the more gentle fire, ſends forth nothing but a meer and unſavoury phlegm, the fiery eſſence it ſelf remaining with the mineral in the Retort, the which if it be more and more urged, and the fire more increaſed, that it may become plainly burning bright, then that mineral cannot longer retain the fire of the ſalt, but diſmiſſeth it, which deſcending into the receiving veſſel, is condenſed into a thick and fiery oyl, which is afterwards to be kept in ſtrong and well ſtopt glaſſes, becauſe it fumes without intermiſſion, and deſires to return into the air, as it were its Chaos from whence it came forth.

This fire is the operator of great effects in Alchymy and Medicine, of which effects very few have known how to diſcourſe. But it hath far different properties and qualities from that which is extracted out of Vitriol, whereof it ſhall be afterwards treated.

And although through the help of this fire, incredible things may be performed as well by Chymiſts as Phyſicians, and other Artificers; yet it is a conſuming, deſtroying, and alſo a ripening fire; neither hath it the leaſt of the moſt noble Pearl with it whereof we have made mention above, and the which in this preparation is converted into ſuch a fire.

That Pearl, if it ſhould be extracted or allured out of Salt, in my ſimple opinion it were to be extracted not by the benefit of the fire, but through the endeavour of metallick and attracting ſubjects.

But although I do not profeſs my ſelf to be ſo skilfull a Maſter, and do not arrogate to my ſelf the knowledge of ſo precious a pearl, yet I cannot but bewray that ſmall little ſpark of Nature which God hath granted unto me, that ſo every one may have a clear knowledge and ſight of what admirable myſteries Salt doth hide in its own vile body.

XIV. *The manner whereby that moſt precious Pearl of Salt may at leaſt wiſe in ſome reſpect be rendred conſpicuous or apparent.*

EVEN as I have admoniſhed in my foregoing writings, that the powers, colours, and virtues of all Vegetables, Animals, and Minerals are found concentred in Fire and Salt, ſo alſo I now affirm and aſſert the ſame thing that by Salt through the benefit of Fire, all Vegetables, Animals, and Metals, may in their own ſpecies, nature and properties be increaſed and propagated into an infinity. So that we have the ſeeds of them.

For example ſake. I prepare Kitchin Salt by the fire, that its tartneſs being loſt, it puts on the nature of an Alcali or Lixivial Salt, I mix ſome parts thereof with ſome barren earth, or with naked ſand, the which I moiſten with water, in theſe I ſow the ſeeds of vegetables, that they may be nouriſhed by that Salt and may grow, which in thus growing do obtain their own proper figures, virtues and colours, they appear green, yellow and red, ſky-coloured, purple coloured, and white, *&c.* and have a ſweet, ſour, ſharp, bitter, ſavour, even as God hath beſtowed on every particular kind its own proper nature, which operation proceeds from this one onely Salt, and the fiery beams of the Sun being tempered with air.

When therefore Beaſts are fed with theſe Herbs growing, and receiving nouriſhment from the Salt, they are of neceſſity alſo nouriſhed and increaſed by the ſame; even as alſo the ſame Herbs growing from the ſame Salt do ſupply nouriſhment and increaſe themſelves.

But if any one could obtain the true ſeed of Gold, and increaſe that ſeed by the help of Salt and Fire; he might (without doubt) obtain great plenty of Gold, but God will not have it that the tail of the Goat ſhould be as long as the Cows, the which being lifted up with too much pride, would ſtrike out her own eyes with her too long tail.

If therefore all things and Gold it ſelf, as alſo Silver, Pearls, and precious Stones, are after an inviſible and occult manner hidden in Salt, and may by the help of art and nature be rendred palpable and viſible; why alſo might it not come to paſs that the moſt excellent Medicine and moſt precious Pearl of the wiſe men might be allured forth out of the ſame Salt? Truly common Pearls are bred out of Salt waters, wherein if the firſt matter of Pearls were not, after what manner or ſort ſhould they bewray themſelves out of the ſame? Therefore that it may evidently be made manifeſt, that by the operation

ration of art, also Pearls may be extracted out of Salt which do far excell those Pearls, which by fishing are drawn out of the depth of the Sea, in beauty, virtue, efficacy and excellency; I will prescribe as much indeed as hath been granted unto me, for demonstrating the possibility of the thing, a certain manner whereby every one shall be able to take to him a firm and sure foundation of weighing or considering of the matter more exactly.

XV. *An operation of alluring forth a Philosophical Pearl out of Salt.*

DIssolve thou in common water, as much of common Salt as thou wilt, by how much the greater plenty thou shalt take, by so much the more thou shalt obtain.

In like manner dissolve in *aq. fort.* one or two Ounces of Silver, pour this solution of *Lune* on the dissolved Salt, and stir both the dissolutions up and down divers times, that it may become white and like unto Milk. For Silver cannot well indure the Salt, but departing from it is precipitated to the bottom, and there resides, in the form of a snow-like Powder, which by the effusion or pouring off the water is to be separated and dried.

This silver powder hath extracted a spiritual and philosophical gold, or the said precious Pearl out of the Salt Water. Because *Diana* hath known no less how to fish Pearls in the Salt Sea, than to hunt wild Beasts in the green Woods: But that Pearl is made corporal and visible in manner following.

XVI. *How the Pearl being attained is made visible.*

IT is to be noted that that silver powder being thus by it self, and without an admixture of other fixed Salts, doth very hardly by fusion return into its former form of silver, but that it flows like Salt, and pierceth any vessel whatsoever, yea doth depart into a smoak. For the spirits of the Salt do render the silver so fluid and volatile, that it is made altogether mercurial; and therefore its more tender and noble part may be separated from its more gross part by distillation, if this could be done by glassen, or earthen, or metallick vessels.

When this mercury of *Lune* is melted in an open crucible, it vanisheth into smoak. It being put into a Glass Retort, refuseth to yield to the fire, the which being too much increased makes the glass to melt, and destroys the glass together with the silver. If earthen vessels be used, the same mercury pierceth the same unhurt like oyled Leather, when it departs, the Salts also depart into smoak, and do leave little grains of silver adhering to the vessel, whereof in this respect there is made a loss, which renders the sublimation void.

Of Iron vessels also here is no use, because of the Salts that are admixed with the silver rising up against the Iron, they dismiss the silver reduced to its ancient body, and besides a little spirit of salt they send forth nothing, so that no separation is made, but the pure and impure do remain co-mixt.

For the sake of avoiding those discommodities I have tried many ways and manners in vain, and at length I took notice, that if such a matter be added to the most penetrating mercury of *Lune*, which may so hinder its efficacy of solving and co-melting, that it may be changed into a porous lump, than that, through the benefit of fire there might be an easie separation thereof, which without this help doth most difficultly exist.

In the name of the Lord, therefore adjoyn thou unto thy fishing Net; that is, unto the mercury of *Lune*, such a matter in due weight and measure which admits not of melting, and which suffers not the mercury of *Lune* to conflux, or melt together. Such are wooden Coals being reduced into a fine powder, with the which being mixt with the mercury of *Lune*, thou shalt fill thy distilling vessel, whether it be earth, or iron, or glass which is the best of all, even unto the half part, and shall set it in the fire, the which is to be gently increased by degrees, untill the glass become burning bright, keep the vessel so long in this heat untill all the spirits are departed, which ceasing, thou shalt take away the vessel being cold, in which thou wilt find the remainder of the mercury which did not ascend, reduced into a corporal or imbodyed silver, or at least wise such, to which adding a little borace is easily reduced into silver, the which doth contain somewhat of gold; but keep thou that subtile and pure matter which ascended in distillation as a precious treasure, and meditate after what sort, or by what means thou mayst be able to fix this precious Pearl, and convert it into a fusible, or flowable, and piercing stone.

But in what respect, or in what manner this thing is to be done, in very deed I cannot tell, because I am he who have not hitherto had leisure, nor time of perfecting that thing, and therefore I have been willing here to shew onely these things which I have seen with my eyes, and handled with my hands.

Another shall be able by his own judgment to make tryal, and to see what God will bestow upon him, I have shewn in stead of the mercurial Statue or Image, that which shall suffice at present.

XVII. *A more easie manner of obtaining a Philosophical Pearl.*

IF thou shalt be desirous of obtaining a Philosophical Pearl after a more easie manner, thou must of necessity thus operate.

Unto half a Loton, *i. e.* two drams of the mercury of *Lune*, add a little of the powder of Coals, and put the conjoyned matters into a small glass, the which set in a crucible encompassed with sand unto that height which the matter in the glass it self shall determine. On the mouth of the glass put a small piece of some glass that it may be well covered, and so place thou a less crucible with the upside downward upon that little glass, that its (top) utmost and highest bound being overwhelmed with the said sand may drive away all air from that little glass.

Set that crucible being in this manner co-fitted, and containing the little glass shut up between them in live Coals of Wood, and make them bright burning hot, that that may remain fired for a quarter of an hours space, then let them cool, and thou shalt find a little lifted up by sublimation, the rest being melted by borace, will afford a silver impregnated with gold, yet without gain, the which demonstrateth onely in the space of half an hour, what may be done: but what gain may be obtainted by this very operation shall hereafter be shewn.

Furthermore it is here to be seen how most beautifull a Pearl doth bewray it self, although very little of it come forth, because in this labour no small part thereof flies away into the air, and sheweth onely its colours alone in the glass, far more beautifull than gold, silver, and precious stones; if any one shall

rightly operate, neither ſhall there be any Painter who ſhall expreſs it by imitating and painting.

For this time take what hath been ſpoken in right and good part, and immediately weigh thou ſo great a thing the more exactly, pray, labour, ſeek, and in ſeeking thou ſhalt find ſuch things which thou couldſt never before have believed.

The Brethren of ignorance, my enemies, will here object againſt me, and ſay, that theſe moſt elegant colours have drawn their original from the ſilver: unto thoſe I briefly anſwer, That they were indeed extracted out of the Salt by the help of the ſilver, but that they do not (*per ſe*) or by themſelves pertain to the ſilver, for if they were of the ſilver they would alſo be ſolved by *aq. fortis*, the which, ſince it is not done, they are not ſilver, but the meer *Anima* or Soul of the ſalt. That this thing may be confirmed by a more evident argument, I bring the ſolution of Saturn or Lead, the which it ſelf alſo can fiſh out the ſame Pearl from Salt, without Silver. If any one ſhall operate after the ſame manner which I but now ſhewed, I alſo add this, that I am hereafter to teach a way whereby *Saturn* may be able to fiſh pure ſimple gold out of all ſalts.

Let us now return unto the moiſt and cold fire of the Philoſophers, and ſee what an admirable fire God hath hidden in Salt Peter.

That a moſt potent fire doth lurk in Salt Peter is not worth our confirming by any argument. That horrible Gunpowder which ſhakes or rends all things aſunder proveth the thing moſt manifeſtly, and *Aq. Fortis*, which diſſolveth and deſtroyeth all Metals, yet another fire of far more powerfull virtue is hidden in the ſame Salt, which very few have known and beheld, and the which we will here make manifeſt, for the honour of God, and the profit of all mankind.

XVIII. *Of the preparation of the moiſt and cold fire of Salt Peter.*

TAke of Potters earth being without ſand, and burnt, 2 parts, and 1 part of Salt Peter very well purified, with both theſe matters being reduced into powder and well mixed together, fill a glaſs retort well coated with clay, put it in a Furnace for diſtillation, and joyn a Receiver to the Neck of the Retort, into which put as many pints or pounds of water as there were pounds of Salt Peter mixed with the earth, that the Spirits going forth may ſo much the ſooner be condenſed into moiſture, after thou haſt exactly joyned and luted thy Receiver to the neck of the Retort, with a due lute (or clay) kindle a fire according to Art by degrees, and the ſpirit of the Salt Peter (repreſenting a yellow or red miſt in going forth) will joyn it ſelf to the water placed in the Receiver.

All the Spirits being come forth, take off thy Receiver, and ſeparate them from the watet, put this ſharp ſpirit of Niter into ſome ſtrong glaſs: it being by diſtilation freed from its ſuperfluous phlegm and rectified, is applied unto Medicinal and Chymical uſes: concerning the operations and virtues whereof there is mention made in the ſecond part of my Furnaces, and in the Diſpenſatory of *Schroderus*. Moreover, the manner of extracting and concentring a fire of this ſpiritis this.

Pour this ſpirit of Niter on the powder of *Lap. Calaminaris* or *Zink* reduced into ſmall little grains that it may diſſolve as much as it can: and when it will diſſolve no more in the Cold, place the glaſs in hot ſand that it may diſſolve more of the matter, filtre the ſolution and by ſand draw off all the phlegm in a glaſs retort; the phlegm being all come off, change thy Receiver, and increaſe thy fire and drive out a fiery oyl, which oyl thou ſhalt keep well ſtopt, becauſe it unceſſantly fuming would wholly vaniſh away in the Air.

This fiery ſmoke of Salt Peter, as alſo that of Vitriol, and common Salt, burns up all Herbs, Graſs, Leaves and Flowers, and whatſoever it toucheth, juſt as if they were burnt with a ſtrong heat of the Sun or Fire.

And this is the preparation of the moiſt and cold fire of Salt Peter, of the uſe and efficacious operation whereof in Medicine and Alchymy, it ſhall be more exactly and fully treated on in the following Chapters.

XIX. *Of the moiſt fire of Allome.*

ALlome alſo by the work of Diſtillation and Concentration yields an efficacious fire moſt like to that of Vitriol, in efficacy and virtues, but the plenty doth not anſwer by reaſon of too much earth wherewith it abounds, yet if ſomewhat of the other Salts be added unto it, it rightly and orderly beſtows its fire.

XX. *Of the moiſt and cold fire of Sulphur.*

ALthough Sulphur finds not a place in the order of Salts, becauſe it refuſeth the ſolving in water, yet it contains a vitriolated ſalt laid up in it, which doth not manifeſt it ſelf before that the more fat ſubſtance thereof ſhall be withdrawn by inflaming, by the operation whereof the ſalt is attenuated or made thin, and is carried on high by the flame like a ſharp ſmoke, ſo that this ſharp ſulphureous ſpirit burns all things which it toucheth, after the manner of all thoſe fires which are drawn out of ſalts.

For the attaining this vitriolated and ſulphureous ſpirit the flame of the ſulphur is to be received, in a certain Alembick made of glaſs or earth, peculiarly for this operation, wherein that vitriolated ſpirit of ſalt condenſeth it ſelf, and iſſues forth like a thick fat, and fiery oyl, not unlike to that which is made of Vitriol, whereof it is treated on in my Furnaces.

All theſe things do very evidently confirm thoſe particulars, which I have many years agoe committed to memory: concerning Sulphur and Vitriol, to wit, that Sulphur is the original of all metals, and that no metal at all is digged out of the earth, which hath not either Vitriol or Sulphur, or for the moſt part both adjoyned unto it, for no ſulphur is deſtitute of vitriol, nor vitriol of ſulphur, ſo that both of them do challenge the riſe or birth of any kind of metals whatſoever unto themſelves. And every ſulphur is by its own proper agent or vitriolated ſalt, which it hath in its poſſeſſion by nature (whereto the central fire of the earth is an aſſiſtant) excocted or boiled up more and more into a metal; neither doth this univerſal agent or vitriolated ſalt depart from the fatneſs, or its patient, untill the fatneſs together with the agent ſhall depart into a malleable metal, or a metal that undergoes the hammer. Lead, iron and copper, do make this thing manifeſt, which metals do never appear without vitriol and ſulphur, and that for this cauſe; becauſe they being as yet unripe and imperfect ones, do ſtand in need of their agent.

A leſs

A leſs plenty of Sulphur or Vitriol is found with ſilver, than with Copper.

Gold hath little of Vitriol or Sulphur, yea plainly none at all, if it ſhall attain to its higheſt maturity, becauſe it is then found to be pure and malleable, and wants not a further fuſion or melting, but by how much the more of Copper, Gold, and Silver have, by ſo much the more of Vitriol or Sulphur they have, as alſo require the more time for their ex-coction and perfecting.

From theſe particulars, it manifeſtly appears in what reſpect metals may in a long time be generated in the bowels of the earth by their firſt principle, namely Sulphur ; and may be ripened to perfection, by its own Salt, or agent, which it hath in its poſſeſſion.

If nature doth effect this in a long time, why alſo may it not come to paſs, that art ſhould perform the ſame in a ſhorter time?

But let theſe things that have been ſpoken be ſufficient, he that underſtands not, nor alſo perceiveth the ſcope or mark, which I ſo clearly ſhew is blind, and doth not admit of a remedy for his blindneſs.

Truly I judge theſe few things, (but yet ſuch as ſhew a moſt long way with a moſt ſhining Torch) to be ſufficient concerning the moiſt and cold fires of minerals, by which the ripening and perfecting of metals, are to be perfected as well by nature in the bowels of the earth, as by art above the earth.

N. B. If therefore a mineral may by the help and impulſe of its own vitriolated Salt, wherewith it is endowed, be ripened from its vile form and loweſt degree unto a better, and at length unto the beſt of all, that is, unto the pureſt gold, it being that which none (that is ſeaſoned but with the leaſt knowledge of natural things) will deny.

Alſo if ſuch a Sulphur is hidden in any vegetable, which anſwers to a mineral Sulphur in its nature and properties, why alſo might it not come to paſs, that this ſame Sulphur might be perfected into mature gold, alike equal to the other? from hence it moſt evidently appeareth that in any Herb, although the moſt abject one, which is promoted by the Sun unto its maturity, a ſpark of the immature beams of *Sol* may be found, which through the operation of art, are to be changed into pure gold. But after what manner ſuch a Sulphur may be extracted out of any Herb or any Wood whatſoever, in all things like to a mineral one, I have long ſince delivered in my little work concerning the nature of Salts, and in the ſecond part of the *miraculum mundi*, and below I will demonſtrate by a much more clear manifeſtation.

Let us proceed to Animals and Vegetables, and conſider whether in theſe very things, ſuch a ripening fire may be found, and may from thence alſo be drawn and made viſible.

But we muſt know that no ſmall living creature or ſmall Herb can grow, live, and receive, increaſe without a certain fiery and Salt Agent ; the which although it cannot be believed by any one that is lifted up with pride, and of a ſtupid brain, yet it in very deed exiſteth, and can eaſily be demonſtrated by the hand of the Artificer.

XXI. *A moſt powerfull manner of extracting a fire out of any Wood, or any Herb whatſoever, and of rendering it palpable and viſible.*

FILL ſome glaſs, ſtony, or earthen diſtilling veſſel with any dried Wood or dried Herb, and diſtill off the Vinegar or ſharp liquor from thence, and ſeparate the Oyl from it ; and pour that ſharp liquor on *Lapis Calaminaris*, *Zink*, or aſhes of lead, which matters do diſmiſs all the unſavoury moiſture in diſtilling, and retain the whole ſharpneſs with themſelves, the which being diſtilled from thence aſcends like unto meer fire, it being of great uſe as well in Medicine as Alchymy, whereof mention ſhall be made hereafter.

But here it is to be noted that this fire extracted by diſtillation, is onely a part of that fire of the Wood and Herbs, and that the other part remains in the Coals thereof, which is far more fixed than that which aſcended, and is that Sulphur which we ſpoke of but now, which wholly anſwers to the nature of a mineral Sulphur, and which may be extracted out of the Coals being ſolved by *Sal. Mirabilis*, which ſhall be taught and manifeſted in the following Chapter.

For if there were no fire in them, after what ſort ſhould they burn and draw out heat ? all Coals being converted into aſhes, after that their hidden Sulphur hath done its office, the feces of the Wood remains like dead aſhes, wherein as yet lies hid a certain ſingular vegetable fire, being altogether of another nature, and wholly contrary to that which aſcendeth in Diſtillation. This water being extracted out of the aſhes preſents a *Lixivium*, the which by decoction exhaleth all the moiſture, and leaves the reſt a fiery Salt, whereof in the ſecond part of my Diſpenſatory. If it be made hot without fuſion, or melting, it becomes the more fiery, ſo that it being bound to the skin for ſome hours in the bigneſs of a pea, it burns a ſmall hole therein as if it had been burnt with a bright burning iron. And therefore Chyrurgeons make uſe of ſuch fires that they may open unripe Ulcers, or make Iſſues.

It may be ſeen by theſe particulars that in any Wood or any Herb, there are alſo fires of divers kinds, the which alſo are found in living creatures, they being partly volatile and ſharp, and partly fixed, and obtaining the nature of *Alcalies* or *Lixivial* Salts.

Both Salts or Fires, after they are conjoyned they loſe their fiery nature, and get unto themſelves another quality and property ; to wit, a middle one, and theſe two contrary fires become an eſſential tartarous Salt, and ſweet in uſe, wherein no fire appears, although that fire being turned out and in by art, may be again extracted and made viſible.

Concerning theſe wonderfull changes of nature, and converſions out of one ſpecies or particular kind into another, many things are found up and down in my writings. In the firſt part of the continuation of the miracle of the World, it is manifeſtly deſcribed after what ſort a plenty of ſuch fire may be attained out of Woods, but the concentring thereof is here delivered. In general it is here to be noted, that one Wood or one Herb doth more abound with ſuch a fire than another. But by how much any Wood or Herb is the elder, and by how much the longer the Sun-beams have operated on it, by ſo much the more of fire is in it, as is manifeſt from the Vine ; which hath received plentifull Rays of that ſort, and therefore excells all other vegetables in the greater and ſtronger fire, as appears not onely by the burning ſpirit, but alſo the tartar, or tartarous Salt thereof, which is almoſt all fire, and yet without Diſtillation and Calcination it cannot be manifeſted.

That therefore it may be brought forth into open view,

view, and be rendred visible, we must make use of the following operation.

XXII. *The manner of manifesting the fire of the Vine.*

FILL thou a Glass Retort with common Tartar, and distill forth the volatile spirit and oyl, the which thou shalt separate after a due manner. Great virtues are in this oyl, whereof I have made mention in the second part of my Furnaces. The spirit is to be rectified in B. that the fiery substance onely may depart, and the unprofitable flegm remain behind; the rectified spirit is to be poured on the fixed Salt, (residing in the Retort, which must be first calcined by a strong fire and made fiery) and from thence again distilled, that the fixed Salt may retain the rest of the unprofitable flegm, and the spirit attain the greater fiery virtues for the performing of wonderfull effects in medicine, the which my writings do teach.

XXIII. *Another manner of extracting or drawing forth a far more stronger fire out of Tartar.*

DIssolve thou that Alcalizated Salt from which the spirit was abstracted in rectifying in a little water, that it may become a very sharp *Lixivium* or Lye; pour one pound of this *Lixivium* on two pounds of white Tartar in a Gourd, and that being reduced into powder, put on a head which being well luted on with clay, set it in sand and kindle a fire by degrees, if thou shalt rightly work thou shalt obtain a most subtile fire, one drop whereof doth burn the tongue, as if it had been touched with a burning Iron.

How wonderfull things may be effected by this fire, I have already shown in other places of my writings.

XXIV. *A manner of drawing forth as yet a more vehement fire out of Tarter.*

TAKE of crude Tartar and the *Regulus* of *Mars*, or the purest metallick part of iron, the *scoria* being separated, equal parts, the which thou shalt mix by beating together, put them in a crucible with a cover so well fenced with clay that it may admit of no air, keep them in a bright burning fire for the space of an hour, then take them away.

From all these particulars it is made known to every one that a vehement fire lies hidden in vegetables readily serving for the effecting of many admirable things in Medicine, Alchymy and other arts, from the declaring whereof the shortness of time and this treatise, commands us at this time to cease. But moreover we must see whether living creatures also are potent in the same fire, and in what respect any one may be made partakers of the same.

XXV. *The preparation and Con-centration of fire out of Animals.*

AS the Vine is the most noble of all vegetables, so man also is esteemed by all that are indowed with judgment to be the most noble of all Animals, or living Creatures; the truth whereof the thing it self affirmeth by a plentifull Testimony.

Therefore we pass by all other Animals in silence, and do here shew (by the following manner) the preparation of that fire onely that lies hid in Man.

The Ancient Philosophers have called the great World, *Macrocosmus*, and man as it were the lesser World, *Microcosmus*, and a comparison being made, they have determined that what things are found in the great World, the same are to be found in the lesser World, that is in Man.

From whence also they unanimously believed, and also committed to memory, that as well the life of the greater, as of the lesser World, doth consist in a saline and saltish spirit, and that this spirit doth bear rule in one place more, in another less. Neither is there any one also who will or can deny, that the whole earth is filled with Salt, as it were its Balsam; and that minerals are alike equally bred thereby in the very bowels of the earth, as vegetables are in the Superficies.

Yet notwithstanding the Salt of the great World is no where more plentifully found than in water, or in the Seas; the which as it is a thing most known, it needs no confirmation. The same thing is to be understood concerning the little World, *viz.* Man, and although the whole body in all its parts abound with their true Balsam, yet a greater plenty of this Salt and Balsamick spirit, is found in his flesh than in his bones, a greater plenty likewise in his bloud than in his flesh, but the greatest plenty in his Bladder, or in the Salt Sea of the lesser World, the which is hidden to none, but it is the custom not to seek necessary things in remote places, but in places nigh where they are most easie to be found.

Hence because a more plentifull Salt is no where found in man than in his Urine, we of right lay hold on an occasion of seeking and con-centrating the fire in the same, and we make use of the following preparation.

XXVI. *The operation of preparing a fire out of man's Urine.*

I Have at large delivered this operation in the second part of my Furnaces, whither I refer the Reader; where he shall not onely find a manifold composing of this fire, but also its various use in Medicine.

But although it be needless to describe that operation there repeated, yet it seems meet to me (for a more evident declaration's sake) here to adjoyn some admonitions which concern it.

XXVII. *Observations which concern the preparation of an Animal Fire.*

SUCH a fire is for the most part drawn forth out of man's Urine being putrified by it self for the space of some weeks, and is by rectifying converted into a moist and fiery essence as the second part of my Furnaces sheweth; I have there taught a more easy manner of drawing forth the same fire out of *Sal-Armoniack*, which is prepared out of Urine, and by the addition of a strong *Lixivium* it is distilled and rectified.

I have also taught the manner of preparing the same fire out of *Sal-armoniack* by the Addition of *Lapis Calaminaris*, by distilling it through a Retort.

Spirits rightly prepared after these manners are equally profitable in Medicine, Alchymy, and other arts; because they are those which being well made are all of them good, after what manner soever they may be prepared.

But although these volatile animal fires do readily serve for the performing of famous and notable things (and the fixed Salt of Urine it self, may by Distillation and

and rectification be con-centrated into another kind of fire) yet they are at a far diſtance from that true Philoſophical fire which the Ancients have hidden with ſo great care and diligence, becauſe that in theſe preparations the beſt and chiefeſt part of the fire flies away and is loſt. But this I ſay, that theſe fiery Spirits of Urine being con-centrated even as I have taught them to be, are indeed able to effect all thoſe things which I have attributed to them, and ſhall as yet attribute. But indeed they do not coagulate the con centrated fire of the Vine, which coagulation is not the leaſt key for the compoſing of an univerſal Medicine.

For when the Spirit of Urine attains this nature, that by coagulating the moſt ſubtile Spirit of Wine, (when poured on it) into a Salt, this Salt extracts the ſoul of Gold duely prepared; the which alſo, if it be changed by it ſelf, and converted into a dry and ſweet Salt, and be fixed, poſſeſſeth the virtues of a Medicament of a moſt famous and great uſe in Medicine.

Every one that is illuſtrated, but even with the leaſt light of nature, ſhall be able by an eaſy buſineſs, to ſmell out what may hiddenly lurk under this Salt.

From the moſt pure Vine is the ſubſtance of the Spirit of Wine, which ſtrengthens the heart of man beyond all other things, as alſo his brain, and other members.

The Spirit of Urine is the pureſt and moſt ſubtile Mercurial Animal Salt, not having its like in penetrating, opening, and reſolving.

This ſubtile Mercurial, Animal and piercing fire therefore, being joyned to the moſt pure vegetable, that is, the Spirit of Wine, that it may be changed together with it into a dry Medicine, any one ſhall be able by an eaſy conjecture to foreſee what it will effect in Medicine.

But that I may make manifeſt the errour, and demonſtrate the cauſe wherefore a Spirit of Urine is ſo ſeldom prepared, which will coagulate the Spirit of Wine into a Salt, I admoniſh that a reſpect be had by every one of the following particulars.

For firſt it is to be taken notice of, that the moſt ſubtile part onely of the Spirit of Urine, and not the more groſs part, is fit for the coagulation of the Spirit of Wine: If therefore in the preparation of the ſame, the moſt ſubtile part ſhall be loſt, through the negligence or ignorance of the operator, it can in no wiſe be brought to paſs, that the more groſs and dreggy part ſhould cauſe that coagulation.

But that moſt ſubtile Spirit doth not onely vaniſh away in diſtillation through an inſufficiency of the Luteing not being good, but alſo a great part of the ſame is loſt before diſtilling, to wit, when the Urine being ſucceſſively gathered, is conſtrained to ſtand and wait too long, ſo that the Spirit by little and little exhaleth and departs into the Air, eſpecially when it is gathered together in the Summer or Winter time, for that fire not being patient of any extreme, is expelled by a little heat or cold, and therefore the fitteſt times for collecting the ſame are the Months called *March* and *May*, or *September* and *October*, in which Months the Air is temperate, neither too hot, nor too cold, thoſe Months therefore are the fitteſt for collecting and extracting of an Animal fire out of it.

Furthermore, *Calx-vive* or *unſlaked Lime* is to be added to the Urine (when putrified) and diſtilled, that the inſipid water may be ſo much the more eaſily or readily ſeparated from that volatile fire, the which is not done if it be diſtilled *per ſe*.

I would not paſs by theſe few things in ſilence for the ſake of the Reader, and of him that is ſtudious of good Medicines: But after what manner Metals may be amended by this Animal fire is not here ſhewn, but God willing ſhall by and by in the following Chapters. But we put an end to the preparation and con-centration of Animal and Vegetable fires, with theſe ſayings, whoſe admirable virtues and faculties in medicines, Alchimy and other profitable Arts, ſhall here be manifeſted in order, as much as time will permit.

Look I pray you on the Elementary Sun, as alſo on the fire of woods, and the virtues of light, and the virtue of both, the which all creatures, and eſpecially mankind it ſelf, is conſtrained to make uſe of for their own ſafety; could even the leaſt graſs bewray it ſelf? or any ſmall worm be bred and live without the *Sun*? could any workmanſhip or artifice be exerciſed without the help of common fire? the which, if it were not, we ſhould be conſtrained to eat unboyled Herbs, and raw Fleſh like wild Beaſts: yea, the whole converſation and negotiation or traffique among men ſhould be wholly taken away, if earthly fire and light ſhould be wanting unto us.

If there were ſome one man onely in ſome whole City or Province, or in a whole Kingdom, who alone could make others partakers of fire and light, would there not be made the greateſt concourſe of all men unto him? but becauſe it is known to every one, and every one hath known by an eaſy manner, how to ſtrike it out of flints, it is had in no eſteem, for it is cuſtomary not to eſteem thoſe things which are made common, although they are pretious. The ſame thing hath happened to the fire, the which although it ought to be made of greateſt account, yet it is reckoned of no worth becauſe it is common and vulgar.

But even as the common fire, and that known to every one, doth by very many moſt profitable operations bring much good to mortals, who can leaſt of all want the uſe thereof; ſo alſo I affirm that thoſe artificial and hidden fires are to be very much accounted of, becauſe a Phiſician can hardly be without them, for the preparations of efficacious Medicines, and a Chymiſt can never want for the tranſmutation of the more baſe metals into better, either of them without the aid of thoſe fires ſhall perform nothing of any great moment in Chymical Labours.

He that works and is ignorant of ſuch fires, what will he effect in metallick operations? he being converſant in cold and darkneſs is afflicted with the ſame difficulty, as a certain brewer or baker is, who wants wood in the winter ſeaſon, or who is not able to uſe water, it being congealed into ice, the one he cannot bake although he hath the beſt meal, and the other brew drink although he have abundance of the beſt malt.

So alſo goes the matter with Alchymical Affairs, the want whereof cauſeth that we handle not the moſt noble Alchimy with any profit, but rather receive loſs from the ſame, daily experience being witneſs, that 100 are wont to be ſooner undone than that it happens to any one man to get himſelf riches thereby. The blame of which diſcommodity is not to be tranſferred on an impoſſibility of the art, but rather to be imputed to the want of thoſe moiſt, cold, and

ripening fires extracted out of Salts, the which after what sort they ought to be used for the amendment of metals, as also for medicine and other arts, shall be taught partly in this, and partly in the other Centuries.

XXVIII. *The general use of our concentred fiery and ripening Spirits, extracted out of Salts, in the amendment and converting of metals into more noble ones; also the preparation of many excellent medicaments, and the increase and amendment of many other arts, are briefly here demonstrated; the which, God granting, shall more largely be declared in their particular use.*

THAT I may discourse in few words whether imperfect metals may by the operation of the more common and gross Salts, and of the fire be broken, destroyed, cleansed, and reduced into a better form, it being that which the fifth part of the prosperity of *Germany* confirmeth by divers experiments.

I affirm that the pure Spirits of Salts, do with a greater efficacy, and far better effect the same, the which, since those simple Spirits are able, better and more easily to perform than gross Salts, why should not also con-centrated Spirits after the best and easiest manner of all perform the same thing?

From a like reason the use of Salts shall not be of so great efficacy in the preparation of medicines, and other arts, as the useing of common Spirits is; the which, notwithstanding being still for the most part clogged with much phlegm, do of necessity not disclose so great virtues, as those con-centred fiery Spirits do which are freed from all phlegm.

The Sun-beams are for an example which do not send forth so great heat, when they are co-mixed with a moist air, as also green and wet Woods do not so vehemently burn with heat, as withered and dry ones are wont to do.

Yea if the hot beams of the Sun are con-centred in or by some hollow glass increasing the fire, or the fires of Coals by a strong blowing of the Bellows, and are as it were constrained into straights or narrow passages, they effect ten times, yea one hundred times more than those which are not centred together after such a sort. But by how much the more strictly those forces of the beams of the Sun, or of other fires are con-centred by so much the greater, stronger, and sharper heat they draw out.

A burning glass of one foot Diameter, onely enflames Wood; but one of two foot Diameter will melt Tin, Lead, and other metallick matters of that sort, which are easie to be melted, as *Bismuthum*, or the whitest, lightest, and basest kind of Lead, *Zink*, the non-splendent metallick dark matter *Koboltum*, &c. But if you extend the Diameter to four foot, the Sun-beams taking the stronger increase will melt silver and copper, and will render iron it self so bright burning hot, that it may be wrought with a hammer, as if it had been heated with Coals. This effect is to be ascribed unto the con centring of the Sun-beams by an instrument, and to the constraining of the heat of Coals, by Bellows, or Wind.

The same thing is to be understood concerning our con-centred and moist fires, which ought to be compared, not onely with the common beams of the Sun, or with the heat of Kitchin fire, but also with those Sun-beams which are con-centred by a glass, and with the fiery heat of Coals constrained or forced by windy blasts. Whence they must of necessity be of greater virtues than the common Salts, and watery spirits of them, the which the more quick sighted will sufficiently comprehend and believe Simple Countrey People do see this thing with their eyes, and handle it with their hands, as well knowing that the subtile, hot, sweet Spirits of Wine and Ale, (and those procuring strength to the heart) when they are freed from all moisture by Distillation, and con centred by Rectification; effect ten fold more than if they had still remained with their humidites.

That thou mayest understand the thing more clearly, well weigh thou Grapes, Bread-corn, or the Fruits of Trees, which we eat in that substance as the trees bring them forth unto us: and they afford us a nourishment, but not such a one, as their juice being pressed out, and separated from its dreggs, and by fermentation reduced into a clear and sweet drink.

If necessity compell, Bread corn may be used for nourishment as it is, yet not so well as when it is separated from its husks, being changed into meal, and reduced by water into a mass or lump, and Salt and Leaven added, and by Fire concocted or digested into Bread of the best Savour. By the same reason Bread-corn being boiled in fair water yields a potion indeed somewhat better than the water it self, but if it be artificially handled, and boyled up into Ale or Bear, the husks are separated from the more pure juice, the which afterwards by fermentation, separates many dreggs from it, and arrives to a more noble nature, yielding a sweeter and better drink. But if the same juice be after that brought by distillation into a greater purity, and con-centred together by rectifying, that the virtues thereof may come into a narrow compass, (because it is a meer fire) it will exercise far greater virtues, than gross Bread-corn which wants a power of exercising so great virtues.

So also doth it succeed with con-centrated Salts, to wit, when the dreggs are separated from them by the help of art, and the more pure parts converted, and con-centred into a fiery substance, performing effects of great moment in Alchymy. But that Salts do commonly destroy metals, as well by a moist as a dry way, is known to every Barber, and persons of no reputation. But after what manner metals being destroyed may be reduced into more noble bodies than they were before, there hath been none hitherto (who being skilled in that artifice or craft) that have not hid it with the greatest care. Hence it hath come to pass, that nothing of profit hath been perceived from metallick transmutations, and Alchymy it self hath been made a mock of by the most unskilfull rout of ignorant ones, as if it were most false, and at the fartheſt distance from truth.

That this doubt therefore may be taken away, and the truth it self may be more evidently placed in our view, I have resolved in my mind, by God's assistance, to place before the eyes of the whole world, a true and profitable transmutation of metals, by a clear description, and to assert the certainty of so many writings set forth by such men, by the most true experiments, so that every one that is seasoned but even with a light or small knowledge of the fire, may by an easy business hereafter obtain some profit from them. But I will first treat of common and crude Salts, and then of the simple Spirits of those, and at length of their con-centred Spirits and Fires, which we have taught to extract out of them.

But before I attempt to describe and assert this kingly and noble art, I have been led first to shew the cause why some places do occur in the descripti-

on

on of the same, wherein words are omitted, and signs or blanks reposed instead of the same.

Indeed this was therefore done, that the art may be concealed from the unworthy, and they in all respects to be driven from the same, and may be made known onely to Adeptists, and the Sons of Art.

Besides also that all secrets may not in all places, and without difference be divulged, but that the chief things thereof may be preserved for friends, lest they be trodden under foot, and broken to pieces by the unworthy, but that they may be left to friends as it were a certain secret stroak, and that an unknown one to others, for to fight successfully.

I therefore earnestly require of every one by a friendly Petition that he be not suddenly angry, if he be not able clearly to perceive, by the sharpness of his wit, all those things which I propose, but rather let him consider that they are not written for him, but for others; by whose capacity they can be perceived. Neither is it altogether necessary that all do know all things, neither also would it be of concernment if friends and enemies attain all those things in their understanding alike, without any difference, which I here openly produce by my descriptions; it is sufficient that some onely, and indeed those that are worthy may clearly and knowingly possess the same, and testifie the truth.

XXIX. *An infallible practice of changing the more imperfect Metals into more perfect ones by the help of crude Salts.*

AS I have already a little before, and also in other places of my writings, evidently enough demonstrated that Salts, or the spirits of Salts, are in the earth, or out of the earth a universal Agent, promoting the maturation or ripening of metals: So here I again firmly affirm the same thing, and do say, that by Salts the gross bodies of metals are destroyed, and transchanged into more noble metals, and that indeed after divers manners, and that more easily or difficultly as any one shall be more or less conversant in Chymical labours.

I will hear God willing make manifest all things, yet not to every one, but to the worthy onely; and that indeed after the manner of a Clock or Watch-maker, who taking some Clock or Watch in pieces, do lay up all the parts thereof in some place without any order; the which he that is unskilfull in the art, shall never again compose and reduce into order. But another who before hath handled that art, will by an easie labour again conjoyn all those parts, and reduce them into the former body of a Clock or Watch.

All those therefore who have experienced the foregoing labours to be perfected by the fire, shall by these my descriptions easily dispatch or accommodate themselves in future things, not easie to be understood by the rout of ignorant persons which have made no experiments in the fire; who will in vain look into those things which I have written; no otherwise than as if any one being plainly unskilfull in reading and writing, should behold written letters, and knows not what they signifie, or what argument they may contain: Such a man if he would be angry with the writer, should he not do him much injury, because as being far remote from the fault of that ignorance which hinders him, whereby he cannot read these letters which he had never learned to read.

The same thing must be understood concerning my writings, which are openly published, not for the sake of any one, but onely of those who have first learned to understand those kind of writings.

But that I may set upon the thing it self, and may teach the amendment of metals for the better, and shew the very foundation of the whole business, I say, that a true changing of them is attempted in vain, unless they are first destroyed, and wholly slain. A grain of Wheat, as Christ himself saith, will never increase or multiply, unless it first putrifies in the earth. If therefore metals ought to be destroyed by Putrefaction, that must needs be done by the help of Salts, according to the truth of the Philosophers Maxim: the corruption of one thing, is the generation of another. The death of one thing, is the life of another. Since therefore metals must die, it must needs be that death be brought on them by enemies, or contrary things, because nothing in natural or artificial things dieth, unless it be slain by its own enemy.

Since metals therefore ought to be destroyed, and killed by their enemies; it is of necessity that they are invaded, tortured, and so long vexed by the same, until the Agent as the stronger part, be overcome by the Patient as the weaker part; that it be slain by it, [or rather the Patient be overcome by the Agent,] and be translated into a better nature, in which action the Patient ought not to depart from the Agent, but to be tortured with an un-intermitting torment.

Whosoever seeing his enemy and conceives himself of the weaker force, indeavours as much as in him lies to decline him, by retreating, but all occasions of running away and slipping aside being taken away, he is constrained to deliver his life to his enemy, who handles the Patient or suffering party according to his own pleasure, and doth whatsoever he will, therefore after the same manner is the melioration of metals, the which although they should be melted together with Salts their enemies, yet would they make little account of them, but would separate themselves from the same; so that every part of them being unhurt, would keep its own nature and essence. But if the Salts do take away the occasion of flight from metals, and do inclose them in their Prisons, that they have no way of escaping, but remain, suffer, and die, then they obtain victory over the Salt, and of slain metals are made more pure and better.

This thing is done in the fire by the moist and dry way, of which enough hath been spoken already.

This is the whole and intire art, and there needs no other superfluous teachings; yet he whom these things doth not suffice, let him read the following operations thorough, wherein he shall find truth, and see with his eyes, and handle with his hand; those things which have been heretofore impossible to him, and very many more.

XXX. *After what manner Metals may be slain by their enemies and be transmuted into better.*

UNTO Metals not one but many enemies are adverse; and part of those enemies are enemies to some and friends to others, but the other part is friendly to some, and at enmity with others. For example sake.

Nothing more prosecutes Gold with an hostile hatred than burning Sulphur and sulphurious Salts, such as are Alcalies, and crude tartar; the cause of this hatred is, because Gold is nothing else, but a fixed

ed Sulphur, and therefore it disagreeth by a capital hatred, with every burning Sulphur; Silver and Lead do love every *Sulphur, and all sulphureous Salts, such as are Vitriol, Salt Peter, Salt Armoniack, and the like*, the which they stand in need of for their colour; they have an hatred against *Kitching Salt, because it is of a mercurial nature*, and therefore not requiring its help, but onely desiring a Sulphur and Tincture, *Copper, Iron, and Argent vive*, or Quick-silver do possess both natures, to wit, *a mercurial and sulphureous one*, and for that cause they prosecute all Sulphurs, and any Salts with love.

Tin is an enemy of all Salts, whether they are sulphureous or mercurial ones, when it is slain by Sulphur and Salt, and recalled unto life, it obtains a more pure and thin or fine body, whether of Gold or Silver, according as it shall be handled.

Moreover, if any should desire to obtain as yet a better essence out of better metals, its necessary that he slay them by their enemies, and raise them up again by their friends; by how much the greater and vehement the enemies are whereby metals are slain, by so much the more those metals do suffer, and with so much the more famous and better bodies do they re-arise.

The whole art therefore consisteth in this, that metals are overwhelmed by their greatest enemies, are slain by them, and after death are separated from them, and that by their best friends, are restored unto a better life.

Thou hast the whole art, neither doth any other thing remain than that thou attempt the matter, and set to thine hand.

For example sake, I will add an operation. Slay a light metallick matter by the sharp Spirits of sulphurious Salts, that it may become a white calx; free this from the Salt Spirits, by water being poured thereon, the which being freed, cannot be reduced into a metallick body by any violence of fire. Likewise slay mercurial metals as are B. by mercurial, Salts their enemies, and change them into white calx's, the which being freed from their saltness, *will be liquid or flowable*; mix those calx's, to wit, the mercurial and sulphurious being slain, put them into a double vessel of cement, cover the uppermost with a certain plenty of B. fence well the juncture of the cementing vessel with clay, set them into a cementing furnace, and at the beginning administer a gentle fire, that the calx's may rise up against or assult each other, and the fixed sulphur may bind the fugitive flowable and mercurial calx's, D. for although in the cement something would depart into smoak, yet that is intercepted by E. and after a certain manner is thus exalted into the degree of F. Too much fire is not presently to be joyned to the cement or plaistering it self, that some time may be granted to the matter that is swift of flight, whereby it may adjoyn it self unto the fixed matter, and may also become fixed and constant with the same for four hours space, therefore the fire shall be somewhat the more slack, and afterwards for the space of eight or ten hours, it shall be kept in a clear bright burning heat, that G. may not melt: the said time being ended, the fire is to be extinguished, and the cementing vessel to be taken away, in G. a black or brittle body shall be found containing Silver, the easy separation whereof we shall afterwards hear.

The calx of both metals being coagulated into a hard stone, if by grinding it be reduced into powder, and be put into a furnace fit for this thing, a metallick body will be attained, being impregnated, not with a little Gold and Silver, especially if the metals shall be slain, not by the Spirits of common Salts, but with gradatory martial waters. In this cement, H. is rendred aureal or golden, and I. is silvery, by one and the same endeavour. The profit also it self is of no small moment, especially if this operation be exercised with the greater quantity, and the bigger instruments alwaies to supply or afford Silver being pregnant with Gold for separation.

XXXI. *A brief and compendious manner of extracting and rendring corporeal, a volatile Gold out of coloured Flints, Red Talck, Granates or Red Marble Stones, Sand, White Clay and the like metallick earths.*

AT the beginning, these mineral or metallick earths are to be made bright burning hot, to be quenched in cold water, and to be broken in a mill, into meal or powder.

After that they are thus broken, thou shalt put them into some Waldenburge, or Cullein Can, and shalt pour so much of *Aq; Regis* on them, that they may onely be moistened, and let them, together with the Can, be placed in a fire of coals, and incompassed therewith, to be made hot; after that the minerals and *Aq; Regis* have waxed well hot tother, so much hot water is to be poured on those very minerals as shall be necessary for the extracting of the *Aq; Regis*.

Put the minerals thus moistened with the water into great pots, and those made of the best earth, having many little holes in the bottom, on which lay paper for sustaining of the minerals that they may not fall out through the holes, but may dismiss the water onely. After the first water is gone forth, other hot water is again to be poured on, and this effusion of water is so long to be continued, untill it depart with the very same sweetness as when it was poured on, and no longer offers any sharpness to the tast. So the common and hot water brings away with it the *Aq. Regis*, and the *Aq. Regis* Gold out of the minerals.

The earthen pots may be placed in a bench bored thorough with holes, through which their bottoms may pass, that so the water may be received in vessels set under them.

N. B. The minerals may also be put into barrels or hogsheads having a double bottom, such as are used for the cleansing of Salt-Peter, that so water may be so long poured on them, untill all the acrimony be extracted by the water.

XXXII. *After what manner out of Minerals being extracted, a true Salt-Peter may as yet be gotten with profit.*

THE minerals being, after the said manner freed by extraction, they are to be co mixed with an equal weight of *calx vive* and wood ashes, and cast together into an heap under some open gallery or room, that now and then it may be moistened with Urine, or in want of that with Rain-water, as oft as they shall be dryed.

In this operation the *Aq. Regis*, which remained in the minerals, and was not wholly extracted by the hot water by the help of the Urine or Rain-water, changeth the Salt in the *calx-vive* into the best Salt-Peter, the which may be washed off with Rain-

Rain-water, and boiled up after the wonted manner.

Therefore after the ſaid minerals have been handled for half or a whole year after the ſaid manner, and are by rinceing deprived of the Salt it ſelf; they may again be (under an open Gallery or Roof ſo expoſed to the air, that Rain come not at it) collected into an heap and be handled after the former manner, for the ſupplying (in their own time) new Salt Peter, the which may be done for many years together. So alſo from that *Aq. Regis* which could not be drawn forth from the minerals, a profit is received.

The cauſe of this Salt Peter, its being made, is this, becauſe the *Aq. fortis*, or *Aq. Regis*, or Spirit of *Nitre* in the ſame Waters, contains as it were the ſeed of Salt Peter, it obtains that nature, that like an Herb it may take an increaſe from other Salts, and be multiplied; whence perhaps the old proverb aroſe, to ſow Salt, which thing the ignorant have received with mock, ſaying after what ſort can Salt be ſown and multiplied, when it is ſolved and drawn from Rain-water? But it hath lain hid from thoſe, what kind of Salt it is, and after what manner it is to be ſown; the which we have here demonſtrated, alſo the ſaying of the Ancient Philoſophers, aſſerting that Salt may be ſown and multiplied like Vegetables.

As to what pertains to thoſe ſharp waters, whereby gold is extracted out of minerals, by what skill they are to be handled as alſo without loſs, yea that they may render that gold with profit; the following operations are to be obſerved.

XXXIII. *A way ſhewing the extraction of a volatile and fixed Gold out of the Water, from which the Minerals are withdrawn, and the profit which may be received by that Water.*

THE beſt way is this, into the ſolution of gold, or into the water which containeth gold, pour in the ſolution of *Lune* or *Saturn* more or leſs, even as you ſuſpect more or leſs of gold to be in that water: As for example. Let there be in the water two or three half ounces of gold, diſſolve thou therefore about two or three half ounces of ſilver, or lead, in *aq. fortis*, and pour this ſolution into the water containing the gold, be it more or leſs, mix them well together by ſhaking or ſtirring, that the water may obtain the form of milk; after they have ſettled in quietneſs, ſhake or ſtir them again, and repeat this motion for divers times the ſpace of one hour, and at length ſuffer all quietly to ſettle to the bottom. Separate all the clear water from the ſediment by pouring it out, and ſtrain the ſediment it ſelf through a filtre, that the water may be wholly ſeparated from the ſilver.

This ſilver is to be dried, and reduced into its former body, after the manner which ſhall by and by follow.

N. B. If the ſilver or lead had not extracted all the gold, the which may eaſily happen, yet that gold is not loſt, for becauſe ſweet water whereby the *Aq. Regis* is weakened is preſent, the which now remains unfit for another uſe of extracting out of minerals; now by the ſolution of *Lune* or *Saturn* deprived of their gold, a ſharp *Lixivium* made of wood-aſhes, and *Calx-vive* may be poured on the ſame, with which a little is to be added or admixed. For do precipitate or fix all gold in ſolutions.

After this manner the *Aq. Regis* is killed, and every metal which it has yet retaineth, it diſmiſſeth like a yellow powder, whether it be gold alone, or mixed with copper or iron, which powder is to be dried, and reduced after the manner which ſhall ſtrait-way be taught.

N. B. That the water after the total precipitating of the metals, being exhaled in a Copper Kettle unto a thin skin, and expoſed in peculiar veſſels unto the cold, it will afford thee a beautifull Salt-peter, concreted or grown together into drops or Ice-acles, whereof thou may'ſt again make an *Aq fortis*, to be again made uſe of for the like operations.

He that ſhall rightly operate ſhall get ſo much Salt Peter as will recompence the charges of the *Aq. fortis*, and *Aq. Regis*: So that he ſhall extract his gold without coſts. For five or ſix pounds of *Aq. fortis*, wherein two or three pounds of Salt is diſſolved, and the which hath at length been precipitated by a ſharp *Lixivium* prepared with *Calx-vive*, doth render ten pound of Salt Peter, the which doth anſwer the price of five pound of *Aq. fortis*, and this is the manner of extracting gold out of minerals without coſt.

XXXIV. *Another and better manner of extracting gold by Aq. Regis.*

TAKE of by torrifying made into aſhes, pour the extraction into an iron Pot, and ſtir the *Cālx* with an iron *Spatula* while it boileth. All the ſharp ſpirits do ſtick faſt to the the phlegm alone vaniſheth by exhalation. When therefore the ſpirits are wholly con-centred with the and are dried, they are to be put into a cloſe Tigil or Crucible upon Coals in a ſecret Crucible or melting Pot, then the fire expels the con centred ſpirits into a receiving veſſel; the which ſpirits may be uſed for a new extraction. A fugacious gold mixt with iron, remaineth with the which Calx being reduced in a Furnace fit for thoſe operations, which the *Germans* do call *Stichofen*, draws out a lead mixt with gold, the which being expelled by a Cupel enricheth the operators with the beſt gold and ſilver.

N. B. But if ſuch lead ſhould not contain ſo much of gold and ſilver, as that it ſhould deſerve a ſeparation by a Cupel, that is again to be mixt with and to be reduced into aſhes, and the operation is ſo long to be repeated, untill the lead being rich enough in gold, may deſerve that ſeparation.

The ſeparation is alſo to be perfected with the Bellows, leſt ſo great a plenty of lead ſhould be melted out of the Teſts, which operation requires much fire, yet the lead may be collected or conjoyned in the Teſt without a waſtefull melting, as ſhall be taught hereafter.

XXXV. *An eaſie making or compoſing of Aq. Regis, for extracting of minerals.*

BEcauſe a plenteous quantity of ſpirit of Salt is eaſily prepared, the Salt Peter is onely to be diſſolved therein, and with that ſolution minerals are to be extracted. For the Salt Peter ſtrengthens the ſpirit of Salt, that it can ſo much the more eaſier ſet upon and ſnatch to it the tender gold in thoſe minerals.

The ſame ſpirit of Salt, may alſo without any rectifying be adminiſtred for this operation, to wit, ſuch as aſcends in the firſt Diſtillation.

XXXVI. *Another as yet more eaſier way of preparing Aq. Regis for extraction.*

BEcauſe ſilver doth always in this operation bewray its being impregnated with gold, which is to be ſeparated by *Aq. fortis*, the ſolution of ſilver is alſo fitly uſed to extract after this manner.

Pour the ſaid ſolution into *Aq. Regis* which hath extracted gold, that the ſilver may attract the greateſt part thereof to it ſelf. But the ſame *Aq. Regis* may again extract other gold, and be attracted by the ſolution of ſilver.

But if there ſhould be no ſolution of ſilver in readineſs, the gold extracted is con-centred with and the operation is perfected by the means or after the manner aboveſaid, by driving the ſpirit out of the and by reducing it in a Furnace, called by the *Germans Stichofen*, as was ſaid before.

N. B. Aq. fortis being diſſolved therein, or poured on or into *Aq. Regis*, or the nitrous ſpirit of Salt, it adds an increaſe and ſtrength to the *Aq. Regis*, becauſe *Aq. fortis* doth corroborate the ſpirit of Salt better than Salt Peter.

XXXVII. *How the Calx of ſilver, which hath fiſhed out gold by Aq. Regis, is to be recovered.*

WHEN the ſolution of ſilver is poured into *Aq. Regis*, and the chiefeſt part of the gold is extracted; reſt is ſo long granted unto it, that the Calx of the ſilver may ſettle to the bottom, and afterwards the *Aq. Regis* by pouring it forth is ſeparated, cleared from the Calx of the ſilver, again to be uſed for a new extraction; unleſs perhaps as much of iron had been admixed with it, in which caſe the white Calx of the ſilver is put into ſome Cloath laid in an earthen or glaſs Tonnel, and hot water is to be poured on it, to take away with it the *Aq. Regis*, which is left in the Calx of the ſilver. The remaining water is to be preſſed out of the Towel or Cloath, and the Calx dried, and reduced in the ſecret Crucible, or is made uſe of in the con-centring of into ſilver or gold, *viz.* gold and ſilver

XXXVIII. *After what manner precipitated ſilver is to be reduced without a loſs of its weight.*

SEeing the greateſt fugacity is procured unto this Calx of ſilver, ſo that its former body cannot be reſtored unto it in common Crucibles without great loſs, this diſcommodity cannot after a more convenient manner be prevented than by that which ſollows.

Mix thou an equal weight of with this volatile Calx, and caſt it into a cloſe bright burning Crucible, that is narrow above, and broad beneath; the which after thou haſt covered with a Cover, and well fenced with the lute of Wiſedom, thou ſhall melt the matter together, nothing whereof ſhall depart into ſmoke, neither ſhall ſo much as the leaſt of it pierce through the Crucible, and all the ſilver which the gold received is by this means attained without any loſs.

This ſilver thou ſhalt by fuſion reduce into grains, and ſhalt ſeparate the gold from the ſame in *Aq. fortis*. And thou ſhalt again apply the ſilver thus reduced unto a new labour, in which labour thou proceeding without intermiſſion ſhalt have a continual ſeparatory operation of gold and ſilver; and this labour thou mayeſt exerciſe with great profit in all places.

XXXIX. *Another manner of reducing a fugacious or volatile ſilver, with greater profit.*

PLace thou at the Stern of this little golden Ship, a little fiſh whoſe name is *Remora*, that it may be ſpoiled of its ſwiftneſs and may be at a ſtand, caſt this ſilver little Ship with the little fiſh *Remora*, ſitting at its Stern, into a cloſe and ſquare Tigil or Crucible, that by fuſion they may depart into one body. In this fuſion not onely all the ſilver is returned without any loſs into its former body, but alſo is by the white *Finns* of the little fiſh, augmented with a certain increaſe of its weight, and becomes more golden; ſo that by this additament more of better ſilver is gotten, than if by the addition of other things it had been reſtored to its former body.

What other profits any one may be able to obtain through the help of this volatile ſilver, we will God willing hereafter teach.

Theſe are the things which I at this time have been willing to teach, concerning the extraction of a volatile gold out of ſtones, and the more poor minerals, as alſo of the extending or bringing forward ſilver by ſucceſſive degrees into gold; of which matter more things ſhall be ſpoken in other places.

XL. *An operation, teaching to extract Stones and Minerals, or Mines that are poor in Silver, and Copper by a moiſt way.*

THeſe matters being made bright burning hot, are to be quenched with water, then moiſtened and extracted with *Aq. fortis*; after the ſame manner as was taught above concerning the minerals of gold, and no difference is here met with but in the waters extracting, ſince gold is extracted with *Aq. Regis*, and ſilver with *Aq. fortis*.

If the minerals or mines of gold and ſilver are at once in readineſs, the gold is extracted by *Aq. Regis*, and the ſilver by *Aq. fortis*, and the ſolutions are to be united, in which diſſolving, the ſilver being precipitated by the *Aq. Regis*, doth alſo ſnatch with it the gold from the *Aq. Regis*; and although copper ſhall be preſent with the mine of ſilver, and it be extracted together with the ſilver by *Aq. fortis*, yet it is no impediment to the operation, for the ſilver and gold do ſink to the bottom, and the copper is retained by the *Aq. Regis* to be afterwards adminiſtred for a new operation, and that indeed as often as any one ſhall be willing.

The copper is recovered from the *Aq. Regis* by thin plates of iron being put therein, which operation makes the *Aq. Regis* red, and wholly unfit for the like labours.

Therefore the iron being then ſpiritual, promotes ſomething out of the lead unto the degree of gold, and ſo the *Aq. Regis* being thus often uſed, it is again rendred profitable.

XLI. *A more easy manner as yet by far, of plentifully extracting Gold and Silver out of poor mines, as Sand, White-Clay, and other the like minerals, by fire without fusion.*

THE mine or mineral *Argilla*, or White-Clay, *&c.* containing a volatile and fixed Gold, being rosted or calcined, and broken in pieces in a mill, fill thou a glass gourd therewith fenced with clay, or made of the best earth, half full, and pour so much of the following *menstruum* on that matter, as that it may be well moistened: but as soon as that *menstruum* is poured thereon, it presently begins to give a smoak, wherefore it is altogether necessary, that thou presently put a head on the gourd or body, which is to be set in sand, and all the moisture separated by distilling, and that while the distillation is performing the gold may be dissolved, but the solving matter it self is to be collected in a receiver by it self, the which hath the virtues of *Aq. Regis*, and may be again applyed for use, as shall by and by be shewn.

After that all the humidity is come forth, take the gourd (being cold) out of the sand, and pour some water on the matter that it may become soft, and that a Salt may be extracted from it, wherein the Gold lurketh, which was contained in the mine; coagulate the Lixivium being full of Gold, into a Red-Salt, the which by adding Litharge, is to be melted in such Crucibles which are not broken.

The Litharge draws the Gold unto it out of the Salt, which is to be separated from the Lead, after that manner which shall be shewn in the following Chapters or Treatises.

XLII. *The preparation of a Water necessary for the extracting of Gold.*

TAKE of

this water of small charges, which thou shalt prepare plentifully without trouble, pour upon mines, and again separate it by distillation, to be again used in new labours, that there may be no need to prepare it again anew, because this doth not onely alwaies remain effectual, but also is increased in every operation: So that thou mayest be able to extract mines and minerals *ad infinitum*, if so be thou shalt prepare but one pound or pint at the first.

N. B. By this means all Gold how little soever it be, is plentifully extracted out of flints, sand, and any other minerals, without any cost excepting fire.

XLIII. *Another water for extracting silver.*

TAKE

this water extracteth silver out of the poor mines of silver, sand, and stones; the operation of the same, is like the former one, and its increase is like the increase of the former water, so that after this manner silver may be plentifully extracted out of poor minerals, and no other cost is required besides fire.

N. B. Instead of may be taken since it performs the same thing in extracting, which the other performeth.

XLIV. *Another easie manner of plentifully extracting gold and silver out of poor minerals, it being of little or no cost.*

MIX thou the mine or minerals with the requisite waters, fill with the same of good earth, set them near each other in a great put it in and distill the spirits, which pay all the charges, and which supply gold and silver without any costs, the which is to be received by lead.

XLV. *Another more easie manner of extracting gold and silver out of minerals.*

MIX the mine or mineral with the requisite waters, and moisten it by degrees, cast the whole into the spirits depart into a receiving vessel, and in the time of distillation, the gold and silver are dissolved by that dissolvant, the which being extracted, remain with or among and are rinced by water out of the mineral, so that they are attained without costs, and the spirits being collected in the receiving vessel, do recompence all charges.

XLVI. *An easie operation of plentifull extracting gold and silver out of fat white Clay or Potters-earth.*

ALthough gold and silver be extracted out of minerals by moist waters, by a troublesome operation as we have taught in the beginning, yet such an extraction brings no small profit, because they may be freed from those waters by precipitation; and those very waters do readily serve for the making or preparing of Salt Peter. With a fat Argilla or white Clay, the matter goes otherwise, because the spirit hath crept into the fat earth, and scarce a half part is received, unless the earth be first deprived of its fatness by making burning bright, it being that which doth also require its own peculiar labour.

Seeing that therefore in all places of the world, whereso ever earth is found, such fat white Clays containing gold and silver do plentifully offer themselves, and none hath been hitherto found, who hath indeavoured to extract and bring them to use, especially whenas they contain but little of gold or silver, not able to defray the charges of the lead bestowed.

I could not but open a very easie way of performing that thing with no small profit, the which is perfected by the following labour.

Mix such an earth containing gold or silver, with or of that greater one, and cast it by degrees into my first or second Distillatory Furnaces, and draw forth the spirits by distilling, that the solved gold or silver may remain in From that which is broken by a Mill or grinding is washed off with hot water, and is reduced by lead as is shewed before.

XLVII. *After what manner by the help of art, gold may be easily and plenteously extracted from the sand of* Granates, Agaths, Saphyrs, *and* Rubies, *and other stoney Mineral earths, which do neither admit of fusion, nor Lead, nor sharp Waters.*

IT is certain that all *Granates* or Marbles, the red, black, ash-coloured, duskish, also of whatsoever colour

colour they are, or whereſoever they are found, whether in Brooks or Rivers, or in Sand, or fat Earth, or in high Rocks, do always contain much of Gold, but that by reaſon of their glaſſy nature, they cannot be tamed by *Aq. fortis*'s, and by reaſon of their moſt difficu't fuſion cannot be wrought by Saturn or Lead; for that cauſe they have made none partaker of their gold, and they have been neglected as unprofitable earths, whenas notwithſtanding they being handled by little labour, they are able to afford much gold.

Some one therefore may ask, becauſe they cannot be ſubdued either by lead or *Aquæ fortis*'s, what courſe muſt be taken, that gold may be extracted out of their bowels? I anſwer.

and alſo by a Fuſible

they may be ſo overcome, that the gold which they have may be withdrawn from them with profit, for becauſe they can bear the fire, they are and perform by a double labour, one through their ſharpneſs, and another by reaſon of a ſtrong fire, ſo that nothing is ſafe from ſo great forces, but all things are conſtrained to yield unto ſo great violence. Hence they do willingly afterwards enter the Salt of Lead, and in time of melting do readily draw out their gold.

XLVIII. *A moſt firm demonſtration, that ſharp Waters and Salts after the manner of the ways hitherto deſcribed, do draw forth more Gold and Silver as it were without coſt, out of Mines or Minerals containing Gold and Silver, than ſumptuous or coſtly melting Fires.*

IT is not unknown to every one that is ſeaſoned but even with a mean knowledge of gold-bearing Mines, that without the addition of Lead or other flowable things, Gold can in no wiſe be melted out of them, whenas therefore there is little Gold in thoſe, and nevertheleſs much of Lead or other matters is required to be added for an eaſie fuſion or melting ſake, who ſhall be fit for the undergoing of ſo great coſts? Hence it hath come to paſs that ſuch poor minerals could bring nothing of profit in common.

It being alſo granted, that there is ſo much of Gold and Silver in Minerals, that they will defray the charges of fire and fuſion, and afford Gold and Silver with profit, yet ſuch operations are not comparable to my inventions uſing Waters and Salts, no more than as Water to Wine, or Night to Day.

For firſt, fuſion or melting far exceeds in its coſts the extraction which is perfected by Salt and Waters. And then it can never be brought to paſs that fuſion ſhould expell all the Gold and Silver out of Mines and Minerals, but leaves ſome thereof in the droſſes, next alſo there is made a loſs of all the volatile Gold and Silver, which are caſt forth by a moſt ſtrong fire, and driven away into the air; on the contrary, of the more ample and wealthy profits, which the extraction of Gold and Silver out of Minerals bringeth, this is not the leaſt, that not onely all the Gold and Silver which is fixed, is drawn out without any detriment or loſs, but alſo thoſe two metals being as yet volatile are extracted at once and made fixt and conſtant in the fire, whenas notwithſtanding by the vehemence of a melting fire, they are wholly diſperſed and reduced into nothing. For the Waters of Salts do fix the volatile fugative ſpirits of Gold and Silver, the which by the vehement blaſts of Bellows, are rendred as yet far more volatile, ſo that by the help of fuſion ſcarce half the Gold is gotten which the extraction by the Waters of Salt affordeth.

Add to this, that not onely all the Silver and Gold, as well the volatile as the fixt is gotten together without any loſs, but alſo the charges of Coals are far leſs, and one operatour may perform as much of this extraction of Gold and Silver, as three in the labour of fuſion or melting.

From hence it is eaſily to be ſeen, how much profit and fruit may be gained by this my moſt excellent invention in all places of *Germany*. For this extraction is not onely for extracting Gold and Silver as well out of rich as poor Mines, but alſo ſnatcheth out all the Gold and Silver, in Flints tinged with any colour, wherewith all Brooks, Rivers, and Fields are filled

Now follow ſome particular tranſmutations of the imperfect Metals into more perfect ones, by common fire, and Crude Salt, and by the not common concentred moiſt fire of Salt.

XLIX. *A fundamental and evident demonſtration, that a true tranſmutation, or tranſ-changing of Metals may be exerciſed in all places of the earth, whereſoever Men may dwell, yea in the leaſt Cottages of Countrey folks, and indeed by the ſame matters and veſſels which are found in them.*

IT is well known, that even the pooreſt and vileſt or meaneſt Countrey can want neither fire, nor ſalt, nor earthen veſſels, neceſſary for the boyling of Meats. Therefore being furniſhed with Salt, a piece of Copper of ſome old Kettle ſhall eaſily ſupply him, the which it ſhall be free for him, by fire and ſalt to tranſ change into a better and more noble body, but becauſe Man hath a far better and commodious Salt for the tranſmutation of Metals in his poſſeſſion, which excells common Salt in its goodneſs, he may of right and worthily make uſe of his own proper Salt before a ſtrange and foreign one, and that after this manner.

Boil thy own, or the Urine of another man, to the conſiſtancy of Honey, in which decoction, all the unprofitable moiſture of the Urine departs by exhalation, and the Salt thereof remains in the Kettle or earthen Pot; admix thou with this condenſed Urine, ſo much of *Calx-vive*, or the aſhes of burnt Woods, that it may come into a thick or groſs lump. But thin plates of Copper cut in pieces, and purged by making them bright burning hot ought to be in readineſs, and alſo an earthen Pot having its Cover, wherein let that maſs of Urine, and *Calx-vive*, together with the thin plates of Copper be put; when thou haſt all theſe things in a readineſs, mix the Urine as aboveſaid with the *Calx* or ſlack-lime or aſhes, and fill thy Pot to the height of three or four fingers, upon which put ſome of the plates of Copper, and ſo *ſtratum ſuper-ſtratum* till the Pot is full, then cover it with its Cover, which thou ſhalt well fence with Lute made of Meal, Water, and Paper, that not any vapour at all may come forth. For aſſoon as the *Calx-vive* is mixed with the condenſed or cothickned Urine, the ſpirit of Urine begins to operate by its own proper efficacy, and therefore it is neceſſary that the Cover be ſtraightway laid on the Pot, and be fenced with a due Lute or Clay; the Pot being thus filled and cover'd, ſet it aſide in ſome certain place for the ſpace of half a year, in which time

time the ſpirit of Urine being ſtirred up by the *Calx-vive*, diſplays its virtues on the Copper, and exalts it into a higher degree, as that it is tinged of a skie and green colour mixed, and is rendred fit for the Painters Art; one pound whereof is more worth than two or three pounds of Copper, one pound whereof doth for the moſt part render one pound with four or five ounces of this colour, and and ſo it affords a profitable tranſmutation of Copper.

L. *After what manner, out of this partly Green, partly Skie-colour of Copper, Gold and Silver is to be ſeparated.*

HE that deſires to ſeparate Gold and Silver out of this colour, whereof no great maſſes are attained, but onely and alone whereby it is demonſtrated that the thing may be done, he muſt uſe the following operation.

Firſt, he muſt take good heed in taking the colour out of the earthen Pot, leſt any thing of the maſs of the Urine, and *Calx* be mixed with the beautifull colour, and render it impure.

The thin plates being taken out, they are to be often crookedly bowed, and moved upwards and downwards, that the colour may fall off from the plates like ſcales. The remaining Copper which is not yet turned into colour, is reſerved for a new labour; to be repeated after the ſame manner. Wine-vinegar is poured on the colour, or the ſharp water of Tartar extracted after the Diſtillation of aduſt Wine from its Lees, with water by decoction, and it is to be ſo long boiled in a Copper Kettle, or an earthen Pot glazed, till all the colour ſhall be ſolved; the ſolution being caſt into a Filtre, the Vinegar or Water of Tartar onely paſſeth through, and a reddiſh powder is left in the Filtre, the which being melted with Lead in a Cupel, after the exhalation of the Lead, it leaves a grain of Gold. For the ſpirit of Urine hath ripened ſomewhat of the Copper into Gold, which the Vinegar or Water of Tartar did not diſſolve but left, attracting onely the Copper by ſolution. And becauſe ſomewhat of Silver is ripened in the Copper through this ſame operation, and is diſſolved with the Copper, by the Vinegar or Water of Tartar, ſomething of common Salt is to be added to the Water of Tartar or Vinegar, that the Silver may not be ſolved by the ſame, but may remain with the *Calx* of Gold, and may be retained with the ſame.

N. B. Pure and clear Vinegar ought to be taken for this labour, if you would preſerve the colour unhurt, for after ſome part of the Vinegar is evaporated away, the green colour of the Copper grows together into fair green ſmall ſtones, one pound whereof is more to be eſteemed than five or ſix pounds of Verdi greaſe, which is ſold in the Shops.

This artificial operation therefore affords a beautifull and chriſtalline vitriol of *Venus*, and ſome ſmall quantity of Gold and Silver; whereof although there be not ſo great plenty that it may bring profit, yet it ſhews the poſſibility of the thing, and teacheth that a tranſmutation of Metals, may be exerciſed in any ſmall Cottage by any Countrey Man.

But if any one ſhall collect Urine, and extract from thence the volatile ſpirit of its Salt by Diſtillation, he ſhall far more deeply pierce the heart of the Copper, and ſhall obtain more of Gold and Silver than he can get by the but now mentioned ruſtical labour, of which matter more things are found in other places of my Writings.

LI. *After what ſort pure Gold may be extracted out of any Copper.*

IN all Copper a ſpiritual occult Gold lies hid, the which in the labour of ſeparation by Lead in a Cupel or Teſt, is not taken notice of, or conſidered. But this very Gold is nothing elſe but the colour of Copper, ſo firmly adhering unto its body, that it remaineth very difficult to be ſeparated from thence; but the operation being rightly inſtituted, although it be not gainfull, yet it demonſtrates a poſſibility of the thing, for the ſake of experiencing whereof, to wit, whether there be Gold in all Copper, thou muſt labour after the following manner.

Diſſolve Copper in *Aq. Regis*, and pour much water on the ſolution, that by this water the diſſolved Copper may be largely diffuſed. Into this ſolution diffuſed by the water, pour Lead that is diſſolved in *Aq. Fortis*, ſo that one or two half ounces of Lead may anſwer to one pound of Copper. But as often as the Lead ſhall ſettle to the bottom, thou ſhalt ſhake or ſtir it, that the ſolution may be well mixed, and that the Lead may attract ſomething of Gold; and may precipitate it with it ſelf to the bottom, the which being dried and ſeparated in a Cupel, will leave a ſmall quantity of Gold, not for an argument of profit, but a token of a poſſibility, which teſtifies that there is Gold in all Copper. But if any thing of profit were to be received, ſuch Copper was to be taken which was already changed into vitriol. But among vitriols the *Hungarian*, *Cyprian*, *Indian*, *Japanick*, and other the like do excell, which do offer themſelves in the Mines of Gold-bearing Copper, and are handled after the following manner.

LII. *The manner of extracting Gold out of natural vitriol.*

DIſſolve thou vitriol in common water, and pour on the vitriol diſſolved, a littled of diſſolved Lead, and ſtir both ſolutions by frequent motions, that the Lead may attract the Gold out of the vitriol, to be dried and ſeparated by a Cupel, which will remain like a grain of greater or leſſer quantity, as the vitriol ſhall contain more or leſs of the ſame.

Of the vitriolated water out of which the Gold was extracted, thou ſhalt again make vitriol by ſo long boiling, and evaporating till a thin skin appear, which being then expoſed to the cold will ſhoot into Cryſtals. But this operation brings with it more profit, if it be not now boiled up into Cryſtals, but that vitriol onely be taken which is drawn out of its Mineral into Water, and after the extraction of the Gold, is at length boiled up into vitriol.

But leaſt this fiſhing of Gold out of vitriol ſhould ſeem wonderfull unto any, we will ſhew a way, whereby Gold may be extracted out of Sea Water, or Sea Salt, the ſolution of Lead aſſiſting: The manner is as followeth.

LIII. *After what manner Gold is to be extracted out of Sea Salt, or Sea Water, not indeed with profit, but onely that it may be demonſtrated, that Gold is hidden even in Sea Water or Sea Salt.*

FILL a great Copper Kettle with Sea Water, and pour thereon a little diſſolved Lead; the which

goes to the bottom becauſe it cannot indure Salt, and is ſtraightway precipitated into a white powder, move and ſtir the water in the Kettle often, that the ſolution of Lead may every where touch the Sea-Salt-Water.

Through this action, a ſpiritual Gold adheres to the leaden powder, and ſinks to the bottom together with it, which powder being freed from its Salt by common Water, and dried, and melted in a Cupel, leaves a ſmall grain of Gold, as a remainder.

N. B. For this fiſhing Silver is more fit than Lead.

LIV. *How, out of poor Mines of Copper, from which no profit can be perceived, Copper, as alſo Gold it ſelf if it be preſent, is to be eaſily and without coſts, extracted and ſeparated.*

THE ſandy or ſulphurous Mine or Mineral of Copper is to be roaſted or calcined, by burning even to the conſuming of the Sulphur, becauſe ſharp waters do not aſſault ſulphureous matters, the Mineral being calcined and beaten into a powder, fill a gourd, and pour our ſolving ſecret on the ſame, the which I have taught above at the extracting of Minerals.

The whole diſſolvent in abſtracting or diſtilling is recovered, and that indeed not without increaſe. But the Copper and Silver do ſtick faſt in the diſſolved Salt, which remained in the Mineral after the abſtraction, and the which is to be waſhed out with water, out of which water, which drew out that Salt, the Gold contained therein, may by the ſolution of Lead or Silver, be drawn forth.

But if the ſame water be boiled untill a thin skin appear at the top, and expoſed to the cold, it will ſhoot into a green vitriol, but for the extracting the Copper out of the Salt-Water, Rods of Iron are to be put therein, which do attract the Copper, the which being withdrawn and waſhed clean, and melted into Copper by fuſion, is adminiſtred for other uſes: For becauſe it is like to a tender and filed powder, it is changed by an eaſie buſineſs into Verdi-greaſe, after the manner which ſhall by and by be taught.

LV. *After what manner Gold may by an eaſie buſineſs by Fire and Salt, be ſeparated out of Copper.*

IF Gold ſhall be mixed with a maſs, or lump of Copper, all the Copper is to be reduced in a bright burning Fire into Aſhes: and the Aſhes are to be infuſed in our ſecret *Aceum* or Vinegar, the which diſſolveth the Copper onely by decoction, and leaveth the Gold undiſſolved, like a ſhining powder, to be dried and melted with Borace, out of which Gold of twenty three Carats proceedeth.

That Vinegar, our ſecret *Aceum*, draws all the Copper from the golden *Calx*. The Copper is ſeparated from the Vinegar by Rods of Iron, being laid therein as we have taught in the foregoing manner.

LVI. *How Copper being extracted out of vitriolated Water, and adhering to Rods of Iron, is to be changed into Verdi-greaſe.*

THIS pure Copper may be moiſtened with the ſtrongeſt Vinegar, and put into earthen Pots, the which being covered with its Cover well fenced with Clay, are to be placed in Horſe-dung, and to be left therein for a time, yet ſo as that the heap of Dung be ſometimes renewed. All the Copper is in a ſhort time changed into Verdi-greaſe, and indeed far more pure than that which is ſet forth to Sale in the Shops, and which is made in *Spain*, by the husks or preſſed out of cluſters of Grapes.

N. B. In extracting Copper out of Mines, regard is to be had unto this thing, to wit, that with poor and wild or courſe veins of Copper, *Lapis Calaminaris*, or *Zink* is ſometimes found to be admixed; which is no ways perceived to be in them. But if thoſe Minerals are extracted with *Aq. Regis*, and this be to be taken away by Diſtillation, none of the *Aq. Regis* goes forth, but onely a flegm without ſavour, becauſe the *Lapis Calaminaris* or *Zink* doth retain all the Acrimony with it, juſt as if thoſe two Minerals ſhould ſay to the *Aq. Regis*, we do not as yet let thee go, becauſe as yet, we have need of thy indeavour for our amendment, *&c.*

But it is certain that whatſoever Minerals and Metals do retain with them ſharp ſpirits, are as yet immature, and may be ripened by thoſe ſpirits, that they may beſtow Gold and Silver, as hath been already ſaid, and ſhall as yet more largely be ſpoken to.

LVII. *Out of wild or courſe Minerals, or veins of Lead, admitting of no melting, out of which no good Lead, much leſs Gold or Silver, can be drawn, how to extract not onely Lead, but alſo Gold and Silver with profit.*

AS we have ſaid above, that ſome Minerals or Veins of Copper do appear in Mines, the which by reaſon of *Lapis Calaminaris* or *Zink* do refuſe all melting, and can be by no fire reduced: So alſo we here admoniſh, that Minerals of Lead are found, the which do indeed contain much Lead, but by reaſon of the *Lapis Calaminaris*, *Zink*, and a ſulphureous Sand being admixed with them, they cannot be overcome by any melting, for theſe matters do take away a ready flowing from the Lead, and do cauſe that ſuch Minerals, which for the moſt part together with Lead, do alſo hide not a little of Gold and Silver, are caſt away as altogether unfit, and unprofitable, whenas notwithſtanding very much profit might be received from them after this manner.

Let the Mineral by pounding be broken in ſmall pieces, and in my little ſecret Furnace which I have fitted for the calcining of Minerals, let it be roaſted with bright burning Coals, that the groſs Sulphur may conceive a flame, and burn. If in time of operation the matter ſhould gather it ſelf into heaps or knobs, and in co-heaping ſhould make round Pellets, it being taken out of the Furnace, let it again be beaten, be ſet upon live Coals and roaſted, and theſe labours be ſo often repeated, untill all the Sulphur ſhall be conſumed, and the Mineral doth no longer co-heap it ſelf into knobs, but being made bright burning hot like dead aſhes; it no longer ſends forth a ſulphureous ſtink. At length out of theſe aſhes being well waſhed, a dead and unprofitable matter ſeparates its ſelf from the good and metallick earth, the which being melted by it ſelf in a Furnace called by the *Germans Stichofen*, becomes a flowable Lead which containeth Gold and Silver.

But if the Mineral be ſo ſtubborn that it altogether refuſing all melting, could not by it ſelf be reduced,

duced, and nevertheleſs contain Gold and Silver, ſomething of Litharge is to be added to that metallick earth, which procures a flux unto it, and yields that Gold and Silver bearing Lead, which by the common operation wholly refuſeth to offer it ſelf.

LVIII. *Another way teaching by the help of Salt and Fire to draw Silver and Gold with great profit, out of all ſtubborn or rude and untamed metallick earths, in whoſe Veins Lead, Copper, Gravel, or courſe Sands, Iron, or* Lapis Calaminaris *have for the moſt part conjoyned in Society, and which do deny all profit by vulgar operations.*

AS Fire burns up every groſs and combuſtible Sulphur in Mines or Minerals, that theſe do at length ſubject themſelves unto melting, and do render Metals eaſie to be hammered: ſo alſo Salt fixeth, and makes conſtant whatſoever volatile body endeavours to flie away into the air, that it may afford a ripened, melted, and profitable Metal. For that cauſe ſuch Minerals common Salt being added as was aboveſaid, are to be roaſted in live Coals, that that devouring groſs Sulphur may vaniſh by burning with a flame, and that together alſo the Metal it ſelf may be promoted to maturity, and ſo that by this very thing, good Gold and Silver may be ſeparated, whenas notwithſtanding otherwiſe, not any one ſhould obtain ſo much as the leaſt thereof out of theſe very Minerals.

Such an amendment and changing the more imperfect Metals into the more perfect ones, may be attained by the help of Salt and Fire.

If therefore common Salt and groſs Fire are able to perform this in Minerals, what ſhall not theſe, not common but ſecret Fires of Salts effect, in tranſchanging Metals already pure, into more pure and ſubtile ones?

LIX. *After what manner Metals are to be amended by pure Fire, or the fiery ſpirits of Salts.*

IT may eaſily be perceived if a groſs Salt and Fire do ſome good to more groſs Metals, that alſo a more pure Fire and Salt may do more good on purer Metals. Inſtruments whoſe edges are made very ſharp by whetting, are far more fit for operation than thoſe that are dull, and will perform more. By how much the ſharper an Auger or Wimble is, by ſo much the ſooner it boareth thorough the Wood, and on the contrary, by how much the more blunt it is, by ſo much the ſlower it pierceth thorough.

He that is earneſtly deſirous to obtain any good in the amendment of Metals, he muſt of neceſſity apply the ſubtile and ſtrong ſpirits of Salts, that he may deſtroy Metals with the ſame, may kill them, and reduce them unto their former life, and ſo may procure more noble bodies unto them. When their former body is reſtored to thoſe moiſt and cold Fires of Salts, to wit, that they may return unto the form of Salt, but of a more noble and ſubtile one, Metals may far more ſpeedily be deſtroyed; a double Fire performs more than a ſingle one, ſince therefore Salt is by it ſelf no other thing but a meer and con-centred Fire, and the Fire of Wood or Coals joyning it ſelf with the other a greater efficacy muſt needs be expected from them than by common Fire alone, but we have hitherto made mention of ſuch operations, and therefore its needleſs here to repeat them. From what hath been hitherto ſaid, every Chymiſt may gather and learn thoſe things which concern the amendment of Metals, wanting the help of Salt and Fire; more God willing ſhall follow.

LX. *Let us now aſcend higher, and demonſtrate what incredible miracles or wonders our ſecret Fires of Salts may effect nigh to that great work of Philoſophers.*

AS in the foregoing Chapters it hath been ſufficiently confirmed, that unripe Metals may by the help of Fire and Salt, be particularly promoted to a more perfect maturity: So alſo in the multiplying of Animals and Vegetables, that thing evidently appeareth; to wit, if ſufficient meat and drink be adminiſtred to any Infant, that he groweth dayly in bigneſs, and ſtrength of body, untill he come to the age and perfection of a Man. The ſame multiplying in Vegetables offers it ſelf to our view, in that a ſmall ſeed or root do ſnatch to them their nouriſhment from an earthly Salt; and the beams of the Sun, and do riſe up into a perefect, great, and fruitfull Tree. This particular tranſmutation is converſant before our eyes, and therefore is a thing moſt known, but after what ſort the moſt noble part or pureſt eſſence is to be extracted out of the bodies of Vegetables, Minerals, and Animals, that other more weak bodies may be ſtrengthned and amended by the ſame Philoſophers have always hidden and covered with the greateſt endeavour. Hence it is, that there hath been very few, and as yet are, who have had the knowledge of this higheſt Science.

As to what therefore belongs to the great work of the Philoſophers, all the Philoſophers do in their writings with one accord affirm, the which I do alſo in all my writings affirm to be moſt true, and do as it were ſhew with my Fingers, to wit, that nothing in the nature of things doth effect a Tincture and Tinge with a moſt gratefull colour, but Sulphur alone, and that one onely, and that this ſame combuſtible immature and volatile Sulphur is fixed and changed by the operation and help of Salts into a true Tincture, the which is as certain as that which is moſt certain, and yet laborious alſo, and requiring a ſpace of time long enough, eſpecially if any one doth inſiſt in a moiſt way. The way of coming unto the end of ſuch a work as I think, yet with the ſafety of others judgment, this is the beſt, if any one bind or fix ſuch a Sulphur, which was already brought unto a perfect maturity by nature, they might bring this profit with it, that it ſhould not require a longer time for its maturity.

But ſuch a fixed and tinged Sulphur, is no where more nearly found than in Metals, and eſpecially in Copper and Iron, but the better and more pure in Gold; the finding out whereof notwithſtanding (by reaſon of its moſt firm and intimate conjunction with its body, as alſo its ſeparation) hath been always eſteemed almoſt impoſſible. For unto diligent ſearchers, a true ſeparator which might ſeparate the pure part from the impure, hath for the moſt part every where been wanting.

For as it is known ſuch a hard or compacted metallick body, can very difficultly be ſeparated and divided into its parts.

The ſolution of ſharp waters, ſups up indeed every Metal, but it effects no ſeparation. For becauſe Metals

Metals are Homo-geneal things, and the metallick Sulphur is ſo ſtrictly bound to its metallick mercury, by the bond of the metallick Salt, it can never be brought to paſs, that by ſuch ſolutions, or by precipitatings, or by other ways, one part ſhould be ſeparated from the other.

If a Metal being diſſolved by a water be precipitated all its parts being ſo mixed as they were before its diſſolution do fall down and ſettle, and admit of no ſeparation. But if any one would alſo render Metals ſpiritual, that ſo the more pure parts might be disjoyned from the more impure ones by diſtillation, yet there is no ſeparation made, but the more pure body it ſelf aſcends, and again as before, it conſiſteth of three principles, performing indeed more in Alchymy and in Medicine than the more groſs bodies of Metals, but is unfit for a true Tincture, becauſe nothing operates in all bodies, but a lively Soul, and that which vivifies or quickens other dead bodies, for it is the ſpirit, as Chriſt ſaith, which quickneth, the body is unprofitable. Let man, or any other living creature be for an example, the which as long as it lives, it moves it ſelf and operates as long as the ſpirit, the Authour of Life is preſent with it; but that vaniſhing away the body wants all motion, and remains a dead Carcaſs. If now it could be brought to paſs, that we could lay hold of ſuch Animal Spirits, and could render them corporal ones, we might alſo perform incredible things by the ſame, and perhaps faſhion or form a living creature of a lump of earth, the which notwithſtanding God hath reſerved to his own ſelf. But this that bountifull Father hath granted unto us, that out of unmoveable ſubjects, or thoſe wanting a moveable and animal life, we may extract their pure Souls or Eſſences, and render them corporal, and effect thereby things of great moment in Medicine and Alchymy.

But the ſouls of Metals do excell herein, as being more fixed and conſtant than the eſſences of vegetables, but they are far more difficultly attained. For the ſouls of vegetables do ſuffer themſelves to be eaſily extracted, but the colours and ſouls of Metals do hardly admit of extraction, and for that cauſe are accounted of by the ignorant for a thing impoſſible to be done, nor indeed is it altogether without ſome cauſe; for the ſeparation of the tinging ſoul from the hard metallick body is a thing of great moment: many are the ways that have been attempted for the procuring of this Sulphur; and ſome ignorant fellows have written Books, of the acquiring or getting of the ſame, whereas 'tis evident that they never ſaw ſuch a Sulphur.

The moſt learned and moſt witty *Helmont* wrote egregiouſly concerning this Sulphur; but yet not ſo clearly as that any one could out of thoſe his writings get a perfect knowledge of the ſame. Nor indeed is it expedient that ſuch kind of Pearls ſhould be caſt under the feet of ſwiniſh Men. There is no Writer (as far as I know) that hath mentioned any thing concerning this matter, clearer than *Iſaac Holland* in his *Ch. De Amauſis*, where he teacheth, that he who hath gotten the art of changing Metals into tranſparent Glaſſes with their peculiar colours, hath purchaſed a notable ſecret in Metallick affairs. He alludes (by way of likeneſs) to the bodies of Men brought to a clarity or brightneſs after this life, and thus declares his Doctrine and ſays; The ſouls of Metals do ſhine forth through their *Amauſa*'s, or clarified bodies, clad in their proper colours, even as the Souls of Men ſhall hereafter ſhine in the other World, from [or through] their clarified bodies. And further he ſaith, that when ſuch *Amauſa*'s [or Glaſſes] are reduced into their former bodies; then the *Amauſa*'s of Copper and Iron become fixt, that of Silver becomes Gold, and that of Gold becomes Tincture. The ſaid Authour hath not clearly expreſſed the manner of accompliſhing this, but in my opinion (without preſcribing ought to any one) this is the neareſt way of attaining to ſuch an operation, *viz.* of getting the ſouls, or the pure Sulphurs of Metals, *viz.* If the Metals be firſt reduced into *Amauſa*'s or tranſparent Glaſſes, out of which their ſouls are eaſier extractable than out of their groſs bodies. But now, for ſuch an extraction here is ſuch a *menſtruum* required as doth not work upon all the whole body, or diſſolve it, but doth onely attract there out of the colour and pureſt Sulphur, and leaves the body behind white. But where ſhall we find the deſcription of ſuch a *menſtruum?* none ſpeak of it openly, but many mention it obſcurely; nor indeed is it ſo neceſſary that ſuch an *Arcanum* of ſo great moment be manifeſted to every one.

But however, this in brief you are to be admoniſhed of, that like draws its like and extracts it. If a mercuriality be to be extracted out of the metallick maſſes [or bodies,] then 'tis expedient to uſe a mercurial *menſtruum*, for like rejoyceth in its like. So ſulphureous eſſences are extractable by ſulphureous *menſtruums*, and not by mercurial ones. For Water doth willingly aſſociate it ſelf with Water, and Oyl with Oyls. And foraſmuch as all the Philoſophers write that the Sulphur or tinging Soul in Iron and Copper, doth as to goodneſs and nobleneſs equalize the Sulphur in Gold, it will be needleſs (in my opinion) to take Gold, but to bring Iron and Copper to that paſs, that they may become tranſparent Glaſſes, from which their colours may be extracted. But if ſo be that any one is minded to prefer Gold before theſe, and to extract the tincture hence from, he may do as he pleaſes, and will find in many places of my writngs a manuduction, [directing him] to the tranſmutation of Gold, (and ſo of the other Metals too) into tranſparent bodies, which thing is highly neceſſary. For there is not and eaſier way of extracting the tincture out of Metals, than by firſt reducing them into tranſparent *Amauſa*'s. Now the *menſtruum* ſerving for this extracting of the Sulphurs out of the metallick bodies is to be ſo prepared, that it diſſolve not the body, but extract onely the Sulphur or pure Soul there out of. Such *menſtruums Paracelſus* himſelf makes mention of, and affirms, that with them the skie-coloured Saphyrs, the red Rubies, and the yellow Jacynth may be ſo deprived of their colours, as that there remains no more of them ſave onely the white bodies. Beſides, that white Cryſtals may (by the help of tinging ſulphureous ſpirits) be died with various colours. Verily 'tis a ſecret of moſt mighty concernment, to have the skill how to prepare ſuch a *menſtruum* as will penetrate the moſt hard Stones and moſt compact Glaſſes to extract them, and withall to communicate to otherſome various colours, without the corrupting, breaking and deſtruction of any of the bodies, the which thing ſeems in my opinion very likely to be true, though as yet I know not how to do it. That which I have tryed by my operations I can write and teach, *viz.* how all the Metals may very eaſily (yet one more

eaſily

easily than another) be changed into fair transparent and most delicately coloured glasses, and how out of these glasses the pure and tinging metallick souls may be extracted, *viz.* by such *menstruums* as are sulphureous, subtile, not dissolving, but onely extracting

But for as much as these kinds of *menstruums* are not (as far as I know) described by any one, and yet are the producers of such notable effects; I could not omit the discovering of something concerning them, for the sake of such as are Students in true Philosopy, and after some sort shew that kind of extraction, which is to be accomplished by the help of our con centrated spirits of salt, or of our moist Philosophical fires.

LXI. *How a vegetable subtile sulphur is to be so actuated by the nitrous moist fire, that it may extract the fixt sulphur of metals, or their pure tinging soul.*

FIrst of all, the oyls of the vegetables are to be exalted by distillations, and often repeated rectifications to the highest degree of purity and subtilty, and afterwards to be once rectified by some con-centrated nitrous fire, that so being already of themselves subtile, they may get a fiery vigour endued with a faculty of seizing upon metallick sulphurs, and of extracting them out of the hard and compact bodies. For any vegetable oyl how subtilly soever it be prepared, hath not any power of entring into the metals, and much less of having any ingress into their glasses, nor can it extract in the least, though such bodies should be covered with it for a long season. But now if an artificial operation shall have sharpned such an oyl with those most subtile spirits of salts, and have rendred it more acute and penetrative than those con-centrated spirits of the salt do lead in the sulphur, and bestow on it a power of attracting to it self its like.

And albeit that such con centrated spirits do when *per se*, and alone, wholly dissolve metallick glasses and make no separation at all, no, nor do not extract the least particle of any sulphureous substance, yet the case with them is vastly altered, when such fiery spirtis are artificially united with most pure sulphureous oyls; insomuch that they bestow on them a faculty of working upon metals, and of extracting from them a most pure sulphur; nay farther, they purchase these oyls a capacity not onely of extracting the colours out of metals, but also out of other things. Now we have taught at large in our second part of Furnaces, the manner of rendring the oyls of vegetables subtile; and as for the nitrous fire requisite to this operation, the way of con centrating it is to be found in this Book a little before, so that 'tis wholly needless to repeat the same things over again which have been afore treated of. And thus far is my knowledge come, *viz.* how (by the help of oyls animated and actuated by the aforesaid means) to extract the most pure soul out of metallick *Amalsa*'s, or those hard and glassy subjects: But how such a sulphur is to be brought into a tinging medicine, I (professing not my self so great a master) do not as yet know. Neither is it at present needfull to exceed the due bounds by so large a treating of such worthy things; for things wonderfull may be effected by this *menstruum* both in Medicine and Alchymy, and in other arts, concerning which we shall (God willing) presently add somewhat more.

And whereas I have made mention here of clarified bodies, and con-centrated spirits; I judge it worth while also to shew what difference there is betwixt those con-centrated spirits and clarified bodies as the Chymists call them.

The clarified bodies therefore are nothing else save bodies purged and mundified by the operation of the fire. For the fire is the ultimate examiner of all things, as being endued with such a power by which it burns up all things, reduceth them into ashes and powder, and out of the ashes makes glass; that being the utmost or ultimate thing whereunto all things are reduced. If therefore there be in any thing any good, which being burnt in the fire is by fusion or melting, turned into transparent glass, it doth manifest it self in its utmost or ultimate essence, and shine forth in its brightness, insomuch that every one may see what lay hidden in its life afore thus burning it. For example, I take wood, an herb, or an animal, I burn it and transmute it into ashes; these ashes I melt and turn into glass. Having thus done, there appears no colour visible, for the glass is white, and that because the sulphur is consumed in the burning; and the mercury is fled away into the air in smoke, as being two principles which are no ways able to resist the force of fire: But the salt, as being a contemner of the fire remained in the earth of no efficacy.

But now a metal being by the fire turned into ashes, though part of the sulphur and mercury hath in the combustion and vitrification flown away into the air, yet notwithstanding the best part remains; and this is the reason why such metallick glasses are coloured according to the metals nature and property, and which (afore thus burning it) was hidden. We will yet farther evidence it by an example.

If I burnt copper or iron, and reduce it into ashes, and do by melting it turn it into glass, then the copper if *per se* and no other thing added unto it, yields a green glass, and the iron yields a yellow coloured glass. But if there be made an addition, then are produced glasses of other colours, as for example.

If I add to burn iron or *crocus martis* the glass of lead, then the glass made by melting will have the yellow colour of a Hyacinth. The same *crocus martis* being molten with common glass, made of wood-ashes and salt; yields a greenish coloured glass which is the natural and proper colour of the iron. For the lead altered the colour of the former mentioned glass of the iron and made it yellow in the melting, and so hindred it from manifesting its true and natural colour. The glasses of two several colours being molten together do exhibit false colours, as may be seen by co-melting a skie-colour and a yellow glass, the which being molten together yield a green colour, and doth so represent it self both in the fire and out of it too. From hence took I occasion to write and teach the way of finding out (by molten glasses) what kind of metal is hidden in any mineral or metallick earth. Which way of proving mines or minerals is far better and speedier than that which is usually done by a decoction and exhalation of lead in the Cupel. Thus may you mix five, six, eight or ten grains of some finely powdered mineral, with one or two lots of Venice-glass being of easie fusion, and put the matter thus mixed in a well covered crucible, and by melting it reduce it into glass. The colour which will be in the said glass, will shew what metal the *minera* contained: Lead will yield a duskish colour, tin, a white, copper, a Sea-green; iron a somewhat greenish, silver a yellow, and gold

a skie coloured: each of which colours is the true and internal colour of the reſpective metal. Gold doth alſo reſemble a Ruby as to colour if other colours be added thereunto. But yet in the mean time, the skie-colour is its proper and natural colour, and ſo is yellow of ſilver: and this is notably agreeable with the truth, though to ſuch as are ignorant, it ſeems a thing wonderfull, for indeed ſuch mens knowledge ends in external things, but they are wholly ignorant of internal ones. But now the colours of gold and ſilver are better and more perfectly known, if there be added unto them ſome fix and white ſulphur, which prevents the gold and ſilver from being thoroughly reduced into their peculiar bodies by fuſion. If the *Calx* of gold or ſilver be molten with Borax, they both return into their former bodies, and do not paſs into glaſs any ways coloured: But that ſome glaſs of eaſie fuſion be mixed with thoſe *Calx*'s, together with a little powder of flints and ſo molten, then the flints will (by reaſon of their ſulphur) hold with themſelves the gold and ſilver and ſo keep them that they admit not of fuſion [or reduction] in their whole body, but do remain in the glaſs with ſome part of the metalline property which renders their internal colours viſible, which elſe would not appear to ſight.

N. B. If you have the minera's of gold and ſilver at hand and melt them with glaſs, their colours will alſo appear, becauſe that in the minera's there always is ſome ſulphur that hinders the metal from wholly returning into a body, ſo that ſome part of it abides in the glaſs and therein ſhews its colour. This alſo is to be minded, that if haply ſome minera or metallick earth contains not one metal barely, but 2 or 3 more metals, then always that metal of which the moſt quantity is in the ſaid minera doth after fuſing ſhine in the glaſs beyond the reſt. As for example.

Suppoſe I would make tryal in the red Granates [ſtones] I powder ſome eight or ten gr. and mix them with one lot of white Venice glaſs finely powdered, and I melt them, and ſo turn them into glaſs. Now in this tranſmutation the glaſs doth not become red, but of a delicate graſs colour, and ſo teacheth me what metals are hidden in thoſe Granates, *viz.* copper and iron, and alſo more of this, [*viz.* the iron] than of the other. And though there ſhould be ſome gold too, yet is it unperceiveable becauſe of the predominancy of the iron over the copper and over the gold: For (in this operation) that metal onely manifeſts it ſelf to ſight, which is in greater plenty therein than the reſt be.

Iſaac Holland would by this vitrification ſignifie unto us, that after this life, *viz.* when the world is conſumed with fire, there ſhall ariſe from the bodies of men reduced into aſhes other clarified bodies, and of ſuch and ſuch colours, according as their ſouls have (either good or bad) framed, or as it were made unto themſelves in this life-time in their groſs bodies. What other thing [I pray] are fair colours, but the virtues of thoſe ſubjects out of which they emit or ſend forth their ſplendour.

Take a ſimilitude hereof from the melting of minerals, wherein though a mineral of ſilver or copper hath in it much ſilver or gold, yet if the ſuperfluous ſulphur be not (before the melting the ſaid mineral) ſeparated by a little as 'twere roaſting fire; but be (together with that groſs ſulphur,) ſet in a vehement melting fire, there will not verily be any metal gotten hencefrom, but that ſtinking ſulphur would tranſmute the good metal into black Scoria's. So likewiſe, no fair and tranſparent glaſs can be (by melting) made out of pure metals, if that kind of groſs ſulphur ſhould adhere unto them.

Theſe few things touching clarified bodies, I could not paſs over in ſilence, and much leſs could I omit this, *viz.* that the bodies of all things may be much better tranſmuted into clarified bodies by our ſecret fire, than by the common fire. For the common fire drives away the volatile parts, whereas on the contrary, our fire doth preſerve them and renders them fixt and tranſparent as well as the other parts. And therefore of neceſſity theſe bodies muſt needs ſhine with fairer and brighter colours than thoſe others, in which the common fire hath expelled the mercury and ſulphur, and left remaining nothing elſe but the ſalt.

But now as concerning ſuch a tranſmutation into aſhes by our moiſt and ſecret fires, any one may eaſily gueſs the way. For whatſoever is put in them muſt be neceſſarily burned into aſhes, and they far better aſhes too than are made by burning in the common fire. For if the common fire burns any herb or wood into aſhes, the ſulphur burns away in a flame, the mercury betakes it ſelf to its wings and away flies it, and the ſalt abides behind in a few aſhes or a little earth. Now our Philoſophical calcination takes away nothing but conſerves all [the principles ſo called] together; and doth in the firſt place produce to view a black coal, then afterwards other various curious colours, and then a white colour, and at laſt to compleat the operation, it yields a red fuſile and medicinal ſtone.

N. B. Here it is to be noted that for preparing a pure medicine, a pure ſubject is to be made uſe of; for if ſo be that any one would endeavour the tranſmutation of an herb, wood, or any animal into a medicament by the help of the ſecret fires, then all the aſhes and feces which were in the herb would alſo adhere unto the medicament and would render it impure, therefore neceſſity requires that you do not take the whole herb, or the whole animal, but onely their eſſential ſalt, the which being void of feces conſiſts onely of the pure principles of the herb; and doth eaſily admit of being tranſmuted into a red tinging, and more ſoluble ſtone than the herb it ſelf with its feces by it, doth.

I would not have you to account of theſe things here delivered you as if they were of ſmall moment. No, for they are ſuch things as cover over with this their vile or baſe covering, ſuch matters as are of great weight, and which will not come to every bodies knowledge. Surely 'tis a conſiderable thing that a part of any vegetable, animal or mineral body ſhould (by conſerving all the moſt volatile parts, and by rendring them altogether conſtant and ſtable, without the leaſt loſs of weight) be ripened into a fixt ſoluble and tinging red, and medicinal ſtone. This way of tranſmuting all things without loſs of the weight thereof into clarified bodies, is of all others the beſt. And thoſe bodies on this wiſe clarified are without doubt of greater efficacy than are the groſs bodies themſelves of the animals, vegetables, and minerals, which do as yet abound with their groſs and impure feces.

But if ſo be any one be not herewithall content but panteth after higher things, he may adviſe with himſelf about extracting the ſoul out of this red and fixed ſtone, and reduce it again by a reiterated operation unto the form of a ſtone, whereby he will without

without doubt make it yet far more effectual. And by how much the oftner any one ſhall repeat this ſame operation, ſo much the more effectual a medicine will he obtain, for it will at every reiteration notably augment its virtues, for by ſuch actions the efficacy and virtues of things are con centrated and driven into a very little compaſs, wherewithall wonderfull things may be performed.

We are yet moreover to ſee what ſpirits are, but principally what con-centrated ſpirits are, and what they are able to do.

And becauſe the matter in hand gives occaſion of treating thereof in this place, we will briefly give you a declaration of the ſame.

LXII. *What ſpirits are, and by what means they operate good or evil.*

IN the firſt place, there are ſpirits called vegetable ones, *viz.* When vegetables are beaten to pieces, and being contuſed are moiſtened with water, (provided they have not juicyneſs enough of their own, or do altogether want it) and ſo fermented, being fermented they are to be diſtilled, which diſtillation brings forth ſubtile and efficacious ſpirits, and ſuch as are the effecters of many profitable things in Alchymy and in other arts, beſides the uſe thereof in medicine.

Secondly, ſundry and divers ſpirits are alſo made out of animals by diſtillation, as out of Blood, Urine, Hairs, Horns, Hoofs, and ſuch other parts of animals, alſo which ſpirits have their uſe in Medicine and Alchymy.

Thirdly, there are alſo ſpirits which are expelled, or forced out of minerals and metals by the force of fire, but principally out of Salts, as Vitriol, Allum, Salt Peter, common Salt and ſuch like; of the preparations of which kind of ſpirits, the Books of Chymiſts are full, and therefore ſtop us from the ſuperfluous repetitions of the ſame. But as for the concentrating of them and the utility of them, it hath been already deſcribed by us.

I hereby give occaſion for all the diligent ſearchers after true Medicine and Alchymy; to contemplate, what may be effected in Medicine and Alchymy, if thoſe fugitive ſpirits were, by our fixing and moiſt fires which ſeparate not any one part from each other, but do fix all the parts together, deprived of their volatility and made fixt. Theſe few things we were willing to mention concerning the ſpirits which are ſubjected to a Man's power and are within his reach, and ſerviceable for the uſe of mortal Men.

LXIII. *The particular medicinal uſe of the con-centrated ſpirits of ſalts.*

WE have heard that the con centrated ſpirits or moiſt fires of ſalts do reduce all things into a *Calx*, after a Philoſophical manner, without a forcing away of the mercurial part, and a burning up of the ſulphureous: inſomuch that (by conſerving, altering and bettering) they fix the whole. Being therefore compelled by a love to my neighbour, I have a mind to ſet down in this place ſome medicaments, as well univerſal as particular; but yet ſo as that they may not fall into the clutches of [my] unworthy enemies, but may be reſerved onely for friends.

And firſt, here ſhall be a medicine mentioned, that amendeth the weak digeſtion of the Stomach.

Take out the teeth of a Wolf or a Dog when he is half dead, (being firſt ſhot with a Gun and pour thereupon two or three parts of the con-centrated ſpirit of ſalt in a Cucurbit, ſet the glaſs upon ſand that it may be heated moderately, whereby the oyl of ſalt may diſſolve them and bring them into a thick pulſe or maſh. Upon this maſh pour warmed water that ſo all the Acrimony of the ſpirit of ſalt may be ſeparated therefrom, and that there remain onely the white pulſe, wherewith (becauſe ſome of the oyl of the ſalt doth yet remain, and is not waſhable off wholly with water) a little Sugar-candy is to be mixed, that ſo that remaining Acrimony may be allayed, and the pulſe be the pleaſanter for your uſes.

LXIV. *An Antidote againſt Poyſon.*

THE teeth of a mad Dog being prepared after the aforeſaid manner, do yield an Antidote againſt Poyſon. And indeed ſo do the teeth of all Animals, but eſpecially the teeth of Stags and their Horns, do (after ſuch a preparation) reſiſt all Poyſons.

LXV. *What Beaſts they are whoſe Teeth and Horns doe (as to medicine) exceed the reſt.*

THE teeth of all ravenous animals, as likewiſe of Sea-monſters, and their Horns, are of great uſe in medicine; as of *Wolves*, *Bears*, *Lynxes*, *Tygers*, *Lyons*, *Leopards*; and as to the watery animals, *Crocodiles*, and ſuch like ravening fiſhes, whoſe horn, teeth, and ſcales, and likewiſe the claws of Birds of Prey, may be by the con centrated ſpirit of ſalt, converted (after the aforeſaid manner) into good medicaments.

LXVI. *An experimental diſcovery of what Vermine are fit for the uſe of medicine.*

TAKE ſtrong and well rectified ſpirit of ſalt, or onely a ſtrong *Aq. Fortis*, put thereinto your Vermine, of what kind ſoever it be, and it will preſently endeavour to get out aſſoon as ever it feels the ſaid moiſt fire. But being it cannot get out, it will ſtruggle till it dies. Now by how much the longer the worm or flie liveth in the *Aq. Fortis*, by ſo much are its virtues in medicine greater, and this may ſerve as advice to every one. As for the way of preparing medicaments out of Bark of Trees and Husks ſhall be mentioned by and by.

LXVII. *An experimental diſcovery, of what Herbs are profitable for Medicine, or unprofitable.*

YOU are to make uſe of the way but now mentioned concerning Vermine, and ſuch Herbs as thou knoweſt not, or ſuch whoſe virtues are to thee unknown, put (one after another) into the moiſt fire; and that Herb which is of a ſlower ſolution, excells that which is ſooner diſſolved, both in ſtrength and virtues. For example, Lettice, Purſlane, Mellons, Cucumbers, and ſuch like wateriſh Herbs, (and ſo is it with fruits too,) have a moiſt nature, and are preſently turned into water by thoſe fires. But Roſemary, Sage, Thyme, Dodder, and other hotter Herbs, require a longer time for their ſolution. Ginger, Pepper, Cloves, Nutmegs, Cinamond, Cardamoms, Zedoary, *&c.* do require a yet longer time

time as to their solution, afore they will thoroughly pass into a water. From hence may any one know the nature and properties of Herbs very easily. This also is to be observed, that the Medicine out of a Vermine, or out of any Herb, is by so much the more efficacious, by how much the vehementer venenosity it abounds withall.

LXVIII. *The manner of preparing an effectual medicament out of venemous Vermine and Insects.*

I have taught in the second part of my spagyrical *Pharmacopæa*, a way of correcting venemous insects by the fixt Liquor of Niter, and of transmuting their venome into an effectual Medicine, which [way of preparation] he who is studious of good medicaments will there find. But now in this place is taught, by what means such like Vermine, and such Herbs as abound with Venome are to be corrected by the con-centrated fire of salt, and to be turned into excellent and penetrative medicaments. The operation whereof is thus.

Pour into some glass vessel, one, two or three ounces of our con-centrated fire of salt, then put thereunto such Vermine as you would prepare your Medicine of, one after another, provided that you do not put more in, than the said fire is able to dissolve and consume. When all are dissolved and converted into water, all the poysonousness is lost [or gone] and they become good medicaments.

LXIX. *The manner of separating the medicament made of Vermine dissolved by the moist fires.*

THere is found to be a great difference amongst Vermine and venemous insects. For some of them are of a dry nature and property, some of a moist, some of a fat and oily nature, insomuch that it is altogether needfull to make a due distinction of their natures. Such insects as be of a dry nature as Cantharides and such like, are to be used in the form of a salt. The aqueous Vermine, as Earth-worms, Spiders, and such like; they exhibit their medicinality in the form of a Liquor: The Balsamick Vermine, as the May-worms, and others of that kind, do (beside the medicament they afford) yield also a fat and Balsamick Oyl; and indeed (both for external and internal medicinal use,) much more effectual than the Liquor it self.

But that the thing may be the better understood, I will here set down an operation, which every one may follow as a leading Star.

LXX. *How the operation in dealing with all kinds of Vermine is to be used.*

TAKE some ounces of May-worms, put them in a glass, pour upon them so much of the concentrated spirit of salt, that the Worms may be well covered therewith and be by little and little dissolved; after that they are wholly dissolved, put the solution into a separating glass, shut the mouth of the glass with your finger, then turn the glass upside down, keeping it so long shut with your finger, till all the fat oil swim at top of the Liquour. Then take away your finger that the Liquour may run out, and when the oil comes, shut the mouth of the glass again with your finger, and let it run out into another glass. Keep this Oil or Balsam as a precious treasure, with the which thou wilt perform wonderfull effects in the curing of diseases, but principally in the Gout and Stone. But yet thou wilt get but little oil from these Worms, and when you put them into your dissolving Liquor, you must have a care that you do not touch them with your hands, but take or catch them with a small Forceps, and so put them into your glass. For they have in them this property; if you touch them with your hands, they presently colour them with their fat Balsom that they cast out, which somewhat resembles the smell of Musk. As if they should say, *Pray let us live, for we give thee all we have: Take this Balsom and make use thereof for the curing of incurable diseases.*

Some men studiously carefull in such affairs have gathered this Balsom, and have found it to be far more efficacious than the Worms themselves, yea indeed too strong, because they were ignorant of the way of correcting it.

LXXI. *The separation of the medicinal Liquor from the moist fire, after the separation of the Oil.*

AS concerning the Liquor from which the Balsom is separated, *viz.* the medicinal parts is very hardly separated without a mortifying of the moist fire; therefore the moist fire of the Salt is to be killed with a contrary fire, that so the separation that is required may be made; and 'tis thus to be effected.

Filter the Liquor consisting partly of the dissolved Worms, and partly of the fire of salt, that so it may be rendred clear, and free from the Coals or Husks of the Worms, if haply there be any of them remaining undissolved. And if (by reason of the too much fatness) it be very difficult to filter, pour thereunto so much common water as to make it thinner, and more ready to pass through the Cap Paper. Into this thus cleared Liquor, drop the Liquor of Salt of Tartar, and it will kill the sharp fire of the salt; so that there will arise from the fire of the salt and from this Alkaly-salt a salt of a middle nature, and concreting into Crystals, and will leave the other part in a liquid form; the which said part will be either white or yellow according as the saline fire which you made use of, is. Now this Liquor is more virtuous than the concreted salt is, as being that which contains the essence of the Worms, which doth not congeal or shoot with the salt, but abides in the form of a Liquor. Experience will teach the business more largely.

Now such qualities as these Worms had afore their preparation and as yet not deprived of their Venome; the same do they obtain after their preparation, but with this provizo, these qualities are safely used, which afore were hazardous. But now the properties of these Worms are these, they do not onely draw out of the body all podagrical humours, but also expell the Stone out of the Reins and Bladder beyond all other medicaments; and besides, do cure other such like diseases as are meerly unknown, and are adjudged plainly incurable. More, it wholly takes away that volatile Gout, which runs wandring through the Members of the Body. But here ariseth this Quæry.

LXXII. *Whether or no every moist fire of salt is also fit for this labour?*

FOR answer I say, that indeed this very labour may be accomplished by any moist fire; whether

ther it be prepared out of vitriol or common ſalt, or ſalt peter. But withall I affirm, that there proceeds a great difference from thoſe ſalts. For the con-centrated ſpirit of niter, doth (after its being mortified with a fix ſalt) ſhoot into ſalt peter. The con-centred ſpirit of ſalt, ſhoots into ſquare Cryſtals. The ſame doth oil of vitriol and ſalt of tartar. But the ſalt that is in this operation made of the common ſalt exceeds the others, as to ſweetneſs. That which comes from vitriol, doth beget a nauſeating by reaſon of its bitterneſs; and that which ariſeth of ſalt peter is of a middle nature. But yet they do all three of them enjoy a laxative and purging faculty; and likewiſe provoke Urine either ſtronger or weaker according as the Vermine are, which theſe ſaid fires have been uſed in the diſſolution of.

N. B. That the operation of the Liquor doth always exceed the virtues of the ſalts. When the ſharp ſpirits of ſalt are not mortified with a *Lixivium* of Tartar, but with the ſpirits of Urine or of *Sal. Armoniack*; the ſalt and liquor become far ſtronger, than when the precipitation is done with Salt of Tartar. For the ſpirit of *Sal. Armoniack* doth for the moſt part precipitate the diſſolved and corrected Vermine into a Powder, which being waſhed off with common water, and freed from all Acrimony or ſharpneſs is uſed in medicine, in a dry form. But this, the *Lixivium* will not do, but always conſerves the Vermine in the form of a liquor.

LXXIII. Queſtion. *Whether or no there may be any more or any other uſefull things learned from this ſolution of venemous Vermine?*

FOR Anſwer. Yes, for this operation doth not onely teach the good and bad properties of all Vermine, but doth withall evidently demonſtrate, that every animal of what kind ſoever, (yea and Men themſelves too) when they are put into ſuch an agony and perceive the approach of death, do diſcover and clearly evidence the internal motions of [their] nature, which they have (in their life time) been indued withall.

LXXIV. *The way how to know the internal nature of every Worm in the earth, Fiſh in the water, Birds in the air, yea even of Man himſelf.*

TAKE a *Scarabæus* or Beetle, either ſuch a one as lives in Horſe dung, or elſe one that is of a coppery colour, put him into a glaſs wherein is ſome *Aq. Fortis*, and you ſhall ſee that in the utmoſt neceſſity [or laſt agony] of death, he will not endeavour to get from out of the *Aq. Fortis*, but will ſtrive to hide himſelf in the earth according to his innate property. But whereas the bottom of the glaſs is too hard for him to get thorough, he will be ſo long endeavouring to accompliſh his deſire, and in ſtriving to get through the bottom till he dies. From hence may it be perceived what his ultimate refuge [or ſhift] is: *viz.* to endeavour the ſhunning of his approaching death, by ſheltering himſelf within the earth.

If you put a flie in the *Aq. Fortis*, ſhe will not go to the bottom but will do her utmoſt to get out at top, becauſe her living is in the air, and ſo all volatile or flying things are wont to do. As for a fiſh if it be put to its ſhifts, it endeavours to ſhun the danger by betaking it ſelf to the bottom.

In ſuch a kind of manner doth the nature of men become apparent, when they are reduced to the extreameſt of difficulties. A godly man, whoſe thoughts are in this life time always upon God, will conſtantly adhere unto him in his Agony, and being upon dying will betake himſelf to him for his refuge, in whom he hath at all times built his hope, and waiting or looking for help from thence, from whence he hath always hoped for it.

But the ungodly Man who hath never in his life time feared God, nor ſet him before his eyes, but hath always yielded himſelf with his thoughts unto the will of Satan, he will very hardly implore (in his greateſt anguiſh) the help of any other than of him, to whom he hath (in this life time) adhered in all his thoughts and actions.

LXXV. *The preparation of good medicaments out of venemous vegetables, by the con-centrated ſpirits of ſalts.*

WE have hitherto taught, that our moiſt fires of ſalts do indeed deſtroy all things, but do not burn up, or force away ought of ſuch things as the common fires are wont to do. That this is true, even the vegetables themſelves bear witneſs, which being put into our moiſt fires are therein diſſolved, and paſs into a water. But their oil which is in them is ſeparated, and ſwimmeth at the top, and ſo may be ſeparated thencefrom, as we have mentioned above concerning the May-worms. After the ſame manner the eſſence of the herb may be ſevered from the ſpirits of the ſalts, as we have there declared. The oyls which by this operation are drawn out of the herbs and other vegetables, do obtain great and peculiar virtues, becauſe they are excellently well corrected by the efficacy of the moiſt fires, and are amended, which correction, and bettering they do not at all attain by their being diſtilled and expreſſed.

LXXVI. *The correction of the too vehemently purging ſubjects by the moiſt fires, whereby they may be ſafely made uſe of.*

Diagridium or *Scammony*, *Hellebor*, *Cataputia*, *Gambogia* and other vehemently purging ſubjects may be diſpoiled of their venemous faculty, by the aforementioned way, and be rendred more ſweet and milder.

LXXVII. *The correction of the too vehemently operative Diureticks, whereby they may be of ſafe uſe in the cure of the Stone.*

DIſſolve Cantharides, May-worms, Earth-worms, Millipides or Pig-lice, in our con-centrated fires, and follow thoſe ways of operation which we have afore preſcribed, and you ſhall acquire an excellent and ſafe medicament, having a faculty of healing the Stone of the Bladder and Reins.

LXXVIII. *The amending of narcotick and ſomniferous ſubjects by our moiſt fires, that ſo they may perform or ſhew their virtues without hurt or danger.*

TAKE *Opium*, Henbane ſeed, Mandrake, or the like ſubject that provokes to ſleep, pour on it the con-centrated ſpirit of ſalt, and it will melt [or diſſolve] therein; if there be in it any oilyneſs, as in the Henbane ſeed is uſual, it will ſeparate it ſelf,

and swim on the top of the liquor, the which is to be severed from the liquor, and to be warily kept; becauſe it being onely anointed on the Temples will preſently cauſe ſleep. The liquor is to be uſed internally, as we have preſcribed in the precedent preparations.

LXXIX. *The amending of venemous ſubjects, that are together purgative, ſudorifick, diuretick, and ſomniferous, by our moiſt fires; inſomuch that they do not onely become ſafe, but are the effecters of much good in medicine.*

AMongſt the number of ſuch kind of ſubjects, are Staveſacre, or the ſeed of the louſe-killing herb, Levant Berries, vomiting Nuts, and many others of ſuch a like faculty, which are to be proceeded withall after the ſame manner, and by the ſame operations as the former.

By this or the like way may all venemous, and vehemently operative vegetables and animals be corrected, ſo as to be ſafely admitted to internal uſes, and to be producers of ſuch effects as are of great moment in Phyſick; whereas otherwiſe (though they have in them excellent virtues) they cannot by reaſon of their vehement operations be taken into the body without danger.

LXXX. *Whether or no poiſonous minerals may be corrected as well as the vegetables and animals, by our ſecret and moiſt fire of ſalt, and be turned into wholeſome medicaments.*

YOu are to know, that not onely venemous animals and vegetables but likewiſe all the minerals that abound with poiſon may be amended, and their moſt preſent or ſpeedily operative poiſon be converted into moſt excellent medicines. For example.

LXXXI. *How the venenate and volatile minerals are ſo to be inverted by our moiſt fires, that the volatile be rendred fix, and the poiſon be made a medicine.*

TAKE of white or red Arſnick one part, pour thereto two or three parts of the con centrated fire of niter, the which [niter-ſpirit] you ſhall diſtill thencefrom in a head and body in ſand; then take the remaining matter out of the glaſs, and waſh it with common water; which being done, you ſhall have the Arſnick, Diaphoretick, and ſuch as may with ſafety be taken into the body; but yet in a ſmall doſe, becauſe it doth ſometimes provoke vomit, and principally when the nitrous fire is ſomething of the weakeſt. But to prevent ſuch vomiting, the ſaid fire is to be twice or thrice drawn off from the Arſnick, by an Alembick; that ſo the poiſon may the better be ſlain, and the volatility tranſmuted into a fixity; and the ſame Arſnick may be afterwards molten and handled with the other metals without all danger of poiſon, which was impoſſible to be done afore. For the Arſnick whoſe poiſonouſneſs is not as yet removed from it, cannot be admitted into the body without great danger. Neither do we here inſert the preparation of ſuch medicaments out of Arſnick, and the like venemous minerals, for this cauſe that they ſhould be introduced into medicine; no, for there are other ſafer medicaments to be had, our aim herein is onely this, to ſhew that even the moſt poiſonous, and moſt fugacious or volatile minerals may be inverted or turned in and out by our moiſt fire, and diſpoiled of their veneno-ſity and rendred fixt.

LXXXII. *The manner of tranſmuting the fugacious and eaſily fluxible minerals by the moiſt fires of ſalts, ſo as that being fixed they hardly admit of fuſion or melting.*

TO exemplifie this, let us conſider of Tin or *Zink*, which are reckoned amongſt the metals of moſt eaſie melting, and are moſt volatile. For the vulgar know that Tin is molten with a very little fire, and doth thereby vaniſh in ſume, if it be but kept in continual flux. But if it be calcined by continually ſtirring it into aſhes, it becometh fix, nor doth it admit of reduction to its former body by any violence of fire, but is turned into glaſs.

So after the ſame manner do we roaſt or calcine Tin, *Zink*, and the other flying metals with our moiſt fires, and burn them into aſhes, and they ſuch ones too as do not return to their former body, and thus 'tis done; when we pour on them our fiery liquors, ſo as that they heat together, or do even by abſtraction [or diſtillation,] again free the ſaid metals from thoſe liquors; for then theſe metals remain in the bottom like to dead aſhes, nor do they ſuffer themſelves to be by any means reduced to their former bodies.

N. B. But whoever he be that knows the uſing of ſuch matters and powders thereunto, as can reduce ſuch aſhes to their former and fuſile bodies, ſuch a one will not ſpend his labour in vain; for he will get a metal of a much more noble and better nature than Tin, whoſe greateſt internal part is gold and ſilver.

But yet let no body imagine that he can perform this reduction by the help of Borax or Salts; no, in no-wiſe. For there are metallick matters required to this labour, to cauſe a fluxing or melting, ſundry preparations whereof I have taught to and again in my writings, but not under ſuch a title or name as if this power or efficacy of thus doing were aſcribable unto them. For I have barely mentioned their uſe in other metallick tranſmutations.

LXXXIII. *How flying mercury is to be ſo fixed as to admit of heating red hot.*

COagulate common mercury with common ſulphur into a black aſhes, and then mix this aſhes with the con-centrated fire of vitriol, or rather with ſuch a fire as is extracted from ſulphur it ſelf; ſo as that there may ariſe from this mixture a thin maſs; of which maſs put one or two lots in linnen or cotten rags, and ſo rowl them up that one fold may come over another, and the mercury may be in the middle. Then tie this ball firmly and ſtrongly with a thread, and let it be environed all about with the fire, that ſo all thoſe rags may be red hot and changed into Coals.

Take out all this red hot maſs, let it cool, ſeparate the burnt linnen rags, and you ſhall find the mercury turned into a red powder; but yet it hath no ingreſs into the metals, nor performeth it any thing of much moment in medicine, becauſe it is converted by the burning of our fire into a dead earth. Neither have I here mentioned this coagulation as if any gain were to be received thencefrom; but onely on this account, that the moſt great virtues

tues and powers of our fires may by the operation thereof be demonstrated.

LXXXIV. *Another experiment easily demonstrating the possibility of rendring mercury constant in the fire, by our secret fires of salts, which thing the known and common fire can never do.*

MELT one part of common and yellow sulphur in a crucible or earthen Pot, and being molten like oil cast thereinto two parts of common mercury, and mix the matter well with a *Spatula*, that the sulphur may assume the mercury, and may pass with it into a black mass. To which mass you must yet add so much sulphur as the weight of the whole mass in the Pot is of. Then all is to be molten together, and to be by well stirring so long mixt untill it get an ashy colour. Then you are to dip in the said mass as it is in flux, pieces of linnen, such as they are wont to use about fuming their Barrels with a brimstony odour, to preserve them from stinking. Such rags being put on an Iron Crook may be kindled, by which kindling they are burnt up, the sulphur and part of the mercury vanishing into the air, but some part being calcined with the flame of the sulphur and fixt, sticks to the burnt linnen. But what virtues this calcined mercury abounds withall I cannot tell, as having never experimented it, and I have onely inserted here this operation, for this end, that the power of our moist fires may be made apparent. Many more meditations and inquisitions will be thereby laid open, which otherwise would never have been sought after nor found out. For in this labour there operateth a twofold fire, *viz.* the visible flame, and invisible moist fire which the sulphur hideth, and by the burning up of its body, manifesteth, and renders visible and efficacious.

For that heavy acid oil of sulphur, which sticks hidden in all sulphur, performeth most great matters in metalline things; and because the flame or external fire exasperates and forceth on the internal, sharp and moist fire of the sulphur, that acid quality sets upon that subject that is adjoyned to it, and destroyeth the same, and advanceth unto a more fixed state.

But that I may in some sort satisfie the greedy searcher after truth in this thing, it seems to me expedient here to mention the occasion, which (without studying thereafter, *viz.* this coagulation of mercury) did by chance bring me thereunto; and did chiefly shew me an excellent *Arcanum* of bringing all Wines, Vinegars, and other such like drinks easily and speedily to a clarity and transparency. Such a secret it is, as I believe never was known as yet to any, and therefore worthy to be here set down for the common benefit of mankind.

LXXXV. *An historical discovery of the reduction and restoration of tenacious and corrupt Wine, to its former clarity and goodness.*

I had some Wine in a Vessel that became viscid or ropy and tenacious; for the amending of which, I sent for a Wine cooper, he pours it out (as is the usual custom) into another fresh vessel, and used thereunto all his art, that so he might better it. He passed it oft times through a long Pipe made of white plates, and perforated with many small holes, and many other means he used, even whatever he had knowledge of, but yet all he attempted was in vain. then at last he put into the Wine no small portion of salt, and shook them both together very strongly, but all in vain, insomuch that he left my Wine corrupt [as he found it] and out of all hope of restoring it.

But because there was too much salt thrown into the Wine, yea so much as that it might be perceived even by the tast, the Wine was rendred unfit to be drunk, though it should have [thereby] recovered its former clearness. So there remained nothing else to be done therewithall, save the extracting of its spirit by distillation. Yet nevertheless I had a good mind yet to try whether or no it could possibly be freed from that tenacity: to this end therefore I kindled some sulphurized rags, being sprinkled over with the mineral or oar of lead reduced into powder, and with that fume imbued I my Wine, as is the usual custom when Wines are through corruption degenerated from their good state or condition. I added thereto the oar of lead because that as the sulphur was burning the fume of the lead might penetrate the Wine and precipitate all the defilements to the bottom. But this experiment did not fadge. Then I took mercury and mixt it with sulphur after the aforeshown manner [in the foregoing Chapter] and dipt some rags therein and kindled them, hoping that the mercury being transmuted into fume would have ingress into the Wine. But yet it appeared quite contrary in the use, the sulphur indeed was consumed by burning, but the mercury would emit no fume, but was contrarily turned into a red powder, and stuck on to the burnt rags. After these burnings, (*viz.* of this mercurialized sulphur) often reiterated, the Wine did not smell of the Brimstone, as it's usual to do, but of Musk or Ambergrease, and recovered its former clarity; but yet not fit to be drunk because of the overmuch quantity of the salt thrown thereinto.

Thus it happened unto me, the which thing others may consider of with a more accurate meditation, and may haply (from this history) apprehend such things, as may in other matters be very profitable. For it is not in vain that I mention these things in this place. Enough is said to the wise. 'Tis sufficient that I have showed the way, if any one refuse to go in the same let him blame himself.

LXXXVI. *How our moist fires of Salt are able after a sort to fix the yellow and common sulphur, so that it may be used with profit both in Medicine and Alchymy.*

TAKE one part of yellow sulphur beaten into powder, and four or five times so much in weight of the con-centrated fire of salt peter, which spirit pour upon the said powder in a glass cucurbit, and abstract it thencefrom several times by an Alembick; this done, the sulphur in the cucurbit will get a red colour and become pellucid or transparent.

If it resolves in the air into a fat oil, the operation is well handled; if not the labour is to be repeated either with the self same fire or with more new, which is the better way. For the said fires are to be so often drawn off thencefrom untill it flow [or resolve] into a fat oil: An oil I say of sulphur which is endued with great virtues, not onely in Alchymy and Medicine, but may likewise be used in other arts with a great deal of profit. But especially it is an egregious Balsom, resisting all the sicknesses of the Lungs, and other putrifying corruptions,

tions, as shall be apparently evidenced in the following Centuries, more largely treating about these things.

LXXXVII. *A way of turning Antimony into a snow-white medicament, by our moist fires of salts, and which is of safe and profitable use against the Plague, all Fevers, and other diseases.*

WHEN the *Regulus* of Antimony made *per se* without iron, and beaten into a powder is perfused or throughly moistened with the con-centrated fire of salt peter, and is for a while kept in warm sand; the moist fire burns the *Regulus* of the Antimony into a white powder. After that the whole shall be of a white colour, pour thereto common water, and it will imbibe or draw to it the fire of the niter, which will again be fitting for other labours, and perform the office of spirit of niter.

The white powder being by many washings rendred sweet, and then dried, performs the office of an excellent diaphoretick medicament and may with safety be used; it strongly resists the Plague, all Fevers and other diseases, that are to be expelled by sweat.

LXXXVIII. *By what means black and crude Antimony is to be reduced by the nitrous fire into a white powder, and the combustible and yellow sulphur separated therefrom, that it may serve as a* Panacæa *for the resisting of all diseases, and may operate by the four Emunctories, Vomit, Stool, Sweat, and Urine.*

ANtimony is by so much the better and nobler, by how much the longer and fairer Rays or Stria's it appears to be of, and therefore such is of greater efficacy in medicine than all other sorts. To this therefore being powdered, pour so much of the nitrous fire as may serve to dissolve it; the which fire will presently even in the cold, begin the work of its dissolving. When that is done, put the glass in warm sand that all the Antimony may be dissolved, and its yellow sulphur may swim at top of the solution like a yellow powder. The solution being cold, strain it thorough a pure linnen cloath, and the sulphur will stay behind in the cloath, and hath its peculiar use in Medicine and Alchymy. But to the solution pour common water, thereby to quench and weaken the nitrous fire, so that the Antimony may fall down to the bottom, in the form of a tender and snow-white powder; the which being well washed and dried, may be made use of as a *Panacæa* to drive away many diseases: For it operateth with a singular efficacy by all the Emunctories, but yet very safely, unless any one doth too foolishly and unskilfully abuse the administration; It is also endued with all those virtues that I have ascribed to my red *Panacæa*.

LXXXIX. *By what means the con-centred fire of Kitchin salt drives over Antimony in a retort like Butter, and affordeth a matter of profitable use in Medicine and Alchymy.*

POUR upon the *Regulus* of Antimony beaten into a powder, the heavy con-centrated oil of common salt, the which being again drawn off thencefrom in a retort by distillation, brings over with it as much of the *Regulus* of the Antimony as it can, and ascendeth like a thick Butter. It is a mighty fire, and very fit for the ripening of some immature metals; and withall is most profitable in Surgery, and lays a good Basis and foundation for the curing of incurable and cancerous Ulcers. If you pour water upon this oil, the Antimony precipitateth out of it, in the form of a white powder; and is to be afterwards well washed and dried; so that being reduced into that white powder, it becomes a good medicament to be used in all those diseases, wherein the aforesaid medicaments are appliable; but with this caution, that it be given but in a very small dose, because it is of a more powerfull operation than the aforegoing medicaments prepared by the help of the nitrous fire are of, and that for this reason, because the oil of common salt makes things fugacious or flying, but the nitrous fires renders them more constant in the fire.

XC. *The way of turning mercury into a red, and strongly purging medicament by the operation of the nitrous fire.*

ABstract two or three parts of our nitrous fire, from one part of purged mercury, by distillation in a glass cucurbit; and it will make the mercury far more fixt than if *Aqua Fortis* were many times drawn off therefrom by distillation. This red mercury is to be freed from its saltiness with common water, and so becomes a strong purge, and is to be used in a small dose of one, two, three, or at the most four grains, and effecteth the cure of *Morbus Gallicus*, and other such like loathsome diseases.

After the same manner there may be easily prepared, not onely sundry and excellent medicaments, by the operation of our moist fires, but there may be likewise done things of great moment in Alchymy and other arts; concerning which time will not permit me at this present to make a more ample narration of, but I will remit it to the next following Centuries.

Now forasmuch as I call in this Treatise the con-centrated spirits of salt, moist fires, and yet as to their outward shape they represent no shew of fire at all; I deem it necessary to shew by a more firm demonstration, that they abound not onely with fiery virtues, but also are (after their inside is turned outwards, and their outside inwards) true, visible, palpable, and sensible fires, but especially the nitrous fire, which best of all confirms this our opinion and saying, it being prepared by the Chymick Art and operation out of a fiery subject.

XCI. *The way of converting or turning the internal and yellow colour of our moist and white nitrous fire from the inmost parts, outward, and making it visible.*

THAT there is hidden a yellowness and redness in niter, is not beyond the reach of any ones capacity, but it is very easily likely, and credible. For seeing that salt peter is a solar child, it must necessarily answer to [or resemble] its father the Sun in colour, form, virtue and efficacy, if it would purchase belief with any one as to its original and nativity. But salt peter shines with a white colour, but the Sun is clad with a yellow garment and shines like the fire; insomuch that there is no correspondency or likeness of colours, though otherwise there is found the greatest similitude in burning, and in ripening all things. This onely being the difference

difference between ſalt peter and the Sun, the one, *viz.* the peter doth particularly onely augment, ripen and advance all things; but the Sun doth univerſally beſtow on all things, life, increaſe or growth, and nutriment, but yet the ſalt his companion is an helping aſſiſtant as ſhall be evidently proved in the end of this book.

I do verily believe, that if it were an eaſily accompliſhable thing by us, *viz.* to extravert the internal and innate redneſs in ſalt peter outwards, and to ſeparate the ſame from its unclean and groſs body, and knew we how to render it fix and conſtant, we ſhould perform things of moſt great moment, in an univerſal way.

But yet for the removing of this doubt, I will ſhew that ſalt peter is the ſon of *Sol*, though (as to its outward Phyſiognomy, it reſembles not its Father. I do therefore ſay, that its Father is the yellow Sun, from him it is generated, but yet by the help of the white Moon, ſhe is the Mother, and beſtows on it the white colour. But I ſay, that the paternal bloud and fiery virtues it hides in its inmoſt bowels. So wiſely is Salt Peter ſigned by its Parents, *viz.* by the Sun its Father, and the Moon its Mother. The Father beſtows on this, his Son a fiery heart; the Mother a white and cold body; from hence 'tis that it is clad with an Hermaphroditical nature, being Male and Female together, hot and cold, red and white, vivifying and killing.

XCII. *Of the admirable nature of Magnetiſm, attracting to it ſelf its like.*

ACcording to my ſimple and ſmall judgment, the red colour of ſalt peter is not (by the operation of any other thing) to be ſeparated from its white body, better and more commodiouſly than by the affinity and likeneſs of ſome certain magnet that will touch it.

For example: Let us conſider a little of common gold and common quick-ſilver, they are ſo linked with a tye of mutual love, and internal likeneſs to each other; that the one draws the other unto it ſelf.

For if in dealing with mercury any portion thereof ſhould happen to fall on the ground, and daſhing it ſelf into a thouſand Atoms, it cannot be by any kind of way better gotten together again, than by the help of ſuch a magnet, as will attract to it ſelf the diſperſed and dilated Atoms; ſuch a magnet metals are, and eſpecially gold, as being conjoyned to it in the neareſt affinity; therefore I ſweep together this ſo widely diſperſed mercury, together with the earth and other defilements from which the ſaid mercury is ſcarcely diſtinguiſhable as being all over covered therewithall: and to theſe defilements do I put a piece of copper, ſilver or gold, which being well ſhaken to and agen amongſt theſe filthes, draws to it ſelf the widely diſperſed and ſmall Atoms of the mercury, and ſo recovers it by extracting it out of all that rubbiſh.

Now when the metal hath attracted mercury enough, and can attract no more, the mercury is to be wiped off from the metal with a linnen cloath; which being again well ſhook amongſt the traſh as you did afore, draws to it ſelf the other Atoms; theſe labours are to be ſo often repeated, till it be all extracted, and ſo renders it thee the ſame without any loſs.

Juſt ſo and after the ſelf ſame manner may the inmoſt ſoul, and which is largely diſperſed throughout the whole body of the ſalt peter, be extracted thence-from; were onely ſuch a magnet but known unto us, as had a great affinity with the ſoul of the niter.

I will yet ſet down another, and a more evident ſimilitude, that ſo the buſineſs may become the more clear and manifeſt and be the better underſtood.

XCIII. *A clear and evident demonſtration, whereby is ſhown that even the moſt hidden things may be manifeſted and rendred viſible by their magnets.*

LET the admirable nature and property of the common magnet be well conſidered; nature having endowed it with two plainly contrary virtues, one of attraction, the other of expulſion. For on one of its ſides it draws iron to it ſelf, and on the other of its ſides it drives it off; and thus it does, not onely in its great pieces, but alſo when 'tis broken into very ſmall bits. For always on one ſide it draws to it ſelf the iron, and on the other ſide drives it from it ſelf, by this operation reſpecting both poles, *viz.* the Northern and the Southern.

But to return to my purpoſe: I will demonſtrate by evident examples and operation, that the inmoſt and moſt hidden nature and properties of things, are wont to be moſt evidently manifeſted and obtained, by attracting, and repelling magnets. For all the things that are, have their enemies and their friends, as ſhall be proved in the following operations.

XCIV. *An operation demonſtrating or affirming, that the internal and hidden natures and properties of things may be manifeſted and obtained by attractive or repulſive magnets.*

DIſſolve ſome lots of lead, and ſuch as is wholly void of ſilver, in *Aq. Fortis*, and precipitate the lead by pouring thereunto ſome ſalt water, this [precipitated lead] waſh with fair water and dry it. Take ſome three or four ounces of this *Calx* of lead, and thereto admix a fifth part of pure gold, being firſt reduced into moſt pure and moſt ſubtile Atoms, on ſuch wiſe as hath been taught in other places of my writings; but if you have not at hand ſuch a *Calx*, uſe another *Calx* of gold prepared any kind of way, but yet the firſt *Calx* is the fitteſt for this operation. Melt both the *Calx*'s, *viz.* the leaden and golden one in a crucible, that the lead may become a fuſile ſtone; but the gold *Calx* will (by this operation) be much heavier, and be white, this whiteneſs is nothing elſe ſave pure and good ſilver, drawn out of *Saturn* by *Sol* ſympathetically, and made viſible, which (afore) lay hidden in the lead in a ſpiritual and inviſible manner.

But ſome may here demand; foraſmuch as there is ſo much ſilver hidden in all lead, whence comes it that none are found that get it out from thence? I anſwer, that there are indeed a many that would get out great maſſes of ſilver out of lead, did they but underſtand the art, and could ſo bring it to effect. But ſeeing they are ignorant of the natures of metals and their properties, and know not how to do any thing, they cannot become maſters of their wiſhes. Now in this extraction, there is a two-fold cauſe preſents is ſelf, *viz.* Sympathy, and Antipathy. The gold by reaſon of the kin and amity

it hath with the lead, draws thencefrom unto it ſelf the ſpiritual ſilver; and becauſe of an inbred hatred it has to ſalt, it drives away the ſame from it ſelf. The gold therefore (in extracting the ſpiritual ſilver out of the lead, hath an aſſiſtant, aiding it by a contrary operation, and ſo bringing to paſs, that there is ſo much the more ſilver extracted, becauſe the ſalt being added to the lead, doth by reaſon of that inbred enmity and difference 'twixt it and ſilver drive this, [*viz.* the ſilver] away from it as its enemy.

And although that out of ſuch lead prepared with ſalt may ſilver be always molten, yea without adding any gold thereunto, meerly becauſe of the inimicitiouſneſs that is between ſilver and ſalt, whereby is cauſed that the ſilver is thruſt out of the lead by the ſame as by its enemy; yet ſo much ſilver is not gotten by that way, no not by the half, as is drawn out by the addition of gold.

For when the gold attracts, and the ſalt expels, there are made two actions together, the one by Sympathy, the other by Antipathy, both aiming at this mark, *viz.* to extract the hidden ſilver and gold out of the lead.

Let there be evaporated in a cupel two ſmall centenaries or hundreds weight, each of like weight; and to one of the centenaries add ſome pounds (of the proportionable ſmall weight as the centenaries are) of pure gold, and there will come from that centenary more ſilver by the help of the gold, than from the other, whereto was added no gold: But the gain by this operation will not be much, or haply none at all; but this is onely to ſhew, that it is verily poſſible, for gold being put upon the cupel with lead, to get ſome ſilver thereout of, and to be more in weight; which effect is produced onely by a ſympathetical faculty. Be now if ſalt doth alſo lend to gold its aſſiſtance, then is there a twofold operation of a double operator; whilſt in extracting of the ſilver out of the lead, the gold is occupied in attracting, and the ſalt in expulſion.

Theſe things were of neceſſity to be laid open by me, foraſmuch as they teach by what means the inmoſt and moſt pure parts are to be ſeparated from the more groſs; ſo that every one may know the natures and properties of things themſelves, *viz.* with what love they imbrace each other, or what hatred there is betwixt them.

By this experiment then, may any wiſe and underſtanding man eaſily learn and believe, that even out of ſalt peter or [any] other white body, the red ſoul may be extracted. Whoſoever therefore ſhall know how to get theſe helpers, *viz.* Sympathy and Antipathy for his purpoſe, ſhall never labour in vain, but ſhall at all times reap fruit by his labours.

And as we have ſhewn that out of any lead, by the help of gold, a good part of ſilver may be extracted; ſo likewiſe may the ſame be clearly proved to be done with the other metals, and which may alſo be effected without the help of gold. Yet nevertheleſs the more fixt metal doth more readily and willingly attract the more volatile and purer part of the other impurer metals, than an unclean metal doth, and even much more readily yet, when there is afore adjoyned to that metal from which any thing is to be extracted, an enemy of that thing which you labour to extract.

Upon this account therefore was I willing to inſert an experiment, that ſo none might account of the thing mentioned as of ſmall moment, but rather that he accurately ponder thereupon in his mind, that ſo he may thereby arrive to things of great moment by a well examining of the ſame.

Now as it hath been clearly and evidently taught that fixt ſilver may be gotten out of any lead, as well by Sympathy as by Antipathy, even ſo may it eaſily be proved, that the ſpiritual gold may be extracted out of other metals, partly by Antipathy, and partly by Sympathy, but much eaſier by Antipathy and Sympathy joyntly together, ſo that one matter may draw unto its ſelf the object it loves, and the other may drive from it what it hates; as we have proved in lead. If then this may be done in metals, why may it not be likewiſe done in other ſubjects.

We will therefore proceed on and ſee, whether or no it can be ſo brought to paſs, that the hidden redneſs may be drawn out of ſalt peter by Sympathy and Antipathy.

Having therefore underſtood by the things already ſpoken, that like draws to it ſelf its like, and is repelled from its unlike, there remains nothing elſe for us to do but to know what that like is, by which ſalt peter ſuffers it ſelf to be extracted.

When we adviſedly conſider the riſe or birth of ſalt peter, it is not to us unknown that it draws its originality from the excrements of animals, but eſpecially from the dung of horned Beaſts, as Cows and ſheep. And foraſmuch as Sheep and Cows do feed onely on Herbs and Graſs that grow in the Fields, and that thoſe vegetables do proceed from the terreſtrial ſalt by the help of the ſolar beams, it is more clearly evident than the Noon-day light, that the hot Sun is the Father of ſalt peter and the cold night the Mother, the earth the Nurſe, and Salt the Food, nutriment and encreaſe of the ſame; the which is to be underſtood as in reference to the *Macrocoſm* or great World. But the vegetables, or all ſhrubs, herbs, and all graſs which ariſe out of the earth in the *Macrocoſm*, cannot be more aptly compared with ought, than with the Hairs and Wool of Men and Beaſts, which are born out of the earth of the *Microcoſm* or out of the animal body, like as the ſhrubs and herbs, and graſs do ſpring forth and grow out of the *Macrocoſmical* Earth. Upon this ſcore, the hairs, hoofs, or claws, and horns of Beaſts; likewiſe the feathers and claws of Birds, and alſo the teeth and ſcales of Fiſhes, do altogether ſquare as to their ſimilitude with ſalt peter; they being ſuch things as whereout of, together with other the ſuperfluous excrements of nature, true and good ſalt-peter may be made with eaſe.

And like as to the procreation of vegetables in the *Microcoſm*, and for their increaſe or growth, there is requiſite a fat and ſalt earth, the warm ſplendor of the Sun, and the fruitfull Rain, whereby all kinds of fruits are born, and ripened; but contrarily by the penury or want of ſalt (it being the onely nutriment,) and of the warm Sun beams, and of the Rain which is the promoter of all fertility, every thing that is vegetable muſt needs periſh and die; even ſo is it in the body of Man: For as long as the heart of Man is in a proſperous healthfulneſs, and that the central fire, or vital ſpirit, and radical moiſture be not defective, all things are well and in good equipage, and the whole body takes increaſe or growth, and the hairs grow plentifully: But on the contrary, when meat and drink fail, the whole body ſuffers loſs, conſumes and withers away and the hairs fall off.

But

But to compriſe all in brief, I ſay, that all growths and augmentations as well in the *Macrocoſm* as in the *Microcoſm*, muſt of neceſſity be at a ſtand and leſſen as ſoon as the warm ſolar beams, together with the nutriment it ſelf ceaſeth and is deficient. So then it is a truth, that in Man as being a *Microcoſm* or little World, and in the other amimals, the hairs may be compared with the Trees, Shrubs, Herbs, and Graſs of the great World, becauſe of the great likeneſs that is between them.

And therefore the hairs of animals and hoofs, claws, feathers and ſcales of them are very like to ſalt peter, inſomuch that one part doth after a ſympathetical manner extract from the other, the moſt great virtues and inmoſt ſoul, and ſo one doth manifeſt the other.

For example, when the skin, hairs, claws, hoofs, or nails of a man or any other animal, as likewiſe the feathers of Birds are ſmeared with the ſpirit of niter, or anointed therewithall, they preſently become as yellow as gold, and do as t'were put on a golden hue. It may now be demanded, from whence ariſeth that colour? comes it from the hairs themſelves, or from the niter ſpirit? If that golden colour did ariſe from the hairs themſelves, then it would of neceſſity be, that it ſhould alſo diſcover it ſelf, when the hairs are moiſtened with other ſharp and ſtrong waters; but thus 'twill never do, but onely when they are ſmeared with the ſpirit of niter, or elſe with *Aq. Fortis*, which containeth the niter ſpirit. From theſe things therefore it is evident, that the ſuperfluities of the *Microcoſm* have a moſt notable affinity with the ſuperfluities of the *Macrocoſm*, *viz.* herbs, and graſs. Hence comes it to paſs, that one part draws or ſucks from the other part its beſt virtues and power, and renders them viſible, which afore lay hidden inviſibly and impalpably in their groſs bodies.

XCV. *The manner of extracting out of niter its gold-like ſoul.*

IF we would go the neareſt way to work with niter to extract its ſoul, then the groſs niter is firſt to be mundified by diſtillation, then afterwards out of this purged body is the moſt pure part to be extracted by a convenient magnet, and the groſs fœces to be removed; and this moſt pure ſoul to be brought by concentration and fixation to the utmoſt degree of perfection and dignity.

And albeit I could here ſet down in more clear expreſſions, the manner of extracting it, yet I am not ſo minded to do becauſe of the unworthy. Let this manuduction ſuffice, whereby is ſhown what means it is to be done by, *viz.* by ſome magnet attracting to it ſelf its like by a magnetick operation. I can at all times exhibit ſuch a yellow gold like ſoul of niter, and uſe it in the ſickneſſes of my neighbour. But, enough as touching theſe matters, we ſhall be more large concerning them, in the following Centuries.

XCVI. *How the moiſt and cold fire of niter is to be ſo ordered as to yield its viſible flame.*

PUT ſome ounces of our con-centrated and moiſt fire of niter in a glaſs, and pour thereupon drop by drop a ſharp *Lixivium* made of Wood-aſhes, or rather of fixed niter, and keep pouring on ſo long, till all the noiſe, ſuming, and ebullition ceaſe, and that the moiſt fire it ſelf be wholly allayed and ſlain. This done, all the corroding faculty is taken away from that fire, which ſaid fire doth by this operation return to its former nature, and is changed into ſuch a ſalt peter as it was afore its being converted into a moiſt fire. Out of this ſalt peter, being now made purer and better by ſo many converſions and operations, may a new moiſt fire be extracted by diſtillation and con-centration, which is far better and much ſtronger than the former.

And now if this ſecond moiſt fire be again extinguiſhed with a *Lixivium* of fixt niter, and be again turned into ſalt peter, and this peter be by a new diſtillation and con-centration turned into a moiſt fire, this ſaid fire will be endued with far greater virtues: For in every mortification and vivification it becomes one degree ſtronger, nobler, and more efficacious; and ſo is the ſalt peter it ſelf too by thoſe converſions and reductions exalted ſeveral degrees, and is at length brought to that paſs, that it can do more wonderfull things than the common is wont to do; for one pound of ſuch a ſalt peter being exalted to the utmoſt degree of ſubtilty is far more efficacious than many pounds of common ſalt peter, and ſtronger, and much excels it in virtue. But it is not expedient that every one ſhould know, what may be effected with ſuch a moſt ſubtile and moſt pure ſalt peter.

The ancient Philoſophers hid the preparation and uſe of common ſalt peter; and why ſhould not we alſo hide ſuch a ſalt peter exalted to the utmoſt degree of ſubtilty, wherewith the common peter is not at all comparable, eſpecially in all ſuch labours whereunto the common ſort is wont to be applied, this operates much readiler, and far better and more effectually.

But that the truth may be clearer than the noonday, I will add one operation of a metallick tranſmutation, by which it ſhall be clearly evidenced unto every one what ſuch a moſt ſubtile ſalt peter is able to effect.

XCVII. *An operation ſhewing the manner how by the help of ſalt peter promoted to the higheſt degree of ſubtilty, the ſuperfluous combuſtible ſulphur of the imperfect metals may be kindled and burnt up; even as common fire burns up wood, inſomuch as nothing will be left remaining ſave a little fixt ſalt and aſhes; ſo likewiſe in this burning up of the impure metals by our moſt pure ſalt peter, there remains alſo nothing ſave that fixt gold and ſilver which lay ſpiritually hidden in the metal, and is [now] left by the combuſtible Scoria's.*

EVery one knows that out of the common Salt Peter and Brimſtone, may Gunpowder be made; but yet ſhort in goodneſs, of that which is made of purified ſalt peter. By how much the purer and ſubtiler the ſalt peter is, ſo much the better and ſtronger powder doth it make. The ſame may be underſtood as touching the other uſes of ſalt peter.

Further, every one knows that the common ſalt peter reduceth the common metals into a Scoria by burning them, and waſheth gold and ſilver, and leaves them pure, concerning which fiery waſhing I have hitherto mentioned ſeveral things. But that the common ſalt peter doth perform this waſhing better than the pure, and this pure better and more efficaciouſly than the pureſt, is no ſuch matter in the leaſt, which thing experience will moſt manifeſtly

open

open to him who will try the ſame. Verily a ſmall fire will not do thoſe things which a greater will do, nor will this greater effect ſuch things as the greateſt will, and this is ſo evident and manifeſt that there is none dares deny it.

Take one part of the *Regulus* of Antimony and four parts of pure Tin; melt them in a crucible and pour them out, and let them cool; this maſs makes all iron and ſteel fuſile, therefore when you would melt iron or ſteel, fill a crucible with either of the metals, ſet it in a Wind Furnace, and leave it ſo long in the Coles till all the matter wax highly red hot. Then take off the cover and put into the crucible, half as much of the ſaid mixt maſs of *Regulus* of Antimony and Tin, as the iron or ſteel put in the crucible weighed, then put on the cover, and cover it over with the Coles, and urge the fire as ſtrongly as ever poſſibly you can, that ſo the maſs you put in, may cauſe the iron or ſteel to melt. When 'tis all well molten, pour it preſently forth, leaſt the Tin flying away in fume, leave the molten iron, and ſo it returned to its former hardneſs and not ſuffer it ſelf to be fuſed.

This matter conſiſting of the *Regulus* of Antimony, Tin, and Iron, or Steel, is ſo hard, that you may ſtrike fire thereout of with a flint.

Now then if you would experiment the aboveſaid combuſtion or burning up, take a good ſtrong crucible made of potters earth, and fill it with ſalt peter, ſet it on live Coals ſo that the ſalt peter may melt, then having caſt your tin and iron in the form of ſmall rods, heat one end of the rods ſo as not to melt, hold the other end in a pair of Tongs, and put it into the molten ſalt peter, that the iron together with the tin and *Regulus* of Antimony may be burnt up as if it were wood, and vaniſh away with the flame into a fume. For almoſt all tin and iron are a meer ſulphur, and being conſumed by the flame, leave nothing elſe in the crucible ſave *Scoria's*, which being waſhed with water, and boiled on a cupel or teſt with lead and blown off, do leave behind, the true gold and ſilver hidden in both metals.

For when by the flame of ſo pure a ſalt peter, the impure ſulphur of the iron and tin is burnt up, it muſt neceſſarily be that what good ſoever was in the metals do remain behind.

I do not therefore here ſet down this operation, as if I would thereby promiſe any one golden mountains. No ſuch matter. For I onely manifeſt theſe, and ſuch like labours meerly for this end, that every one may know, that ſalt peter being brought to a requiſite purity, is wont to burn up imperfect metals as one burns up wood; and it may be eaſily gathered thencefrom, that ſuch a pure ſalt peter doth as to its virtues much exceed the common peter.

As for ſuch like labours of burning up the imperfect metals by ſalt peter purified in a due manner, and of getting pure gold and ſilver with profit, they ſhall be taught in the following Century (God willing.)

For even as this firſt Century doth for the moſt part treat of fire and ſalt; ſo the chiefeſt part of the following Century ſhall treat of the wonderfull and great efficacy of purified ſalt peter in deſtroying, and reducing metals, and that with great bettering of them, and with no ſmall profit. And albeit I was deſirous of inſerting in this firſt Century, ſuch like profitable betterings of the metals, yet it could not well be done; principally becauſe that there are many other things concerning the profitable uſe of the con-centrated ſpirits of ſalt, that I muſt neceſſarily paſs over here, becauſe the number of this Century is already up, and therefore muſt I refer them to the following Centuries.

And foraſmuch as there is frequent mention made in this Century, of glaſſes and crucibles, which none can be without in the preparing and uſe of theſe moiſt fires, becauſe of the many hazards and loſſes wherewithal common inſtruments are accompanied, for they often break, or elſe eaſily let out or ſpill the boiling matters; it is altogether requiſite that I ſhould here have manifeſted this excellent invention of mine, which preventeth all ſuch diſcommodities; and which I hinted at in the ſecond part of my *Miraculum Mundi*.

But whereas I have beſtowed both thoſe inventions there on the poor, of meer gift, it would be an unjuſt thing to take away from them what is theirs; nay rather they ſhould have by good right more beſtowed on them. So then being not able to proceed any farther as to this caſe, this thing onely remains, *viz.* an affirmation that neither Medicine nor Alchymy can want or be without ſuch excellent Inventions. But yet if any one deſires to have them, he may write to thoſe two men, to whom I have given them, that they may trade for the poor; whatſoever any one that is deſirous of knowing thoſe ſecrets ſhall bargain with them for, he will not be repulſed but obtain his deſire, and purchaſe from them the ſecret; the which proceſs I will nevertheleſs deſcribe, omitting the naming of the matters.

XCVIII. *The way of putting glaſſes in diſtillation and digeſtion, and ſo conſerving them, that the boiling matter be not ſpilt.*

TAKE

with this matter fence your glaſs, that the matters you put into them run not out, or be ſpilt, and you ſhall not loſe them.

XCIX. *The manner of preparing ſuch crucibles as will hold metals in flux a long time, and which can neither be broken nor melted.*

R. Saltpeter Coal duſt & good earth or gat Crucible Clay,

mix theſe matters and moiſten them with common water, that they may be converted into a maſs, of which you ſhall (by a crucible mold) frame ſmall and great crucibles, knocking them into your mold with an heavy mallet, according to the manner I deſcribed in the fifth part of my Furnaces. Then take them forth of the mold and dry them in the air, and when they are dry uſe them; for they need not any burning in the Potters Furnace. They will (being rightly handled) ſtand a long time in the coals, and will not chap, neither will they melt with the moſt vehement fire.

C. *An infallible demonſtration, that in ſalt and fire all things lie hidden; or, that by the help of the Sun and Salt all things are generated, ariſe, grow, and encreaſe.*

FOraſmuch as I cauſed to be ſtamped at the beginning of this ſmall work, a circle with a ſquare in its inſide, and with theſe annexed words, *In the Sun, and in Salt are all things*; (the truth of which figure

figure and inscription is sufficiently enough evidenced by the so many operations described in this Century;) it seemed worth while unto me, to make an assertion here in the end of this Treatise by a true and evident demonstration, that all things are procreated, conserved, and encreased by the Sun and Salt, as being the principal and most noble creatures of God; but with this provizo, that there be present the seeds of those things that require multiplication.

For though the Sun and Salt were yet far excellenter and nobler subjects than they now be, yet notwithstanding could they not produce or generate so much as the smalleſt herb or meaneſt worm (to say nothing of a Man) without seed. If we have but seed, then it is permitted us by God, to propagate the same by the Sun and Salt. The begetting of seeds, God hath reserved to himself alone. The seed therefore is for us sufficient, which if we have, we are able to propagate and encrease it even to infinity, by the efficacy of the Sun and Salt, (that universal nutriment of all things.)

The universal medicament and nutriment that the Countrey men use about conserving their Vineyards, Grounds, and Pastures, is the Dung of Cattle and Sheep; from the which Dung being laid to the roots of the Vines and Trees, and thrown into the Fields and Pastures, the Vegetables do attract their necessary nutriment, do grow and bring forth fruits needfull for the support and nourishment of Men and Beasts.

But forasmuch as this nutriment which all the Vegetables do extract out of the Dung of the Beasts is nothing else but a urinous Salt, and that we know how to prepare out of the common Salt, such a urinous Salt which may be used about dunging and fatning the Earth instead of Dung, therefore verily we may be without that said Dung, being but furnished with such a Salt; the which being Alkalizated by the fire doth extend it self much wider, or goes farther, and dures much longer in the Earth, nourishing and dunging it, than the Beasts Dung doth.

Besides it gives to all Fruits and Corn, a far sweeter savour, and smell, than Dung it self doth, the truth of which will easily appear to him that will make tryal of the same. Nay more, and what is of far greater moment; there may (by the help of such Salts) be communicated to Fruits, especially to those that grow on Trees, and to Grapes, a most fragrant odour; if instead of Dung, such Salts be used to the Fields and Gardens, and some spices or other things of a fragrant smell be mixed with those Salts, and put to the roots of the Vegetables. An example will illustrate it more clearly.

Plow up some part of some barren Ground, such as is so for want of Dung; or, even some meer sandy Ground, and throw upon it of the said salt as much as is sufficient, and by plowing mix it with the Earth it self, and sow therein any kind of grain you please, and it will spring up out of the salted Earth or Sand, and be encreased, and recompence the pains taken about it, with an hundred fold encrease of the seed, even just as if you had dunged it, nay better than with the common Dunging.

And now I pray, whence doth that faculty of growing, encreasing, and multiplying arise, save from Salt alone, which you sowed your barren Field withall? For the seed cannot purchase to it self nutriment, and aliment, growth and encrease from the barren Sand and Rain-water onely. And this you may try the truth of very easily, if you fill two wooden Chests or Boxes with common Sand, and put to the Sand in one of them one, two, or three pounds of that inverted Salt, according to the bigness or smallness of your box) and in the other box let there be onely Sand. If now you sow divers seeds in each of the Sands, and set them in the air, moistening them with Rain-water, those seeds will indeed grow out of both the Sand-boxes and get increase, but yet that which grows where it has been sprinkled with Salt is far fuller and perfecter, insomuch that it will hold on its growth till it comes to its utmost ripeness, whenas the other seeds in the other Sand box will by little and little perish and dye.

It evidently appears from hence that the faculty of growing and increasing, in all things proceedeth from Salt onely. If so be therefore, that Pease, Beans, Oats, Barly, Rye, Wheat, Wine, and all kinds of Fruits, do grow, and are increased by the benefit of Salt, it necessarily follows, that Salt is the subject and universal nutriment.

But that it may be understood how the common Salt (which otherwise is wont to corrupt or extinguish all the faculty of growth in those things it is mixed withall) is to be inverted or turned in and out, that its hurtfull corroding property being put off it may put on the nature of Alkalies or urinous Salts, I do here covertly set down the manner of the operation, so that it may remain hidden to mine enemies and be communicated onely to my friends.

Take common Salt, *&c.* [See the Preparation in Append 5. p. *Prosp. Germ.*]

Let them be well heated red hot together at the fire, this done, the salt will be dispoiled of its Acrimony and get an urinous property, and being used in a due quantity instead of Dung, to barren Grounds, causeth that the seeds sown therein produce much fruit. But this kind of dunging requireth frequenter Rains than that which is done with Dung; and therefore it may be better and more commodious in mooriſh places than Beasts Dung, if it may be done, which conjoyns the said salt, and produceth the most wished effects

But especially the said salt is far better for Vines and Fruit Trees than Dung is: for it gives to Grapes, Apples, Pears and such like Tree-Fruits, a far better savour than Dung is wont to afford: Besides, this benefit accrues to Vines thereby, that being sprinkled with that Salt, they have oft times nutriment enough for twenty years, and do every year bring forth Fruit most plentifully: whereas the nutriment of dunging will scarce suffice for five or six years.

Further, That Salt may be far easier, and with much less costs carried and transported into the high Mountains than Dung can; for a far greater quantity of Dung is required than of the said Salt, which said Salt diffuseth it self far larger, or goes much farther than the Dung, and dures longer.

I did this very spring-time last past, put such an inverted salt to some half dead Vines, which being planted in a lean sandy ground could scarce grow up a fingers heighth, and they presently began to flourish, and grew up so fast that the growth was day by day perceptible. When therefore on a certain day I was shewing some Friends of mine the melioration of metals, in my Laboratory, to be effected by the help of common salt, as they were wondring at the thing, I shewed them those Vines afore my Laboratory, that sprang up from the half dead stocks, and

they measuring some of the branches of the Vines, found that in two or three months they were grown some 6, 7, 10, and 11 foot long, and the stocks or stalks whence they grew were two or three times thicker than at first; which great change or transmutation in the Vines, proceeding from the salt, would be more admirable and profitable than that of metals, if we did not look upon that transmutation of gold with such covetous eyes. And forasmuch as this transmutation spoken of, was observed in the month of *July*, and that there are almost yet three months for Vines to encrease and grow; any one may easily conjecture what an encrease the wood [or branches] of the Vines would have in the space of a whole Summer.

But let this suffice concerning the inversion of the common salt, being a most profitable promoter of the growing faculty in all things; the which things I was necessitated to declare here in the end of this small work, that so I might demonstrate those things which I asserted at the beginning of the same, *viz.* that in salt lie all things hidden, and by the seeds of things and the help of the Sun are rendred visible, palpable and essential.

An Admonition to the friendly Reader, or a Proposition not prescribing or tying to any body, whereby is shewn how much benefit the Countrey may in general obtain by my not chargeable extraction of Gold and Silver out of the fugacious or flying Minerals.

THAT my inventions may be in many places profitable for the whole Countrey, I judged it worth while, briefly to declare my meditations or conceptions thereabouts; and to make a declaration of the way or manner which I judge it may most exceeding profitably be done by.

First of all, I suppose it is sufficiently well known that Princes and Noblemen are occupied or troubled with otherguess burdens and business than to employ or busie themselves with the care and enquiry after the metalline mine-pits, that are here and there in the Countries subject unto them. And if they should commit the care of these things to their servants, 'tis likely that they would rather pass their time in feastings or merry meetings, than in a painfull search of Mines and metallick Veins in the woods and mountains. And as for the subjects themselves, seeing they are altogether rude and ignorant of such arts, by what means, and with what success they can undertake such kind of Labours, any one may easily gues. These are the Causes why things of such great moment are let slip without any profit at all, and are plainly neglected. But in my judgment, though it be but slender, any Prince that hath many Subjects under his obedience, may every year gather store of gold and silver, and that without costs, if he would but onely cause a small Laboratory to be erected, wherein the poor Mines may be extracted with due waters; and leave given to such of his subjects as breath after the knowledge of such Arts, to frequent such a Laboratory, and there to learn such Arts, with this *Proviso*, that every one should bring the gold, silver and copper boiled or gotten out of the poor minerals by the help of the said extraction, into the Mony-shop or Coining house, at such a rate as they are every where esteemed or valued at, and not transport it out of the Countrey. Now by this means, not only the chief Magistrate would without any cost and labour get no small profit by the mony, but likewise every body would to their utmost, labour in the inquisition after such poor Mines, that he might get Gold and Silver, and other Metals, out of those poor metallick Veins, and get gain for him and his. But now if the Prince or Magistrate will not permit his Subjects the exercise of such a work, but keep all to himself, any one may easily conjecture, that not so much as a man will set about searching after such Mines, but will rather hide them, especially if the Magistrate (as is wont to be sometimes done) would constrain his Subjects to such kind of Labours.

This (according to my simple opinion, no ways prescribing to any what to doe) would be the readiest way, without hurting of any man (nay rather it would help and assist many a man) of furnishing our Country with Gold and Silver Coin, which Foreigners have made it bare of. But this will not be by any way, unless the Magistrates themselves do make a beginning, as to the institution of such a work, by this means inviting and stirring up their Subjects to undertake such like Labours, which will bring great Treasures even to the whole Country. By this means may rich Mints be set up in very many places, instead of those which at this time afford Mony or Coin so sparingly, and no small portion of Copper too, mixed with it.

These few things was I willing to advise for the sake of the good of the whole Country; only laying down my simple opinion without prescribing a rule to any, hoping, that no body of what rank or condition soever they be, will take it otherwise than well.

Secondly, Every Prince and great man would mightily promote the common welfare of his poor, if he would but take the care of shewing the way of so inverting common Salt by one hours heating it red hot, and bringing it to that pass, that it may be made use of instead of Cattles dung, for the fatning and bettering of barren Vineyards, unfruitfull Gardens, and other Fields that are backward or slow in bearing Fruits: for verily, even from this very Art would redound much profit to some Countries. For many Vineyards here and there, and many Grounds do want due tillage because of the scarcity of Dung, whereas otherwise they would prove very profitable both to the Subjects and Magistrates, if they could be fatned and made fertile by this kind of way.

Besides too, all Wines would be had in much more plenty, and be of a far sweeter and pleasanter taste, by such a medium, than if the Vineyards and Fields were dunged with Beasts dung. But as touching this thing, see more in the continuation of my *Miraculum Mundi*.

The end of the First Century.

The Second Century

OF

GLAUBER'S

Wealthy Stoze-houſe of Treaſures.

Which doth Illuſtrate his hitherto publiſhed Writings, with a more evident Explanation, and doth more clearly demonſtrate the Truth hidden in them.

The Firſt *Arcanum* or Secret of the Second Century,

SHEWETH,

By what means ſuch Metals as are imperfect, wild, and in a manner unapt for uſe or ſale, may be ripened or bettered by Common Salt and Fire, ſo as to yield forth Gold and Silver with benefit and advantage.

I have in the foregoing firſt Century, as alſo in the Appendix to the fifth part of the proſperity of *Germany*, deſcribed the incineration or reduction into aſhes, which is to be done with Coals in a peculiar Furnace, fit for torrefaction or calcining.

Though this be a laborious way and tedious, yet is it not without its benefit, provided that a great quantity (as I have already oft times ſaid) of the not vendible minerals and metals be thereto uſed. But that ſuch an incineration may be done after a more eaſie and compendious manner, the following way may be made uſe of.

Build an Hearth of good and fitting earth upon a firm foundation, put thereupon a Furnace [or an Arch] of good ſtones, adjoyn hereto an Oven, [or ſide Furnace] out of which the fire may play and emit its flame over all the ſaid Hearth, and paſs thereout of by a Chimny made for that purpoſe. Upon this Hearth put thoſe metalline earths being broken in a Mill, and commix them with the Salt, and Coals reduced into powder, and leave them for twenty or twenty four hours, that they may be all well fired and heated red hot: For by this means, the ſalt makes the fugitive metal in ſome ſort conſtant and able to brook the fire; and the wild ſulphureouſneſs leaves the metalline mineral, and adjoyns it ſelf to the ſalt, and converteth it into a vitriol or *Sal. Mirabilis*. This twenty or twenty four hours heat, gets a conſtancy and fluxibility to thoſe wild metallick veins, and doth withall by that labour ſo fit and prepare the ſalt, that it doth afterwards by an eaſie mutation paſs into good ſalt peter.

After that the ſaid minerals have gotten themſelves a better ſtate by the ſaid Cementation, they are to be drawn out of the Fire or Hearth, with iron inſtruments fit for ſuch a purpoſe, and new and freſh minerals are to be put in, and to be dealt withall after the ſame manner as we ſaid but now.

The minerals that are taken forth are to be broken in a Mill, and then the ſalt to be waſhed off with common water, and to be afterwards uſed about making ſalt peter, the which we have taught in the Appendix.

The light Coals [or Scinders] and unprofitable earth is to be ſeparated by water, from the metalline part, and this metalline part, or heavier *limus*, being reduced and molten in the Furnace called *Stichofen*, yields a beautifull or pure and gainfull metal.

There are ſometimes found in many places of *Germany*, wild, fugacious, and unmeltable minerals of lead, which for that they contain in them Sulphur, Antimony, or *Lapis Calaminaris*, do not admit of reduction in the Furnace called *Stichofen*, but do either go off in fume, or turn into droſs. But being firſt roaſted after the aforeſaid manner, and fitted for liquefaction, the lead, comprehending in it ſilver too, may be thence gotten with profit, whereas otherwiſe they are wont to be dealt withall without any fruit, and are therefore given over. This

incineration

incineration therefore is profitably uſed to ſuch degenerate minerals.

Now if ſo be any would deal with vendible and good metals, and would have profit from them by incineration, he muſt proceed this following way.

II. *The manner of reducing lead into aſhes, and ſo handling it with the ſpirits of ſalt, that gold and ſilver may be thence gotten with profit.*

I have at large taught in my firſt Century, that in the ripening of metals and other chymical operations, a greater fire is endued with ſtronger power than a leſſer, which is eaſie to be underſtood by thoſe that have any wit.

I juſt now taught the maturation and bettering of unprofitable and wild metallick earths with crude and groſs ſalt.

But foraſmuch as the groſs ſalt and a weak fire cannot of neceſſity put forth ſo much ſtrength as a ſtronger fire is wont to doe, therefore for ſuch as deſire a ſtronger fire than the common ſalt, the purer part is to be (by the help of Art) drawn out of the crude ſalt and to be ſeparated from its groſneſs and impurity, the which is eaſily brought to paſs by diſtillation. And as for theſe fires of ſalts, and the procuring them in great plenty, my writings, but eſpecially the precedent firſt Century, do clearly and evidently treat of them, and this ſecond Century will yet treat of it more.

III. *The operation of incinerating the lead, or reducing it into aſhes.*

HAving built a Furnace ſuch as is for Cementation, put therein a ſtrong iron Pot, juſt after ſuch a manner as the ſand cupels [or pans] are wont to be made, let there be a Grate to make a fire on, let the Furnace be bigger or leſſer according to the bigneſs or littleneſs of the Pot you would put in, or according to the quantity of lead-aſhes you would make. Put fire under the Pot and heat it red hot, and put thereinto ſo much lead as is requiſite for the covering of the bottom of the Pot; the lead being molten, ſtir it about in the Pot without ceaſing, with an iron ſpoon having a long handle, the which labour will turn the lead into aſhes in the ſpace of about two hours. Take theſe aſhes out, and put in more lead into the Pot, and repeat this labour ſo often untill you have gotten enough aſhes. Theſe aſhes of lead are fitted to receive an amendment by the ſpirits of ſalts, and afterwards to yield their gold and ſilver by fuſion, and that with profit.

IV. *The manner of bettering the aſhes of lead by the ſpirits of ſalts, and of extracting thencefrom the gold and ſilver with gain.*

FIrſt of all, you muſt have plenty of the ſpirit of ſalt or *Aq. Regis*, as concerning the eaſie getting ſuch ſpirits, we have mentioned the way at large in the foregoing Appendix, and will yet treat more of them in this preſent ſecond Century.

Beſides, you muſt alſo provide your ſelf of red or reddiſh kind of flints, which (beſides iron) do alſo contain in them a volatile gold. Out of theſe is the tincture to be extracted by the ſpirit of ſalt, or by *Aq. Regis*; after that manner I delivered at large in the firſt Century, and in the Appendix to the fifth part of the proſperity of *Germany*, and will yet farther teach more clearly and more compendiouſly in this Century.

Theſe extractions are to be poured upon the lead-aſhes, that they may be well moiſtened therewithall; the unprofitable phlegm is to be evaporated by a gentle heat, and the fire to be augmented that the ſpirits alſo may follow; of which more heavy ſpirits there will be enough remaining in the ſecret Cementatory Pot, and as much as is ſufficient for the due operation upon the lead, that ſo being bettered it may afterwards prove a gainfull emitter of its gold and ſilver.

He that has a deſire of exerciſing this labour with greater profit, may ſatisfie his deſire, if he will but pour on ſuch extractions twice or thrice upon the ſaid lead-aſhes, that they may be con-centrated by them afore they are cemented in the Cementatory Veſſel, and may be reduced into the bettered lead. For by this means, all the labours and coſts will be more largely recompenced, and the more plenty of gain gotten.

This now is the making the lead-aſhes, whether you do either *per ſe*, or by the help of the other metals, convert it by Cementation into a better metal.

V. *A brief deſcription of the ſecret Cementatory Pot, which admits not of any ſpilling, and which is ſealed with the Seal of* Hermes, *of which I made mention in the firſt Century.*

BUild with Stones or Clay or Potters earth ſuch a Furnace as that is, which I deſcribed in the firſt part of my Furnaces, as neceſſary for the making of ſpirit of ſalt. But let the lower part thereof be a little broader that ſo the Metals being caſt upon the Coals may not ſtick to the walls of the Furnace and ſo be ſomewhat loſt, but may fall directly down on the live Coals. It muſt be made four ſquare and of ſuch a bigneſs as may ſerve the purpoſe according as you are minded to cement a greater or leſſer quantity of metal therein.

VI. *Of the Cover of the Cementatory-pot, what it ought to be, that ſo it may ſuffer nothing to goe away in fume.*

THIS Cover of this Cementatory Box or Furnace which I told you was to be made of the Lute of Wiſedom, is not properly a Cover but a Leaden Ciſtern, ſerving for the reception of thoſe ſpirits which are driven up by the fire out of the Lead-aſhes. This Lead-receiver is to lie in another Leaden Ciſtern, which is to be filled with water, and 'tis to be ſo fitted to a pipe that is to come out of the Furnace, that the aſcending ſpirits paſſing thereinto may be the better refrigerated by the water, and the ſooner condenſed, and ſaved for farther uſes.

VII. *Of the uſe and benefit of this ſecret Cementing Pot.*

WHEN any one has a mind to cement the Lead-aſhes, from which the extractions of the coloured Flints have been ſometimes abſtracted in the ſaid Cementatory Box, and to graduate them, or ſo bring to paſs that they may contain [or hold the] Gold and Silver, let him firſt of all fill his Furnace with Charcoal, and let him ſo order it that his fire may kindle by little and little till the Furnace be well heated red hot; till this is done, the Cover that is at top is to be taken ſo long off, that ſo neither the heat

heat nor ſmoke may paſs out at the ſide through the Pipe into the adjoyned Leaden Ciſtern.

When the Furnace is thoroughly heated, and that 'tis now time to begin the Cementation, the top of the Furnace is to be ſhut with its Cover, that the heat may be forced to paſs through the Pipe into the Receiver. Having ſo done, you are to fill an Iron Spoon or Ladle of your prepared Lead-aſhes, and put them into the Furnace at the fore-hole which ſerves for the throwing in your Coals, the which aſhes are to be ſo put in as to cover the Coals over, but not ſo as to choke them but that they may have air enough to burn, and that the fire be not put out, but doe juſt in that manner as you are wont to diſtil the Spirit of Salt. By this means all the Spirits that remained yet behind in the Lead-aſhes, will betake themſelves into the Receiver, and the Aſhes of the Lead will be bettered by the graduating and tinging ſpirits, and will part of them be reduced into a body, and part will yet retain the form of aſhes, and fall down through the Grate to the bottom of the Furnace. Then the Furnace is to be again filled with Coals, and more Aſhes are to be put thereon with a Spoon as afore, and this labour is to be continued ſo long till all the Aſhes are conſumed.

All the labour being finiſhed, take out your Aſhes together with the lead reduced into a body, melt them in the Furnace which is called *Stichofen*, they will melt wondrous eaſie, then put ſome ſmall part thereof to the Teſt, thereby to try whether or no they are enriched enough, to be turned into a Litharge and undergoe the metallick ſeparation.

If they won't as yet brook the trial, let the Lead be again turned into Aſhes in your Iron Pot, and repeat the whole afore preſcribed labour, and that ſo often till at length the Lead be rendred rich enough in Gold and Silver, the which may be converted into Litharge after the uſual manner, and ſeparated from the Gold and Silver. The Litharge being taken away, and gathered together, and broken in a Mill, ſerves for farther uſes in this operation. The *Regulus* of the Gold and Silver that is left upon the hearth is to be taken out and to be farther mundified in a Cupel after the accuſtomed way.

This is that more compendious incineration and reduction of Lead, which kind of bettering it, enricheth the operators with Gold and Silver.

N. B. That in this Cementation the ſharp ſpirits do carry over with them ſome of the Volatile Lead into the Receiver, and there it ſettles to the bottom; the which powder being freed from all the Acrimony of the ſpirits by due waſhings, and being then dried, may be uſed to all ſuch intents and operations to which the Mercury of Saturn is wont to be uſed, and which is made by diſſolving the Lead in *Aq. Fortis*, and precipitating it by Salt-water.

N. B. This diſtilled Mercury hath more hidden under it than the other hath; for it carries hidden in it a Volatile Gold, which may be ſeparated from it and improved about the gradation and Tincture of other Metals, and that with no ſmall profit, concerning which we will ſay more afterwards.

Thus, friendly Reader, haſt thou my more compendious incineration and reduction into better Metals, the which I would not hide from thee, and hereby ſhall I ſatisfie thoſe to whom the way preſcribed in my Appendix is too tedious and laborious and they may make uſe of this way inſtead of that other, which withall is eaſier and will without all doubt yield more Gold and Silver than that other way.

VIII. *Another emendation or bettering of Lead by the graduating extractions of coloured Flints.*

EXtract either coloured Flints, ſuch as have in them Volatile Gold or Sand or Clay, by the ſpirit of Salt or *Aq. Regis*, and draw off the Liquor by Diſtillation. If you thereto add Salt afore their extraction the diſſolvent will receive encreaſe from the Salt, eſpecially if done in ſuch an inſtrument, in which a great quantity of extracted matters may be abſtracted in a few hours, without either Cucurbits or the other commonly known diſtilling Veſſels, and the ſame operation may be continued a long while. By this means, there is not onely the leaſt loſs of your diſſolvent, but it rather gets no ſmall encreaſe from the Salt. By this inſtrument alſo, thou maiſt not onely prepare great ſtore of ſharp ſpirits neceſſary for thy operation at the beginning, but likewiſe commodiouſly extract your Minerals, and ſeparate the diſſolvent again from the Minerals ſo extracted, ſo that you ſhall not loſe the leaſt particle of your diſſolvent.

But foraſmuch as all the Gold, Silver, and Copper may much eaſier be ſeparated from its *Menſtruum*, by this ſo unheard of and never ſeen inſtrument, than by the way of precipitation, 'tis altogether better and ſafer for a Man not to precipitate his extracted Metals, but rather draw off the *Menſtruum* from them, that ſo he may have them dry. And though that all the ſpirits go not wholly off, ſo as that nothing of them abide with the Metals, yet they do no hurt, but rather exalt the Litharge that is put unto them into an higher degree, as it alſo does to the Aſhes themſelves of the Lead, when they are cemented together in the afore deſcribed cementing Furnace; in which Cementation the Volatile Gold is, together with the corporal Gold conſerved, and which otherwiſe would vaniſh away in the common melting Fire.

But if ſo be that any one has a mind to precipitate the Metals extracted out of poor Mines, after the manner preſcribed in the Appendix, to the intent he may after the precipitation make Salt Peter of the remaining Waters, he may reduce the *Calx*'s of the Metals, and principally of the Gold very eaſily and without any loſs, by this following way.

IX. *The manner of reducing the precipitated and waſhed* Calx *of* Sol *without any loſs.*

THE precipitation of Gold by *Lixiviums*, Liquor of Flints, Spirit of Urine, Solution of Mercury, hath been clearly enough deſcribed in the Appendix to the fifth part of the proſperity of *Germany*; but yet the reduction of the ſame was paſt over in ſilence, becauſe of the too much haſt of the ſaid Book. Therefore it ſeemed unto me neceſſary to inſert the ſame here, for their ſakes, who have but little knowledge, or in a manner none at all in theſe affairs; for ſhould I go to propound ſuch a thing for the skilfull Chymiſts, I ſhould but do what is already done, eſpecially becauſe he deſerves not the name of a Chymiſt who is ignorant of the reduction of the ſolar *Calx*.

But foraſmuch as it may ſo happen, that even the unskilfull may ſet about this extracting of the Minerals, and yet be ignorant of the way of reducing the Gold though they ſhould have extracted it; therefore have I judged it not amiſs to illuſtrate that re-

duction by my deſcribing thereof here, the which being divers, according as the precipitation is made by ſuch or ſuch a means, doth alſo require different operations.

X. *The reduction of the ſolar* Calx *precipitated by the Liquour of Flints.*

ALbeit that Borax reduceth every *Calx* of *Sol* to its former body, if it be therewith mixed and melted in a Crucible, yet that would prove too dear, if ſomewhat a greater quantity thereof be required for the reduction; for there muſt be of it at leaſt twice or thrice as much in weight as is of the Gold, if you would have a due reduction of the Gold made. The reaſon is this, becauſe the Flints precipitated to the bottom together with the Gold, and ſo ſticking on to the Gold impead its fuſion ſo that it cannot rightly come together into its due body. Hereupon is it neceſſary that there ſhould be the double or treble weight of Borax added to the Gold if you would have all your Gold return unto its former body without detriment.

But whereas there are alſo other matters to be found which make the Gold fuſible and are not ſo dear as Borax is, the uſe of ſuch things is to be admitted, but eſpecially when a great quantity of Gold is to be reduced. Otherwiſe if it be but little Gold that is to be reduced, and you have not the aforeſaid matters at hand, one may for ſuch a ſmall trial uſe Borax. But where there is a greater quantity to be reduced the following matter will be found to be far more profitable and beneficial.

XI. *How the Gold which is precipitated by the Liquor of Flints, is to be melted without Borax, by the Glaſs of Lead only, which is of a far meaner price.*

TAKE of your Gold precipitated by the Liquor of Flints and dryed, one part, of Glaſs made of Lead and beaten into powder, three parts; the which mix well with the Gold and put into a Crucible, which ſaid Crucible let be put into another bigger one (for which operation the Haſſion pots are moſt fit) that ſo if the Gold chance to flow out of the inner pot, it may ſtay in the outer and be conſerved. For the Glaſs of Lead is of ſuch a nature that it uſually perforates or runs through the pot. Having thus done put your twofold Crucible containing your commixed matters into a wind Furnace, ſuch an one as I have deſcribed, and when you have covered it, put Coals under it [or about it] and urge your fire for one quarter of an hour, that all may well flow, then pour it out, and ſeparate the *Regulus* of Gold with a ſtroke or two from the glaſs of the Lead; which ſaid Glaſs hath attracted to it ſelf all the flinty matter, and ſuffers the pure and malleable Gold to ſettle to the bottome into a *Regulus*.

N. B. If your glaſs of Lead be ſtill yellow as it was before the operation, 'tis a ſign that all the Gold is ſeparated therefrom; but if it be of a green colour 'tis a ſure ſign that it has as yet ſome Gold mixed with it. For Gold being mixed with Glaſs ſhews its being there by yielding a skie-colour, the which skie-colour is neceſſarily changed in the yellow glaſs of Lead into a green; becauſe every yellow and skie colour do in their commixtion beget a green.

Now then that you may get out the reliques of the Gold out of the leaden Glaſs you muſt proceed the following way.

XII. *By what means the Glaſs of Lead which as yet contains in it ſome reliques of Gold is to be dealt withall, that it may let them goe out of its body.*

MELT that Glaſs of Lead in a well covered pot, that I mean in which you ſuppoſe ſome Gold to be, and being well molten caſt in a little iron filings, and mix it well by ſtirring it with an iron rod, and leave it in the fire thus molten, for one quarter of an hour, that the ſulphur of the Glaſs may be killed by its corroding of the iron, and may let fall a leady *Regulus* wherein the Gold will be, and which (in the firſt melting) the Glaſs held up, will ſeparate it by the Cupel from the Lead.

N. B. But here you are to obſerve that the filings of the iron are to be uſed very ſparingly to this precipitation; for by how much the more iron is added, ſo much the greater will the *Regulus* of the lead be, and conſequently require a greater Cupel, which is not ſo neceſſary.

For put caſe the Glaſs of Lead in which the Gold is ſuſpected to be is about one pound weight, and there is but about a *Quinta*, or certain ſmall weight of Gold; now it is not neceſſary to have any more than one Lot of Lead or thereabouts, precipitated thereout of into a *Regulus*, to which precipitation is required no more than one Lot of the filings of Iron. For the *Regulus* of Lead precipitated out of the Glaſs, doth for the moſt part anſwer in weight, to the weight of the Iron filings uſed about the precipitation, or to ſpeak more clearly, you will get ſo much leaden *Regulus*, as the Iron is you added.

The remaining Glaſs becomes black and is unprofitable for any farther melting with Gold, but yet needs not be caſt away, becauſe thoſe *Scoria*'s do yet contain much Lead, and therefore ſerve to be mixt with ſuch Pots as you have uſed and broken about Metals, or with other wild and hardly fuſile metallick Veins, to render them fuſible, being I ſay commixt with theſe, and put in the Furnace which the *Germans* call *Stichofen*, do not onely yield forth all their Lead, but withall draw out the Metals out of thoſe matters which were mixed with them in the melting. But they are principally profitable for the melting and reducing of thoſe Metals, which do not onely very difficultly admit of fuſion by themſelves, but withall do, being mixed with the Aſhes of Tin, ſo much the more difficultly ſuffer themſelves to be reduced by melting, unto their former bodies. But in defect of ſuch Metals and Minerals, as are not but with much adoe tamed by Liqueſaction, you may put to that black Glaſs of Lead, one fourth part onely of filings, or *Scoria*'s of Iron made into powder, that ſo both the matters thus commixt may be molten in the Furnace *Stichofen*. So by the addition and help of the Iron, all the Lead will be reduced to its former body, and will withall extract out of the Iron whatſoever of Gold and Silver lay therein hidden; ſo that by this means there may be reaped a great benefit from this reduction of the Glaſs of Lead. But yet that Lead is to be tryed by a foregoing tryal, whether or no it be rich enough in Gold and Silver to quit the the coſts of ſeparation? For if it be not, it muſt be uſed to the afore deſcribed incineration, that ſo there may be no loſs either of the Gold or the Lead.

XIII. *The*

XIII. *The preparation of the Glaſs of Lead, for the reducing ſuch Gold as being precipitated by the Liqour of Flints, is of difficult fuſion.*

TAKE of white and fuſile Flints [or Pebles] one part, and of *Minium*, or any other Aſhes of Lead, or elſe even of Litharge it ſelf four parts, each of which being powdered apart, you are to commix and melt them well in a ſtrong double Pot, then pour them out, and you will have a Hyacinth-coloured Glaſs, the which Glaſs is to be powdered and mixt with the Gold, and it makes the Gold Powder which reſiſteth melting fuſible.

XIV. *Another way of reducing Gold precipitated by the Liqour of Flints.*

TO one part of this hardly-melting Gold which is precipitated by the Liqour of Flints, admix two or three parts of Litharge, which matters put in a ſtrong double Pot, and cover it well, and melt them well down in a Wind Furnace, that the Litharge may draw unto it ſelf all the Flints, and all the Gold may ſeparate. Having ſeparated the *Regulus* from the *Scoria*'s of the Lead, you muſt precipitate theſe *Scoria*'s, which do as yet hold in them ſome ſmall portion of Gold into a ſmall leaden *Regulus*, with the filings of Iron, as we ſhewed you but now, that ſo you may alſo have even that reſidue of Gold. The *Scoria* are conſerved by being reduced in the Furnace *Stichofen*, according to the operation already ſpoken of.

XV. *Another way of rendring the Gold precipitated by the Liqour of Flints fuſible.*

TAKE of the ſaid Gold one part, and the fixt Salt made of Salt Peter and Tartar, by combuſtion or calcination, three parts; commix them and melt them down in a crucible well covered. In this co-melting the Salt ſwallows up the Flints, and the Gold being at liberty ſettles to the bottom. Pour out the molten maſs, and ſeparate the *Regulus* of the Gold from the Salt, the which being diſſolved with common water gives you your Liqour of Flints, to be again uſed to precipitate more extracted Gold.

This Salt doth not ſo eaſily perforate the Crucibles as thoſe Glaſſes of Lead do, and therefore is it to be accounted of as the beſt and eaſieſt of all theſe three preſcribed ways.

XVI. *The way of reducing Gold, precipitated by the ſpirit of Urine.*

THE ſpirit of Urine or of *Sal. Armoniack* doth perfectly precipitate all the Gold out of the *Aq. Regis*; the which being waſhed and dried, doth not admit of reduction after the manner of the other Gold, for if it be but onely heated a little before it becomes red hot, it preſently takes fire, and fulminates with a far more dreadfull noiſe than any Gunpowder. For if you put a ſmall portion of the ſame, and no bigger than a Pea in a Silver, Iron, or Copper Spoon, and put it on the Coals that it may wax hot, it will give ſuch an horrible crack, that 'twill even dull the hearing, and make a dent in the Spoon as if it had been beaten in with a Hammer. From whence it may eaſily be conjectured, that if ſomewhat a bigger quantity be put in a Pot on the Fire, it would make Pot and Furnace flie, by its ſo dreadfull thundring a ſtroak into moſt ſmall ſhivers.

So then there is need of great warineſs, to prevent the happening of ſo great danger, which is eaſily prevented by the following manner of operating.

XVII. *By what means the fulminating force of Gold precipitated by a* Lixivium, *or ſpirit of Urine is to be taken away.*

MIX with this Gold precipitated by a *Lixivium*, or by the ſpirit of Urine, half a part of Sulphur reduced into Powder, and let the ſaid Sulphur be removed therefrom by burning amidſt live Coals; for ſo being deſpoiled of that fulminating force, it may without danger be reduced by any kind of ſuch matters as promote fuſibility.

XVIII. *By what means Gold that is deſpoiled of its fulminating force, by means of Sulphur may be reduced.*

FOraſmuch as this Gold is void of all impurity, there needs [not] the addition of ſuch matters as promote fuſion, ſeeing it is of it ſelf prone enough to melt. But yet leaſt ſome grains of the Gold ſhould ſtick on to the Pot, 'tis expedient to add ſome portion at leaſt of ſuch a kind of matter as accelerates or haſteneth fuſion. And for this work, Borax, and the dry Liqour of Flints are excellent, of which if you add but one half part onely to ſuch Gold, (or, if you take of the Flints prepared with Salt of Tartar) it will by that means preſently melt, and the Borax, or Liqour of Flints will not retain the leaſt doit of the Gold.

XIX. *The manner of reducing the Metals that are not gotten out of the Waters by precipitation, but are freed from them by abſtracting them.*

THE Metals which are extracted out of the Mines, and freed from the waters by the abſtracting of the diſſolvent, cannot be ſo pure as thoſe are which ſettle to the bottom by precipitation. For it is very rare for Gold and Silver to be found in metalline Veins, Stones, or Clay, without being commixed with other Metals; becauſe for the moſt part, Copper is mixt with Silver, and Copper or Iron with Gold, the which being unſeparated in the reduction makes the Gold and Silver impure. But now in the precipitation one Metal is freed after another from the *Menſtruum*, and are not mixed with each other. But on the contrary, in the way of abſtracting it, all the metals remain mixt together without any ſeparation, and require a new ſeparation and conſequently a double labour, and more expences.

This inconveniency may be eaſily remedied by him who is verſed in the knowledge of my dry ſeparation of Metals. I have mentioned it in divers places of my writings, ſo that it would be needleſs to trouble the Reader with a ſuperfluous rehearſal of the ſame in this place.

But foraſmuch as every one hath not by him all my writings, I believed that it would be worth while, if I ſhould here ſet down that Laver or Bath which waſheth off the Metals with the help of Salt peter by the dry way. For, without the knowledge of this Artifice of ſeparating the extracted Metals from each other, there would be yet requiſite much labour, and much coſts for the obtaining of the ſaid Metals.

Metals. But they are very eaſily, and with little labour, and with ſmall coſts ſeparated the one from the other by the way here by us deſcribed, and indeed with more gain than is wont to be had by the way of precipitation.

And even as in the precipitation of Metals there is always ſome [portion] of the Waters, that puts on the nature of Salt Peter, *viz.* when the Waters that have been uſed, which are as it were the Seeds of Salt Peter, are implanted in an Alkaliſate Salt, and ſo do multiply themſelves in a wonderfull manner.

So likewiſe in the dry ſeparation of Metals, there is in a manner, yet more Salt Peter gotten, *viz.* thus when they are ſeparated in the melting Pots, from each other by Salt Peter, and by an artificial precipitation of one Metal after another, the Salt Peter you uſed is rendred fixt and Alkalizated, which Alcalizated niter is to be accounted of, as the root of Salt Peter. This root being implanted in acid Salts, is in like manner enriched with a plenteous encreaſe, and reduced into natural and inflamable Salt Peter; for, by it do the ſharp Waters get to themſelves the nature of Salt Peter, from thoſe Alkalizate Salts. And if ſo be you ſeek not after the common Salt Peter, it is better to ſow the Seed of Salt Peter (that is, ſome ſpirit of niter which you have uſed) into the appropriate root of Salt Peter, that is, into fixt niter. For by that means you will have (at the encreaſe) a wonderfull Salt Peter, which, in all operations, doth far more powerfully act than the common Salt Peter, what way ſoever it be mundified by; which is evidenced in my foregoing firſt Century.

Therefore foraſmuch as in the ſeparation of Metals by the dry way, there remains (after the operation is over) ſo much fixt Salt Peter as there was of nitrous Water in the moiſt extraction, it always abundantly ſupplies both Seed and Root of Salt Peter, ſo that they may be exceeding plentifully multiplied by other Salts, nor will you have any need of buying any more new Salt Peter for the now ſpoken of Labour. Verily this is a moſt compendious way, not onely of ſeparating all Metals even in fuſion, but alſo of ſomewhat bettering them, as ſhall be afterwards demonſtrated.

XX. *By what means ſuch Gold as is commixt with Iron, or Copper, and from which (being extracted out of the Minerals) the diſſolvent has been drawn off, is to be reduced.*

LET ſuch unclean Gold be commixed with two or three parts of its weight of the Glaſs of Lead, and melt them in a ſtrong Crucible. If there happen to be much Iron, it will of its own accord yield a leaden *Regulus*, which being forced by the heat of the Fire in a Cupel will leave your Gold pure, becauſe the Glaſs of Lead is wont to attract unto it ſelf Iron and Copper. But if ſo be there is but little Iron mixt with your Gold the *Regulus* of Lead will not ſeparate or precipitate in the melting, and therefore as it melts ſome filings of Iron are to be added, and to be accurately ſtirred with a red hot Iron, that ſo a *Regulus* of Lead may fall to the bottom, bigger or leſſer according to the muchneſs or littleneſs of the Iron you added.

XXI. *Another proper and fitting matter to reduce ſuch Gold as hath Iron in it.*

TAKE of Salt Peter one part, and of Antimony four parts, reduce them into a black Glaſs, by melting them. This Glaſs being powdered and commixt with a wild or raw and not fuſile Gold and ſo molten, precipitates the *Regulus* of the Gold to the bottom, and brings the Iron into *Scoria*'s.

XXII. *The ſeparation of the Antimony from the Gold.*

SUCH golden *Regulus*'s do not admit of ſeparation in the Cupel, like as thoſe do which the Glaſs of Lead is uſed to. Therefore Salt Peter is to be uſed in the melting Pots or Crucibles, to make the ſeparation of them.

Put this Antimonial *Regulus* in a melting Pot, melt it down in a Wind Furnace, and being molten caſt in by little and little ſome dry Salt Peter, that ſo it may ſeize upon the *Regulus* and tranſmute it into *Scoria*'s. The *Scoria* flowing in the Pot like water, are a ſign that the Gold is well cleaned, and that all the Antimony is reduced into *Scoria*'s. Then pour it forth into a Cone that it may cool, and the pure and malleable Gold will ſettle into a *Regulus* at the bottom. Now all the Salt Peter is rendred fixt in this operation, then if you put your *Scoria*'s again in the Crucible, and put into it ſome Coals and melt your *Scoria* down, almoſt all the Antimony being freed from the Salt Peter will gather into a *Regulus*, and will again ſerve for reducing of more Gold; for it will as readily reduce your extracted Gold unto its former body, as the [aforeſaid] Glaſs it ſelf will. But this labour requires a diligent Operator who knows how to handle it with ſingular skill, though it be eaſie, and requireth not any great Artifice, but onely an accurate diligence, which uſe onely makes a Man skilled in.

The Salt Peter uſed about this labour, gets the nature of an Alkali Salt, and being put on the live Coals doth no more burn, but being diſſolved in Water yields a ſharp *Lixivium*, very proper for many operations, and ſerving inſtead of a Lye made with Wood-aſhes. But the chiefeſt uſe thereof is this, *viz.* ſeeing it is the true root of Salt Peter, it may be added to other Salts, out of which in proceſs of time, it will be notably augmented and produce new burning Salt Peter. He that has a deſire gainfully to augment this fixt Salt Peter with common Kitchin Salt, and again to tranſmute it into inflamable Salt peter, may accompliſh his deſire if he makes uſe of the following operation.

XXIII. *The way of making moſt excellent and inflamable Salt Peter in plenty, and with profit out of common Kitchin Salt and the* Lixivium *of Salt Peter that has been uſed.*

THere is ſo ſmall a difference betwixt common Kitchin Salt, and Salt Peter, that the Salt may eaſily be turned into Salt Peter, and that by ſeveral operations, as well by the ſeed of Salt Peter as by ſharp ſpirits, as we have taught above, or even by fixt niter which operation we will here ſhew.

We will uſe for an example, the baking of Bread, and the brewing of Ale. If when the Meal is with Water brought into Dough, there be added unto it but a few grounds of Ale or Leven, the whole maſs begins to heave it ſelf up, and becoming thin [or light] is rendred fit to be baked into Bread, the which hath altogether the ſame property as thoſe few Ale Grounds, or that little Leven had. And ſo that very ſelf ſame Dough is likewiſe fit to make other Meal ferment, even to infinity. The ſame is likewiſe

likewiſe obſervable in the brewing of Ale, ſo that he who hath but once onely ſo much Ale Grounds [or Yeſt,] or levened Dough as ſerved his turn once, may brew Ale and bake Bread even to infinity. So likewiſe is the ſame evidently manifeſt by the encreaſe of Vegetables, which may be infinitely multiplied by the Alkalizated Salt of the Earth, if you have but once their Seeds and Roots. In like manner may the ſame propagation be performed by another way, *viz.* by ingrafting of that which you would propagate into another of the ſame kind. For example, I have in my Garden excellent Apples, Pears, Cherries, or ſuch like Tree-fruits, and I have a mind to ſee more of them in my Garden; therefore do I cut off ſome branch, or perhaps even the Tree it ſelf to the trunk or body, of ſome wild, or at leaſt not ſo noble a Fruit-bearing Pear Tree or Apple Tree, and therein, *viz.* in that branch or ſtock, do I ingraft according to Art ſome little boughs or cions of ſome other Tree that bears excellent Fruit, and which I deſire to encreaſe, the which Tree now doth no more produce the wild and degenerate or bad Fruits, it did according to its kind, but ſuch Fruits as the Tree whence the cion was taken, bears.

By theſe kind of ſimilitudes may any one that hath underſtanding eaſily ſee, that it is poſſible by Art, to tranſmute one nature into another, if, *viz.* the Seeds and Roots of things are applied to this tranſmutation. But now if any one ſhould plant a ſtalk or leaf in the digged earth, and would thereby encreaſe or propagate it, he will never ſee any ſucceſs of his labour; for the ſtalks and leaves would rot and ſo no new Herb would again bud out from them as is wont to be out of the Seed and Roots.

Even on this wiſe is it with Salt Peter, which if it be mixed with common Salt it would not verily produce any encreaſe, as 'tis wont to do out of its Seed and Root, as we have already laid open.

Such likewiſe is the nature of Metals, touching the propagation and encreaſe of which their proper ſeeds and roots are requiſite. What I pray are thoſe Tinctures, (one onely particle of which and that no bigger than a Pea, being caſt on an whole pound of Tin or Lead, tranſmuteth that ſame Metal into pure good Gold, and changeth and augmenteth it ſelf (as being the true ſeed of Metals) a thouſand fold, out of ſo groſs and earthly a body into ſo noble and ſo golden a nature in ſo ſhort a ſpace of time,) what (I ſay) are thoſe Tinctures, but the very ſeeds of Metals, and the very metallick roots. But by what means they are to be obtained, and to be brought under a Man's power, for my part I do not know. But yet I could not but deliver my ſimple opinion and conceptions concerning this thing, to the ſtudious of Art.

'Tis certain that all Metals have their riſe out of one and the ſame Seed, but that they differ ſo very much amongſt themſelves, and that one becomes more ripe than another, is to be imputed to the diverſity of accidents. In one and the ſame Tree are produced Bloſſoms, and ſmall Fruits of an unpleaſant taſt; then afterwards bitter and immature ones, and at length ripe and ſweet ones, and are not alike either in form, odour, or ſavour, nor are they of like effects, and yet do they all ariſe out of one beginning, *viz.* out of their Seed and Root. So is it even with Metals.

For as touching their Seed I do verily believe, that if from the moſt ſoft and as yet moſt immature Metals, ſuch as *Zink*, Lead, Tin, Antimony, Biſmute, Cobolt, *&c.* their ſtinking combuſtible and ſuperfluous Sulphur, could by ſome Bath or other be ſo taken away, as that nothing may remain ſave onely a moſt pure Mercury, that then I ſay ſuch a Mercury, or ſuch a Seed of Metals may be eaſily tranſmuted by pure Gold, as being the moſt pure Root of Metals into a true Tincture.

But to turn common Salt into Salt Peter, the operation is thus.

Take one part of black or of any other common Salt, and mix it with two or three parts of *Calx-vive* being reduced into Powder by lying in the Air, and lay it in ſuch a place as lies open to the Air and Sun-beams, but yet keeps off the Rain, as we have taught in the Appendix.

Moiſten this heap with the aboveſaid *Lixivium* of Salt Peter, and being dried, repeat the moiſtening and drying ſo long, untill the ferment ſhall have converted all the common Salt and turned it into inflamable Salt Peter, the which doth either ſooner or later happen, according as the operation hath been the more diligently or negligently handled. All being turned into Salt Peter, let an extraction be made with common Water, as the uſual cuſtom is, and lay the Reliques in the aforeſaid place, and again moiſten them with the ſaid *Lixivium* as afore, or in defect thereof ſprinkle them with common Water, ſtill moiſtening them after each drying, untill there be a new encreaſe of Salt Peter begotten, the which you are to waſh off with common Water. And ſo this operation proceeds, or holds on even to infinity.

XXIV. *Another far more compendious way of converting common Salt, by the help of fixt Salt Peter into excellent Salt Peter.*

MIX ſome certain weight of common Salt diſſolved *per ſe* in common Water, and as much of fixt Salt Peter likewiſe diſſolved in common Water, mix them in a wooden Veſſel; in which Veſſel the fixt Salt Peter being as it were a ferment will ſeize upon the common Salt, and turn it by fermentation into excellent Salt Peter.

He that deſires a more mature Salt Peter may inſtead of the ſolution of common Salt, pour upon the fixt Salt Peter *Lixivium*, thoſe ſharp waters of Salt Peter, which have already been uſed about other labours, and they will ſeize upon that *Lixivium* with a more vehement operation, ſo that of both the ſolutions as well the acid and ſpiritual, as the fixt and corporeal Peter, there will be gotten in a few hours ſpace, the moſt excellent Salt Peter and ſuch as cannot be by any other way whatſoever purchaſed.

N. B. If any one has a mind of getting a greater quantity of Salt Peter, he may firſt diſſolve his common Salt in the ſharp Water of Salt Peter, and [mix it] in that ſelf ſame *Lixivium*, [*viz.* of Peter,] and after the mixing of theſe two contrary ſolutions evaporate the common Water, that the Salt Peter may ſhoot into Cryſtals, of which there will indeed be a greater quantity, but then it will not be ſo good as that which was made by the firſt operation.

XXV. *Another gainfull way of making good and burning Salt Peter out of common Salt, by the help of fixt Salt Peter.*

COmmix equal parts of the *Scoria*'s of fixt Salt Peter that you have uſed, and of the common

Kitchin Salt together, and add thereunto twice as much *Calx-vive* firſt reduced into Powder by lying in the Air, [as they both weigh.] Of this mixture make up round Balls, and ſo pile or ſtow them with Wood, that it may be a *Stratum Superſtratum*, [or a Bed of each orderly,] as the Chymiſts call it. Kindle your pile of Wood and let all your Balls be red hot for an hour: And the fixt Salt Peter will by a wonderfull inverſon tranſmute the nature of the common Salt, and turn it into Salt Peter, but yet not inflamable till the Salts have been moiſtned ſome due time, and ſo attracted a life out of the Air, and made fit to conceive a flame, or to burn.

N. B. If inſtead of Rain-water you uſe ſuch Waters as you have already uſed and extracted your Minerals withall, to moiſten your maſs with, then will you thence get in ſome few Weeks ſpace, an inflamable Salt Peter.

But foraſmuch as in the extraction of Minerals and ſeparation of Metals, there will be ſuch a great quantity of ſharp nitrous Waters, and likewiſe of fixt Salt Peter offer themſelves for the accompliſhment of this operation, and ſo great a benefit and gain is gotten by that ſo plentifull an augmentation of your Salt Peter (which hath already ſufficiently profitably paid your coſts) out of vile and common Salt; hence clearly follows, that all thoſe hitherto deſcribed labours and operations are effected, in a manner without any coſts or expences, which is indeed an unheard of thing, but yet moſt true, and exceeds the belief of ignorant Men.

XXVI. *The reduction of Silver extracted out of the Minerals, and freed from the* Aq. Fortis *by abſtraction, [or drawing off the ſaid* Aq. Fortis.*]*

THE Silver from which *Aq. Fortis* has been drawn by Diſtillation, needs not any matter to help on fuſibility, for as much as it doth of its own nature admit of a very eaſie Flux; but that the Fugitive Spirits that adhere unto it would carry away ſomewhat of the ſame. So now, to prevent this diſcommodity, you may add unto ſuch a Silver a little of the fixt Salt ſeparated out of the *Lixivium* [of fixt Peter,] the which Salt Alkaly will mortifie the acid ſpirits ſo, that they ſhall not be able to carry off any thing at all in the melting.

XXVII. *The reduction of extracted Copper.*

IF the Copper be not mixt with any other Metals, and be but little in quantity, it may be reduced ſo in Crucibles by it ſelf, but if it be in a plentifull quantity it may be done by blaſt.

But where it contains Iron or *Lapis Calaminaris*, (which two the Minerals [of Copper] do frequently abound withall) there it admits not of reduction *per ſe* without the help of other matters, becauſe of the Iron, *Zink*, or *Calaminaris*; which Minerals aſſociating themſelves with the Copper, in the melting are wont to make it brittle. But this inconveniency may be prevented the following way.

XXVIII. *The way of making Copper, which hath Iron in it malleable by reduction.*

MIX ſuch Copper as hath in it *Lapis Calaminaris* or Iron, with common Salt, and put it in a Crucible and melt it, that ſo the Salt may aſſociate or draw unto it ſelf the Iron or *Lapis Calaminaris* out of the Copper, and turn them into *Scoria*'s, leaving the Copper, which will ſettle to the bottom and go into a *Regulus*.

XXIX. *By what means Copper is to be ſeparated from the Silver, if they are both together extracted out of the Mines, and the Silver has not been precipitated out of the ſolution by the Water of Salt, but the diſſolving* Menſtruum *hath been abſtracted from them ſo conjoyned both together.*

IF the Silver be more in quantity than the Copper, then the Copper is eaſily extracted out of the other by the Water of Salt wherein a little Tartar hath been diſſolved. For Salt and Tartar do readily diſſolve Copper, and leave the Silver.

But if the Copper bear the Bell, and there be more of that than the Silver, then will it be better to precipitate the Silver firſt by the Water of Salt, out of the firſt extraction of the Minerals; and afterwards the Copper will be likewiſe freed by abſtracting the diſſolving *Menſtruum*, inſomuch that each of theſe two Metals are gotten apart.

XXX. *If the extracted Copper comprehends in it any Gold, by what means the Gold may be therefrom ſeparated.*

ALbeit if a ſolution of *Saturn* or *Lune* being poured on the diſſolved Copper, and well ſhook with the ſame ſolution will fiſh out ſome Gold, yet it gets not all unleſs it be debilitated by ſome *Lixivium*. But now the *Lixivium* being poured thereunto that ſo the ſolvent being debilitated may the eaſier let go its Gold thereby, hath with it this inconveniency, *viz.* that the ſolvent is made wholly unprofitable to be uſed about any more extractions. Nay more, there's alſo this diſcommodity, that if an error be committed by pouring on a little more *Lixivium* than is expedient, there will alſo precipitate ſome of the Copper together with the Gold.

To prevent therefore theſe inconveniencies, the ſolution of the Copper which contains in it Gold, is to be drawn off even unto drineſs, in my ſecret and by me invented diſtilling Veſſel, in which Veſſel it may eaſily and in great plenty be done; and the following *Menſtruum* which diſſolveth onely Copper and not Gold is to be poured upon the dried matter, that the Copper may be diſſolved, and the Gold (be it either much or little) may remain in the bottom undiſſolved. The diſſolved Copper may be precipitated out of the Water with a *Lixivium*, whereto is added ſome of the Liqour of Flints, and be waſht and dried, and with ſtrong Vinegar be turned into a moſt delicate Verdigreace. The Water that is thus made uſe of, if it be poured on Alkalizated Salts yields good Salt Peter.

He that does not much regard that green colour may ſeparate the diſſolvent from the Copper by Diſtillation, and again uſe the ſame for the like diſſolving of new Copper.

But now there muſt be in the Copper ſo much Gold as to quit the coſts of this labour, and to prove gainfull; otherwiſe it is better to leave the Gold with the Copper than to buy it at ſo dear a rate.

XXXI. *The*

XXXI. *The making of ſuch a* Menſtruum *as diſſolveth the Copper and drives from it ſelf, or precipitates the Gold.*

THIS diſſolvent is no other than *Aq. Fortis*, wherein a little Tartar is diſſolved. For the Tartar being an enemy to the Gold, is wont to precipitate the Gold out of the ſolutions like as common Salt doth Silver out of *Aq. Fortis*. By this way may all the Copper be eaſily ſeparated from the Gold, concerning which, more ſhall be ſpoken in its due place.

XXXII. *Another reduction of Copper that hath Gold in it, and the perfect ſeparation of the Copper from the Gold.*

ADD to ſuch Copper that hath Gold in it, ſome Silver, and melt it with ſo much *Regulus* of Antimony as is twice the weight of the ſaid Metals thus together taken. Separate the ſaid *Regulus* together with the Copper from the Silver by the addition of Salt Peter, that ſo the Silver may retain with the Gold that was in the Copper, the which is to be afterwards ſeparated if it be worth the while. Now it is not neceſſary preſently to ſeparate it, foraſmuch as it is far better many times to abſtract ſuch a Copper that has Gold therein from ſuch a Silver, that ſo the Silver may be enriched with a great quantity of Gold by ſo many abſtractions; the which abſtractions require but very little coſts beſides the charges of the Fire and Crucibles.

For all the Salt Peter uſed hereabouts, together with all the Copper and all the *Regulus* of Antimony may be thencefrom again recovered, by him who rightly knows the precipitation. Beſides, there lies hid under this operation, ſome great matter as concerning the amending of the Metals. For it is a way of arriving to the knowledge of impregnating all Silver by Copper, with Gold, and Copper it ſelf with Silver; concerning which thing there are more inſtructions to be found in other places of my Writings.

Theſe things may at preſent ſuffice, touching the reduction of the Metals extracted out of the poor Mines, and [concerning thoſe things which by reaſon of the haſty Edition of the Appendix to the fifth part of the proſperity of *Germany* were omitted therein;] the which defects the well minded Reader may from hence ſupply.

XXXIII. *A brief deſcription of the above mentioned artificial Inſtrument, by the help whereof the ſpirits neceſſary for the extraction of the Metals out of the poor Mines that contain in them Gold, Silver and Copper, are plentifully prepared, the Minerals themſelves extracted, and the diſſolving* Menſtruums, *again eaſily ſeparated from the Metals.*

THIS incomparable and by me newly found out Inſtrument, being moſt profitable and commodious for the eaſie extractions of Metals, and preparations of the diſſolving *Menſtruums*, is made of a peculiar earth, and is almoſt of the figure or likeneſs of a Bakers Oven, and is either of a bigger or leſſer ſize, according to the quantity any one has a mind to labour in; In the forepart it hath a Door, and in the end [or top] or very near it, it hath an Outlet. To the Cover ſerving inſtead of an Alembick, a great receiving Veſſel is to be fitted, fit for the reception of the outgoing ſpirits. After that the Furnace is heated, the prepared Salts being put in peculiar Pots or Crucibles made of the beſt earth are to be put with a pair of Tongs prepared for this peculiar uſe into the Inſtrument, and all the ſpirits will be drawn off with a ſpeedy Diſtillation. Now there is no danger here of breaking the Inſtruments, and the Diſtillation may be done in the ſpace of one or two hours, how great a quantity ſoever of Salt was uſed to the Diſtillation. When the Diſtillation is over, the Pots that were put into that Inſtrument or Furnace are to be again taken out with your Tongs, and preſently other Pots filled with Salts are to be put in the room of them you took out, and the ſpirits again driven out by a new Diſtillation. This labour may be kept on as long as one pleaſeth, or as long as he hath any matter to diſtill withall; becauſe the Veſſel never cools as long as the Diſtillation is continued. This Furnace therefore is moſt notably fit for the Diſtillation of a great quantity of Salts, and that by a labour which is ſo exceeding ſpeedily finiſhed.

The ſame way of Diſtillation is to be obſerved in the extraction of Minerals or Metalline Earths, the which can be far ſooner extracted and far ſpeedier this way, than by that deſcribed in the Appendix which is to be done by heating the Glaſſes.

After the ſame manner is the diſſolving *Menſtruum* it ſelf ſpeedily again abſtracted from the extracted Metals, and being thereby preſerved without any loſs is to be applied to farther uſe. This Inſtrument therefore doth ſo compendiouſly and eaſily diſpatch all thoſe ſaid labours, that (ſet aſide your Fire and Salt) the plentifull making your ſpirits, the abundant extraction of the Minerals, and the ſeparation of your *Menſtruum*'s from the extracted Metals and its preſervation, are in a manner done without any coſts.

XXXIV. *Now follows an explication of ſome ſecrets effected by the help of my* Sal. Mirabilis, *concerning which there is mention made in the ſecond part of* Miraculum Mundi.

IT is clearly evident from many places of my Writings, and principally in the ſecond part of *Miraculum Mundi* that my *Sal. Mirabilis* is diverſly prepared; hence it follows of courſe, that the uſe thereof is different. For it hath one uſe when (after the ſpirit is thencefrom diſtilled) it is taken out of the Cucurbit, and hath as yet a corroſive nature. Contrarily, it hath another kind of uſe when this corroſive Salt is diſſolved in common Water, and filtred, and ſet in the cold, that ſo the beſt part thereof may ſhoot into long Cryſtals, which having no corroſive power, ſerve for a peculiar uſe. It hath likewiſe another uſe when it is deprived of all corroſivity and turned into a ſweetneſs, as I have ſhown in many places of my Writings. This is to be known by ſuch as would uſe it, for this or that labour, that ſo they may commit no error, but be thereby rendred Maſters of their deſires the more eaſily.

We will therefore make inſpection into ſome of thoſe principal ſecrets which are declared in the ſecond part of *Miraculum Mundi*, and examine whether or no they can be effected after the ſame manner I preſcribed?

XXXV. *By*

XXXV. *By what means any Water, Wine, Ale, Vinegar and other liqours may be coagulated in a few hours ſpace into hard pieces like Ice, by the* Sal. Mirabilis.

FOR ſuch a coagulation of all watery and moiſt things, well edulcorated (as the Chymiſts phraſe is) *Sal. Mirabilis* is to be taken and ſuch as is ſhot into long Cryſtals, prepared of an equal weight of Salt and good Oil of Vitriol, becauſe a moſt great drineſs ariſeth from the Oil of Vitriol.

Such an excellently well prepared *Sal. Mirabilis*, and which is ſhot into long Cryſtals, is to be reduced (by calcination in the Sun) into a fine powder, that ſo it may loſe all its moiſtneſs and yet not melt. For if it melts, then it would need grinding again; one part of this calcined *Sal. Mirabilis* is able to coagulate three parts of Water, Wine, Ale, or any other liqour which it is mixed withall, into a dry matter like to Ice, inſomuch that it may be carried in a Sack or a Sieve full of holes.

But what uſe ſuch a coagulation may ſerve for, would be too tedious to declare in this place. Any one will find what uſe is to be thereof made, if he well meditates upon the thing.

XXXVI. *The ſeparation of the Water, Wine, or Ale, from the* Sal. Mirabilis.

THE coagulated liquors may be commodiouſly ſeparated from the *Sal. Mirabilis* by Diſtillation; but the aquoſity of the coagulated Wine and Ale are to be ſeparated onely by Diſtillation, and the groſſer part remains behind in the Cucurbit with the Salt. But the *Sal. Mirabilis* is by calcination, again freed from all impurity, and again made white and fit for any other ſuch like new effect.

N. B. I doubt not but that there are other ways of coagulating watery liqours into Ice, concerning which we ſhall ſay ſomewhat in their due place.

XXXVII. *How the ſharp ſpirits of Salts, as* Aq. Fortis, Aq. Regis, *Spirit of Salt, Spirit of Vitriol, of Allum, and the like may be coagulated into hard Salts, not unlike to frozen Water.*

THIS coagulation of ſharp Spirits out of Salts, is done the ſame way as the coagulation of common Water, and other ſweet liqours is performed by; but the ſeparation ought to be done in Veſſels of the beſt Earth, or in Glaſs, becauſe of their ſharpneſs. And certain it is, that with theſe coagulated Spirits of Salts many things of great moment may be done, the mentioning whereof we for brevity ſake do here paſs over.

For I have purpoſed to demonſtrate at this time, ſome ſecrets onely which are mentioned in the ſecond part of *Miraculum Mundi*, and to aſſert the truth of them.

By theſe two deſcribed coagulations any one may eaſily learn that the coagulation of other moiſt things are poſſible to be done.

XXXVIII. *How the head of a fountain may be ſtopped up by this* Sal. Mirabilis.

IT ſometimes happens that there breaks out a Spring of Waters in ſome places where it proves offenſive and hurtfull. And foraſmuch as they are ſometimes very difficult to be ſtopt up, I will ſet down a way in this place of ſtopping it by *Sal. Mirabilis*, but chiefly to this end, that the nature and property of things may be throughly learned, and beſides, that even Arts and Sciences themſelves do ſometime bring no ſmall help, eſpecially when no counſel avails. Take therefore of your *Sal. Mirabilis*, heated red hot as much as is ſufficient, wrap it up in a linnen cloth and thruſt it into the hole of the Fountain, and it will be turned with the Water into an hard Stone, and thereby enforceth the Fountain to ſeek it ſelf ſome other paſſage.

XXXIX. *The way of ſeparating the Phlegm from ſubtile Spirits.*

BEcauſe the Volatile and ſulphureous Spirits of Salts are of great efficacy in Medicine, and principally when their Phlegm or aqueous humidities are removed from them, the which thing every one can't bring to paſs, I have therefore judged it worth while, even for the ſake of the Sick, to diſcover an eaſie way of ſo doing, by my *Sal. Mirabilis* as follows.

Fill a Glaſs Cucurbit half full with *Sal. Mirabilis*, pour thereupon the Volatile Spirit of Vitriol, Niter, or common Salt, and diſtill thence by B. the moſt ſubtile Spirit, the which will come off, and leave the unprofitable Phlegm behind with the *Sal. Mirabilis*, the which (by heating red hot) you may again render fit for new operations.

XL. *Another and eaſier way, yea even almoſt an incredible and miraculous one of freeing Wine, Ale, Vinegar, Brandy, and all other moiſt liquors from their unprofitable Phlegm in a moment of time, by my* Sal. Mirabilis.

THE precedent coagulation of moiſt liquors ariſeth from that moſt great drineſs which lies hid in the *Sal. Mirabilis*. But this way we now deliver, proceedeth from the con-centrated cold of moiſt Fires, which Fires we have treated of in the firſt Century, and 'tis thus.

Take one pound of the aboveſaid *Sal. Mirabilis*, put it in a ſtrong Glaſs, and pour thereupon two parts or pounds of the con-centrated and cold Fire of ſome Salts, whether it be of Vitrol, or common Salt, or Salt Peter, whoſe Fire excells the Fires of other Salts; and let them lie quiet for ſome hours, and there will be made an Icy maſs of them both, the which you ſhall in the Winter time ſet out in the Snow or in ſome cold place which by how much the colder ſo much the better; where the longer it abides in the cold, the more will the cold Fire be con-centrated, and conſequently ſo much the greater matters may by ſuch a con-centrated body be effected.

XLI. *The receiving or catching the breath of Men, as they ſit in ſome warm Stove, and the changing it into the form of Ice.*

IF thou haſt a mind to create a kind of admiration amongſt thy Gueſts or Friends when they are with thee, and to give them ſome profitable recreation, you may accompliſh your deſire the following way.

Carry with thee a Glaſs full of the moiſt Fire of Salt, and which is coagulated by the *Sal. Mirabilis*, and hath ſtood ſome hours in the cold, into the warm Stove, and hang it up over the Table by a thread

thread or ſmall line, when your Gueſts are ſet at the Table, and when they ask you what this ſignifies, you may tell them that you will for their Recreations ſake, ſhew them ſome pleaſant diverſion; after they have made an end of eating and drinking. Upon this they will all of them have a deſire to ſee thoſe tricks and ever now and then caſt up their eyes upon the Glaſs. But after that the Glaſs has there hang'd a minute or half minutes ſpace, the breath of the Men that ſit about it will preſently apply it ſelf to the Glaſs, and ſtick on to the outſide thereof like Snow, and cover it all over; and thicken more and more, inſomuch that in a ſhort time it will have a thick and hoary beard, all about conſiſting of natural Ice; and will ſo long keep on its encreaſing as the con centrated cold laſts in the Glaſs. Then at length the Glaſs growing a little hot, after the internal cold of the con-centrated Fire is conſumed, that Icy beard begins again to melt and being reſolved, to diſtill into a Water, for the receiving of which diſtilling drops ſome Veſſel is to be ſet under. This is a wonderfull Diſtillation of Men's breath, which coming out of their mouths in their diſcourſing, is reduced by the con centrated Fire of Salt into Ice, and at length, again into Water by the heat of the Stove.

This ſo ſpeedy an operation or tranſmutation of a moiſt and watery vapour into natural Ice, ſeems indeed at the outſide view to be but a vile and unprofitable thing; but if it be but well minded by the ſight of the internal mind, it not onely begets a moſt great admiration, but withall opens the moſt excellent knowledge of natural things.

Such as greedily hunger after Gold will ſay, what benefit comes from theſe tricks? had Gold but diſtilled from the Glaſs we would have ſaved it, what need we any Water? or if it had been noble or generous Wine, we could have prized ſuch an ingenious knack, and drunk it off. Take away that filthy Water and bring us the gallant Wine. Such diſcourſe as this, let one of thy Friends purpoſely utter, being thereto firſt ſuborned by thee, that ſo thou maiſt the more delight the reſt of thy Friends that are ignorant of theſe things, by thy preſently ſatisfying him that is ſo deſirous of Wine, ſaying, that if thy Friends and Gueſts do deſire better Wine, thou art ready to draw it them. Upon this, thy Gueſts will diligently liſten and deſire to ſee what better Wine thou wilt draw them out of thy Celler. The chiefeſt of theſe will well know that thou haſt not in thy Cellar ſuch variety of Wines.

In the mean while, have ready ſome ſmall Glaſſes which contain ſome Ounces, filled with the concentrated Fires of Salts, and well ſhut and ſtrings tied ready unto them; now when thou haſt a mind to give them a reliſh of thy Art of bettering Wines, and rendring them more generous, command a Cann of common Wine to be brought thee, and give it to thy Gueſts to drink But now when they ſhall perceive that it is the ſame ſort of Wine they had formerly, and that thou haſt not given them any better, thou ſhalt ſatisfie them by the following way.

XLII. *A momentary operation of rendring any common Wine more generous, and exceedingly bettered by the cold Fires of Salts; and that in the preſence of many Men.*

COmmand one of thoſe Glaſſes prepared for this purpoſe to be brought unto thee, and let it down by the thread into the Glaſs full of Wine, which being done, the con-centrated cold that lies in thy little Glaſs, which thou hang'ſt in the greater one of Wine will draw to it ſelf the watery and unprofitable parts of the Wine, and change it into an incipid Ice. And by how much the longer you leave that little Glaſs in your Wine, ſo much the more Water will be drawn there out of, and the Wine will be made the more generous thereby. But the ſooner you take it out, the leſs Water will be ſeparated; ſo that out of one Cann of Wine you may by this means give your Gueſts ſeveral ſorts of Wine to drink, or rather may let them better the Wine themſelves even according to their pleaſure. For by this operation the unprofitable Water being drawn out of the Wine and turned into Ice, is ſeparated and taken away; part therefore of the Water being taken away, the remainder muſt neceſſarily be much more efficacious and more ſweet than it was afore, when it had Water conjoyned as yet with it.

A Maſter of a Family uſing this Artifice may make for himſelf and his Gueſts, divers Wines though drawn out of one Barrel.

Now ſuch a ſecret is not onely full of Curioſity, but alſo of profit, and may prove helpfull and do much good ſeveral ways. I could if need required declare a thouſand conveniencies, and Commodities proceeding therefrom. But becauſe I judge it needleſs to ſpend time in declaring them, I will at preſent mention onely ſome few, remitting the reſt to the following Centuries, in which ſhall be made mention of them according as the [matter and] time requires or permits.

XLIII. *The amending of any midling or ſmalliſh Ale in the Winter Seaſon, as well at Home as Abroad.*

IT ſometimes happens that a Maſter of a Family hath but onely one ſort of Wine or of Ale in his Cellar, the which he is accuſtomed to drink, and puts not in his Cellar any better Wine or Ale either by reaſon of poverty, or elſe becauſe the Cellar lies open to every body, both Men-ſervants and Maid-ſervants, and they will to the beſt Tap, and ſo he fears it will be too chargeable.

But foraſmuch as old Men's Stomachs, when they ſometimes feed on Stock-fiſh dried, or on Martelmas Beef, or Fiſh, by reaſon of its debility through old Age, cannot perform its office of Concoction: The Ale or Wine may by the help of this ſecret be preſently rendred ſtronger, eſpecially in the Winter Seaſon, in which Seaſon a warmer and ſtronger draught of Ale and Wine is more beneficial than in the former months, and then they can better brook the want of the ſame. But ſome may object and ſay, where ſhall I get ſuch a concentrated cold as may enable me to extract the Water out of the Wine? hereunto I anſwer that there will be many that will prepare it for time to come and will ſpare it to others; and yet no body needs ſo great a quantity thereof neither. If a Maſter of a Family hath but one onely half pound of the ſame, he may uſe it his whole life time, if he but keep it ſo as that the Glaſs break not and ſpill it. For when he hath taken away the Water of one or two Pots of Ale or Wine, let him remove the Ice from the Glaſs, and ſet it again in the cold till he needs it. For ſuch a cold concentrating Magnet always keeps its virtues, and is never corrupted, but always fit for the effecting of many wonderfull things.

N. B. If you have not thoſe fires of Salts the heavy Oil of Vitriol, Oil of Salt, or *Aq. Fortis* may be uſed hereabout; but yet theſe Oils do not in any compariſon perform what thoſe concentrated Fires of Salts are able to effect. But however they demonſtrate the thing it ſelf though they bring no great ſtore of profit, and this any one may eaſily underſtand.

For there is a great difference betwixt the watery and not watery Fires of Salts, any common and ſimply bare Water cannot become ſo cold as the Water of any Salt, and this Salt-water cannot be ſo cold as a common Spirit of Salt, nor can this Spirit by any means arrive to that degree of cold as a concentrated Spirit uſually attains to. So a skin of Leather is never ſo cold as Wood, nor Wood as a Stone, nor a Stone as an heavy Metal; the difference proceeding from the thickneſs of the compaction, for verily any thing will concentrate the more cold or heat and fix it with it ſelf, by how much the compacter and thicker body it ſhall be of. For it is the property of a concentrated cold to kill a thing and to make it hard and ſtiff. Contrarywiſe a concentrated heat gives a ſpeedy life, and correction, and emendation, and this experience it ſelf teacheth.

O happy Man is he that can make a Metalline Salt as compact and thick, and heavy as a Metal, and can by conſerving it a due time in the heat of the Fire, that the heat may by little and little and gradually be concentrated and fixed therein, make it fuſile. Without doubt ſuch an one would get a Tincture that would cure the moſt grievous Diſeaſes, and change the imperfect Metals into perfect. For it is the Fire onely that begets a maturity to any thing, and by how much the ſtronger and greater the Fire is ſo much the ſpeedier and better amending of any thing may be expected.

Theſe things which I have here briefly declared are of greater moment, dignity, and weight than any one can believe; and beſides there's no doubt but that there will ſhortly ſome ſtep forth, who will without any fear teſtifie the verity of Art, by changing imperfect Metals and turning them into pure Gold; ſo common will Alchymy become in this Age, which was neither heard of nor ſeen before in this World. Nay more, Men will make this Art ſo familiar unto them that they will not much eſteem even of particular Tinctures.

But why God permits ſuch things to be done, is to us wholly unknown, thus much we ſee onely, that doubtleſs there will follow ſome great change in the World; happy ſhall they be who having the fear of God before their eyes, and are of a pure mind, cannot be hurt by the Devil nor Sin his Mother.

XLIV. *Wherein this ſecret is beneficial to thoſe that travel in the Winter Seaſon.*

NEceſſity doth ſometimes enforce old Men to undertake a Journey in the Winter, which, if no urgent haſt forceth, may be ſo ordered that at Noon and Night quiet reſt may be always taken in ſuch a place in which is plenty of Meat and Drink.

But if ſo be that an urgency of occaſion requires a going on forward, whether one ride on Horſeback, or in a Coach or Waggon, and that either the Snow render the way difficult, or ſome Wheel of the Waggon be by chance broken, and ſo the journying Perſon hindred from coming to the place aimed at in the appointed time, he is ſometimes by this means conſtrained to turn aſide to a poor Peaſants lodging, or if his fortune be a little more favourable, he is neſſitated to Inn in ſome poor Village, where he can neither meet with Wine or good Ale; he now that thus journieth may out of the poor Wine or Ale make himſelf better Wine or Ale, and the better provide for his health if he hath about him, ſuch a magnet in ſome ſmall Glaſs that attracteth Ice to it.

XLV. *What profit thoſe that ſail in the Sea may have by this ſecret.*

IT may ſo happen that a Man taking Ship with hopes of arriving in a ſhort ſpace of time to the end of his Voyage, though he has ſome little of good Wine or Ale, may be enforced if the Wind prove contrary to ſtay longer upon the Sea; his good Wine therefore and his Ale being ſpent, he may make that ſmall Beer in the Ship which the common Marriners drink of, better, and preſerve his own health.

XLVI. *How by the help of this ſecret the unprofitable Phlegm of Brandy made of Corn may be taken away, that ſo it may become equal to the ſpirit that is made of the lees of Wine.*

TO the effecting of this buſineſs there is required a greater Magnet, which may remove that Phlegm then needed to the Wine or Ale, becauſe Brandy is of an hotter nature than Wine or Ale, which do more willingly let go their waterineſs than aduſt Wine is wont to do.

XLVII. *By what means the ſuperfluous wateriſhneſs is to be taken away from the weaker or wateriſher Vinegar, that ſo it may be made ſtronger.*

THE wateriſhneſs of the weaker or more aqueous ſort of Vinegar doth ſuffer it ſelf to be more eaſily extracted by the help of that Ice-attracting Magnet, and the rather becauſe it, *viz.* the Vinegar puts on an Icy form much ſooner than any other Drinks.

XLVIII. *It may be quæried, whether or no this bettering of Wine, Ale, Vinegar, Brandy, and other Drinks, and rendring them ſtronger and ſweeter, may be done in great plenty, or whether it is to be accounted of as a curioſity onely?*

FOR anſwer, verily it is a moſt excellent ſecret moſt aptly ſatisfying the curious inquiry of mortal Men, which the World as yet never knew, and yet it can effect ſuch unheard of things, which it is not neceſſary that they ſhould be divulged.

As touching the plentifull ſeparation of Water from Wine, Ale, or other Drinks [in great quantity] the ſame may be done and that with profit, and in ſome places bring no ſmall gain to him who knows how rightly and artificially to accompliſh the ſame. I have done enough as to my affairs in laying it open; we muſt not boil meat for the ſlothfull and thruſt it into their mouths. Let them get it themſelves if they will, and rightly take care of their own matters.

XLIX. *Whe-*

XLIX. *Whether or no likewiſe a great quantity of cold Fires out of Salts may be eaſily prepared.*

FOR anſwer, yes, ſo great a quantity of them may be prepared as a Man would wiſh for, or as his neceſſity ſhall enforce him to deſire. But becauſe ſuch cold Fires of Salts are the effecters of admirable and incredible things which the World never knew of, therefore the copious preparing and getting of them deſerves to be concealed. Let therefore every one be content with thoſe things which I have publiſhed in the firſt Century: haply in proceſs of time more may follow.

L. *How my* Sal Mirabilis *can free watery Oils of their ſuperfluous humidity.*

MIX one pound of this my *Sal Mirabilis* reduced by warmth into a fine Powder, with ten or twenty pounds of good Oil Olive, or new Linſeed Oil; the *Sal Mirabilis* is to be commixt warm with the Oil, and being well ſtirred about with it, draws to it ſelf all the Water, and ſettles to the bottom of the Veſſel, from which the clear Oil is to be ſeparated by pouring it off; and all the Water and impurity of the Oil is to be ſevered from the *Sal Mirabilis*, that ſo it may be recovered and be again profitable for ſuch like operations.

LI. *The way of taking off the muſtineſs or ſtink from a Veſſel corrupted or grown muſty by lying, that it may be again fit to put more Wine into.*

SMear over the inſide hollowneſs of ſuch a Veſſel with the concentrated moiſt Fire of Salt, that it may be every where wetted, and ſprinkle thereupon ſo much of the *Sal Mirabilis* as will ſtick thereunto. For ſo that cold Fire of concentrated Salt, with the attracted *Sal Mirabilis* will become hard and not run, and ſtick on to the Veſſel; and that ſaid Fire will in a few days ſpace burn up all the mouldineſs and ſtinch, juſt as if the common Fire of Wood had been uſed thereabouts. The Veſſel being waſhed with boiling Water is again rendred fit and convenient to put Wine into.

This operation is not here taught for ſome ſtinking Veſſels ſake that is not worth the while, but to this end, that other ſecrets of greater moment, and which are profitable, may be learned thereby and known. For under theſe operations lie hidden many wonderfull things, and ſuch as the greateſt part of the Readers will not conſider. But to what end is it to light up a Torch before ſuch Men, that are left by God in blindneſs and darkneſs, and hath not vouchſafed to beſtow on them any Eyes.

LII. *The manner of preſerving all kinds of Fruits, Eggs, Onions, and other moiſt Fruits of the ground a long time from corrupting.*

THE ſweet or dulcified *Sal Mirabilis* is to be well dried by the help of the Fire, and being put in ſome Veſſel with Fruits, Eggs or ſuch like, with a thick and cloſe laying [or bed of one upon the other] doth by its drineſs ſo preſerve all things, and by its attracting virtue of all corrupting humidity, that for a long time they feel not the leaſt corruption.

LIII. *Queſtion. Why doth the* Sal Mirabilis, *which Corn has been macerated withall afore its ſowing, and ſome whereof is mixed with the Earth, [or ſown] attract the Rain, coagulate it, and hold it with it ſelf longer than other Salts?*

FOR anſwer, this is to be imputed to its moſt great drineſs which it abounds withall.

LIV. *The preparation of the* Sal Mirabilis, *ſo as that it may become an univerſal Medicine for all Vegetables.*

THE *Sal Mirabilis* as it is of it ſelf, is by reaſon of its corroding virtues which it as yet retains plainly unfit for the multiplication of the Vegetables, for that being ſo uſed would prove more hurtfull than profitable. Upon this account it is neceſſary that to one part of it be added two parts by weight, of the beſt *Calx-vive*, which being moiſtened with Water and made up into Balls, are to be well heated red hot for an hour, that ſo all the corroſivity being introverted the *Sal Mirabilis* may be Alkalizated, and uſed to the Vegetables for an univerſal Medicine; for it conſerves its attracting force, and loſeth it not in the heating red hot.

LV. *What's the reaſon that Wood lying long in the Water wherein* Sal Mirabilis *is diſſolved, is turned into an hard Stone?*

FOR anſwer, this operation is to be aſcribed to the incredible aſtringent property and nature, that the *Sal Mirabilis* is endued withall.

LVI. *To reduce an half dead Tree to life again by the help of* Sal Mirabilis, *that it may revive and begin again to ſprout out.*

MIX with the digged up Earth, with which the Roots of the Trees are covered, one, two, three or more pounds of the *Sal Mirabilis*, according to the bigneſs or littleneſs of the Tree, and again, cover over the Roots with the ſame, and pour upon the Earth it ſelf, ſome Rain-water, that being thereby moiſtned, the Roots may the better partake of the Salt that is mixed with it.

By this means, the Tree will attract to it ſelf the Medicine or good nutriment out of the Salt, and will be cheriſhed and refreſhed juſt as a piece of bread or other food being given to an hunger-ſtarv'd Man reſtores him his ſtrength again.

LVIII. *How by the help of* Sal Mirabilis *moſt hard and inſoluble ſubjects may be very eaſily diſſolved.*

LET the nature and property of a Char-coal of Wood be conſidered, the which is ſuch, as that if it be kept in the greateſt Fire for many years, and all external air kept out from it; it will neither ever melt, nor ever loſe ought of its body, but will come out again in the very ſame form as it had at your putting it into the Fire.

So likewiſe a Wood-coal is able to endure an hundred, yea a thouſand years in the Earth, Water, or even the moſt ſharp corroſive Waters unhurt. This ſo moſt ſharp a tryal, neither Gold nor Silver though they be the pureſt and moſt conſtant are able to undergo. And although a Coal be thus durable, yet nevertheleſs will I diſſolve it in half an hours ſpace, and

and convert it into a red fuſile Salt, which is diſſolvable with Water, and yields a wonderfull liquor which is the effecter of incredible operations both in Medicine and in Alchymy.

LIX. *What* Sal Mirabilis *is to be uſed to diſſolve the Coles.*

THE *Sal Mirabilis* is diverſly prepared, as appears in the ſecond part of *Miraculum Mundi*; but what way ſoever it be prepared by, it may be commodiouſly applied to the ſolution of Char-coals, nor needeth it any farther preparation, but even juſt ſo as it is taken out of the Cucurbit and is as yet corroſive is to be uſed to diſſolve all things.

LX. *The manner of reducing any Char-coal in half an hours ſpace to its firſt matter, that is, into a ſulphureous Salt, by the* Sal Mirabilis.

MELT two or three ounces of *Sal Mirabilis* in ſome Pot or Crucible, and throw in a peice of Wood-coal or Char-coal, and cover the Pot with its Cover, and let it flow for one half hour, that ſo the Salt may diſſolve as much of that Coal as it can, and may leave the reſt of it which it cannot diſſolve, undiſſolved. Then pour out your matter and you ſhall find a red Stone of Salt, which being taſted upon the Tongue burns it like Fire, as all Alkaly Salts do. For the corroſive force is inverted by the Vegetable Sulphur, and changed into an Alkaly.

This red Carbuncle being diſſolved in Water yields a green Solution, which being filtred, and let ſtand ſtill for ſome hours, appears of a white colour, and being let alone quiet longer, acquireth a yellow colour. One drop thereof gilds over an imperial as Sulphur does, if it be therein put. For the Char-coal is no other thing but a Sulphur of the ſame nature as the Mineral Sulphur is of, and penetrating all the Metals, ſuffers it ſelf to be fixed with them, and doth after another manner perform all thoſe things that the Mineral Sulphur is wont to do.

The very well skilled *Sendivow* in his Dialogue concerning the Sulphur of the Wiſe Men, ſaith he is ſtrongly guarded, and ſits Captive in a dark Priſon, and is not eaſily freed; but Salt gives him a deadly wound.

A Sulphur therefore ſits in this black Coal in a dark and obſcure Priſon, ſhut up with ſtrong Bands, and is a Captive, nor can any one free him from thoſe Bands but onely Salt. But being once releaſed out of Priſon, he is wont to come in view, and not before.

Thus now have we brought forth Sulphur out of his obſcure Body. And now will we alſo bring him forth to publick view.

LXI. *How the Vegetable Sulphur is to be made viſible.*

IF you pour into the white Solution of the Coals ſome Acidity, as Vinegar, Spirt of Salt, of Vitriol, or ſome *Aq. Fortis*, and that leiſurely and by little and little as much as is requiſite for the killing of the *Sal Alkaly*; the Sulphur will ſettle to the bottom like a white Powder, which being ſeparated from the Salts, and waſht with fair Water, and dried, will burn and exactly anſwer to the virtues of the Mineral Sulphur.

LXII. *Another way demonſtrating that a Mineral Sulphur lies hidden in all Vegetables.*

PUT this green or white juice of the Wood or Coals expreſſed or ſqueezed out by the Salt, in a Glaſs Cucurbit upon ſome *Sal. Armoniack* powdered, put on an Alembick and draw off all the moiſture by Diſtillation, in which Diſtillation the ſpirit of the *Sal. Armoniack* will bring over the Helm, the Vegetable Sulphur of a golden colour. It is a moſt penetrative Spirit and of wonderfull efficacy in Alchymy and Medicine, and this will eaſily be credited by him, who knows its penetrating and graduating virtue and property, in which it excels all other penetrative Spirits, you muſt keep it very warily becauſe it eaſily vaniſheth.

LXIII. *There is yet another way of making the ſame Sulphur of Coals viſible.*

WHEN you have poured out our Carbuncle out of your melting Pot, beat it into Powder and mix therewith half its weight of *Sal. Armoniack* powdered, draw off by a Glaſs Retort, both matters exactly commixt by Diſtillation, that the *Sal Armoniack* may bring over with it that Sulphur. Waſh off this red matter drawn out by Sublimation, with common Water, the which being freed from the *Sal. Armoniack*, is a Sulphur inclining from its reddiſhneſs to a yellow colour, and is altogether like to the Mineral Sulphur.

LXIV. *There is likewiſe another way of extracting the ſame Sulphur out of Coals.*

FIrſt of all, exactly melt the Coals by the *Sal Mirabilis* in a melting Pot, that the Salt may be accurately Alkalizated by the Coals, and burn the Tongue like Fire. Then pour it forth and beat the Coals into Powder and put them in a Glaſs, and pour upon them Spirit of Wine freed from all its Phlegm. Then ſet the Glaſs in warm Sand and ever and anon take it out and ſhake it well that the Spirit of Wine may extract the Sulphur, and leave the Salt untoucht. Your Spirit being as red as bloud, pour it out into another Glaſs, and again, pour on more Spirit of Wine upon the matter, and repeat the former operation; theſe pourings on, and cantings off are to be ſo often repeated, till the Spirit of Wine when poured on will extract no more. Put all theſe red extractions into a Glaſs Cucurbit, and ſeparate the Spirit of Wine by a B. and it will leave behind in the Cucurbit a ſweet Oil of the colour of bloud; a Medicine of ſo great moment in all Chronical Diſeaſes, as that none is to be preferred afore it. For this Sulphur is far better than the Mineral Sulphur, which for the moſt part is mixt with ſome Arſenical property, whereas this is extracted out of the Coals of Wood, and is therefore far purer and neceſſarily more conducive to Man's health.

And as touching the whole operation of this precious balſamical Sulphur, which is but little inferiour to potable Gold, the chief knack of duely making it conſiſteth in this, *viz.* that the *Sal Mirabilis* be well and accurately Alkalizated by the Coals. For if not, the Spirit of Wine would diſſolve the *Sal Mirabilis*, and would not extract the Sulphur, nor would it anſwer thy wiſhes, if it be not deprived or deſpoiled of all its humidity.

He

He that ſhall be well skilled in the due handling of this Operation, will obtain a moſt excellent Medicine not much inferiour to potable Gold, of a ſweet and pleaſant Taſt, and of an admirably gratefull Odour and Colour. By ſuch a means as this, is extracted out of a dead Herb, or dead Wood, its greenneſs in the firſt Solution made by Water; and after the Extraction with Spirit of Wine, the moſt delicate red Colour thereof, with a moſt ſweet vegetable Odour; all which lay hidden in the black Coal, and are again brought forth to light.

The uſe of this moſt delicate Oil of Sulphur is not ſmall both as to the metalline Operations and other Arts; and this ſo ſpeedy a putrefaction and revivification of the dead Vegetables into a living medicine carries in its Intrails a great myſtery.

LXV. *It may be demanded, whether or no the Coles themſelves are to be onely made uſe of for this revivification of the dead Vegetables, and not the green or dry Wood they are made of, and the Herbs too, may alſo be thus dealt with.*

FOR anſwer, even the Herb it ſelf, or the unburnt Wood it ſelf may be changed in a Crucible into a red Stone by the *Sal Mirabilis*. For the operation tends to the ſame end be it Herb or Wood, green or dry, or made into a Cole.

LXVI. *It may be queried, what Wood or what Herb being changed after that ſame manner by the* Sal Mirabilis, *yields the moſt excellent Medicine.*

FOR anſwer, the Woods that are weightieſt do excel all others; for they are riper and have in them a better Sulphur, than thoſe Woods or thoſe Herbs have which are lighter, and grow up in half a years time, the older the Trees are, the more fit for medicine they are; ſuch as are the Roots of Vines, Juniper, Box, Beech, Oak, Cedar, and ſuch like.

LXVII. *A Demonſtration, that out of dead Herbs and ſuch as are again reſtored to life, may new Herbs be produced without the addition of the Seed of other Herbs.*

FILL ſome Pots with ſome Fertile Earth or Clay, void of all Herbs or Seeds, and moiſten it with the green or white Juice of the Coals. If now you expoſe theſe to the Sun and Rain, there will ſpring up thencefrom divers new and unknown Herbs.

LXVIII. *How by the help of* Sal Mirabilis, *Metals are to be diſſolved by the dry way, and to be converted into moſt excellent Medicaments, and firſt of Gold.*

WHEN you would make your trial of Gold take a piece of golden Money, and bow it, and add thereunto ſo much *Sal Mirabilis* as may be 5, 6, or 8 times the weight of the Gold. Melt it in a Wind Furnace, and pour it out into a Veſſel fit for to receive molten Metals; and you ſhall find your Salt to be of a purple Colour. If all the Gold ſhould not be diſſolved but ſome part thereof ſhould ſettle to the bottom, ſeparate that *Regulus* from the purple Salt, and diſſolve your remaining Gold in a Crucible with new *Sal Mirabilis*, that ſo all the Gold being diſſolved may colour the Salt with a purple Colour. With this purple Salt may be performed many very profitable things, which appertain not to this place. 'Mongſt which thoſe are chiefeſt which reſpect the emendation or bettering of Metals, concerning which, I will here add onely one Operation.

LXIX. *The graduating of any Iron into Gold by this purple Salt.*

FOR the due performing of this, you are to have ſtone-like melting Pots, and the beſt that can be, ſuch as by no means may drink in the Salt, or let it run through, for that the Solution of the Gold with the Salt is otherwiſe wont to hide it ſelf in ſuch Pots as are not ſtrong enough.

If thou canſt not get ſuch, 'tis better for thee to abſtain from this labour, than to loſe thy Gold, unleſs haply thou haſt a mind to try the poſſibility of the ſame.

If therefore thou deſireſt to encreaſe the *Quinta*, [or ſmall weight] of thy Gold which thou haſt added to thy Salt, with ſome Augmentation; put two or three *Quinta*'s of Iron bits or pieces into a good Crucible, and having put thereto your purple Salt, melt it very accurately for one half hour, in which time, the Gold will precipitate it ſelf out of the Salt into the Iron, and graduate ſome of it by turning it into Gold. For whilſt the purple Salt doth eat upon the Iron and conſume it, it doth together therewithall make ſome of it participant of a golden Nature by graduation.

I do not inſert this Operation here, to the end that by the help thereof a Man ſhould think of getting Maſſes of Gold, no; for the ſole end of my propoſing it was this, that I might confirm the poſſibility of the thing by ocular Demonſtration.

Now as here the Iron is graduated by the help of the Gold or golden Ferment, into Gold; ſo likewiſe may Copper be graduated and exalted into pure Silver; by the application of a ſilvery Ferment, as followeth.

LXX. *The manner of exalting Copper into Silver.*

DIſſolve Silver in a Crucible by the *Sal Mirabilis*, made of Salt-peter and Oil of Vitriol; in which Solution you ſhall get a green Salt, fit for the graduating of Copper into Silver, after the ſame manner as we taught but now of the Gold.

And albeit the Silver augmentation be not ſo great, yet the poſſibility of the Art is thence apparent and demonſtrateth, that one Metal admits of being converted into another. But yet he that has good skill in handling this labour, will, if he be fraught with good and apt Crucibles, which can hold the *Sal Mirabilis* and not ſwallow it up, receive no ſmall benefit by this ſame Operation. The *Scoria* which are remaining in this, and the precedent Operation are not to be thrown away, but to be mixed with Litharge, that ſo being reduced by blaſt, they may graduate the Lead, and enrich it with no contemptible Portion of Gold and Silver. For great are the Vertues of this Salt in graduations, which the Ancient Philoſophers have openly enough hinted at, ſaying that their Salt augments the redneſs of the Gold and whiteneſs of the Silver, and that this is a thing moſt true, he who ſhall in a due manner perform the Operation will learn that ſo it is, by his own Experience.

But leaſt an Errour ſhould be committed and ſome of your Gold and Silver loſt, it is better that a Man exerciſe himſelf in making his Experiments in the leſſer Metals; and omit the dealing with Gold and Silver ſo long till theſe leſſer Metals make him a

ſufficiently experienced Maſter for the dealing with the greater.

LXXI. *How Iron may be exalted into Copper in the melting by the help of* Sal Mirabilis.

DIſſolve one or two whole Lots of Copper in melting it by *Sal Mirabilis*, which Solution will yield thee a Salt enclining from a green, to a black colour.

Into the ſame Pot which contains your Copper diſſolved by the *Sal Mirabilis*, put three or four Lots of bits of Iron, and adjoyn them to the Copper diſſolved in the *Sal Mirabilis*, and force it with the Fire, ſo that they may be kept in flux together for one half hours ſpace. By this means the diſſolved Copper will adhear to the Iron by precipitation and exalt ſome particles of the Iron into Copper. All being well molten, pour it out into your Cone that the Copper may ſettle in a *Regulus*. The *Sal Mirabilis* and Iron being turned into a *Scoria*, are uſefull for the inriching of Litharge, in the ſtrong melting by blaſt, with Gold and Silver.

N. B. If the Mercury of Saturn be mixed with theſe, or elſe with thoſe other *Scoria*'s which were left by the Gold and Silver and are far better, and ſo be melted together with a ſtrong Fire, the Lead will be bettered and that by an encreaſe not to be contemned, and will abundantly pay for the labour and coſts. But yet I would not put any one upon the undertaking of this work; except he be well verſed with meltings in Crucibles and without them, by the Bellows upon Hearths. For I write not theſe things for young Beginners, but onely for ſuch who well know what belongs to the Art of melting.

But yet that he may have ſome manuduction into theſe labours, I will declare the general uſe of the *Sal Mirabilis* in the emendation of Metals.

LXXII. *The univerſal uſe of* Sal Mirabilis *in the emendation of Metals.*

THough the wonderfull Salt of Art diſſolveth all Metals, and conjoyneth them in a ſpiritual manner as it were, and renders them efficacious to better each the other in the Fire, yet is there a difference to be obſerved in that thing, by him who deſires to follow the neareſt way, and to decline all diverſions, or goings about. For example.

He that has a mind to diſſolve and conjoyn the Metals, Gold, Silver, Lead, Copper, Tin, and Iron, by the *Sal Mirabilis*, that they may diſplay their virtues in operating to the perfection of each other, muſt take for the Gold, Iron, Copper, and Tin, ſuch a *Sal Mirabilis* as being prepared of common Salt doth eaſily diſſolve thoſe Metals. But now the ſame Salt uſed about Silver and Lead, would effect nothing as to their Solution, becauſe there is no familiarity or friendſhip between common Salt, and Lune, and Lead, for it is an enemy to thoſe Metals, kills them, and reduceth them to nothing.

N. B. But when thoſe Metals are by the help of Salt reduced into their Mercuries, then may it come ſo to paſs, as that they may be conjoyned with Gold, Iron, Copper, and Tin; for without a foregoing preparation, they enter not into the Salt, unleſs the *Lune* and *Saturn* be diſſolved in that *Sal Mirabilis* which is prepared of Niter, and be adjoyned to the Solution of *Mars* and *Venus*; of which Solutions the one doth very willingly embrace the other, inſomuch that one Metal doth eaſily operate upon the other, and conſequently a profitable graduation, fixation, and emendation ſucceeds.

But now if you would have your Metals, not conſtant in the Fire, but volatile and made flying, then, that *Sal Mirabilis* is to to be uſed, which is made of Salt Peter or Kitchin Salt, by the help of Sulphur.

This is the univerſal uſe of *Sal Mirabilis*, ſerving for the Solution, Graduation, Fixation, and contrariwiſe Volatiliſation, or the converſion of all Metals into a volatile nature. But the ſpecial Solutions, Fixations, or Graduations of them by the Salt of Art, require an addition of ſome Vegetable Sulphur, which being adjoyned to the Metal, yields ſome help to the *Sal Artis* in the Graduation of a baſer Metal, which help the conjunctions of Metals that be of a ſulphureous nature, do not at all need; though indeed 'tis better if you help them with ſome Vegetable Sulphur. For Sulphur and *Sal Artis* are like Male and Female, they bear a mutual love to each other, and beget a rich Off-ſpring; when they lovingly court each other in the Fire, even alone and without the addition of any Metal, and are brought unto perfection. So then, thus by theſe operations may gain and profit be divers ways, and in divers manners gotten, as well particularly, as haply alſo univerſally, (but this laſt way I am not as yet acquainted with.)

All theſe things do ſufficiently, yea abundantly ſhew one the way of arriving by the help of the Salt of Art, to the attainment of ſuch things as are of ſome moment. Enough to the wiſe.

Although that the Metals do admit of a moſt eaſie Solution by the *Sal Mirabilis* in the dry way, yet notwithſtanding, that Solution may yet more commodiouſly be perfected the following way, *viz.* thus, when the Metals are put into the Cucurbit or Retort, in the diſtilling off the Spirit. For whilſt the Spirit is driven off, out of thoſe diſtilling Veſſels, the Metal is diſſolved during the Diſtillation, and remains in the bottom with the *Sal Mirabilis*. But whatever of the Metal remains undiſſolved, is to be removed; but the golden Lunar, Venerial Salt, *&c.* is to be kept for ſuch uſes as it is neceſſary for.

N. B. If ſo be any be minded to pour on again that diſtilled Spirit, upon the Metalline Salt abiding in the bottom he may ſo do, and 'tis profitable; becauſe that Metalline Salt is by this means rendred far more commodious and apter for Tranſmutation.

But that none may err from the right way, it is neceſſary that we firſt ſhew how the Metals (out of which being bettered, Gold and Silver are to be extracted) are to be afore prepared, that ſo they may admit of being the more eaſily exalted and amended. For all things are to be done by the preſcribed method, and to be managed by [promoting them to] their appointed limit and ſcope, if any profit is thence ſought.

Lune and *Saturn* do not by any commixion aſſociate themſelves to the Meralline Salt, unleſs theſe ſame metals be firſt reduced into their Mercuries, concerning which thing we have treated at large in the third and fourth part of the proſperity of *Germany*.

LXXIII. *By what means the imperfect Metals may (by the* Sal Mirabilis*) be turned into perfect ones.*

TAKE of *Sal Mirabilis* four ounces, the filings of *Venus* half an ounce. Put this matter in a ſtrong, double,

double, and well covered Haſſiack Pot, ſet it in a wind Furnace, melt it ſtrongly for half an hour, that the *Sal Mirabilis* may rightly diſſolve the Copper and make it ſpiritual. To this Copper thus made ſpiritual, add half a part in weight of the Mercury of Saturn, and melt together both metals by a repeated melting, for an half or even an whole hour. In this conjunction and operation, the ſpiritual Copper will get to the Saturn by graduation, no ſmall bettering and fixation. For by how much the longer they are kept in flux, ſo much the greater amendment doth Saturn purchaſe. But yet no *Regulus* can thus *per ſe* ſettle to the bottom, unleſs ſome Iron be added in the melting, concerning which, no certain weight can be preſcribed. For when ſome ſmall bits onely thereof, or ſome little particles are put in the Crucible, the Salt is mortified by corroding of the Iron, and lets fall the amended Lead which in the Cupel leaves the Gold and Silver.

This way ſhews you the manner of uſing the *Sal Mirabilis* for the amending of metals.

N. B. Other metals may alſo be rendred ſpiritual by the *Sal Mirabilis*, by which not onely *Saturn* but likewiſe *Luna* may be graduated, or exalted to a golden degree. But yet *Saturn* is more commodious and fitter for this operation than *Luna* is. For when the *Mercury* of *Saturn* is graduated and reduced, there needs no other labour than the ſeparating of that *Regulus* on the Teſt, where the Gold and Silver is left behind in the Cupel. But if the *Lunar Mercury* be amended by graduation, and precipitated into a *Regulus*, it is firſt to be ſeparated by Lead in the Cupel, and afterwards the Gold and Silver are to be ſeparated by *Aq. Fortis*; ſo that there is requiſite a twofold labour, which in the operation by *Saturn* is but one; and therefore it is to be preferred as to theſe operations before *Lune*.

N. B. All ſuch ſubjects as have a graduating virtue, as *Lapis Calaminaris*, *Hematitis*, *Smiris*, *Granate*, *Talk*, &c. may be uſed to theſe labours. But however Gold is the beſt of all, which if ſo be that any one is minded to uſe, it behoves him to be furniſhed with ſuch Pots and Crucibles, which do not drink up the Gold, and ſo rob you of more than the produced gain amounts to.

Thus have we demonſtrated the uſe of the ſimple *Sal Mirabilis*, in the bettering of metals.

If ſome Sulphur be added to the *Sal Mirabilis*, it exalts the metals with a far more profitable graduation, and brings more gain than that ſingle operation, which is inſtituted by the *Sal Mirabilis* ſimply and alone *per ſe*.

LXXIV. *The manner of conjoyning Gold contrary to its nature, with any burning and Volatile Vegetable Sulphur, and of amending the other Metals, all done by the help of my* Sal Mirabilis.

Every body full well knows that there is no affinity or familiarity betwixt burning Sulphur and Gold, which is a fixt Sulphur; foraſmuch as they are exceedingly inimicitious to each other, and yet this enmity may be at length changed into the greateſt amity.

For 'tis uſual with all ſuch as are wont to ſeparate molten Gold from Silver by precipitation, to uſe common Sulphur about that precipitation, which by its innate Antipathy thruſts out the Gold from the Silver; the ſame thing is likewiſe done in the moiſt way, when the ſame Gold is precipitated out of *Aq. Regis* or Spirit of Salt, by ſulphureous Salts, ſuch as are Crude Tartar, Salt of Tartar, Spirit of Urine, and other Alkali Salts.

Theſe are to ſhew that Gold hateth and ſhuns Sulphur worſe than any thing, as being its Capital Enemy; and yet theſe moſt bitter enemies doth the *Sal Mirabilis* eaſily reconcile and convert this ſo great an enmity into ſweet friendſhip. This operation hiding in its Bowels great Myſteries deſervedly, and by all right lies hidden to this ungratefull World, if theſe Myſteries could be excepted which fell into the hands of mine enemies, in my Laboratory, unwittingly to me, who without any regard had to the Writings given me by way of an Oath under their Hands, do now make merchandiſe of ſuch ſecrets, and ſo baſely abuſe my good Will. Although the manifold uſe of this great Treaſure hath eſcaped them, upon this account it hath ſeemed good unto me to reveal unto the whole World, thoſe things that fell within their reach, that ſo it may be known to all, that ſuch great ſecrets proceeded from me onely, and not from others, nor from thoſe mine enemies themſelves.

Take one *Quinta* or ſmall weight of Gold, more or leſs, reduce it into thin leaves or plates, and bow them in the faſhion of a Cilinder, and add thereunto ſix, eight or ten parts of *Sal Mirabilis*, which matters you muſt melt in a Crucible with an accurate and ſtrong fuſion: When they flow, throw in ſome pieces of Coals into the Salt and Gold as they are melting in the Pot, that the *Sal Mirabilis* may diſſolve the Gold and Coals in the melting, which uſually is done in half an hour or thereabouts. The matter being poured out will ſhew you whether or no you have well operated for all the Gold, as likewiſe the *Sal Mirabilis* and Coals will be diſſolved and changed into a red Stone, that bites the Tongue as if it were Fire.

This Fire and red Stone, is the golden Carbuncle of the Ancients, for it ſhines in the dark like a burning Coal, and produceth ſuch wonderfull effects in Medicine and in Alchymy, which we have no mind at preſent to reveal. For this Gold being thus conjoyned contrary to its nature with Sulphur and Salt, is by that means unlockt, opened and prepared; as that it may by an eaſie buſineſs [or labour] be made ſpiritual, and that divers ways by divers *Menſtruums*, either Acid or Urinous, and be diſtilled over the Helms, and the pure ſeparated from the impure.

And albeit that I here make uſe of no Circumlocution and ſpeak no plainer, yet have I ſpoken enough to the Wiſe, and have ſhewed them ſuch a way to go in, as that whereby they may without labour, as 'twere arrive to the moſt happy and wiſhed end, unleſs God for ſome ſingular cauſes prohibit it.

But that I may not altogether ſhut the door of Art upon the Son's of Art, I will teach them the making of a moſt excellent Medicine out of this Carbuncle.

LXXV. *The way of making a moſt excellent Medicine out of the Carbuncle of Gold.*

THIS Carbuncle is to be beaten into Powder, and the beſt Spirit of Wine is to be poured thereupon, which may extract the Tincture. This tinged Liquour is to be poured off into another Glaſs, and more freſh Spirit is to be again poured upon the matter, that it may again extract in the heat more Tincture; theſe Labours you muſt repeat ſo often till

till all the Tincture is extracted, and the Spirit will be no more coloured. The Spirit being drawn off by distillations in a Bath leaves behind a most red Tincture in the bottom, in the form of a Liquour named *COS*, for here are present, *Colour*, *Odour*, *Savour* or *Taste*; the Colour and Odour from the Gold, and Sulphur; the Savour from the Salt. The remainder which is left after the Extraction of the Tincture is not to be thrown away as unprofitable, but to be converted with new *Sal Mirabilis*, and Coals made of Vine wood into a red Stone, by fusion, and to be so long extracted till all the Gold be converted with the vegetable Sulphur into a Medicine. For one onely labour serves not to extract the whole Gold by the Spirit of Wine; but the oft repeated labours attain to the end proposed.

Thus hast thou friendly Reader a Medicine of great moment and of great efficacy, in which the most pure parts of the Gold and of the Vine are conjoyned, nor can they be other than a most profitable Medicament for men and metals.

LXXVI. *How by the help of this Medicament, there may be conferred on the Seeds of Vegetables, such an excellent faculty of growth, that they may be as it were seen grow, and may obtain a much nobler Nature, Colours, Savours, and Vertues, than they are wont to get out of the most stinking Dung.*

MIX with one part of fat Lome, Clay, or Earth done into Powder, four parts of Sand, that so the fatness of the Earth may be somewhat allayed. With this mixture fill a Pot, such a one as the Gardeners are wont to keep their Flowers in; pour thereupon some Rain-water wherein is mixt [or dissolved] a little of that Medicament made of the Carbuncle, and plant or sow in that Earth some of those Herbs which abide unhurt by the Winters cold. Set the Pot with the implanted Herbs to the warm Air, but so, as that no Rain come at it, for the Rain may wash away that medicinal nutriment. When the Earth becomes dry, you must pour on more of the Medicine prepared of the Carbuncle, and that so often as need requires. So will the Herbs begin to grow, which if they meet with no other nutriment besides the Rain-water, they cannot attract any other whereby their faculty of growing may be promoted and encreased. And for as much as the Golden medicament was adjoyned to the Rain-water, the Herbs must necessarily draw it to themselves together with the Water, and obtain other properties than if they grew from the stinking Beasts Dung.

N. B. Under your Pot that contains your Herbs is to be put a Dish made of good and firm Earth, or else of some Metal, which may serve to catch the medicinal Water, that flows through the bottom of the upper Pot, or distills thence, and having received it may not drink it up but conserve it. Besides, it would not be amiss if some of that medicinal Water were put in the under Platter, which might always keep the bottom of the upper Pot moist, and so may supply the Herbs with an uncessant nutriment. It would be better also, if the Pot it self were made of some Metal and not of Earth, that so it may not drink in that precious Water, but rather conserve it.

LXXVII. *What is to be observed in this Operation, that a good effect may proceed from thence.*

IN the first place, diligent heed is to be taken, that the Lome or Earth you take, partake not of any salt faculty, nor hath any other corrosive Property, for many such Earths there be which would hinder and spoil the faculty of growing.

Secondly, there must regard be had to the moistening of the Earth, lest the Seed be choked with too much humidity, or in defect of sufficient moisture, dry up and wither.

Thirdly, there must be observed a measure of the Medicament it self, that neither too much, nor too little of the same be commixt with the Rain-water. For an overmuch quantity thereof burns up the Seed, and a more sparing Portion cannot yield nutriment enough to the Herbs.

Farther, some Musk or other things that emit a fragrant Odour may be therewith mixed, which addition is wont to get to the Herbs a most fragrant Odour. If so be a man fears to apply the aforesaid precious Medicament to this Operation, because of the Costs of the same, he may use that Tincture which we taught a little afore, to prepare of Coles onely without Gold; and which indeed will perform all those things, (as in reference to the growing faculty) which that Golden medicament is wont to perform; this onely excepted, *viz.* that the Herbs will not partake of that golden Property which they obtain by that Golden medicament.

The things we have here written and published concerning the promoting the faculty of growth in golden Herbs, though they seem not of any great moment, yet hide they under them mysteries of great moment, the which many Artists will apprehend, and convert unto their use.

LXXVIII. *How any Wood or any Wood-coal may be so prepared by the* Sal Mirabilis, *as to be capable of a long while resisting the Fire.*

DIssove some *Sal Mirabilis* in common Water, put some Wood or Wood-coal therein, let it lye in it for some days, or so long till it be well glutted with the Liquor and become ponderous. Then take it out and dry it very well at the fire, that all the moisture vanishing away may leave the *Sal Mirabilis* in the Wood: Then put it in the said Solution yet again, and take it out and again dry it, which labour will render the Wood so much the solider by how much the oftener it shall be repeated. By this means, all the Pores will be filled with the Salt and the Air wll be shut out, that it can penetrate it no more; without which Air no Wood can ever take fire or burn. If now you put such Wood or such Coals with other Wood and Coals in the fire, these [un-imbibed Coals, *&c.*] will be consumed by the Fire in a short time and be reduced into Ashes, but those others will remain untoucht, and may be taken out unhurt, though indeed even they too will be burnt if they lye over long in the Fire. This is certain concerning Coals, that those that are made of more weighty Wood, and which abound with a greater Quantity of Salt, such as are the Oak, Beech, Juniper, Vines, and other Trees whose Wood is ponderous dure far longer in the Fire than those Coals do which are made of Firr, Pine, Alder, Willows, and such like lighter Trees, and which have a lesser Quantity of Salt, and this now I do not mention barely for fashions sake, but to this intent, that occasion may be given from this kind of knowledge of drawing some profitable matter therefrom; as for Example.

LXXIX. *How*

LXXIX. *How ſuch kind of Woods which are always ſo near the Fire, as that they are ſtill in danger of being burnt, and thereby threaten damage may be conſerved from firing.*

DIſſolve ſome *Sal Mirabilis* in Water, and with a Pencil ſmear over ſuch Wood which by reaſon of its nearneſs to the Fire is always in danger of being burnt. When the Water is dryed up, moiſten it again with the ſame Water, and repeat this moiſtening ſo often, till it hath drunk in a ſufficient Quantity of the *Sal Mirabilis*, and become able to reſiſt the heat. By this means might men be often freed of many fears and cares, in ſhips dawb'd with pitch and in other places, where by reaſon of the too nearneſs of dry Timber there is danger of firing.

LXXX. *How by the help of* Sal Mirabilis *any Wood may be conſerved ſo, as for a long time to remain unhurt in the Water.*

HE that deſires to preſerve Wood, that it may not be detrimented by the Water nor rot in a long time, may be maſter of his wiſhes, the following way. Dry your wood very well, and being dry moiſten it with ſtrong Oil of Vitriol very exactly, and being moiſtened ſprinkle it with the *Sal Mirabilis* beaten into Powder, that it may ſtick well on to the Oil of the Vitriol. For the Oil of Vitriol doth in its penetrating of the wood carry in the Salt thereinto, and makes in the outſide thereof every where about a black Cruſt, juſt as if that wood had been burnt by the Fire. Now becauſe Coals reſiſt putrefaction, it muſt neceſſarily follow that the wood being in that wiſe ordered muſt remain a long time unhurt in the water.

LXXXI. *The Preparation of the* Sal Mirabilis *for this Work.*

THere ariſeth no ſmall difference amongſt the Salts themſelves from the different way uſed in making the *Sal Mirabilis*.

If the Oil of Vitriol wherewithal this *Sal Mirabilis* is prepared, be not by reaſon of the ſuperfluous humidity ſtrong enough, any one may eaſily conjecture that a good *Sal Mirabilis* cannot be made thereof, becauſe the Kitchin Salt would receive therefrom but little alteration. To prevent this inconvenience thefore, you are to take equal weights of Salt and Oil, that ſo one may be aſſured that the common Salt is well inverted, and made a good *Sal Mirabilis*.

LXXXII. *By what means trial may be made, if the* Sal Mirabilis *be duely prepared, and how it may be fitted for this and other Uſes.*

ITS Colour ought to be white and tranſparent; its figure is in long *Stria*'s or Chryſtals; its taſt is like Ice melting upon the Tongue and yields ſome bitteriſhneſs. Being dryed in the Fire and all the moiſture gone off, it will looſe three parts of its own Body, and retain a fourth Part onely; being diſſolved in Water it will recover thoſe three Parts again.

But on the contrary, if it ſhoot into a ſquare Figure, and hath as yet a ſaltiſh taſt, and being dryed loſeth but little of its weight; it is not worth a ruſh, and ſhews that either the Oil of Vitriol it ſelf was not good, or that there was not enough uſed to the Operation. Theſe things we would not bury in ſilence, that ſo we might well adviſe young beginners, and withdraw them from their Errours.

LXXXIII. *It may be queried, whether the* Sal Mirabilis *ſerves for the uſe of Artificers and Craftsmen.*

FOR anſwer, yes. For this *Sal Mirablis* is not onely able to perform things of great moment, and thoſe too, ſuch as are not common; both in Alchimy and in Medicine; (a rehearſal of which, we ſhall for brevities ſake omit) but withall it may be uſed in other Arts and Handycrafts with great admiration and profit; and this we cannot neither at this time demonſtrate becauſe of the but now mentioned brevities ſake. We will onely ſhew here, that even the pooreſt Husbandman, might (if they knew its preparation uſe it to notable advantage and profit.

LXXXIV. *How every Countreyman may encreaſe any kind of Corn or Seed with a thouſand fold encreaſe, by the* Sal Mirabilis *if he can get it.*

WE have aforetold you, that the *Sal Mirabilis* being ſo, as it is *per ſe*, is plainly unapt for the multiplication of the Vegetables, unleſs that corroſive Faculty be taken therefrom by lime or other *Alkali* Salts, [the which muſt be done] if you would expect therefrom any good concerning this multiplication. Here now will I diſcloſe a buſineſs of no ſmall moment; yet not to this end as if I would perſwade the Countreymen, to get for the future, or afford to their Corn ſo plentifull a faculty of encreaſing. No, no, I well know that they know not how to make the *Sal Mirabilis*, and if they did, yet would they not depart a Nails breadth from their Ancient Cuſtom. For 'tis a common Proverb, Old Dogs are very difficultly tamed; and this, the common Courſe of mens Lives doth clearly teach; wherein you'l find, that a man hardly unlearns that in his old Age which he learned in his Youth; ſo that an Old man doth very difficultly ſuffer himſelf to be withdrawn from thoſe things whereto he hath been accuſtomed when young. Neither is it my purpoſe ſo to do, for as much a I inſert the things here mentioned by me, for this end onely, *viz.* that the poſſibility and wonderous Properties of the *Sal Mirabilis* may be brought out of Darkneſs unto Light, and may be made evident to the whole World.

I would likewiſe be thus underſtood as touching other Workmen, for whom theſe things are not delivered or treated of, that they ſhould deſiſt from their old Cuſtom, and obey my admonitions and inſtructions; but for this end it is onely that I publiſh theſe things, *viz.* that they every one may know that my *Sal Mirabilis* can be an helper to men of all ranks, and alſo may bring even to the Craftsmen themſelves and to the pooreſt Husbandmen, great fruit and benefit.

Now when you hear it mentioned that ſome Grain of Corn is augmentable beyond the uſual Cuſtom, by an unheard of multiplication, it muſt of neceſſity be, that it emit more than one, two, or three Stalks, for as much as ſo few Stalks, cannot yield ſo great an Encreaſe. But now if one Grain is to put forth ſo many Stalks, it is wholly neceſſary that it be done by ſome certain ſingular and ſtrong

 eſſicacy

efficacy of expulſion ; and that too, even preſently and at the beginning when the grain is at firſt ſown in the earth. For whatſoever is not here done even at the beginning, will never be done afterwards

For all the ſtalks that ſpring forth after are ſmall, and quite unfit to bring forth Corn. So then, ſeeing that many ſtalks are to break out at one and the ſame time out of one grain, if an eminent multiplication is expected to follow, then verily 'tis even neceſſary that ſome help be adminiſtred to that ſame grain afore it be put in the earth, that ſo it may plentifully grow and be ſpeedy, in preſently ſending forth even at the very beginning, good ſtore of ſtalks.

The Countreymen know not any thing ſerving to ſuch an operation but onely Dung ; but I do even now again ſay as I have often done afore, that this effect of the uſual and common multiplication ariſeth not from the Dung it ſelf, (as being but the outſide Husk) but from that ſulphureous Salt that lies hidden in the Dung. Hence it is, that by how much the purer and better the Salt is ſo much the ſpeedier and more efficacious an operation ariſeth therefrom. If then, that ſuch a Salt can be made by Art, which performs the ſame that Dung does, it altogether follows that we are able to do the ſame without Dung, and that far better than by Dung, in which the Salt is ſo much dilated, and which (by the benefit of Art) we contract into a narrow compaſs.

I hope the well minded Reader will not be diſpleaſed that I uſe ſo many words here, about the ſtinking Dung of Animals, becauſe I can't indeed uſe in this place any other manner of ſpeaking, ſeeing I intended the laying open of this thing, and therefore am I even compelled to ſpeak of the ſame: For he that minds the publication of any thing, cannot do it, unleſs he ſpeaks of the ſame. And although that Dung may ſeem to ſome finical Men a very contemptible thing, yet notwithſtanding it is the onely and principal *Medium*, by the help whereby our daily Bread and the neceſſary ſuſtaining of our Bodies is had. But as for the ſtinking Dung of Animals, I even remit it to the Dunghill, and return to my *Sal Mirabilis*.

LXXXV. *Whether or no a thouſandfold encreaſe may be had of Corn by the* Sal Mirabilis.

MELT one or two pounds of *Sal Mirabilis* in a Crucible, then throw in ſome Coals and diſſolve them, and reduce them by Solution into a red and fiery Stone ; which matter being compounded by melting of them both, beat into Powder and pour thereupon common Spirit of Wine, that it may wax red by extracting out the Tincture. Pour this out into another Veſſel, and pour on other Spirit upon the aforeſaid matter. And this pouring on and canting off, is to be repeated ſo often till all the redneſs is extracted. By this extraction you ſhall get a ſulphureous Salt, fit to ſteep or macerate Corn withall; becauſe it agrees very well to the properties of that Salt which ſticks hidden in the Dung of Beaſts: Now I uſe Spirit of Wine to the extraction for this cauſe, for that it haſtens the germination or budding of the Seeds even as well as the Salt doth, and enricheth it with an emiſſion of many Stalks. But yet your Spirit of Wine muſt not be over ſtrong, for then it would hinder the faculty of growing, the which thing even the Salt will alſo do if too great a quantity thereof be added to the weaker Spirit of Wine, becauſe it would by burning up the Seed, be an impediment to the faculty of the Seeds growth. It is therefore neceſſary that a good regard be had (in thoſe operations) to a due meaſure. For an overmuch acceſs of any thing is wont to be no leſs hurtfull than a defect or clearly wanting of the ſame.

This is the preparation of the *Sal Mirabilis*, neceſſary for the macerating of Corn, that ſo it may produce many Stalks ; now follows the true and genuine uſe thereof in macerating of the ſame.

LXXXVI. *The true and right way of macerating Corn in the* Sal Mirabilis.

THere are ſeveral kinds of Corn, and of theſe various and different ſorts. Hence is it, that one Seed is longer a macerating than another is; and that becauſe one becomes ſoft ſooner than doth another, or attracts humidities to it ſelf quicker than another, ſo that regard is to be well had to the difference thereof. Rye and Wheat are encompaſſed with thin Skins, and therefore are the ſooner macerated, Oats require a longer time, and ſo doth Barley which has a yet harder Husk than the Oats hath, and therefore requires a longer time for its maceration. But as touching theſe things, every one may find them out by his own underſtanding and often experience, becauſe it is impoſſible to mention all things ſo clearly and perſpicuouſly. But this is a general rule, your Corn is to be ſo long left in ſteep, untill you may eaſily bite it a pieces, for you muſt beware of ſoftning it too much, for then it would preſently putrifie, and by that its putrefaction corrupt and ſpoil all the growing faculty. But experience will inſtruct you far more commodiouſly and more perfectly herein, than a larger deſcription can.

LXXXVII. *The true and right way of ſowing your macerated Corn in the Earth.*

ANY one may eaſily conjecture that if the Corn macerated by the aforegoing way, be ſown in the Fields the uſual way and ſo thick as the Husbandmen are wont to do, it will not ſucceed becauſe of the overmuch thronging and thickneſs by which the Corn would hinder each other and ſo choak themſelves. This incommodity therefore is to be prevented, and ſuch macerated Grain to be thinly ſown in the Fields that they may have room for the freeneſs of Air, and ſo may grow up and not ſpoil each other by a mutual ſuffocation.

Nay rather that the more accurate diligence may be had or uſed about this ſowing, a Man may make him ſome wooden Inſtrument, whereby together and at once many grains of Corn may be ſown in the earth in good order and at a certain diſtance ; concerning which labour I have purpoſed to ſpeak more at large in another place. For ſo no grain will unprofitably periſh, and with one Sack of Corn may be ſown more Ground than ſix, eight or ten Sacks are wont to do otherwiſe ; my too ſhort time conſtrains me to break off my diſcourſe concerning theſe things.

LXXXVIII. *By what means the* Sal Mirabilis *may bring profit to the Dreſſers of Vines.*

IF there could be a good quantity had of *Sal Mirabilis*, and that without great coſts, 'tis without doubt

doubt but the Vines might be made very fruitfull therewithall.

But becauſe they are ignorant of the preparation thereof, who dreſs Vines ; 'tis expedient for them to acquieſce in their Beaſts Dung, or make uſe of that onely for the fattening and dunging of their Vines, which is made of common or Kitchin Salt by inverting and Alkalizating it by *Calx-vive*. Unleſs a man has Vines about his Houſe or in his Garden, and would make them fruitfuller than ordinary. For to make tryal thereof in great Vineyards would be too coſtly.

But yet I will propound another way to the Vine dreſſers, by the help whereof they may get plenty of Wine every year. I have at large taught in my foregoing Writings, and that by various deſcriptions, by what means one may be Maſter of noble and ripe Wines every year, yea even in thoſe times, in which by reaſon of the coldneſs and unſeaſonableneſs of the Air, and the want of the Solar-beams, the Grapes cannot attain their due maturity: and withall, how in thoſe places where they ſeldom or never grow ripe, [they may be ripened] by concentration by the help of the Fire, or elſe by fermentation with their own vinous ſpirit diſtilled out of the Lees, and added to the ſaid Wine ; [having I ſay already taught this] there's no need of repeating it again. Yet nevertheleſs if God lengthen my life out ſo long, I have purpoſed to write a peculiar Book of the propagating and bettering of Wines.

But that I may ingratiate my ſelf with thoſe who not much caring for poor thin Wines, deſire to have ſome noble Wine in their Cellars, I will here reveal a certain ſecret which may not onely refreſh the body and ſpirit of many thouſands of Men, high and low, rich and poor, throughout all *Germany*, yea and all *Europe* too ; but alſo adminiſter them no ſmall profit.

I have taught a little afore, how by the help of the *Sal Mirabilis*, and of the concentrated and cold Fire of Salts, a Man may make his Gueſts different Wines out of one Cup, and therewithall refreſh them ; and I have likewiſe ſhewed, that ſuch a bettering of Wine may be exerciſed in moſt places, with notable profit.

The truth of which thing, it hath ſeemed good unto me to demonſtrate divers ways, for the ſake of my Neighbour.

I have frequently laid open in my Writings ſome excellent ſecrets, and have withall made a diſcovery of the moſt great benefit which one may thereby receive.

But becauſe I have not pointed out with my Fingers where and whence ſuch notable profit is to be gotten, the moſt part could not apprehend or find the ſame, and have therefore rejected the thing it ſelf being it was not ſo perſpicuouſly and clearly laid open, as unprofitable and worth nothing. And now leaſt it thus happen to this ſecret, if I ſhould not ſhew and point as it were with my Fingers, the benefit thereof, and if therefore ſuch ſecrets lying in the dark ſhould not come forth to the profit and uſe of mankind, (which would be a grievous thing and to be lamented, if it ſhould not,) it hath ſeemed good unto me to manifeſt the utilities of the ſame.

LXXXIX. *By what means notable profit may be gotten by my Water-attracting Magnet.*

FIrſt of all, it is no ſmall benefit when the overmuch Water is taken away from the poorer ſort of Wines, with which *Germany* doth every where almoſt abound, and the Wines made nobler, ſtronger, more efficacious, and more durable, and do get a far more acceptable ſavour.

For the unripe and watery Wines are not of any long laſting, but do in a while loſe all their ſavour and all their ſtrength, and become mouldy, and corrupt with lying, and 'tis not ſeldom that they grow tenacious, or ropy, thick and muddy, reddiſh and filthy : all which incommodities doth my Magnet cure in the ſpace of one onely hour, by the drawing away the overmuch wateriſhneſs.

XC. *The ſecond benefit.*

IF the plentifull Vintage or large encreaſe of the Wine ſhould be more than you have Barrels to fill, nothing can be more acceptable than that the Wine may be concentrated by the Magnet, (which draws to it ſelf the Water and turns it into Ice) by extracting the overmuchneſs of the Water, that ſo by this means the more contracted Wines may be laid up the more commodiouſly, and may if not very good, be rendred better.

XCI. *The third benefit, and which is moſt acceptable to all Maſters of Families.*

IF ſo be that the Maſter of the Houſe had a whole Cellar full of Wine, and every Veſſel filled with the like or ſelf ſame noble Wine, without any difference ; then verily the Maſter and Servant would be of equal degree, nor ſhould the Maſter have any prerogative above the Servant. But now uſing the help of the ſaid Magnet, he may have his Wines bettered as he pleaſeth, and have divers VVines in his Cellar, as we taught a little above ; if, *viz.* he ſhall draw from it the unprofitable watery part.

XCII. *Another way of getting profit by the Magnet's drawing the Water out of Wines.*

THE Anatomizing and examen of VVine diſcovers, that in twelve meaſures thereof, there is about one of more noble ſpirit, and almoſt one meaſure of Tartar. The reſidue are nought elſe but an inſipid water altogether like to common water. Now when the Wines are to be tranſported out of the Countries wherein they grow, into more remote places, what need is there of carrying the water with it ſo long a Journey? would it not be better to ſeparate ſome part thereof from the Wine, and ſo tranſport the VVine, and let the water alone, and thereby ſhun a great deal of charges disburſt for the carriage of water into ſuch places as have enough already? would there not redound a great benefit hereby, both to the Buyers and Sellers of Wines? yea verily, I believe that there will not onely redound unto them a great conveniency, but withall a great deal of Treaſure.

XCIII. *There's yet another way of getting notable profit by the ſaid Magnet*, viz. *if the ill taſt and fetidneſs be taken away from the Brandy, uſually made of Corn.*

THere is ſome mention made in what went afore concerning this amending ; but 'tis not done ſo clearly and manifeſtly. I will therefore open it more clearly and more perſpicuouſly in this place.

Mix one part of your Brandy made of Corn, with two parts of common water poured thereunto, that the

the ſtench and ungrateſull ſavour may diffuſe it ſelf into the added water. Having ſo done, you muſt again free this Brandy thus tempered with water by putting your Magnet thereinto, and ſo will you draw therefrom all the ſtinkingneſs, and 'tis juſt as if you had waſhed that VVine, and rinſed off all its filth.

XCIV. *The benefit purchaſed by ſeparating the Water from Vinegar.*

IF you would have benefit by this liquor, the ſame may be done by the ſame reaſon; in thoſe places out of which it is tranſported into other Countries; if, *viz.* the unprofitable water be removed after the ſame manner as we taught to be ſeparated from the VVine.

XCV. *By what means good Wine and Vinegar may be every year prepared by the help of this ſame Magnet, in thoſe Countries in which the Grapes do not ripen.*

ALthough that in all the Coaſts ſcituated upon the Rhine, as in *Rhingovia*, *Moguntia*, *Wormatia*, *Algentorati*; in *Alſatia*, the *Palatinate*, *Franconia*, *Auſtria*, and the Dukedom of *Wurtenberg*, (in which places, the Wines do for the moſt part arrive to their perfection every year) this Art be not ſo very neceſſary; yet nevertheleſs *Saxonia*, *Miſnia*, *Thuringia*, *Suevia*, and *Bavaria* do ſtand in need thereof; in which Countries the Wine doth for the moſt part remain acid, unleſs the Summer hath by a ſingular chance hapned to be very hot. For in theſe places it is no leſs profitable than pleaſant to drink a ſweeter and nobler Wine inſtead of the more acid Wine, if ſo be one could get it by the help of the ſaid Art. Beſides, this ſame Art yields no ſmall profit and benefit in thoſe Countries, in which though the Wine is (as we ſaid but now) wont to be noble. For it may happen that ſome unſeaſonable Weather may hinder the ripening of the Grapes, and that the Vineyards wanting the due heat of the Sun cannot arrive unto maturity. For oftentimes in one and the ſame Countrey, there are divers Wines produced, ſo that one ſort exceeds another in nobility and goodneſs. Thoſe therefore that are good and generous need not the help of this Art, but contrarily the ſmaller and leſs noble Wines want it. Hence I conclude that in all the Countries of the World, whereſoever Wines are made, this Art may be ſerviceable and profitable to any one.

XCVI. *How in thoſe cold Countries*; *as in* Poland, Denmark, Suedeland, Norway, *&c. Which by reaſon of the Coldneſs of the Air admit not of making Wine, there may nevertheleſs good Wine and Vinegar conducive to the health of Man be made.*

THough the Cold may ſo hinder as that Vines will not grow, nor Vineyards be, yet notwithſtanding thoſe places ſo obnoxious to the Cold, have plenty of Apples, Pears, and ſuch like Tree-fruits; whoſe Juice being preſſed out, and fermented, and after the Fermentation, freed of the greateſt part of the unprofitable water, will give a better and more durable Drink, than that which is made the uſual way of Apples and Pears. For this drink cannot laſt long becauſe of the muchneſs of the humidity, but becomes ropy, acid and muddy, and ſo corrupts.

So likewiſe may thoſe Countries that abound with Corn be rendered partakers of moſt excellent and wine-like Drink, which may be uſed and drunk inſtead of Wine, to the great benefit and advancement of the health of the Body; and it is to be thus done.

Firſt of all, let very good Wheat be made to germinate [or ſprout] by ſtewing in ſome gentle heat; [as in making of Mault] then after the ſprouting let it be put in ſome warm Furnace, or in great Coppers, and ſtirred about with ſome wooden thing without ceaſing till it be dryed. In this Operation you muſt have an eſpecial care, that the Corn ſmatch not of the Fire, which is then brought by drying to a ſufficient hardneſs, when it is not ſoft in biting it with your Teeth, but leaps as 'twere in pieces; this is a ſign that you have done your work well. Having prepared it thus, let it be broken [or ground] and boiled after the manner of other Ale, without Hops; and then after it has fermented let it be freed from its ſuperfluous moiſture by our Magnet. So will you have remaining a ſweet Drink not much unlike to VVine; which Liquor if you would yet have more near in its likeneſs to VVine, you muſt put in for every Tun or every Butt about a pound of Tartar in the Fermentation, that ſo it may ferment together with the Corn, and may give unto this Drink a winy Taſt.

After the ſame manner may excellent Metheglin be made of Honey and Sugar, or ſuch a kind of Drink as but little differs from the Savour of VVine. An Art, verily, moſt profitable in thoſe places which have no VVine, but have that defect ſupplied by the great Quantity of Honey and Sugar. The manner of making ſuch a kind of Drink is this.

Let there be added to the Honey ſo much water as is ſufficient, for their boiling together in a Copper, and let them being boiled be diligently ſcummed ſo long till the Honey becomes thick again, and gets a duskiſh or a reddiſh Colour, which is a ſign, that the leſs ſweet, and leſs honied Savour is removed away, by the boiling.

To this Honey reduced to the ſaid thickneſs, let be again added as much water as is ſufficient, that they may be boiled together, and being boiled put up in Barrels. Whilſt it is yet warm ſome Ale-yeſt muſt be added, which being fermented, renders this Liquor ſo ſweet that it is but little inferiour to Wine; moreover it will come nearer to the Taſt of Wine, if a due part of diſſolved Tartar ſhall be added thereunto in the Fermentation, that ſo being fermented together herewith, it may acquire to it ſelf a winy Taſt.

N.B. But here good heed muſt be had, that in the laſt Solution there be not taken too little water, but rather more than is wont to be taken in the making of common Mede. The reaſon is this; becauſe the Honey gets not its due Fermentation, but retains its uſual and a kind of nauceous Sweetneſs, and cannot be made partaker of a winy Savour.

But now, water enough being added, promotes the Fermentation, and cauſeth that it gets its Purity and Clarity much ſooner, and is of an excellent ſweet Savour. After that this Metheglin hath gotten the requiſite Clarity, the ſuperfluous water is to be abſtracted thenceſrom by your Magnet, which water being removed, the remaining ungrateſull Savour of the Honey going away together with the water, vaniſheth, and this VVine of the Honey, gets its ſtrong Spirits from the Honey, and has a winy

winy Savour from the Tartar. If any one be so minded, he may add to the Honey in the first boiling, some Spices, or which is better, may hang them in a little Bag in at the Bung, that so they may be fermented with the Metheglin, and give it a sweet Savour. The Spices are these that follow: Cardamoms one, Coriander two, Orris Roots three parts; the which will give the Metheglin a fine Taste. The Flowers of Elder make it taste just like VVine made of the Apian or Muscadel Grapes. Cinamon and Cloves also do give it a delicate Sweetness. But every one may use such Spices as he thinks best, according as he fancieth this or that Taste. Of such Metheglin is made most excellent Vinegar, which scarce is inferiour to wine Vinegar though of the very best Sort.

XCVII. *Whether or no, there be any other benefit, which our Magnet can bestow.*

HE that shall onely diligently enquire by trials made, will without doubt, find, that such a Magnet as attracteth water, can be profitable many ways; which to treat largely of here, the time will not permit. For because that this Magnet draws out of all Liquors, their superfluous water, it doth certainly bring much Benefit, and manifold Fruits, very many of which, we would here dclare if need required. But the time admits not of any longer dwelling about these things. But yet, however, I will reveal an Art for the Poor's sake who have no VVine growing, nor any money to buy it, and are therefore enforced (but especially in the winter Season) to drink cold water after their hard Labours;) by the help of which said Art they may have good VVine to drink all the year both in the Summer and VVinter months; I mean in those places in which there s plenty of VVine made, and is in the Autumn Season squeezed out with wine Presses.

In all those places in which store of Grapes are prest out with Presses, there is great store of the husks, the which is partly kept for the Beasts to nourish them in the VVinter, and partly thrown away as unprofitable, especially in those Seasons which afford a great Quantity of VVine. But if so be that the Wine Harvest be somewhat poor and not so plentifull, then they pour water upon all the husks or on some part of them, and leave it so for some days, and again press them; and thereby is made a Drink that has some kind of wine-like Savour which is given to the Servants, and other Labourers to drink instead of bare water.

But now in such Years wherein they are thoroughly busied in curing or making much VVine, they have not the time to bestow about making that Drink then. Nay sometimes they have such a deal of VVine that they have not Cask to put it in, but are compelled to give away their smaller VVines to others, aud stuff their Cellars with the more noble.

If therefore the poorer sort would have now and then a good Draught of VVine, they must get them some large Vessels which they must fill with the Offal of the Grapes, and with water poured thereupon, and leave them thus, so long untill the rich People have done with their wine Presses and stowed their VVines in their Cellars. Then may they also press out their second VVines in the rich mens wine Presses, and by the oft-spoken of Magnet separate the unprofitable water therefrom, and so lay up their VVine, the which will last and abide good and durable all the Year about, which it will not otherwise do. For such kind of second VVines dure only (for the most part) but the VVinter and Spring, and part of the Summer, and the utmost time they remain any thing good is but till the Month of *July*, afterwards they grow ropy or musty. But now the unprofitable part of the water being separated, they get a shorter or longer durability according to the moreness or lesness of their Concentration. This advice and secret was I willing to bestow upon the poor that they may also drink good VVine

But they may demand where should we get us such a Magnet, by the using of which we might make our second VVines good? I answer, they may borrow it of the Rich men who have Vineyards, for so long; and when they have done with it may restore it them again; for it is so lasting that it never loseth any thing of its Body nor of its Virtue, but always remains good. The rich men therefore will buy it of the Chymists, the preparation whereof is clearly and perspicuously delivered in my first Century. If now this be done (which I doubt not of) the Chymist by preparing, and the Merchant by using of the same will reap no small Benefit and profit. And questionless, there will be found some men that are studious of new things, who will make trial of this Concentration of Wines in small experiments; that so they may fish out the possibility of the thing. But I know not whether they will exercise this Operation in a greater Quantity or no. For its neither here nor there to me whether they will exercise this Art or let it alone. For this is the natural disposition of most men, they would very willingly get store of gain, provided it could be done without great labour and much trouble. From hence it is certain, that this Art of Concentrating Wines by cold Fires will not be so soon common, especially because I have not here delivered how such a Magnet may be made in great Quantity, and applied to use.

But yet I think I have sufficiently done [or hinted at] those things I have revealed. Let others draw out of their own store too, if they have any thing. More things I could not reveal, for many weighty causes which I count it needless to mention here. Very many men will commit many Errours, e're they attain the right Scope. Verily it would be much better if there were a greater Number of such Persons as readily understood this Art; especially in those places of *Germany* in which the Wines are so acid, that it will make ones Eyes run with water if a bigger Draught than ordinary be drunk to quench Thirst. And therefore in those places Ale is in the most esteem, and indeed it is no contemptible drink, if good, but yet it is not at all comparable to the noble Wine, concerning which noble Liquor these Verses may rightly be pronounced.

With what a lovely gift are all things blest
By th' noble Wine from tender Vines expreſt,
To ſick mens pains it doth an eaſement bring,
It joys the Countrey Peaſant, makes him ſing.
And you ſhall ſee that that man whom to day
By means of Wine lies tumbling in the way,
Will on the Morrow have his t'other lay.

There are many Songs in the praise of Wine, but Ale is not celebrated with any ditty, though it be never so good. Upon this account therefore the noble Juice of Wine is not undeservedly preferred before all the rest, provided it has its due generousness and excelling goodness. But if it be not good, 'tis wholly expedient to help it, lest by keeping its Sou-

riſhneſs and wateriſhneſs it periſh. But filthy covetouſneſs bears too great a ſway upon mortals, inſomuch that there are too many to be found that would rather pour water to their Wine and ſpoil it, than better it by abſtracting of the water.

I have often heard the complaints of Vineyard Maſters in thoſe Seaſons, in which they have had whole Cellars full of ſmall and poor Wines, which have not arrived to ſo much ripeneſs as to be able to be ſold and tranſported into other Countries. Hence comes it to paſs, that if they lie along while and be not drunk up, they degenerate more and more, and become exceeding poor, and at length corrupt by lying and ſo periſh for altogether ; unleſs it happens by chance that ſome years of a more happy Vintage do ſucceed, with which more noble Wines they may mix their ſmall ones, and ſo ſell them off, but yet with a poor profit, becauſe the Merchants are not wont to buy midling Wines, but the very beſt of all. But they may have noble Wine every year by that means that I have ſhewn. For if one eighth part of water were extracted from the Wine, it might have the name of good Wine. But now if a fourth part of that water ſhould be taken away thencefrom it would become far more excellent, for a little water is able to make a moſt noble Wine ſmaller and more baſe, a tryal whereof you may make as follows.

A Hogſhead of rich Wine, containing ſome ſix Reniſh *Oma*'s or *Aulms*, coſts an hundred imperials; yea [ſometimes] more, an hundred Duckets; Now if you take thencefrom one eighth part of the meaſure, and put in the room thereof one eighth part of water, you will find by the taſt, that its goodneſs is ſo much diminiſhed, that that Veſſel will be ſcarcely valued at fifty imperials. But if a quarter part be taken away, and ſo much water put in its room, any one may eaſily conjecture that ſuch a Veſſel filled with ſuch Wine will be hardly judged worth twenty imperials.

So then by this way that I have told, any Wine might be brought to ſuch a nobleneſs by taking away one fourth part onely of its water, that a Veſſel which afore would have yielded but twelve imperials, will afterwards yield three times the price.

By all this that hath been ſpoken may any one eaſily conclude the truth of the true Alchymy, and what incredible benefits may be reaped thencefrom. From this ground I ſay, that that delicate ſup of Wine which I have here taught the preparation of will ſo inflame many, even of the enemies of Alchymy, that they will for the future put their hands to the Coals, and try to get thereby ſuch a delicate Magnet, and to have it by them.

This Magnet will alſo help not a few Alchymiſts themſelves that are in ſtraights and want, and afford them a good Cup of Wine ; whoſe Vineyards, Houſe, and all their ſubſtance, the ſmoak and hot fire hath already driven up the Chimny, and [in lieu thereof] this cold fire will recover them again with no contemptible increaſe. For this Leap-year 1660 is the firſt year ſince the World's Creation, in which the miſerable Coal-blowers may arrive to a way of getting their Bread, if they will but ſtretch out their hands. And that I may be here well underſtood, I don't onely mind the concentration of Wine, for there are other moſt profitable uſes to be found out of theſe cold fires ; which time will manifeſt.

It ſeems good unto me to add by way of an overplus (becauſe I have taught the making of a Cup of good Wine, and there is a great familiarity 'twixt Wine and Corn,) the ſhowing away how one may get a moſt delicate ſort of Bread and of an excellent ſavour, that ſo he may be furniſhed with the choiceſt of Food and Drink.

Let ſome part of the water be extracted by the cold Magnet out of new Milk, that it may be made better than the common Milk. This would be a moſt excellent nutriment for the ſuſtaining of Infants, whoſe Mothers die too ſoon. For every Infant cannot bear raw Cows Milk ; and if the ſuperfluity of the Water be removed by boiling, the Milk (not brooking much boiling) doth eaſily taſt of the fire, which would not be if it were freed of its water by the oft mentioned Magnet, for it would remain ſweet, and be of an excellent Taſt. With this fat Milk, moiſten your Wheat Meal, (which muſt be of the beſt) in the ſtead of water ; and let the Bread be baked, and without doubt the Bread will be of an excellent Taſt, which could not be by the common baking, although that Butter were added thereunto. One may feed upon this Bread alone, without Cheeſe and Butter, becauſe the Cheeſe and the Butter are with the Milk in which they lie hidden, added unto the Bread. Such Bread is ſtrong nouriſhment and far better for filling and nouriſhing than the common ; and in eating thereof one may eaſily commit exceſs, becauſe it notably pleaſeth the Pallat by the ſweetneſs of its taſt. For ſo it happened on a time to me, for eating ſuch Bread as was made up with fat Sheeps Milk I exceeded a mediocrity in my eating. But verily this is wont to happen to ſuch as in their eating and drinking, abuſe the delicate Meats and Drinks, and ſo fall into the hands of the Phyſicians, becauſe indeed the moſt Diſeaſes do ariſe from too much fulneſs and ſurfeiting. And therefore good reaſon is it that a moſt ſpecial regard be had to a mediocrity and temperance in all things.

XCVIII. *How the Water attracting Magnet may be ſerviceable to Phyſicians.*

IN my opinion a Phyſician may very well examine the Urine of the Sick, and Anotamize the ſame, and that more eaſily than by an external bare aſpect or looking-on onely, if, *viz.* he ſeparate and take away therefrom a part of the water by the Magnet. For by this means he will diſcern a great difference betwixt the one and the other part, and know the cauſes and properties of Diſeaſes ; and that far better and more certainly than by a bare outſide view, after the Gallenical faſhion, or by the weight, and by Diſtillation according to the cuſtom of *Paracelſus* and *Turnheiſer* ; But I leave it to every ones pleaſure to enquire which of theſe three ways is to be preferred.

And now follows by way of Corrolary or Surpluſage, a deſcription of certain moſt excellent Medicines to be adminiſtred, for the curing of moſt greivous Diſeaſes both in Men and Beaſts.

XCIX. *The Cure of the Stone in the Reins and Bladder, and likewiſe of the Gout.*

THE Stone of the Reins and Bladder, and the Gout, are judged to be the moſt greivous Diſeaſes, and in very deed they are moſt grievous Sicknelſes, but eſpecially the Gout, which being various and manifold afflicts the Body of Man with moſt grievous Pains. Now for the cure and removal of theſe

theſe Diſeaſes, I will preſcribe a certain and ſafe Medicament, eaſily preparable, and of ſmall charge.

Take one or two pounds of white Tartar, and pour upon every pound beaten into Powder about ſome eight or ten pound of common water, which ſet over the Coals in a well glazed earthen Pot, and boil it ſo long, till all the Tartar ſhall be diſſolved by the water, which you may try if done or no with a clean wooden Spoon, putting it to the bottom and ſeeing if there be any left undiſſolved. In the boiling you muſt very diligently take off the Scum with a wooden Scummer, that ſo there may remain no impurity. After that all the Tartar is diſſolved and that there appears no more Scum, evaporate the water ſo long till a thin skin appears at the top. Then take off the Pot from the Coals, and ſet it in ſome cold place, and leave it there unſtirred for a day, and there will ſtick on to the ſides of the Pot, delicate Cryſtals like a Dye, having a Cubical form. *Paracelſus* calls this mundified Tartar *Ludus*, and that very properly, and without doubt he did ſo, becauſe it gets (after its purification the ſhape of the ſquare Dice. Out of this pure and Cube-like Tartar is prepared an univerſal Medicine againſt all tartarous Diſeaſes, as follows.

If you have one pound of this pure and Cubical Tartar, reduce one pound of Crude Tartar into a white Salt by Calcination; the which you are to diſſolve with ſo much common water as is neceſſary to its diſſolution; filter the diſſolved Salt through Cap-Paper, that you may have your ſharp *Lixivium* freed of all its Fæces. Pour this *Lixivium* into the glazed Pot wherein your pound of the ſaid purified Tartar is, and boil it accurately therewithall; in which boiling the Tartar will be eaſily diſſolved by the *Lixivium*, and be turned with the ſame into a ruddiſh coloured juice; though that your *Lixivium* and Tartar had each of them a white and clear colour. The reaſon is this, becauſe the Tartar is as yet defiled with many hidden and black Fæces, and doth at length after its ſolution with the *Lixivium* render them viſible and manifeſt. Paſs this muddiſh ſolution through a filter, and it will be a yellow liquor, and leave many Fæces in the Philter, good for nothing but to be thrown away, for they are of no virtue more. Verily 'tis a thing worth the admiring, that there ſhould yet be ſo many Fæces left in ſo well purified a Tartar. This liquor being thus prepared is very profitable for the taking away and curing of all kinds of Tartarous Diſeaſes, by being daily uſed, or however, it doth at leaſt ſtrongly tame their violence, but you muſt firſt purge the Body by Antimonial Medicaments, one of which we will preſently ſhew you.

N. B. This Medicament will be yet far more noble, if all the humidity be vapoured away and the reddiſh Salt that is left be diſſolved in good ſpirit of Wine and filtered, and the ſaid ſpirit of Wine be again ſeparated therefrom by a gentle Diſtillation. For ſo by this ſecond ſolution, there will be ſevered yet more Fæces and the Salt it ſelf will get a yet greater purity.

This Salt may be ſafely uſed as a moſt precious Treaſure againſt all the aboveſaid tartareous Diſeaſes; For it expells Urine, and drives out all the impurities out of the Reins and Bladder, and hinders the gathering together, and generation of Sand or Stones in thoſe Members.

But if there be already Stones generated, and that they be not too hard, it conſumes them by little and little, and carrys them off; provided that Antimonial purges be (as we ſaid but now) afore uſed to purge the Body with.

I have in theſe few words taught thee how the *Ludus*, that is, the Dye-like figured Tartar is changed by its own proper liquor Alkaheſt, or its own Alkalizate Salt into a Medicine reſiſting all Tartareous Diſeaſes. The Doſe thereof is a Scruple in Wine, Ale, or other Vehicles, oftentimes every day, or twice at the leaſt, *viz.* Morning and Evening, for ſuch as are fifteen or twenty years old and upwards, and they muſt faſt after the taking of the medicament, for ſome due time.

Such as are younger, from three, four, to ten, or twelve may take at one time, three, four, ſix, eight, or ten grains, according as they are older or younger.

This ſo excellent a medicament have I deſcribed for the benefit of mankind, nor is there as far as I know, a better, though it ſeems to ariſe of ſo vile a Parentage, and be ſo mean. Suffer not thy ſelf to be affrighted by any one, but uſe the ſame boldly, whenſoever neceſſity requires; and firmly believe me that thou wilt not find a better, I do not deceive thee; and the truth hereof will be demonſtrated by its uſe.

This is a quick and wonderfull purification of Tartar, and a changing it into a ſweet Salt, which is neither ſweet nor ſour, but a midling taſt 'twixt both, and it gets a middle nature, from the Acid and the Alkalizate Tartar. Now follows the Antimonial Purge.

C. *An univerſal Antimonial Purge to be uſed in all grievous Diſeaſes, with a very happy ſucceſs.*

TAKE of Crude Antimony, Tartar, and Niter, of each alike, Powder them each apart, commix the Powders, being mixt, put them in a melting Pot or Crucible, and kindle them with a live Coal, that by this kindling they may flame up, and go into a ruddiſh kind of coloured maſs. Your Pot being yet hot ſet it into your Wind Furnace, and melt it, that all your matter may flow in the Crucible like water, then pour it out into your Cone, and being cold take it out, and ſeparate the *Regulus* therefrom, and lay it by for other uſes, becauſe 'tis not ſerviceable for the operation here minded. Now out of one pound of Antimony, you'l have eight Lots, or four ounces of *Regulus*, ſo that of your one pound you will get a *Regulus* of four ounces or the fourth part of the pound. The *Scoria*'s which will be of a reddiſh colour and of a fiery taſt upon the Tongue muſt be again melted in the ſame Pot they were melted in, if it be whole, or in ſome new Pot, and when they flow, put a live Coal into the Pot. The Salt-peter will ſeize upon the Coal, and being occupied about corroding the ſame, will let fall the remainder of the *Regulus* it as yet held up. Then the matters being poured out into your Cone, and cool, ſtrike off the *Regulus* at the bottom with the ſtroke of an hammer, and beat the *Scoria*'s which will be of a red colour and fiery taſt, into Powder, and being thus poudered let the Salts be extracted [or diſſolved] in the heat with common fair water; the which holding in them the moſt pure Sulphur of Antimony do turn the water into a red *Lixivium*, in which is hidden the Medicine that we ſeek after; and is to be gotten thence by the following way. For after that the Sulphur is diſſolved, by diſſolving all

all that will be ſeparated by the Salts or Lye, the Reliques or Remainder are good for nothing.

Having ſo done, diſſolve white and purified Tartar in fair water, in ſome glazed Pot, and thou ſhalt have an acid Solution; being thus hot as it is (for when 'tis cold the Tartar will again ſhoot in it) pour it by little and little into the Antimonial *Lixivium*, and it will debilitate the ſame, ſo that the Sulphur of the Antimony will fall down to the bottom in the form of a yellowiſh or reddiſh Powder When all the Sulphur is ſetled, ſeparate the clear Water of the Salt, from the Sulphur, by canting it off; then pour on ſome warm Water and waſh it ſo often till all the Salt be gone off. Then philter it, that all the Water may be ſeparated and the Powder ſtay in the Philter, which you ſhall put upon new and dry Cap-paper thereby to remove all the waterineſs, and then dry it in the heat of the Sun. This is that Univerſal purging Medicament which drives out all malignant humours by all the Emunctories, *viz.* by Vomit, Stool, Sweat, Urine, and Spittle, out of the whole Body; and that very ſafely if warily adminiſtred, and the Doſe thereof not too much encreaſed; in which caſe even the Galenical medicines themſelves do hurt, if their due Doſe be exceeded Hereupon it is better that there be uſed at the beginning rather a leſſer Doſe than too much, that ſo no errour may be committed, and a ſafe trial may be made, how much the ſtrength of the Patient will bear or not bear. And albeit that the Doſe of this medicament ſhould be given in ſo ſmall a Quantity as not to work, or have any viſible Operation at all, yet nevertheleſs it well performs its Office, and drives out the Diſtempers, but yet more ſlowly than when 'tis adminiſtred in a due Doſe, ſuch as may give about one, two, or three Stools. And to ſuch as are ſtrong and youthfull Perſons, the Doſe may be given in ſuch a Quantity as to cauſe Vomit, in ſuch I ſay as can brook vomiting. The uſual Doſe for thoſe that are above fifteen Years of Age is, one, two, three, four, or five Grains, according as they are older or younger. To Infants and ſuch as are a little elder an eighth part, a quarter, or half a Grain even to an whole Grain, may be adminiſtred, with regard had to the Age and the Diſeaſe. This medicine is of good uſe in all kinds of Diſeaſes, and in all kinds of Men, [and Women] ſave onely Women with Child; and to them you muſt adminiſter either none at all, or at leaſt wiſe ſo little as to be ſure it provokes not to any inclination of vomiting. And the like is to be obſerved by ſuch Perſons who are ſo weak, as that they clearly want ſtrength requiſite for this Operation [of vomiting.] But yet it may be uſed even to new born Infants, *viz.* for Convulſion Fits with which a great many of them are wont to be ſnatch'd away without any remedy. The Doſe muſt not exceed the bigneſs of a Rape-ſeed, and it muſt be adminiſtred in the Mothers milk. But if the Infants are grown already up to be ſomewhat ſtronger and are above half a Year old, the Doſe of the ſaid medicament is to be a little encreaſed, that it may operate viſibly, and ſo caſt forth all the malignant humours out of their Bodies; and they themſelves may not be afterwards afflicted with the Small-pox, and other ſuch like Diſeaſes as Infants are ſubject unto. Verily, all the Children whom I have given this medicine unto, have not hitherto taſted of thoſe Diſeaſes; the which truth the Parents of ſuch Infants and others can confirm by their Teſtimonies. But eſpecially this medicament is a moſt preſent remedy againſt the Epilepſie both in young and old, and a moſt certain Secret in the Plague and all Feavers; and a moſt excellent purge in the Gout, Leoproſie, French pox and other moſt grievous Diſeaſes; and likewiſe in external new Wounds, in Fiſtula's and old Ulcers, what Name ſoever they are called by, if it be but uſed inwardly to purge them. Briefly, this medicament hath ſcarce its fellow, ſo that we have no reaſon at all to regard ſuch men as out of meer ignorance, oppoſe and ſlander Antimony in their learned bawlings, and ſay that it is nothing elſe but Poiſon, and therefore no ways profitable. But let no body believe their barking, but firſt try the ſame, and he will clearly find the contrary.

This indeed I readily confeſs that Antimony is of no uſe in the body of man, nor can it be, afore it is prepared; but after preparation I do boldly affirm it to be a moſt admirable medicine.

Concerning which, reade but the chiefeſt of the Ancient Philoſophers, eſpecially *Baſil Valentine*, who in the honour of Antimony wrote the Triumphant Chariot [thereof.] Do but ſee what *Paracelſus*, *Alexander Suchten*, and ſeveral others have recorded in writing, concerning the incomparable Vertues and Power of Antimony; by all whoſe Writings is clearly evinced, what things lie hidden in Antimony, I forbear to ſpeak of other Phyſicians as well modern as ancient. For it poſſeſſeth the Vertues and Powers of all Vertues and Powers concentrated. What need many words? Let it be brought but to the Teſt, and it will moſt apparantly teſtifie by its trial, what Treaſures it carries in its boſom. The things that I ſpeak of here proceed out of meer pity and love to my Neighbour, that I might help his ſickneſs and miſeries. A very ſmall Portion of the ſaid medicament may be able not onely to preſerve a whole Family for a whole Year free from all the Diſeaſes that might befall them, but alſo to rid them of them. So likewiſe it ſends packing all the ſickneſſes of beaſts by its effectual Virtue. I was willing from a faithfull and good mind to beſtow this comfort and help upon mankind, againſt all incident Diſeaſes, whether external or internal; In the third following Century ſhall be deſcribed more very excellent medicines againſt all kinds of Diſeaſes, which may be made uſe of by ſuch as without cauſe are afraid of Antimony.

And as touching that Salt which is made by the mixtion of the acid Water of the Tartar, and the *Lixivium* made of the Tartar calcined; it is not inferiour as to its excellency and eminency to the but now ſpoken of Sulphur of the Antimony it ſelf; herein onely is the difference, that there is to be adminiſtred a bigger Doſe thereof. And therefore it muſt not be thrown away, but after that the Sulphur is ſeparated, the inſipid Water is to be evaporated, and there will then remain a yellow Salt behind, which has even yet in it no ſmall Portion of the Antimonial Sulphur; and therefore 'tis in a manner better than the Sulphur it ſelf, becauſe of its own peculiar Nature, which by the diſcharging its own office [or proper work,] may be even *per ſe* reckoned up amongſt thoſe moſt excellent medicines which ſtrongly reſiſt all Tartareous diſeaſes.

For that reaſon therefore do I commend this Salt moſt highly to all ſuch as are burdened with grievous Diſeaſes. The preparation thereof is altogether eaſie, for it is not made of any chargeable matters, but mean ones, and therefore not without cauſe to be highly eſteemed of.

The

The doſe of this ſo excellent a Salt is tobe encreaſed or diminiſhed according to the Quality of the Perſons and the Diſeaſes. To ſuch as are of ripe Age, one Scruple or ſomewhat more is ſufficient. To Infants, and to ſuch as are a little older, from one to twelve Grains may be given, regard being had to the difference of their Years. It gently purgeth the belly, without any kind of Danger, it draws out all evil humours, and eſpecially it helps the gouty and ſtony Perſons with a moſt wiſht for Eaſement.

The weight of thoſe two contrary Salts, *viz.* of the fixt Salt of Tartar by which the Sulphur is extracted out of the Antimony, and of the common and acid Tartar diſſolved in Water, and which precipitateth the Sulphur of the Antimony out of the *Lixivium*, cannot be certainly defined and limited. For according to the greater or leſſer Quantity of the *Lixivium*, is required more or leſs of the Tartar water to be poured upon the *Lixivium*, that ſo being mortified it may let go that Sulphur of Antimony it holds up in it ſelf. The *Lixivium* it ſelf will ſhew you if you have not poured on Water enough of the Tartar by its being not yet freed of all the Sulphur, and that there is more Water of Tartar required to allay all its Acrimony that all the whole Sulphur may be turned out. A bigger Quantity of the Water of Tartar poured on the *Lixivium* [than juſt enough] doth not ſpoil it; it takes in as much of the diſſolved Tartar as it can, and what is overplus remains an acid Tartar, and is not changed in its Nature. But whatever of it is diſſolved in the *Lixivium* is no more Tartar, becauſe it becomes a midling Salt of the two, neither acid nor ſweet, but partaking of both Natures, and diſſolves in cold Water, which the acid Tartar will not do.

This Salt therefore is able to perform great matters in medicine, and not onely in medicine but in Alchimy too, and in other Arts can it exhibit abundance of riches; concerning which thing, more ſhall be ſpoken in another place.

Thus finiſh I now this my ſecond Century, wherein I have not onely abundantly ſupplied thoſe things which by reaſon of the overmuch haſt, I could not inſert in the *Appendix* to the fifth Part of the Proſperity of *Germany*, but have withall laid open ſome part of the Uſe of my *Sal Mirabilis*, as much as the ſhortneſs of my time would give me leave to do.

If by the Grace of God I have a yet longer Life vouchſafed me, I will about half a Year hence, bring ſo great a benefit not onely unto my own Countrey, but perhaps even to the whole Chriſtian World, as ever they received from any man, in ſo much that the World ſhall ſeem as if 'twere new, and ſo for the preſent I reſt and make an End.

The Third Century
OF
GLAUBER'S
Wealthy Stoze-houſe of Treaſures.

Wherein many Profitable Chymical Secrets are diſcovered.

Faithfully tranſlated out of the High-Dutch of the Authour.

Courteous Reader,

HAving ſome Years ſince begun to communicate to the World my manifold profitable Inventions in Centuries, but of late been hindred by ſickneſs and other impediments from continuing the ſame: yet now being ſollicited thereto by many Lovers of Art, I could do no leſs than to endeavour to give them ſome ſatisfaction by the publiſhing of theſe; and withall aſſuring them, that, in caſe God be pleaſed to continue my Life (notwithſtanding that becauſe of great Age and Sickneſs I am fain to keep my bed) I intend to compleat the reſt of my promiſed Centuries, deſiring the kind Reader in the mean time to accept of theſe three, and to pardon the confuſed manner of writing them, having for want of leiſure, ſet them down as I found them in my Notes, being chiefly the occaſional diſcoveries and inventions during my Chymical Labours. Neither would I have the Reader offended that in ſome places I break off ſo abruptly, eſpecially where I am ſpeaking of the matter which Adam *brought with him out of Paradiſe, for whatever may be wanting in this fifth Century ſhall God willing be ſupplied in the ſixth: I alſo deſire the Reader not to be moved by the Calumnies of any Envious ignorant Perſons, to think that the things here ſet down (being moſt of them new and unheard of inventions) are mere Fables and invented matters, and no real experimented Truths, but rather remit the verification of them to time and his own Experience, which will not fail to ſatisfie him of the Truth of the Particulars herein contained. Farewel.*

THE THIRD CENTURY.

1. TO waſh common Tartar Snow white in a few hours time, and reduce it to a pleaſant Salt which diſſolves in cold Water, and wherewith of Sugar, Honey, or any ſweet Fruits at all times, yea all hours of the day, and in all places Liquors may be prepared like to Wine in Taſt, ſmell, colour, ſtrength and virtue, and of which afterwards good Brandy and Vinegar may be made with great profit.

2. To purifie common Salt in great quantity, in one days time, ſo as to become very white, pure and tranſparent and of a pleaſant Taſt, ſhooting into cubical Cryſtals fit for the Tables of great Perſons, its taſt being very agreeable, and the meat ſeaſon'd with it much more wholſome than that which is dreſt with the common Salt. *See the Treatiſe of the nature of Salts.*

3. A ſecret to preſerve all ſorts of Wine, and make them durable, whether of Grapes, Sugar, Honey, Apples, Pears, Quinces, Figs, Plums, Cheries, Malt, Wheat, *&c.* and is of great uſe to a Houſe-keeper.

4. Any of the forementioned Wines may with eaſe be turned into very good Vinegar, not inferiour to that which is made of French or Rheniſh Wine. *See my Vegetable Work.*

5. To make good *Sal Armoniack* of ſeveral contemptible matters which are trod under foot and caſt out on the Dunghill very eaſily and in great quantities, ſo as one Man every day may prepare one hundred pound weight of it with ten ſhillings charges. *See my Treatiſe of the Mineral Squill in order to long life.*

6. A ſecret water wherewith in an hours time the yellow colour in Diamonds may be drawn from them, which makes them ten times more worth than they were before. *See my Treatiſe of the Divine Character.*

7. In like manner may the dark red colour of Granates be extracted, leaving them onely ſo much colour as makes them like Rubies. For Granates and Rubies reſemble each other in their bodies and colour, the onely difference between them being, that the Granates abound with too much colour, which makes them leſs valued, when therefore ſome part of their colour is extracted from them, they do in virtue, hardneſs and beauty, equal Rubies, one Karat of which is more worth than ten pound of Granates, ſo as this extraction muſt be very gainfull to him that is Maſter of it. *See my third Appendix to the ſeventh part of my* Pharmacopœa Spagyrica.

8. In like manner alſo may be extracted the colours of blue Saphyrs, yellow Jacinths, Topaces, and Purple Amethyſts, by which means they become white as Diamonds, and when brought to the ſame degree of hardneſs are every whit as valuable as they. *See my third Appendix as before.*

9. In a moments time to rob *Sol* of its colour and make it white as Silver. *See my Treatiſe of the Seal of God.*

10. To ſeparate from *Mars* and *Venus* when diſſolved in Water as well as from any other Vitriol, by means of an artificial Precipitation, their hidden ſpiritual *Sol* or Tincture, and that in a moment; a thing of great uſe in Phyſick, as well as in the tranſmutation of Metals. *See the ſecond Appendix.*

11. To extract *Sol* out of Sand and Stones with great eaſe and little charges, which by precipitation is afterwards ſeparated from the diſſolvent, retaining its former ſtrength, and may be made uſe of again for the like extraction. *See the proſperity of* Germany *the ſeventh part, or* Novum Lumen Chymicum.

12. To extract *Sol* from *Luna* with a ſmall quantity of diſſolvent, which, after precipitation of the *Sol*, remains in its full ſtrength, and may be uſed as before to the great gain of the Artiſt. *See* Glauber's *Laboratory, and proſperity of* Germany, *7th. part.*

13. In one days time to prepare a particular, whereof one part will tinge three parts of *Venus* into *Lune*. *N. B.* This Tincture is a white Stone which being placed in a fit Furnace, and a due fire adminiſtred, within few days the whiteneſs will be changed to a yellow colour, and that into a fix'd red, whereof one part being caſt upon four parts of *Lune* in Flux, exalts it ſo far that in the ſeparation it gives a fourth part of *Sol*. Which ſudden fixation is performed by the proper Agent of the matter which is white of it ſelf, and yet affords a red Tincture, when handled, as is here ſet down. *See my Treatiſe of the ſecret fire of* Artephius.

14. In a ſhort time to prepare a particular Tincture of a red ſubject, which exalts Silver to that degree, as to yield much *Sol* in the ſeparation. *See my explication upon* Pontanus *his Letter.*

15. A good graduating water which being digeſted with *Lune*, makes it yield much *Sol* in ſeparation. *See the Treatiſe concerning the moſt ſecret natural Sal Armoniack every where to be found.*

16. Another graduating water in which Mercury being digeſted, becomes coagulated into *Sol* and *Luna*. *See the fiery Alkaheſt.*

17. Another fixing water, which being once or twice abſtracted from Mercury makes it loſe its property of making *Sol* and *Venus* white, and on the contrary gilds *Luna* when rub'd upon it. I have as yet carried this experiment no further, but am of opinion that if Mercury were long enough digeſted in the ſame, it would turn the Mercury into Tincture, coagulating and fixing each common *Mercury* into *Sol*. *See Haſtecal.*

18. A volatilizing Water which being abſtracted from *Sol* highly exalts its natural colour, and carries it over the Helm, which done it is no more common *Sol*, but may in a ſhort time be fixed into a tranſparent red Carbuncle. *See my third Appendix, &c.* concerning the Griffins Claws, and Eagles Wings.

19. A water of like nature that volatilizeth all fixt matters, wherewith in one ſingle Diſtillation, the Tincture or Soul may be extracted from *Mars*, *Venus*, and all coloured Stones, and carried over the Helm; which Tinctures afterwards with one rectification are highly purified, and have their Medicinal and tinging virtue doubled, which exalted and multiplied Tinctures, notwithſtanding their great volatility may within twenty four hours time be concentrated, by means of a ſecret Magnet, and fixed into a Stone, penetrating all compact Bodies, with which incredible things may be done in Alchymy and Phyſick. *See my third Appendix, &c.*

20. To prepare a Salt in an hours time, and without extraordinary charges, which makes all fixt matters

ters volatile, and is of ſuch virtue that when a little of it is joyned with Spirit of Wine it makes it ſo ſtrong and fiery, that it diſſolves all Metals, Minerals, Animals and Vegetables, carrying their Q. Eſſence over the Helm, and is the effecter of wonders in Phyſick and Alchymy: ſo that he who knows how to prepare and make uſe of this wonderfull Salt, needs never want either bodily health, or a competent ſupply of maintenance. *See my Treatiſe of* Elias Artiſta *in Quarto.*

21. A wonderfull, to all Men known, but withall contemptible matter, which every where may be had for nothing, which whoſoever knows, together with the uſe of it, needs never want, becauſe thereby he may effect whatſoever is neceſſary for Soul or Body. *See my firſt, ſecond and third Appendix of* Pharmacopœa Spagyrica.

22. The manner of preparing a running Mercury out of all Minerals and Metals, and that in one days time, which joyn'd with *Sol* becomes fixed into *Sol*. *See my third Appendix.*

23. How ſuch a Mercury may be prepared in an hours time of the martial *Regulus* of Antimony, without any charges to ſpeak of, which is a true Tincture, fixing the imperfect Metals into *Sol*. *See my Treatiſe concerning the ſecret Fire of the* Magi.

24. A water made of a particular ſort of Chalk which changeth a yellow or brown skin into white, and which cannot be waſh'd off with water, of valuable uſe for Ladies and Gentlewomen. *See my 4th. Century in* Folio.

25. A water prepar'd of *Sol*, which turns white hairs into a yellow gold colour. *See my Laboratory.*

26. Another water made of Silver, which tinges hair cole-black, good for ſuch as are gray hair'd, and endeavour to conceal their Age. *See* Glaub. *Concentrate.*

27. A water made of *Sol*, which colours the hair and skin of Man, as alſo the bones and horns of Beaſt, and feathers of Birds, of a fair laſting Purple. *See* Glauber's *Laboratory in* Quarto.

28. A water into which when any Metal is put, it begins to grow within twenty four hours time in the form of Plants and Trees, each Metal according to its inmoſt colour and property, which Metalline Vegetations are called Philoſophical Trees, both pleaſant to the Eye and of good uſe. Vide *my fourth Century.*

29. A water made of Sand and Flints, having the property of changing Wood that is laid in it, in a ſhort time into hard Stone of ſeveral colours according to the pleaſure of the Artiſt.

30. A dry water, or rather Stone, upon which if any volatile ſaline Spirit be poured and ſet in the Sun, it preſently ſucks in the volatile mineral Spirit and in one days time makes it ſo fixt that it may be made red hot in the Fire, without any evaporation. *See my univerſal Coagulator.*

31. By this means alſo may the combuſtible ſtinking Sulphur, the greateſt enemy of Metals be fixed, which afterwards being caſt upon the imperfect Metals in Flux, doth meliorate them, and make them afford *Sol* and *Luna* on the Cupel with profit. *See my ſecond Appendix.*

32. In like manner may Antimony without any loſs of weight be fixed, ſo as no more to cauſe vomiting, but caſts all evil out of the Body inſenſibly by ſweat, reſtoring health, and renewing youth. *See my proper Agent.*

33. In the ſame manner may Orpiment be fixed, ſo as no longer to be a Poiſon, but a Meliorator of imperfect Metals.

34. Likewiſe alſo may Arſenick be fixed within two or three days time, ſo as it may ſafely be taken inwardly, being an excellent Diaphoretick for the cure of Diſeaſes, and good to exalt Metals, ſo that in ſeparation they afford Gold and *Lune*. *See my proper Agent.*

35. Much after the ſame manner may Mercury, without any conſiderable loſs of weight (though with longer time and more patience) be fixed, ſo as to ſuffer himſelf to be melted and hammer'd like any other Metal, and on the Cupel leaves *Sol* and *Luna*. *See my Treatiſe of the univerſal Coagulator.*

36. In like manner may the martial *Regulus* of Antimony be fixed into a tinging Stone, that meliorates all imperfect metals.

37. A wonderfull Magnet which being put into any watry Liquors or Oils, draws the water to it ſelf leaving the Oils more pure, ſubtile and penetrating. *See* Elias Artiſta.

38. By means of this Magnet, we can ſeparate from the higheſt rectified Spirit of Wine, one half of inſipid water, which Spirt of Wine after this ſeparation is an effecter of wonders.

39. This Spirit of Wine when poured on pulveriſed Coral and thence abſtracted, brings their red Tincture over the Helm, being a wonderfull Cordial and purifier of the Blood.

40. By means of this Spirit of Wine, may the Cordial Virtue of Pearls be brought over the Helm, being of great efficacy for the recovery of ſick and weak Perſons.

41. This Q. Eſſence of Wine being poured upon clean waſhed Egg ſhells, diſſolves them, and diſtilled from them, brings over with it their Stone-breaking and diſſolving virtue, and is a ſingular remedy in the Gout, and the Stone of Kidney or Bladder.

42. The ſame alſo diſſolves the *Lapis Lyncis* and *Judaicus*, as alſo Crabs Eyes ſo called, and other Stones found in Fiſhes, carrying their virtues with it over the Helm. *See my fifth Century.*

43. The ſame Spirit of Wine diſſolves, extracts and brings over the Helm, the inmoſt virtues of all Animals and Vegetables carrying them over the Helm, whence incomparable medicaments may be prepared.

44. Black Snails ſuch as are found in *May* on the Graſs diſſolved in the ſame, and brought over the Helm, and duely exhibited to thoſe that have the Gout or Stone, carries off all tartareous ſlimy matter from the Kidneys, Bladder, and other parts of the Body by Seige and Urine.

45. Aloes, Saffron and Myrrh diſſolved in the ſame, and their Tinctures carried over the Helm, affords an excellent *Elixir Proprietatis*, very conducive to long Life. *See* Paracelſus *concerning* Elixirs.

46. Cantharides diſſolved therewith, and brought over, are a powerfull Diaphoretick, above all others, cleanſing the Kidneys and Bladder, but ought to be heedfully uſed, becauſe it is a vehement Medicine, which being overdos'd will hurt the Kidneys, Bladder and Ureters.

47. The Leaves of Helleborafter, extracted and brought over with the ſame, affords an Excellent *Aqua Vitæ*, conducing to long Life. *See Paracelſus.*

48. Sea Squills being diſſolved in this Spirit of Wine, and ſpiritualized by being brought over the helm, is of great uſe for removing of Diſeaſes, and maintaining of health.

49. *Nux Vomica*, being firſt grated and then diſſolved therein, and their reſtorating Vertue being brought

brought over the Helm, doth wonders in reſtoring the decayed ſtrength and health of man, but muſt be uſed with underſtanding.

50. Common Mercury diſſolved and brought over with the ſame, is the higheſt Medicine againſt the French Pox and all venereal Diſeaſes.

51. Mercury of Antimony prepared after the ſame manner, affords a Medicine againſt all Diſeaſes of mankind.

52. Fixed Antimony thus extracted and brought over is a Diaphoretick curing all Diſeaſes, and reſtoring the higheſt degree of health.

53. In like manner may many excellent Remedies be prepared, out of all Vegetables and Minerals, for reſtoring and preſerving of health.

54. A further uſe of our Water attracting Magnet is this. Abſtract the Oil of Tartar, Hartshorn, Amber, Soot, or that which is diſtill'd from Smiths Coals, and the Magnet will attract all the Water and bad Smell to it ſelf, which remains with the Magnet, and the pure clear and ſubtil Oil, onely comes over, which Magnet being made red hot, loſeth its water and ſtink and may be made uſe of as before.

55. In like manner may the Oil of Wax and Bricks, commonly called the Oil of Philoſophers, be deprived of their bad Scents, and made exceeding penetrative and pleaſant.

56. So alſo may all Vegetable and Animal Oils diſtill'd by retort, be purified and made pleaſant.

57. Likewiſe all the Oils of Herbs, Seeds, Woods and Spices, which with the addition of Water are diſtill'd by a common Still, may by diſtilling them from our Magnet be made much more ſubtil, and their ſweet Smells much more ſtrong and piercing; ſo that a little of theſe Oils ſet in an open Veſſel, perfumes not onely the Room in which it is but alſo the whole houſe, they being ſo volatile that without any Fire they vaniſh in the Air.

58. And as by means of this volatalizing fiery Spirit, the pleaſant and well ſcented Oils of Spices may be greatly meliorated and exalted; ſo likewiſe may all ſtinking and poiſonous Vegetables, Animals or Minerals, thereby be made much more ſtinking and venemous, ſo as their Smell alone will be ſufficient to kill men, doing it with far greater expedition than any Corporal poiſons whatſoever. See *Elias Artiſta*.

59. All well ſcented Oils, may by means of our volatile ſaline Spirit, be purified to the higheſt Degree, and afterwards be reduced to a hard Body: which Body then is no common groſs Body (as being a coagulated Spirit) but a clear, tranſparent ſpiritual pure Body.

60. This Labour may with profit be practis'd on Amber, whoſe Oil being by rectification made clear and tranſparent, and then digeſted with our fiery ſalt Spirit, becomes hard again as it was before diſtillation; by which means we may make pieces of Amber as big as we pleaſe, and may mix with it ſome ſmall Threds of *Sol*, and ſo ſhall have the old highly eſteemed Stone called Chryſophoros; or elſe we may put into it, whilſt yet it is ſoft, little Worms, Flies, Spiders, Piſmires, or whatever elſe we pleaſe, which is a notable Curioſity and ſhews as if they were grown there, to thoſe that are ignorant of this Art.

61. In the ſame manner may the Oil of Turpentine be reduced to a hard Gum, to very good uſe and purpoſe.

62. All diſtilled Oils of Seeds, Woods and Spices, when by long ſtanding, they turn yellow, red or thick, may by means of this fiery ſalt Spirit be again made clear, thin and tranſparent, when ſome of the ſaid Spirit is poured on the ſaid Oils and ſo diſtilled, ſome part of the Oil comes over clear and tranſparent, the other part remaining in the Glaſs, in the form of an hard Gum, in which ſmall Inſects may be incloſed as before ſaid of the Amber.

63. Amongſt all Oils theſe following are apt to grow thick and ropy, *viz.* the Oils of *Lignum Rhodii*, Oranges, Limmons, Juniper-berries; thoſe of Cloves and Cinamon are apt to grow red. The Oils of Fennel-ſeed, Anniſs, Coriander, Caroway and Cumin-ſeed, and all other Oils diſtill'd from Herbs and Seeds, that have hollow Stalks, and are umbelliferous, foraſmuch as they abound with much volatile Salt, are apt to turn thick: If any of theſe be rectified with an acid ſaline Spirit, it immediately deſtroys the volatile Salt, and the Oil becomes clear and tranſparent, and the remaining part of the Oil becomes hard as a Gum, and is a ſpecial inward and outward Medicine.

64. And foraſmuch as a fiery ſaline Spirit can make old and red Oils clear, thin and tranſparent, we may conclude, that ſuch a Spirit is able alſo to volatilize and bring over by diſtillation thoſe Oils which by length of time are become hard and dry in Seeds, Herbs and Woods, and cannot by maceration in water be brought over, but muſt by this more powerfull means be made thin and volatile, that they may afford their Oils as eaſily in diſtillation, as green Seeds and Woods are uſed to do.

65. Now as thick and ropy diſtill'd Oils may be made thin, by means of ſaline Spirits; ſo there are ſome ſalt Spirits wherewith we can coagulate all thin and ſubtil Oils, in the form of a volatile pleaſant ſtrong ſcented Salt, of great uſe in Phyſick.

66. In this manner, *viz.* by pouring a ſtrong ſaline Spirit upon them, we can diſtill ſubtil and powerfull Oils from all roſins, gums and thick juices, and afterwards reduce them again to the hardneſs of Amber.

Thus Maſtick, Frankincenſe, Benzoin, Storax, Camphir, *&c.* afford very pure clear and tranſparent Oils, which when hardned to the conſiſtence of Amber, draw ſtraws and other light matters to them like it.

67. In like manner alſo can all ſulphureous Minerals be purified to the higheſt degree, when diſtill'd with ſuch a Spirit, and then may be reduced again to hard tranſparent clarified Bodies: and amongſt the reſt Antimony and Orpiment do afford in this way moſt powerfull and ſuperlatively penetrating medicinal Stones.

68. And as theſe fiery ſaline Spirits do bring over by diſtillation all unfixt ſulphureous Subjects, and purifie them; ſo they do the ſame in fixt Sulphureous Metals, Eg. *Mars* and *Venus*, which Metals being thus purified may be fixed into tinging medicinal Stones.

69. They who know the art of the metallick purification and fixation, are poſſeſſours of an incomparable Treaſure, foraſmuch as by this means in three days time with the charge of one Crown, a true univerſal Medicine may be prepared, for the Bodies of men and metals, not in great quantity indeed but ſufficient to aſſure the Poſſibility of it, and may afterwards be tryed in greater quantity.

70. By means of ſuch a fiery ſalt Spirit fixt Chryſtals, Flints, and other hard Stones may be made volatile and ſpiritual, and then may tinge them with what

what colours we pleaſe, and coagulate them again into hard tranſparent colour'd Stones, and that of what form and faſhion we pleaſe. This is a very gainfull Art, becauſe fair tranſparent colour'd Stones are always preferrable to *Sol*.

71. And as we have underſtood that by means of volatilizing waters, not onely Vegetables and Animals, but alſo minerals and fixt metals may be made volatile, and their pureſt parts brought over the Helm, and by this means do wonders as well in Phyſick as Alchymy. Now though this ſeparation of the pure part from the impure, by means of Diſtillation be highly to be valued, yet there is a better, eaſier and leſs chargeable way to ſeparate the purer parts from all Metals, Minerals, Stones, Sand, and coloured Earths containing *Sol* and Tincture, by means of a Magnet, which being laid in the Solutions of Metals, and extractions of Stones, within a few hours time draws to it all the ſpiritual as well as fixt *Sol* and Tincture contain'd in the ſaid Solutions; ſo that after abſtraction of the diſſolvent by Diſtillation, we find the diſ-animated dead Body, which being put aſide, we ſeparate the attracted *Sol* or Tincture from the Magnet, and thus obtain whatſoever good was hid in the foreſaid groſs Bodies. *N. B.* Though indeed this extraction of *Sol* and Tinctures be very eaſie, as hath been ſaid, yet I ſhall here, for further information of the Reader, ſet down what ought to be obſerved in the extracting of *Sol* from each Metal, Mineral, Stone, or Earth. And firſt of fixt *Sol*.

72. When there is fixt *Sol* in Sand or Stones, we need onely to pulverize them, and pour upon them *Aq. Regis* wherein common Salt hath been diſſolved, and let them boil together a quarter of an hour, by which means the *Aq. Regis* draws the *Sol* out of the Sand and Stones, in which extraction if we then put the *Sol* attracting Magnet, it will draw the *Sol* to it ſelf, which being ſeparated from the Magnet, is melted down with fluxing Powder, the *Aq. Regis* continuing good to be employed on the like occaſion.

73. But when in the Sand or Stones there is no fixt but onely a volatile unripe *Sol*, then we muſt put the Sand or pulverized Stones into a Glaſs Retort, and pour upon them of our volatilizing fiery Alkaheſt, and abſtract the ſame from the Sand or Stone, by which means it carries the *Sol* over with it, which hath been attracted by the golden Magnet, which being reduced will be found good and fix'd *Sol*. The diſſolvent may again be uſed to the ſame purpoſe.

74. But if the Stones beſides the *Sol*, do alſo contain *Lune*, then an *Aq. Fortis* muſt firſt be poured upon them to extract the *Lune*, and afterwards precipitate it by caſting ſome common Salt into the Solution, by which addition of Salt the *Aq. Fortis* is turned into an *Aq. Regis*, and being poured upon the Stones, it extracts the *Sol* alſo.

75. For if at firſt we ſhould pour an *Aq. Regis* upon theſe Stones, it would indeed extract the *Sol*, but withall ſo alter the *Lune*, that it would be impoſſible afterwards to extract it with *Aq. Fortis*, and therefore we are to proceed in the manner aboveſaid.

76 In like manner alſo we are to proceed with white, yellow and red Earths, for to extract the *Lune* and *Sol* that is in them. And if it be a fat Earth and contains fix'd *Sol*, it muſt firſt be made red hot to rob it of its fatneſs, becauſe elſe it would devour too much *Aq. Fortis*.

77. But when the Earth contains onely volatile *Sol*, as the yellow Earth of *Sileſia* and the red *Terra Lemnia Sigillata*, it muſt not be made red hot, but pour ſome Alkaheſt upon it, and ſo bring the *Sol* over the Helm.

78. Yellow and red Earths do commonly contain *Sol* or *Lune* or both, and therefore we may boldly make trial of them; for oftentimes a great treaſure is ſhut up in very contemptible Earth, ſuch as might ſerve to maintain many thouſands.

79. In the ſame manner we may extract the fixt as well as immature *Sol* out of Ruddle, red Jaſper, and red Blood-ſtones, which in ſome parts are found in great quantities.

80. With our *Sol* attracting Magnet, we can extract much *Sol* out of any common Vitriol, and after the *Sol* is extracted, reduce the Solution to Vitriol again, which is as good for the Dyers uſe as it was before.

81. With the ſame Magnet, good *Sol* may be extracted out of thoſe yellowiſh, reddiſh, and greeniſh waters which flow from ſome Mountains, which waters being to be had for nothing, muſt make this work very gainfull.

82. And in caſe we ſhould not be able to meet with this ſort of running waters, then we may take the Copperas Stones which are often found in Sand, but for the moſt part grow in fat Earth, which when they are expos'd to the Air, fall in pieces, and having water poured upon them afford a good Vitriol, which eaſily yields the ſpiritual *Sol* it contains to our Magnet. So that an Artiſt can ſcarcely be to ſeek for ſubjects, from whence unripe volatile or fixt *Sol* may be had with profit.

83. *N. B.* But when we have a mind to bring the volatile *Sol* which is in red Sand, Stones and Clay, with volatilizng waters by Diſtillation over the Helm, it is good to add to our Eagles Wings, or volatilizing water, ſome of our moſt ſecret *Sal Armoniack*, by which the ſame is extreamly ſtrengthned and animated, ſo that like a *Griffin* for ſtrength, it carries the Man on Horſeback away in the Air to his Neſt.

84. *N. B.* This *Griffin* is the Artiſt, that prepares this fiery water, wherewith he ſeizeth as with his Talons the Man armed Cap a Pe; that is, red Stones, Sand and Earth, abounding with a martial Tincture, extracts and carries them to the young ones in his Neſt, that is, provides a good maintenance for his Family thereby.

85. But becauſe to theſe operations of extracting *Sol* volatile and fixt, and Tinctures from the ſubjects juſt now mentioned, when we work them in quantities, much *Aq. Regis*, or other like waters are required, which every one hath not an oportunity to prepare for himſelf, and therefore muſt buy them, which encreaſeth the charges of the operation; wherefore I am willing to teach a near way to prepare theſe corroſive waters.

86. Foraſmuch then as we know that Vitriol is an univerſal acid, and the chief of all Salts, and the Spirit it yields by Diſtillation, much more fiery than that which is forc'd from other Salts, therefore we may make uſe of the Oil of Vitriol, for a *Baſis* with the help of others Salts, to prepare ſeveral ſorts of ſaline Spirits, with ſmall labour and charges, in manner as follows.

87. *Recipe* two parts of Niter diſſolved in water and one part of Oil of Vitriol, diſtill them in an Allembick, and you will obtain a good *Aq. Fortis* to diſſolve *Lune*, *Saturn*, and *Mercury*. This operation ſpends little Fire and comes over eaſily.

88. And if we diſſolve one pound of Salt, and as much Niter in three pound of Water, adding thereto one pound of Oil of Vitriol, and diſtill it in Sand, by Alembick or Retott we ſhall get ſix pound of good and ſtrong *Aq. Regis* to diſſolve *Sol*, *Venus*, *Mars* and *Jupiter*.

89. But when we take two pound of Salt, and diſſolve it in three pound of Water adding one pound of Oil of Vitriol, we get five pound of good Spirit of Salt. The Salt that ſtays behind is called *Sal Mirabilis* or wonderfull Salt, becauſe wonders may be done with it, as appears from ſeveral parts of my Writings, theſe Salts being of divers vertues according to the nature of thoſe Salts that are added to the Oil of Vitriol in Diſtillation.

90. Theſe Salts are commonly added to metals, and melted down with them in Crucibles, by which means they become diſſolved in the dry way, which is much eaſier and readier than the wet way of diſſolving.

91. In particular by this way we can diſſolve Sulphur, which reſiſts all corroſive ſaline Spirits, and remains undiſſolved by them.

92. Now to obtain Oil of Vitriol with eaſe and in great quantity, we may proceed ſeveral ways, and eſpecially thus, by diſſolving Vitriol in water, adding a contrary to it, which ſeparates all its impurities, by which means the purified Vitriol may with a ſmall Fire be reduced to Oil, ſo as one pound of Oil of Vitriol will not require above ten pound of Coals.

93. And becauſe Oil of Sulphur is of the ſame nature with Oil of Vitriol, yea is more proper for ſome operations than it, therefore we may make uſe of the ſame Oil of Sulphur, to prepare ſtrong ſaline Spirits, eſpecially becauſe the ſame may be prepared in quantity and very compendiouſly, according to a particular way deſcribed by the Ancient Philoſophers.

94. They have taught us the preparation of Oil of Sulphur in their wittily deviſed Fables, giving to this Oil the name of *Venus*, whom *Vulcan* when come to Man's eſtate took to Wife: by the word *Vulcan*, we are to underſtand every combuſtible Sulphur, and by the word *Venus*, its incombuſtible corroſive Oil, which for this reaſon probably they called *Venus*, becauſe when a drop of it falls on burning Coals, it gives forth a red ſmoak like to *Venus*, or becauſe this acid Oil like a wicked Woman, has ſharp Teeth, and a keen deceitfull Tongue, wherewith they lay hold of Men, and lead them aſtray in the ſame manner as this Oil cleaves to, and enters a League with every metal to which it is joyned, foraſmuch as all metals proceed from Sulphur, and have great affinity with it, as the Woman hath with Man.

Here follows an Explication of the Poetical Table, teaching us to make the Oil of Sulphur in quantity.

95. We reade that *Vulcan*, that is, a combuſtible Sulphur, took *Venus* to Wife, by which is meant the incombuſtible Oil of Sulphur; now whilſt *Vulcan* was buſie at his work in the Caves of the Earth, for he was a Miner and a Black-ſmith, *Venus* betakes her ſelf to *Mars*, who lies with her; now when *Vulcan* found his Wife in the embraces of another Man, he calls all the Gods to his help, who appearing, caſt an Iron Net over *Mars* and *Venus* that they might not eſcape, but with great ſhame be expoſed to the deriſion of the Gods.

96. When *Vulcan* is kindled in a Furnace made for that purpoſe, that is, labours in metals, the flame carries *Venus*, i. e. the Oil of Sulphur into *Mars* his lodging, that is, into the Recipient, which muſt be fill'd with Steel Wire, where ſhe commits Adultery with *Mars*, that is, begins to diſſolve the ſame, and produceth a Vitriol, which when expoſed to the moiſt Air, becomes reſolved into a clear ſweet water, which from the Steel Wire runs into the Veſſel appointed to recieve it, which ſweet water is nothing elſe but *Aroſtrus* the Son of *Mars* and *Venus*, or the martial Oil of Sulphur, or to ſpeak more plainly, the Vitriol of *Mars*.

97. This Vitriol of *Mars* is called by the Philoſophers the juice or water of the Birch Tree, and of which they ſay the Philoſophers Stone may be prepared, for many of them have writ concerning it, and pointed to this ſweet Iron Juice, which they have termed Birch Tree Waters, becauſe of the likeneſs it has therewith, for when in the Spring-time we make a hole with a Piercer, reaching to the Pith of the Tree, and thruſt into it a Quill or Faucet, much ſweet water proceeds from it, which ſome make uſe of to brew Beer, becauſe the ſame is accounted very good againſt the Stone in the Kidneys and Bladder.

98. This Vitriol alſo is *Virgil's Arbor Opaca*, or dark Tree, whoſe Branches he declares to be eaſily flexible; now what is more flexible than Iron, or Copper Wire, which are therefore compared to the Birch, which is a very juicy Tree, and hath very flexible branches.

99. That this ſhady Tree is the fitteſt, according to *Virgil's* Doctrine, to break off one golden Twig after another is alſo certain, for I have tried it divers ways and found it to be true, that it affords its golden Twigs very freely to him that knows how to handle *Proſerpina*.

100. But if the Artiſt be acquainted with the uſe of our *Sol* attracting Magnet, he may then with eaſe and more profit, without Diſtillation or Fire, break off the ſaid Twigs, than he could do with the help of *Proſerpina*.

And thus I conclude this third Century, the fourth and fifth follows, which will be found of better uſe than this.

THE

THE FOURTH CENTURY.

To extract the Sol *that is in Granates.*

1. IF Granates be melted with Glaſs, that contains *Lune*, the *Lune* containing Glaſs will unite it ſelf with the *Sol* that is in the Granates, which with an *Aq. Regia* may be afterwards ſeparated.

To make a good Mercury *of Wine.*

2. *Recipe* Crude Tartar and pour upon it a Lye of Salt of Tartar, diſtill in an Alembick, and you'l have a ſtrong Mercury of Wine, which is a much ſtronger and more fiery Spirit, than Spirit of Urine, eſpecially if ſome *Sal Armoniack* be added to it.

To make a Mercury of Metals.

3. And if before we diſſolve a Metal or Mineral in the foreſaid lye of Salt of Tartar, or in the Crude Tartar, before that both theſe contraries be put together, then the volatile Spirit of Tartar will bring over the Tincture or Mercury of the ſaid metal or mineral in the form of a ſubtile Spirit. In this manner we may drive the Mercury of all minerals and metals over the Helm.

What the Soul of the greater and leſſer World is.

4. *Plato* call'd common Salt the Soul of the great World, and if ſo, then Salt of Tartar may very well be accounted the Soul of the leſſer World: for whatſoever is in the Macrocoſm, the ſame is alſo in the Microcoſm.

All ſuperfluities of Nature afford a volatile Salt.

5. For the Salt of Hartſhorn of Hair, Soot, Blood, and of the Seeds of Muſtard, Creſſes and Scurvygraſs, *&c.* are much of the ſame Nature as *Salt* of Tartar.

A Good Bath.

6. Common water ſprinkled upon red hot Flints or Pebbles that are found in running Streams, affords an hot Vapour, which by reaſon of the ſubtil Sulphur of the Stones it carries up with it, is very penetrating, ſo that in this manner without any other Fire we may prepare an hot dry Bath, very available to cure many Diſeaſes by ſweating, the great vertue of it chiefly proceeding from the ſulphureous Spirit of the Stones.

To ſeparate Sol *from* Luna *by fluxing in a Crucible.*

7. When we have a mind to ſeparate *Sol* from *Luna* by means of Sulphur we need not make uſe of granulated or filed *Saturn* for precipitation, but inſtead thereof we may make uſe of Antimony, becauſe the granulated or filed *Saturn* is made hard and influxible by the Sulphur: neither ſhall we make uſe of common *Venus* for precipitation, as *Erker* teaches, but ſuch a *Venus* as hath been made friable with Arſenick or Orpiment, by which means we ſhall get more *Sol* than without Arſenick, becauſe Arſenick and Orpiment contain much volatile *Sol*, which in this Operation becomes fixed with the *Luna*.

To recover the Sol *and* Luna *which is got into the Pores of the Crucible.*

8. The Crucible muſt be beaten into fine Powder, and put into a reverberatory fire, ſtirring it continually by which means the Antimony and Sulphur vapour away, and the *Sol* and *Luna* remains with the Earth, which, with ſtrong Waters may be ſeparated.

Another way to perform the ſame.

9. Or we may add filings of *Saturn* to the powder of the Crucibles, and give them a ſtrong heat, by which means the *Saturn* will take in the *Sol* and *Luna*. *N. B.* But the Separation with ſtrong Waters is the more eaſie way of the two.

To extract the Colour from Sol.

10. *Venus*, *Jupiter* and *Regulus Martis* melted into a maſs with *Sol*, and *Venus*, the *Jupiter* and *Regulus Martis* afterwards ſeparated from the *Sol* by *Niter*, then melt other metals as before with the *Sol*, and ſeparate them as before with Niter, which muſt be continued till the *Sol* have loſt his Colour.

11. The droſs being afterwards melted in a Crucible, and a ſmall quantity of Coles made of Blood caſt upon it, the extracted Tincture of *Sol* will ſeparate it ſelf from the droſs, falling to the bottom like a *Regulus*. *N. B.* The metals *Venus*, *Jupiter* and the martial *Regulus* may be ſeparated from the droſs onely with common wood Coal.

12. Niter fixed by the *Regulus* of Antimony, and diſtill'd with *Sal Armoniack*, gives an excellent *Mercury* of metals, which hath a ſcent like muſk.

To extract Sol *out of Stones.*

13. If we take Sand or Stones that contain *Sol*, and melt them with Lead aſhes into Glaſs, and reduce them again with fixed Salt, then by cupelling this Lead aſhes, and the reduced Sand or Stones ſeveraltimes, we ſhall have the *Sol* that was in the Stones.

To extract Sol *from Stones.*

14. The black or brown Pebbles found in Brooks, and which break ſmooth like Glaſs, being mixed with the beſt Eagles wings and diſtilled by retort, yield much *Sol*.

A Tincture from Metals.

15. *Jupiter* is the higheſt Regent over the upper Conſtellations. *Sol* gives to all Stars their Light, *Mars* rules upon Earth, and *Saturn* in the Earth, and of theſe four an univerſal Tincture may be prepared.

16. *Mars* and *Saturn* in particular yields great riches, when being reduced to Glaſs they are ſeveral times driven through a Reverberatory, according to that of the Ancient Philoſophers; by *Saturn* and *Mars*, fire and art, great wealth may be found.

That there is a renovating vertue hid in Spiders.

17. Spiders renew themſelves every month by caſting their skins, wherefore a medicine prepared of them by the Flame of Spirit of Wine renews man.

18. It

18. It is alſo to be obſerved that all Birds, eſpecially thoſe that feed upon Flies and Worms, when they are ſick, cure themſelves by eating Spiders.

Secrets of Serpents.

19. All ſorts of Serpents renovate themſelves once a year by caſting their skins, wherefore if we extract them with Spirit of Wine, and correct them by burning away the Spirit of Wine, they yield an aſſured medicine againſt all Poyſon, and renews man.

20. *Regulus* of Antimony being duely fixed with *Sol*, tingeth as well in the wet as dry way.

Sol *and Sulphur yield a Tincture.*

21. Common combuſtible Sulphur cannot join with the incombuſtible Sulphur of *Sol*, without ſuch a medium as partakes of both their Natures, *viz.* Antimony: when by this means the combuſtible Sulphur is fixed by the incombuſtible Sulphur of *Sol*, the *Sol* gives it ingreſs into imperfect metals to tinge them.

To make Sol *red.*

22. If the Blood of the Lion be digeſted with Tartar and *Aqua Fortis*, this purple Colour will be changed into a red, and ſeparate it ſelf from the Salt, falling in form of red powder to the bottom, and is a moſt excellent Colour for Painters.

To make Purpuriſſa, *or a Paint to make the Face look ruddy.*

23. Diſſolve *Sol* and *Jupiter* in *Aqua Regis*, digeſt and edulcorate with Water, yields an excellent paint for Women. *N. B.* But a little Oil of Talk ought to be added to it.

An Experiment upon Purpuriſſa *or the Blood of the Lyon.*

24. When we digeſt or boil the Blood of the Lion ſo long till the red Colour becomes as white as milk, and then pour upon it as much Water, as has been evaporated during the boiling, this milk will be chang'd again to Blood.

25. Of the blue Paint called Smalt, by means of Salt of Tartar may a moſt excellent Paint be made for Limners, not inferiour to Ultramarine.

26. Of *Mercury*, *Jupiter*, Sulphur and *Sal. Armoniack* is made the Paint called *Aurum Muſicum*.

A Cementation that graduates Venus *into* Sol.

27. *Recipe* Vitriol calcined to Redneſs, mix it with Salt and Coal duſt, lay this with thin Copper Plates *ſtratum ſuper ſtratum*, put them into a Fire that may keep the Plates of *Venus* red hot for ſix hours without melting them, by which means the *Sol* in the *Venus* will be encreaſed; if we repeat this Cementation ſeveral times till the *Venus* be of a golden colour, the gain will be much greater. *N. B.* The cauſe of this melioration is, becauſe the Coal Duſt hinders the corroſive Spirits of the Vitriol and Salt from corroding the *Venus*, and therefore onely penetrates and graduates the ſame.

To make all Corroſives ſweet.

28. Vitriol diſtilled with Salt yields a Corroſive Spirit, but if Coal Duſt be mixed with them, they give a ſweet Spirit, which graduates *Lune* into *Sol* when digeſted therein.

29. *Recipe*, *Calx* of *Jupiter* mixed with *Mercury* of *Lune*, and therewith Cement plates of *Venus*, by which means the ſaline Spirits introduce the white Sulphur of *Jupiter* into the *Venus*, and change it into *Lune* containing much *Sol*.

A ſweet graduating Spirit, uſefull to the Melioration of Metals.

30. *Recipe*, Coal Duſt, mix them with *Sal Mirabilis*, and diſtill by retort, and you will get a ſweet graduating Spirit, exalting ſome Metals to *Sol*.

The Philoſophical Work.

31. The Father of all things is the warm Son, their Mother is the moiſt Moon, the Earth is the Womb, the Wind carries the Seed through the Suns driving into the Womb the Earth, which foments, and at laſt brings forth the Child.

Sulphur is the Father of all Metals.

32. The Central Fire in the Earth mounts upward continually into the hollow places of the Earth, and meeting with water or moiſture, cleaves to it and makes Stones, as alſo all Metals and Minerals of different natures and properties, according as the water is pure or impure.

Sulphur is the univerſal Coagulator.

33. A ſulphureous vapour is that which coagulates Mercury, as well in Vegetables and Animals as Minerals.

Demogorgon the Grand-father of all things.

34. The Central Fire in the great World keeps it in continual motion, and cauſeth the growth of all things as well upon, as under the Earth, being the Governour of the great World.

The Vital Spirit, or radical moiſture, is the Life and Growth of all Men.

35. As the great World is governed and maintained by the Demogorgon or Central Fire, ſo Man the little World is governed, and maintained in continual motion and growth, by the Vital Spirit ſeated in his heart.

36. Fire is the Father of all things, Water the Mother, the Earth is the Womb, the Wind or Air drives the Fire, being the univerſal Agent, into the Water, being the univerſal Patient, in order to bring forth Fruit. *See my Treatiſe of the divine Character.*

37. Man, Beaſts, Fiſh and Fowl, and all that lives and grows, draw their life from the Air, onely the *Salamander* draws his life, and has his Body from the Fire, wherefore alſo in power and ſtrength he excells all living Creatures.

38. The

38. The ſecret Fire of the *Chaldeans*, which at all times draws Fire out of the Air, wherewith the Jewiſh Prieſts kindled their Sacrifice, as may be ſeen in the *Maccabees*, is made of Steel, Niter and Sulphur.

39. When we abſtract an *Aqua Regia* wherein Sol is diſſolved from the Butter of Antimony, the Soul of *Sol* and Antimony comes Bloud-red over the helm, which poured upon a Solution of *Lune*, the *Lune* falls to the bottom, and draws the Tincture of *Sol* and Antimony to its ſelf out of the Water, and the *Lune* by this means becomes red, and is a Tincture and Univerſal medicine for humane and metallick Bodies. *N. B.* The remainder of the *Sol* and Antimony that did not come over is wholly fixt, and a good Diaphoretick, thus the Souls of the dead, *i. e.* of *Sol* and *Lune* are brought up from Hell. *See Nuiſement de ſpiritu & ſale Mundi.*

40. When in the manner now ſaid with the Butter of Antimony, we bring over the Soul of *Mars* we get a much higher Tincture than from that of *Sol*, and in coming over becomes wholly fixt *See my Treatiſe de 3 principiis Metallorum.*

41. In like manner may from the Butter of Arſenick and *Lune* a white Tincture be brought over the helm, tinging *Venus*, *Mars*, *Jupiter* and *Saturn* into *Lune*. *N. B.* Theſe Tinctures in coming over are fixed by *Plato*'s Stygian Water, ſo as to need no further fixation.

42. But if we precipitate theſe Tinctures of *Mars* and Antimony with the Solution of *Sol*, and then edulcorate and dry the ſame, we by this means do obtain a dry graduating Water, which being molten with any white or red metals makes them yield good Gold, and *Lune* on the Cupel to the great profit of the Artiſt.

43. Oil of Vitriol mixed with *Sal Armoniack*, is alſo of good uſe to bring over Tinctures, but not in that quantity as Butter of Antimony.

44. Our dry, ſweet univerſal tinging water diſſolves white Pebbles and Cryſtals, and changeth the ſame into precious Stones of ſeveral colours, excepting onely their hardneſs, which it cannot communicate.

45. The eaſieſt way to get the *Sol* or *Lune* that is in *Jupiter*, is by caſting it upon molten *Venus*, which draws the *Sol* and *Lune* to it ſelf out of the *Jupiter*.

46. In like manner doth the *Regulus* of Antimony when in flux readily draw to it the *Sol* and *Luna* in *Jupiter*, and then waſhing the *Regulus* with Niter we get the *Sol* and *Luna* contained in *Jupiter*.

47. But this operation ought not to be done in Crucibles made of common Earth, which eaſily break and ſpill the metal, but in thoſe that are made of a fat crucible Clay, mix'd with coal duſt, as is taught in the fifth part of my Furnaces.

48. As the Sulphur in Tartar coagulates a thin water into a hard Hepar, or Liver ſo called, ſo likewiſe doth a fixt Sulphur coagulate *Mercury* into *Sol* and *Luna*.

49. The often calcining of Salts and diſſolving them in Water, doth purifie them, and makes them eaſily fluxible, and in particular Vitriol may by this means be ſo purified, as to yield its Oil with a very ſmall heat.

50. The Solution of *Saturn* and *Lune* poured into a volatile Spirit of *Mars* or *Venus*, draws the tinging volatile Sulphur out of the Water to it ſelf, and makes the ſame Corporal and fixed.

51. Tartar contains a coagulating and tinging Sulphur, for it coagulates Water into a Hepar, and tinges red metals to a white Stone, which may be pulverized; this Sulphur is the cauſe why Tartar will not diſſolve in cold Water as other Salts.

52. When therefore the Tartar is freed of this Sulphur that coagulates all Water, then much good may be done therewith as well in Phyſick as Alchimy, and many other Arts beſides.

53. Tartar by being boiled in a ſtrong Lye, lets go its coagulating Sulphur, and a neutral Salt proceeds from them both; but if we have a mind to ſeparate the Lye from the purified Tartar we muſt do it with an acid, that may mortifie the Lye, by which means the purified Tartar will be left ſnow white.

54. If the Lye be kill'd with a Spirit of Niter or *Aqua Fortis*, then from both theſe contraries proceeds a good Niter.

55. But if we make uſe of a Spirit of Salt, then there is made up of both a tartarized Spirit of Salt.

56. If we take diſtill'd Vinegar to mortifie the Lye, then from the joyning of thoſe both proceeds a neutral volatile Salt which is a good Diuretick in the Gout and Stone.

57. This is the beſt way of purifying Tartar, which after this Operation is of far greater uſe in Phyſick and Alchimy than the common Tartar.

58. Tartar as hath been ſaid, contains a coagulating and tinging Sulphur, coagulating all Water into a thick Hepar, and exalting the Colours of metals. Thus we ſee that by boiling Golden or Silver Veſſels with Tartar, their ſeveral Colours are exalted.

59. And whoſoever has the Art of ſeparating this Sulphur from Tartar, may by means thereof effect great and wonderfull things.

60. A like wonder working Sulphur is likewiſe found in Animals, and more eſpecially in man, who brings it with him into the World.

61. Whence ſome Philoſophers tell us, that *Adam* brought the Philoſophers Stone with him out of Paradiſe, and after his death carried it with him into his grave.

62. Minerals alſo afford the ſame coagulating fixing and tinging Sulphur, for which reaſon the Philoſophers Stone is ſaid to be Animal, Vegetable and Mineral, becauſe of each of theſe three Kingdoms an Univerſal medicine may be made for men and metals.

63. But the eaſieſt way is, when we extract the beſt part of all theſe three Kingdoms, and conjoyn them according to Art for an Univerſal medicine.

64. Wine is the chief of Vegetables, Man of Animals, and Gold of Metals.

65. Spirit of Wine purges and purifies all things, with its purifying Flame; as may be ſeen in my Purgatory of the Philoſophers.

66. The volatile Salt of Animals, and eſpecially of Man purifies all things by its volatilizing Virtue, as appears in our moſt ſecret *Sal Armoniack.*

67. The incombuſtible Sulphur of metals tingeth the Bodies of men and metals, to the higheſt pitch of Health, as may be ſeen in the third *Appendix* to the ſeventh part of my *Pharmacopæa Spagyrica.*

68. *Demogorgon* with his Ruſſet mantle and green Coat, is the Grandfather of all the Heathen Gods *i. e.* of all metals.

69. And like as in the Earth he doth generate and bring to perfection all metals, ſo alſo out of the ſame, if the Artiſt knows how to manage him, he perfects all unripe and imperfect metals, in a ſhort time, with the help of Fire, to that degree that they ſhall endure the Teſt as well as *Sol* or *Luna*.

70. This wonderfull virtue of fixing all volatile minerals, the Philoſophers call their ſecret Fire or proper Agent, wherewith not onely the imperfect metals, as *Saturn*, *Jupiter*, *Venus*, and *Mars*, but alſo volatile *Mercury*, combuſtible common Sulphur, Antimony, Orpiment, and Arſenick may be fixed, ſo as on the Cupel to leave *Sol* and *Lune*.

71. And as this Demogorgon, or inviſible ſecret Fire of the wiſe Men, doth fix the unripe minerals and metals into *Lune* and *Sol*; ſo likewiſe can it fix the ſaid minerals and metals, and exalt them to an higher degree than that of *Sol*, even to the *pluſquam* perfection of true Tinctures, whereby all imperfect metals may be changed into *Sol*.

72. This our Demogorgon hath the virtue even as it comes raw and unprepared out of the Earth to change and meliorate all metals as follows.

73. It makes *Saturn* as hard and white as *Lune*, when tinged with it, of which all manner of Veſſels and Diſhes may be made, it onely wants the ſound of *Lune* and enduring of the Teſt.

74. If a little of this Tincture be caſt upon fluxed *Venus* it preſently becomes white and hard as Steel, continues as fuſible as before, and yet is ſo hard that it cannot be filed, ſo that ſeveral Veſſels may be made of it, not ſubject to bending or breaking.

75. When caſt upon melted *Jupiter*, it makes it hard as *Lune*, and ſounding like it, is of great uſe to make all ſorts of Veſſels of.

76. And amongſt other things that may be made of it with great profit, this is one, *viz.* that Looking-Glaſſes may be made thereof, which being poliſhed continue a long time clear and fair, without being obſcured in moiſt Weather, as other metalline Glaſſes are, and all this by reaſon of the extraordinary hardneſs of the metal. *See my Treatiſe of Looking-glaſſes.*

77. This Tincture caſt upon *Lune*, makes the ſame Coal-black throughout, ſo that it is no more like *Lune*, of which Bells and Clocks may be made of a far better and clearer ſound than thoſe that are made of *Venus* and *Jupiter*.

78. By this means alſo in times of War, or other danger *Lune* may ſo be diſguiſed as not to be known for ſuch, and ſo may be a good way to preſerve it from being taken by the Enemy.

79. In like manner it makes *Sol* ſo hard that it can no way be bent or deſtroyed, and therefore might be of good uſe in many of the following caſes

80. It would be very proper for ſome great Emperour or King to make his Statue of, it being indeſtructible, and not to be diminiſhed or injur'd by any way whatſoever.

81. Money coin'd of this *Sol* would be of good uſe if a King or Prince had a mind that his Coin ſhould not be tranſported elſewhere, becauſe differing ſo much from common *Sol* it would not be paſſible in other Countries.

82. This golden Coin alſo would not be ſubject to be clipt or fil'd.

83. Medals alſo might be made of this *Sol*, and would be a great curioſity beſides the indefectibleneſs of them.

84. It would be excellent alſo to make Rings of, eſpecially ſuch as are deſigned for the remembrance of Friends, as laſting for ever.

85. It would be very proper to caſt Seals of, or the divine Character or other ſecret *Sigils*. *See my Treatiſe of the Divine Character and Seal of God.*

86. Or the ſaid Divine Character being expreſt upon my *Lapis Ignis* (which being but for a little while carried in ones mouth, cures many grievous Diſeaſes without any other Medicine) might be ſet in this hard *Sol*, and ſo without waſting be carried conſtantly about one. *See my Treatiſe of the Mineral* Squilla *in order to a long life.*

87. Great Princes alſo might have Armour and Arms made of this hardned *Sol*, which would be much better than any of Iron or Steel, which eaſily take ruſt, to which *Sol* is not Subject.

88. Of this *Sol* might alſo very conveniently be made Candleſticks and Lamps, with other Veſſels for the uſe of the Church and Altar.

89. To many more uſes this *Sol* might be put, eſpecially for that by reaſon of its hardneſs, it ſuffers it ſelf to be poliſhed to that degree, as to caſt a great luſtre from it, like the Sun.

90. As to the further uſe hereof, *See my Treatiſe* de tribus Lapidibus ignium ſecretorm.

91. With the hardned *Lune*, *Venus*, *Jupiter*, *Mars* and *Saturn*, many profitable and curious things may be done, which for brevitiy ſake are here omitted.

92. The Sulphur of the Philoſophers when ſet free from his dark Priſon, wherein he is detain'd by his Brethren, by our Key that opens all Locks, gives his Deliverer for reward, the poſſeſſion of the three Kingdoms in the World, *viz.* enabling him to make all Vegetables grow ſwiftly, and very fruitfull, to cure the Diſeaſes of all Animals, and to meliorate and exalt all Metals.

93. And when the Philoſophers, ſaith *Sendivogius*, ſee this Sulphur reſtor'd to liberty, ſwimming in their Sea, they worſhip it, and draw it out with a Silver Line, though others do it with their *Sol* attracting Magnet, and fix it into an univerſal Medicine, wherewith they afterwards effect wonders: *As may be ſeen in my* Elias Artiſta, *and Purgatory of Philoſophers.*

94. The Philoſophers ſay, except firſt you make our *Sol* (that is, the redeemed Sulphur) and Mercury white, you'l never be able to make them red.

95. They ſay alſo, our *Sol* tingeth not except it be firſt tinged it ſelf, that is exalted in its colour.

96. All things in the World have their riſe from Fire and Water, and derive their Purity or Impurity, from the Purity or Impurity of their Parents.

97. The common Fire brings forth its Fruits very ſlowly, whether they be Stones, Minerals, Animals, or Vegetables.

98. And ſo do likewiſe the warm and dry Sun, and moiſt Earth: but when we aſſiſt Nature with Art, then ſhe works much more ſwiftly, and brings her Fruits to maturity in much ſhorter time.

99. The Meteors in the Firmament which are made of Fire and Water, eſpecially Thunder and Lightning, produce ſometimes Stones, and caſt them to the Earth.

100. A common fulminating Powder made of Sulphur, Niter and Tartar gives a ſtinking offenſive ſmoak, corrupting ſome things, and meliorating others: whereas a Fulmen prepared of Niter, *Jupiter* and *Mercury*, yields a particular tinging mercurial Water. The Fulmen of *Venus* tinges *Mars* into Copper, that of *Lune* graduates *Venus* into *Lune*; and the Fulmen of *Sol* graduates and tinges *Mars* into *Sol*.

The univerſal Fulmen of the great Tincture graduates all Metals into *Sol*, which God of his mercy grant unto us, Amen.

THE

THE FIFTH CENTURY.

The beſt particular and cheapeſt Univerſal.

1. WHEN with the help of *Sendivogius* his *Chalybs*, or *Glauber*'s Magnet, we have extracted the colour from *Sol*, and again reſtored it through *Venus* and Antimony, we may by oft repeating the ſaid extraction and reſtoration get great profit, this being one of the beſt particulars that can be. This multiplication of *Sol* may very well be compared with the generation of Man, for as a Man in generating, doth with meat and drink reſtore the loſs of his Seed, by which means he continues the ſaid multiplication for a long time, by turning the meat he eats into Prolifick Seed; ſo likewiſe the Chymiſt changeth *Venus*, *Mars*, *Jupiter*, *Saturn*, *Mercury* and *Lune* into *Sol*, by feeding the diſſpirited *Sol* that has loſt its colour with them, reſtoring it to its former ſtrength and vigour.

2. The Sperm of Man is not the Seed of Man, but onely the Shell and receptacle thereof, as may be ſeen in Old Men, whoſe Sperm is unfit for generation by reaſon of the weakneſs of their vital Spirit.

3. So likewiſe the Seeds of Vegetables, are not all pure Seed, but the Houſe and Vehicle thereof, that is, of the growing and multiplying virtue, which appears in that when the Seeds have been kept ſo long till this vital virtue is exhaled from them, they never bring forth any thing.

4. No more can *Sol* be ſaid to be the Seed of metals, but onely the receptacle thereof, for the Seed is not the whole Body, but onely the lively colour of the Body, and the vegetative and multiplicative virtue that is hid in it.

5. Now as the Seed of Vegetables is more perfect and noble than the Vegetables, ſo likewiſe is mature fixt *Sol*, more perfect than *Mercury*, *Saturn*, *Jupiter*, *Venus*, *Mars*, though in the imperfect metals alſo a Seed be hid, but not ſo fixt and good as that in Gold.

6. The imperfect metals may be compared to an Herb, whoſe Seed is not yet ripe, which being put into the ground cannot grow or multiply, but rots in the Earth.

7. The virtue of Corals lies not in their whole Bodies, but in their colour; and therefore *Paracelſus* bids us not to make uſe of Corals in ſubſtance, but extract their Tincture, and uſe that for Phyſick, wherefore alſo he rejects white Corals, as being an unripe Fruit, from any uſe in Phyſick.

8. For this reaſon alſo the immature gray Pearls, which are frequently found in Cockle Shells in freſh running waters, are looked upon as uſeleſs in Phyſick.

9. And this not without reaſon, for as unripe Grapes are the cauſe of griping of the Guts, and hurt the Body; ſo ripe Grapes nouriſh and ſtrengthen the ſame, eſpecially when by fermentation they have quitted their Fæces.

10. All imperfect metals ſubvert and trouble the Stomach, and cauſe vomiting and purging, and that by reaſon of their unripeneſs.

11. Whereas on the contrary *Sol* taken into the Body cauſeth not the leaſt alteration, but powerfully ſtrengthens the ſame when reduc'd to Potability.

12. Thus *Sol* may be compared to ripe Grapes, which when eaten raw, do indeed no hurt to the Body, but rather affords ſome nouriſhment, yet cannot ſtrengthen the Heart, Brain, and whole Body, and make a chearfull mind; but when by fermentation they are delivered from their skins and other impurities, they readily and as it were in a moment perform all this.

13. In like manner when *Sol* by fermentation hath laid aſide his groſs Body and become Spiritual, if then made uſe of, it not onely nouriſheth as ripe Grapes, but exerts its virtue like a Spirit or Q. Eſſence of Wine, penetrating the whole, and making it lively, ſtrong and vigorous throughout.

14. Neither do the other metals diſplay their hidden virtue, untill by fermentation and diſtillation, they be ſubtilized and their groſs Bodies laid aſide.

15. Thus when *Lune* by fermentation and diſtillation is ſubtilized, then it draws away all Diſeaſes of the Brain, and corroborates the ſame exceedingly even as *Sol* doth the Heart.

16. *Venus* ſo purified ſtrengthens the Reins and procreative faculty.

17. The volatile ſweet Spirit of *Mars*, removes all obſtructions whatſoever, provokes the terms in Women, and opens the Hæmorroides in Men.

18. The ſweet Spirit of *Saturn* cures all inward and outward hot Diſtempers.

19. The ſweet Spirit of *Jupiter* cures all Diſtempers of the Lungs.

20. The volaltile Spirit of *Mercury* cures the venereal Diſtemper.

21. *N. B.* Theſe volatile ſpirits of metals muſt be cautiouſly uſed, as being of very great force.

22. The manner of preparing them, may be ſeen in my Book of Fires, but moſt plainly ſet down in my deſcription of the moſt ſecret *Sal Armoniack*.

23. All Spirits act according to their nature and property either good or ill, as the Bodies are good or evil from whence they are taken.

24. *The Spirit quickens, the Body or Fleſh profits nothing, ſaith Chriſt*, John 6.

25. Theſe words are ill interpreted, when underſtood by ſome, as if Spirits onely were of uſe, and Bodies not at all, which is a great miſtake, as it is applied by ſome.

26. Indeed in Metals, Vegetables and all Animals without the uſe of reaſon, who grow, move, and live, by the driving of their in-born Spirit, it does hold true, for when their Spirits are by Art ſeparated from their Bodies, the ſaid Bodies are thenceforward of no uſe, as being upon the ſeparation of their Spirit, dead and without all virtue.

27. But the caſe is different with Man, who being created in the Image of God, and endowed beſides his Animal Spirit, with an immortal Soul, which latter onely and immediately derives from God, and not from nature, as the mortal Spirits of Animals do.

28. Wherefore *Pythagoras* was much miſtaken, in believing that the immortal Souls of Men, when departed from their Bodies did immediately enter into thoſe of Beaſts.

29. Which miſtake of his ſeems to have been occaſioned hence, becauſe he knew how by Art to take

take away the Soul, *i. e.* Tincture from *Sol*, and transfer the ſame to an imperfect metal, thereby making the ſame in all things like to true natural *Sol.*

30. Certain it is that this may be done by art, for the fixt Body of *Sol* may be deſtroyed, its Soul extracted, and by being joyn'd to another metal make it good *Sol.*

31. When this diſanimation of *Sol* is duely performed, the Body is left wholly dead, and is in all things like a volatile unmalleable mineral, and cannot endure the teſt, but fumes away like Arſenick with a little Fire.

32. But in caſe this diſanimating of *Sol* be not rightly done, ſo that the Body continues as white as *Lune*, and malleable (which is a ſign that ſome life is ſtill left in it) then his Colour may be reſtored again by means of imperfect minerals, as well as his former fixedneſs in the Fire.

33. But when the Body of *Sol* will no longer endure the fire, but goes away in ſmoak, then we can ſay it is truly dead and no more *Sol.*

34. He that finds difficulty to believe this, let him reade *Paracelſus*, *Sendivogius* and other Philoſophers.

35. *Sendivogius* ſaith, *Our Steel*, that is, our Magnet, *can draw from the Rayes of the Sun, what many have ſought for and not found; if this our Magnet copulate eleven times with* Sol, *the* Sol *becomes weakned almoſt to death, and the Steel or Magnet ſhall conceive and bring forth a Son more illuſtrious than his Father.*

36. From which words it appears that *Sendivogius* had the Art to diſanimate *Sol*, elſe could never have writ ſo plainly concerning it.

37. It is certain alſo that there are ſome, that at this time can do as much within a few hours, I having lately been an Eye-witneſs of the ſame, with three other perſons in company.

38. It is not neceſſary to ſay any more how this cheap and ſpeedy way of diſanimating *Sol* is to be performed; foraſmuch as all the Philoſophers writings are full of it.

39. However to pleaſure the unskilfull I will add thus much, that this may be done four ſeveral ways.

40. But the eaſieſt and cheapeſt way is by means of Spirit of Wine, and a microcoſmical ſaline Spirit; yea this extraction may be performed by a Spirit of Wine alone, without any animal Spirit, or by an animal ſaline Spirit without the Spirit of Wine.

41. If this were not ſo, we might have reaſon to accuſe both ancient and modern Philoſophers of falſhood, who tells us that *Adam* brought the Philoſophers Stone with him out of Paradiſe, and after his death took it with him into his Grave.

42. Which words may ſeem ſtrange to ſome, foraſmuch as he was driven bare and naked out of Paradiſe.

43. Yet the Authority of thoſe who aſſert this being ſo great and inconteſtable, it cannot well be called in queſtion.

44. What therefore the Philoſophers meant by this Stone which *Adam* brought with him out of Paradiſe, is well worthy our Enquiry.

45. The Philoſophers commonly ſay our ſtone is a ſtone and noſtone, *&c.* which implies thus much, that to outward view it is a ſtone, but in deed and in vertue, a Concentrate form of *Sol.*

46. Wherefore *Petrus Bonus* ſaith, *We do not ſeek* Sol, *but the form of* Sol.

47. What is then properly this form of *Sol*?

48. *Anſw.* It is a ſubſtance which to outward view looks like a contemptible ſtone, and yet is of ſuch ſuperlative Vertue, that when joyned with imperfect metals on the Fire, it tranſmutes them into the higheſt perfection of *Sol.*

49. It may further be demanded, whether *Adam* brought ſuch a matter with him out of Paradiſe, whereby this tranſmutation of metals into *Sol* may be performed?

50. *Anſ.* Yes he did bring ſuch a matter with him out of Paradiſe, and after death took it with him to his Grave, wherewith all Diſeaſes of mankind may be cured, and all metals changed into the fineſt *Sol.*

51. If this be ſo, might ſome ſay, *Adam* muſt either have been very blind, in not diſcerning the Treaſure he was poſſeſſed of; or very envious in not communicating the ſame to his Poſterity.

52. I cannot believe that *Adam*, out of envy withheld this ſecret from his Children, but rather ſuppoſe that the blindneſs into which his fall had caſt him, was the cauſe of his not percieving the great Jewel he had about him.

53. But how could he be blind, who was made by God himſelf, and after his own Image?

54. *Adam* was certainly blind, and his blindneſs proceeded from his Pride, becauſe he aſpired to be like to God; he was not blind as to his outward Eyes, but his heart was blinded, which is by far the worſt blindneſs of the two: For all ſin and wickedneſs blinds the hearts of men, that they cannot percieve the folly of their doings.

55. Thus *Adam* alſo by means of his diſobedience to God, became ſo blind, as not to percieve, or be ſenſible of the Love that God had for him before his Fall, and how richly he had endowed him.

56 Whence alſo his Children were ſo wicked and blind, that the one Brother ſlew the other; which wickedneſs hath ſtill encreaſed in their Poſterity, as appears by the deluge, and the deſtruction of *Sodom* and *Gomorrah.*

57. And thus the World from day to day ſtill grows worſe and worſe, notwithſtanding the Examples of God's Vengeance againſt Sinners.

58. And all this proceeds becauſe men are ſo generally blinded by the Devil in ſin and wickedneſs.

59. But to leave this, it may be further queſtion'd; that ſeeing all mankind is become ſo blinded through *Adam*'s fall, as not to diſcern the Jewel they carry about them; who then was the Perſon that firſt diſcovered, that man was the Poſſeſſour of ſo great a Treaſure?

60. *Anſ.* Who was the firſt diſcoverer of this Treaſure I cannot tell, but thus much is certain, that it was an honeſt man and fearing God; becauſe God doth not reveal his ſecrets to the wicked; wherefore *Tho. Aquinas* ſaith, *Our Holy Art, either finds a man holy, or makes him ſo.*

61. But ſome will ſay, don't we reade of Heathens that have been Poſſeſſours of the Philoſophers ſtone; and how can we imagine that thoſe who have no knowledge of God, and are blinded with ſin, ſhould ever be able to find out ſo great a Myſtery?

62. *Anſ.* Thoſe Heathens that have been Poſſeſſours of this great ſecret, were not without the knowledge of God; for they lived according to the Law of Nature, honouring God and loving their Neighbour; wherefore alſo God accepted of them. They learnt to know God from his Works of VVonder,

and

and according to their knowledge, loved, honoured and feared him ; and ſo were made Partakers of his grace, light, and the knowledge of his ſecrets.

63. We are alſo to know that the Ancient Philoſophers know more than one way to attain the Philoſophers Stone ; though indeed the moſt of them ſought it in minerals and metals, which is the longeſt way.

64. And that becauſe it is impoſſible to change the metallick ſpecies, without bringing metals back into their firſt matter. *See my Treatiſe of the principles of metals, and the ſeventh part of my* Pharmacopœa Spagyrica.

65. But others have taken a nearer way to attain this ſecret ; and to ſome Chriſtians God hath been pleaſed to diſcover the ſhorteſt way of all, by revealing unto them that he made *Adam* every way perfect, giving him all that was neceſſary, either for his Soul or Body.

66. Now that *Adam* could not diſcern how richly God had endowed him, was his own fault, becauſe he was diſobedient to God, following the deceitfull Serpents advice.

67. And after this manner doth the Devil yet daily deceive Men, by perſwading them to do againſt the commands of God, and that their diſobedience ſhall not bring any ſuch miſchief upon them as God's threatnings ſeem to import.

68. This then is the reaſon why Men do not underſtand the ſecrets of God, becauſe they give too much way to Sin, whereby they become blinded, that they can neither ſee nor hear the good that comes from above.

69. Now the reaſon why moſt of the Alchymiſts have ſought for this great gift of God in minerals and metals, and eſpecially in *Sol*, is this, becauſe their intention was to multiply *Sol*, which they ſuppoſed could no way better be done than by ſowing it like other Seeds in the Earth, but could not imagine that beſides common *Sol*, there were other ſubjects, wherein the *Sol*-making virtue did reſide.

70. Which opinion of theirs was probably grounded upon that ſaying of the Philoſophers. *What you ſow, that you will reap.*

71. This ſeems at firſt ſight very rational, that from filth or excrements no good, and ſo no *Sol* can come ; but let us hear the other ſide alſo, and we ſhall be otherwiſe informed.

72. For the Philoſophers ſay that their Medicine is Vegetable, Animal and Mineral ; ſo that Vegetables and Animals are not excepted.

73. *Albertus Magnus*, writes that the greateſt mineral aurifying virtue is in Man, and eſpecially in his Head between the Teeth, and proves it ; becauſe in dead Men's Skuls he had found grains of *Sol* ſticking between the Teeth.

74. The ſame is alſo confirmed by *Thomas Aquinas*, *Rhaſis*, *Janus Lacinius*, and others.

75. There is alſo an old Book, whoſe Authour is unknown, which treats at large of that ſubject which *Adam* brought with him out of *Paradiſe*, wherein the Operator is warned to have a great care of the fumes of the matter as he would avoid the Plague, or the moſt deadly Poyſon. From this Authour I have alledged ſome paſſages in my other Writings, and ſhewed that the Philoſophers Stone may be prepared of any ſubject whoſe Elements may be ſeparated.

76. Now certain it is that from all Animals and Vegetables, the Elements may be ſeparated, and conſequently follows, that from all Vegetable and Animal Subjects, the Philoſophers Stone, or univerſal Medicine for the Bodies of Men, and Metals may be prepared.

77. *Morienus Romanus*, who prepared this Medicine for King *Calid*, declares that he took the ſubject matter of it from Man.

78. For when the King asked *Morienus*, in what kind of ſubject the Philoſophers Stone was to be lookt for ; he anſwered, the Medicine is in thy ſelf O King ; wherefore alſo after that he had finiſhed the Work, he wrote round about the Glaſs, in which the Medicine was, theſe words : *He who carries all about him, needs not the help of another.*

79. Thereby intimating, that he always carried about with him, whatſoever was neceſſary for the preparing of the Medicine, and therefore did not ſtand in need of the King's aſſiſtance.

80. This ſame honeſt *Morienus*, writes plainly concerning the preparation of this Medicine, and doth as it were with his finger point us to the matter, in theſe words of his, quoted by *Arnoldus de villa nova* ; *Grind the Phlegmatick and Cholerick with the Sanguin, untill it become a tinging Heaven*, &c.

81. *Arnoldus* explains theſe words of *Morienus* thus: *The Phlegmatick is cold, as* Mercury, *the Sanguin is warm and moiſt, as the* Sol *or Gold, the Cholerick is hot and dry, as* Sal Armoniack : intimating that of theſe three, *Mercury*, *Sol*, and *Sal Armoniac*, the Philoſophers Stone is to be prepared.

82. But that he meant not this concerning common *Mercury*, *Sol*, and *Sal Armoniack* is apparent from this, that *Morienus*, as ſoon as he had prepared the Medicine for the King, went away privately, without expecting any reward from the King ; it alſo appears from the anſwer before mentioned, which he made to the King, that he ſpoke of ſuch a *Mercury*, *Sol*, and *Sal Armoniack* which every Man carries about with him.

83. This is abundantly confirmed by all the Philoſophers that went his way, foraſmuch as they declare that no charges are required to the preparation of it, that their ſubject is a contemptible matter caſt out upon Dunghills, and trod under feet, and that the Poor have it as well as the Rich.

84. *Morienus* yet more clearly intimates this, in telling us that the matter whilſt it is preparing, exhales a ſmell like to that which comes from the Graves of the Dead, which is a very offenſive ſmell.

85. Now like as Vegetables whilſt they are putrifying give forth an ill ſcent, and Animals a worſe, as appears in the ſtink of rotten Eggs, and the putrefaction of Man's Blood, eſpecially when the ſame are putrified in a cloſe Glaſs in warm Horſe Dung.

86. For without putrefaction, there can be no ſeparation of the Elements by Diſtilation, and if no ſeparation be made, neither can any melioration or exaltation be expected.

87. We know that every *Chaos*, as it is a product of the four Elements, contains many impurities, and in particular much dead Earth, and Water void of all virtue ; and that the Element of Fire alone is proper to heal and meliorate Men and Metals.

88. Wherefore ſeeing that no ſeparation of the Elements can be without a foregoing putrefaction we muſt conclude putrefaction to be the beginning of our Work, without which no goodend can be expected.

89. Now he that knows our Horſe Dung, and how to putrifie the well known and every where to be found moſt univerſal natural ſubject by means of the

ſame, he will eaſily afterwards by Diſtillation ſeparate the moſt pure and all things penetrating and meliorating Element of Fire, from the groſs Chaos to his great ſatisfaction, and make uſe of the ſame to the aſtoniſhment and wonder of the ignorant.

90. But in this ſtate it is onely good for the health of Man; and therefore in order to its meliorating of Metals, the pure Element of Fire muſt be firſt fix'd with *Sol*, by which means it obtains ingreſs into imperfect Metals, reducing them to the perfection of *Sol*.

91. Now when the pure Element of Fire is ſeparated from the Chaos, and reduced to the higheſt degree of purity, then it ſtinks no more, neither is poiſonous as it was before purification, but is an Antidote againſt all poiſons whatſoever, wherefore alſo the Philoſophers have called their Medicine *Theriaca*.

92. But all this is to be underſtood onely of that ſubject which every man carries about with him, and brings with him out of his Mothers Womb.

93. If any one following the Letter of *Morienus*, ſhould take for his ſubject common *Mercury*, *Sol* and *Sal Armoniack*, neither will he be miſtaken, but if he rightly proceeds will have a good Work, though it be not at all neceſſary to make uſe of common *Sol* and *Mercury*, becauſe our natural ſubject contains both a living *Sol* and *Mercury*.

94. It is no prejudice to our Animal Subject, if we join Minerals with it, becauſe our *Sol* joins it ſelf with all ſubjects, and unites it ſelf readily with them. But if we be ignorant of the due proportion and compoſition of *Sol*, *Mercury*, Sulphur, or any other metal or mineral, then it is better to prepare our Medicine out of this one ſubject onely, becauſe ſo there is leſs danger of erring, as I can witneſs by experience.

95. I have alſo found by experience that this Microcoſmical Subject is alone ſufficient, without the addition of any minerals or metals, to meliorate all imperfect metals.

96. As to a particular this of all others hath pleas'd me beſt, *viz. Recipe* common *Sol*, and with the help of our Magnet diſanimate it ſo, that it may be no longer *Sol*, as not enduring the Teſt, and ſmoaking away with a ſmall Fire like Arſenick.

97. Then take this *Sol* and conjoyn it with our Microcoſmical Subject, with which digeſt a ſolution of *Lune*, by which means the *Lune* will be meliorated, and on the Cupel leave *Sol* to good profit.

98. But if we joyn common *Mercury* and common *Sol* with it, and caſt this mixture into a ſolution of *Mars*, and digeſt it for ſome days then the pure *Sol* and eaſily flowing *Mercury* graduates a good part of the groſs and difficultly flowing *Mars* into good *Sol*, to the great ſatisfaction of the Artiſt.

99. And if we unite *Lune* and *Jupiter* therewith, and caſt this mixture into a ſolution of *Venus*, and digeſt it the moiſt way, then by means of our ſecret Salt theſe two white united metals change the red *Venus* with little loſs of weight into good *Lune* that will abide the Teſt. And it is indeed matter of wonder, that our univerſal Salt, ſhould be of ſo great virtue, when fermented with white or red metals, to change other imperfect metals into good *Sol* and *Lune* on the Teſt.

100. Wherefore this ſhall be my concluſion, that in Man is hid the greateſt virtue of changing all metals, as well as the Bodies of Men, both univerſally, and particularly; which if intended for the melioration of metals, the adding of fixt *Sol* and *Lune* for a ferment will facilitate the ingreſs into other metals, and further diffuſe its tinging virtue.

N. B. I ſhall not be ſatisfied till I have given a fuller and plainer deſcription of this Royal Labour, which I intend to do in the ſixth Century, if God permit.

Novum

Novum Lumen Chymicum:

OR A

NEW CHYMICAL LIGHT.

Being a Revelation of a certain new invented ſecret, never before manifeſted to the World.

Whereby a clear and unextinguiſhable light is ſet before the Eyes of the blind World, and, as it were, palpably demonſtrated, that good Gold may he found and attained with profit, every where throughout the whole World, as well in cold as in hot Regions, ſo that in all thoſe places, where Sand and Stones are found, a Man cannot ſet his Foot, where, not onely Gold, but alſo the true matter of the Stone of Philoſophers is afforded.

READER,

I will now addreſs my ſelf to the diſcovering of the wonders of God, not hitherto heard of; to wit, that throughout the whole Earth, no leſs in cold than in hot Countries, where there are Sand and Stones to be had, good Gold may be extracted from thence with profit. Becauſe a Man cannot ſet his foot in any place where Gold doth not exiſt. Nevertheleſs Chalk, or Lime-Stones, are to be thence excepted; becauſe they onely ſeldom or never contain any thing of Gold, otherwiſe all ſandy and rocky Stones, all Flints of what colour ſoever, as alſo all Sand, fine and courſe, all ſandy Stones upon high Mountains, in deep Valleys, in the bowels of the Earth, in Ponds and Rivers, and laſtly, all the Sand on the Sea-ſhore, none excepted, although it hath as yet obtained no colour, but be white and clear. The which indeed will ſeem incredible to very many, but is aſſerted by me as a ſincere truth, which I never found, by reading or hearſay, but have proved by many and various experiments. Some of which I will here ſet down for the confirming and demonſtrating the truth of my Writings, that by thoſe, all Men of a ſound mind may be able to diſcern, that my Aſſertion is no Dream, nor fabulous trifle, but ſufficiently founded upon experience in the light of nature.

Therefore I would not have thee judge of thoſe things which thou underſtandeſt not, nor canſt not at preſent apprehend, but remember that the wonders of God triumph with magnificence and power. But ſearch out thoſe things in every part before thou preſumeſt to interpoſe thy immature judgment. And although in the proof thou ſhouldſt be miſtaken as may eaſily happen to one making tryal, yet do not impute the errour to my Writings, but rather to thy own unready Wit. For I will here write nothing but what I have oftentimes performed, and can yet perform at any time. Conſult other ſearchers after this matter, among which I think all cannot err, in a matter ſo eaſie, that even a Boy of ten years of Age may apprehend it, for what belongs to the poſſibility of it, but it will be evident to many of them with me, That there is Gold in all Sand and Stones, through all places of the World. *But there is no need that I ſhould here ſhew the way of extracting it from them, in a great quantity or large uſe, but rather I ſhall beware, that I put not ſo ſharp a Dart into the hands of my Adverſaries, to wound my ſelf, for I have publiſhed this to gratifie candid Friends, not Counterfeits, but leaſt of all the Compilers of notorious Libels, in which opinion, I will remain and acquieſce.*

We

WE will now proceed to the Trial whether those things which I have here written be true, and are able to abide the Examen of the Cupel, to wit, that in all Sand, there is good Gold.

The first Specimen of Probation.

R *Ecipe* one Ounce of white Sand or Flint, which you esteem to be altogether void of Gold, with which mix three parts of *Minium*, or of any other Ashes of *Saturn*. Put this mixture into a VVind Furnace, or to the Bellows, let it flow well together for an hour, and it will turn to a yellow glass; suffer it not to stand too long lest the glass of *Saturn* perforate the Crucible, and run out into the Ashes. Pour out the glass and powder it, and mix it with half its weight of *Sal Alcali* or Pot-ashes, put this mixture into an Iron Crucible, into which you have first put some bits of Iron, or old Nails; give fire and cause the matter to flow, and the glass of *Saturn* will be continually reduced by the *Mars*, and at length return into Lead: Pour it out into a Cone, and the *Regulus* of *Saturn* will sink to the bottom, and the Sand or Flint will be uppermost as a dross. After all is cold, take out the *Regulus* of *Saturn*, which hath drawn to it self so great a roughness and blackness from the Iron, that it cannot easily be cupellated: which you may remedy thus: put this black *Regulus* of *Saturn* into a Crucible in a VVind Furnace, cause it to flow well; and if there be of that one Ounce, cast upon it a Drachm or somewhat more of Salt-peter, and make them flow together, then the Salt-peter will attract the roughness from the *Saturn* and turn it into *Scoria*. Which being poured out and the *Regulus* of *Saturn* separated from the *Scoria*, it will be white and tractable, and easily runneth upon the Cupel. This I call washing. But if thou knowest not how to perform this Lotion, which yet in it self consisteth in an easie labour, put thy black and rough *Regulus* of *Saturn* into such an Instrument (as they call Treib Scherbe) or, a close Cupel, under a covering [or Muffle,] and suffer it so to be defecated for the space of half or at least a quarter of an hour, pour it out and separate the *Scoria* from the *Regulus*; which will be white and tractable. But the Lotion by Salt-peter is much the better.

Of this *Regulus* of *Saturn*, and of that same Lead of which the Ashes of *Saturn* were made, take equally the same weight, exactly weighed with the lesser weights, put each of them apart upon a dephlegmed Cupel, suffer them to run; compare one with the other, and you shall find, that *Saturn* which was blown off with the Sand or Flint to leave behind it a grain of Gold, but on the contrary, the common *Saturn* will onely leave a grain of Silver. Who now can deny, but that the grain of Gold proceedeth from the white Sand or Flint? For no Gold could come from the Salts. This Specimen of Probation is a palpable Argument, that Gold is contained in all Sand and Flints of what Colour soever. But that there is no difference between one Sand or Flint, and another, so that there is no more Gold in one than another, I do not assert, for (in that respect) they greatly differ. Also that the Sand of hot Regions containeth more Gold than that of cold Countreys, is in no wise to be doubted, as every prudent Man will easily think. For we have set down this Specimen of Probation, onely to the end that you may find Gold to be in all the Sand and Flints of the whole World.

The second Specimen of Probation.

R *Ecipe* one part of white Flint or Sand, with which mix three or four times as much Salt of Tartar, or of any other Alcaly, which mixture put into a Crucible, so that it be not above a third part full, because this mixture in the melting might rise up and run over the Crucible; let it stand half an hour, that it may be well melted, and it will be turned into a white transparent glass. Pour it out and dissolve it in water, or rather in a *Lixivium*, and the Sand or Flint will be dissolved, and converted into a thick Liquor. In this Liquor digest for the space of an hour or two, half an Ounce of Filings or Raspings or rather thin shavings of Lead, and the Lead will extract the spiritual Gold from the VVater of Flints, and will thence grow yellow: VVhich being taken out of the VVater dry, cupel it, and you shall find a grain of Gold. Also cupel another half Ounce of the same Lead, and you shall find a grain of Silver, as is commonly wont to be had from all Lead, from which you may be certain that white Flints and Sand, contain spiritual Gold, which becometh corporeal with Metals.

A Third Specimen of Probation.

DIssolve *Saturn* in *Aqua Fortis*, and pour into the solution Salt water, and all the Lead will fall from the VVater like a white Powder: mix three parts of this edulcorated and dryed *Calx* of *Saturn* with one part of Sand, to which add half so much of the Salt of a *Lixivium* or other Alcaly; which mixture put into an Iron Crucible, into which you have first put some bits of Iron, which being covered, suffer it to melt for the space of full half an hour, untill the sharp Spirits of Salt which were in the Lead be mortified by the Iron, for then the *Saturn* is reduced and rendered corporeal, which being poured out into a Cone, the *Regulus* of *Saturn* falleth to the bottom, which you may wash with Salt-peter as we have taught above, or purge it from the Fæces on the Treib Scherbe [or Muffle] weigh it exactly by the lesser Probatory Weights, weigh also as much of any other common Lead, which is not melted with Sand, cupel each by it self, and that Lead which was melted with the Sand, will leave a grain of Gold in the Cupel, but the other common Lead leaveth onely a grain of Silver. Which sufficiently proveth that there is Gold in all Sand, none excepted. But I do not assert that all Sand containeth so much Gold as that it may be thence extracted with profit. Because some Sand is poor, other rich, another richer. Therefore whosoever intendeth any profit by this ought before hand to know the difference of Sand and Stones, that he may not lose his labour. The which may easily be found out by experience, to wit, if you do nothing in great Quantities, before you have made trial in lesser, that is, such as may be performed by the lesser Specimens of Probation.

A Legitimate and Infallible way and manner of finding out and proving every Flint, Stone, and Sand, whether it containeth much or little Gold.

R *Ecipe* four ounces of Sand, Flint, or other Stones or Rocks, which you have a mind to prove; heat them red hot in a Crucible, and cast them so into cold Water, where they will become tractable,

tractable, and may easily be brought to fine Powder, to those four ounces of powdered Flints, Sand or Stones, put into a small Glass Cucurbit, pour two ounces of *Aq. Regis*, that the Sand may be well moistned; set the Cucurbit upon warm Sand for half an hour, and the *Aqua Regis* will attract to it self the Gold which is contained in the Sand or Flint. To which if two ounces of hot Water be poured into the Cucurbit, and mixed by a strong shaking it together, and filtred through a brown Paper, the Water with the Gold goeth through the filter, and the Sand will remain in the Paper, to which if you pour a little common Water, and let it run through it will take out the residue of the Gold, which yet adhereth to the Sand, which is to be added to the first. Upon this Solution if you pour a *Lixivium*, but rather Spirit of Urine; that *Lixivium* or Spirit of Urine, mortifieth the *Aqua Regis* and precipitateth the Gold which is in it in form of a yellow Powder, from which the Water is to be poured off, and the *Sol* to be edulcorated with fresh Water, and dryed, and that very warily, because Gold of this sort, when it groweth hot, fulminateth, so that it is shattered into minute parts. To this fulminating Gold if you add a little common Sulphur, and make it red hot in a Crucible, it doth not fulminate. If you reduce such a *Calx* of Gold mixed with Borax in a clean Crucible, you will find how much Gold that four Ounces of Sand or Flint contained. *N. B.* Except the Sand or Flint should happen also to be impregnated with Iron, which would render the *Sol* brittle and pale. For in that case, the *Sol* precipitated from the *Aqua Regia*, and burned with Sulphur would not flow with Borax, because the Iron being mixed with it, would adulterate the Probation: But if you cupel such Gold partaking of Iron, with *Saturn*, the Iron may be separated from the *Sol*, and the proof will be void of errour. *N. B.* That Sand and Flints, may indeed be proved another way; but seeing this which we have here prescribed, is easie to be practised, we will rest in that.

But this one thing is also necessary to be known, *viz.* It is indeed true, that in all Sand and Flints there is Gold, as the above mentioned proofs do witness; nevertheless know that there is a difference between native, corporeal, and solid Gold, and the volatile spiritual first Ens of Gold. For the corporeal Gold is easily extracted by the help of corrosive Waters or Salts; but the spiritual not so. And because corporeal Gold is always elicited by the benefit of the above mentioned Probation it may thence happen, that although in white Sand there should plainly be no corporeal Gold, nevertheless by the help of the aforesaid Probations it would be thence elicited, indeed not much, nor no more than what the Lead which was used for the proof, did contain of Silver: because the *Lune* in the melting or dissolving hath attracted to it self the spiritual Gold, from the Flint or Sand, so that it is thence tincted and transmuted into Gold. Which is manifest in that the grain of *Sol* doth not exceed the magnitude of the grain of Silver, which is gotten from other common Lead. But if besides the spiritual, there be also corporeal Gold in the Sand, the grain of *Sol* will necessarily exceed that of *Luna*, for the Silver which was contained in the *Saturn* doth not vanish into Air but remaineth. and because it doth not remain the same Silver, but passeth into Gold, that change is ascribed to the notable Operation of the first Ens of Gold, or spiritual Gold in the Sand. Wherefore whosoever intendeth to extract Gold from Sand, Flint or Stones with profit, ought to know certainly before by smaller experiments, that besides spiritual, they also contain corporal Gold. For I have written this Book onely upon the account of extracting from them corporal Gold, leaving the spiritual Gold to Philosophers that of it they may make their Stone. But necessity required that I should lightly touch at those few things. For if according to my prescribed Probations, any one in working should have found a grain of Gold of equal quantity with the grain of Silver, he might wonder in his mind, which way the Silver had made its escape, seeing that he had found Gold instead of Silver. Wherefore I thought it necessary to shew the reason of that, for the taking away all scruple from every ignorant mind. Wherefore whosoever seeketh Gold from Sand or Stones, let him chuse such, from which corporal Gold may be extracted with profit. For they will afford him such profitable fruit, as the white Sand denieth. But that for the performing my Specimens of Probation, I have taught to take white Sand, I have done it for this reason, that I might make it evident to every one that there is Gold in all Sand, but that it cannot be extracted from all with gain. For white Sand or Flint is very often void of corporal Gold, but never of spiritual, by which Silver may be converted into good Gold. I might have passed by this admonition with silence, seeing that those things are not necessary to be known by the vulgar, in asmuch as corporal Gold will abundantly satisfy their desire; but a Philosopher neither wanteth, nor seeketh corporal Gold, but onely spiritual, to prepare of it a Tincture. Add, that to him it is sufficiently known, in what subjects the first Ens of Gold is plentifully contained. Hence, although the first Ens of Gold be also in white Sand, as is manifest by the foregoing proofs, he useth not that, but rather seeketh such Stones for his work, as contain much Tincture. Neither also doth any true Philosopher so tie himself to this or that subject onely, that he will not elicit his Tincture from any other, inasmuch as it is evident to him that the first Ens of Gold may be found in all things in the whole World. For whersoever there is Sulphur, there may also be had the first Ens of Gold, whence a Tincture may be prepared. But it is evident that in all Vegetables, Animals and Minerals there is Sulphur. For the matter of the Stone of Philosophers, every where offereth it self, so that the poor as well as the rich may attain it without cost, according to that saying of the Philosopher; *That their matter is every where obvious, and prepared without money, trod under foot and thrown to Dunghils.* So the true Philosophers speak and write. But Sophisters, who falsly assume the name of Philosophers, wandring up and down from Court to Court, where they offer their service for the acquiring the Philosophers Stone, by their lying Fables, perswade credulous Noble men, that the matter of the Stone is to be sought in this or that place or mountain, as in *Hungary*, *Transylvania*, the Forrest of *Hercynia*, *Thuringia* or *Bohemia*, or in the Rocks of *Sueden* or *Norway*, and elsewhere. Others again perswade credulous Persons, that the Stone of Philosophers, can be made of nothing but common Gold, and therefore require of their Patrons not onely some ounces, but some pounds of Gold, for their own greater profit. One of those Pseudo-philosophers was lately here at *Amsterdam*, who by per-

swading certain Merchants, trickt them out of two and twenty Marks of Gold, thence to make the Philosophers Stone. He indeed put the Gold into the Vessel according to his own manner, before those Merchants, giving to it a continuall Fire But after much time being elapsed, when they expected to reap the Fruit, he, who had plaid the Philosopher, privately withdrew himself into I know not what Countrey, and would not return to take out the two and twenty marks of gold. Therefore the Merchants themselves being about to take them out, found those solar Birds were flown, and had left onely the empty nest. Which empty nest as yet lies in a place in this City, nor doth any one know how to convert it to his own use. But if the Merchant had given to that impostor in hand, onely two, or at the most three ounces of gold, they had not received so great a loss. But as they unadvisedly credited his fine Clothes, and his finer words, so they were intollerably deceived.

A true Philosopher wanteth not so much gold for his Medicine, inasmuch as if he bringeth but one half ounce to perfection, it may suffice for his whole life, and may be in his own power to do the same again as often as necessity shall require, so that he will have no need to run up and down from one to another who are greedy of gold, to blemish the noble art of Chymistry, and bring it into hatred with the whole World.

Some years since, when I had written of the Prosperity of *Germany*, and from a good intention had taught *how Wine and Corn might be concentrated, and in case of necessity, might be commodiously carried from one Countrey to another, and there safely kept in Garrisons or Fortresses for future use*; fearing that at sometime while the Shepherd slept, that most ravenous Wolf the *Turk* might break into the *German* Fold, and cut the throats of what Sheep he could not carry away. Against which, *Farner* with his accomplices, hath set forth notorious Libels, and hath every where traduced me for a false Prophet: Whose Calumnies I have not opposed, because he hath sheltred himself under the protection of Princes. Moreover, this *Farner*, with a consort of ruiners of fame, or good name, have reproachfully wounded my Honour, by falsely accusing my Writings, and traducing them for Lyes: And seeing that almost all of them abide in great Men's Courts, and have not put their names to ther invective Papers, I have not indeed been able to reach them. But yet at length those Men of darkness, who have concealed their names, that they might give the greater reputation to their slanderous Papers, do come to be more and more known to me. Besides at last the event hath shewed those things to be true, which I had predicted should happen; to wit, that the depraved Christians should be chastised by the *Turks* and *Tartars*. But it is to be pitied that also Men of better note, should be ensnared and captivated by the common judgment, by reason of that Company of the Devils attendants. For the unerring truth declareth, that the righteous scourge of God, will not be taken away from us, before such spoils of a Man's good name be restrained by the Magistrate.

Now, to return to our purpose, to demonstrate, that not onely Gold, but also somewhat more rare; to wit, a true Tincture is hidden in Stones, and by the help of Art may be extracted from them, which the Ancients have hinted at in these words: *Auro quid Melius? Jaspis*, &c. And that there is much Tincture contained in the Jasper, I have long since inculcated in other places of my Writings. *Paracelsus* highly commendeth *Red Talck*, *Granates*, *Antimony*, and *Lapis Lazuli*, adding that Tinctures or the first Ens of Gold, may be gotten from them by the help of sublimation. Moreover the first Ens of Gold, may also be found in other Stones, especially in the *Hematitis*, *Scythis*, *Magnesia* of *Piedmont*, *Smiris*, and others of that kind, in which it is so fixed, that there is nothing wanting to obtain it but onely the way of extracting, and giving it ingress by *Sol*. On the contrary, the first Ens of Gold is indeed in Vegetable, Animal, and Mineral Sulphur, Marcasites, and Antimony, and that abundantly, but so volatile that Stones are to be preferred to them.

And although my intention in this Book extendeth no farther than the extracting of Gold out of Stones, Sand, and Flints, yet nothing hinders but that in a few words, I may also shew, that in Stones, there is not onely fixed Gold, but also volatile, whence a true Tincture may be perfected. Which Tincture I have not as yet made, but nevertheless I am certainly perswaded that it is in no wise impossible to be done. For whosoever can render the first Ens of Gold, in Stones, volatile, and draw it out by Distillation, he will continually obtain a gradatory water, whereby he may coagulate every running Mercury into good Gold. But he that knoweth how to joyn this volatile Gold with corporal *Sol*, to unite them and procure ingress, may thence expect a far greater good. For the first Ens of Gold is more conducible for the preparing Tinctures, than corporal Gold, as one of the Philosophers hath signified in the following words: *Thou canst not make Gold or Silver, except thou shalt obtain their first Ens.* The first Ens of Gold, which is hidden in all Vegetables and Animals, coagulateth Mercury also into a yellowness, but not constant; but if it shall be fixed, it also coagulateth and fixeth with constancy, but not before. Therefore it is most certainly true, that where Sulphur is, there is also the first Ens of Gold; and where there is the first Ens of Gold, there is also Tincture. Therefore seeing that Sulphur may be found, in all things in the World, even in the smallest Herb, it followeth that also from every Herb, Wood, Stone, or Bone, a true Tincture may be prepared. Whosoever will believe, let him, it matters little to me whether it be believed or not, I think my self satisfied in that I have not put that light which I have received under a Bushel, but have exhibited it to the World for information. For the light conduceth nothing to him who is blind, and resolveth to remain so. You shall find more in my third Century, as also in the sixth part of my *Pharmacopœa Spagyrica*.

How it may be known whether Sand, Flints, and the like Stones, being pregnant with Gold, contain much Gold, or but little.

WHite Sand and Flint, contain the least Gold of all; which Sand indeed is never without Gold, although it cannot be extracted from it with profit. In the white and red, there is more Gold than in the white, nevertheless not always so much as will pay the cost. In the yellow, brown, or black, there is commonly much Gold contained, whensoever veins of white or yellow Sand run through them, and especially when such Sand shineth with abundance of small golden

golden sparks, closely adhering to each other. In like manner that Sand is rich in *Sol*, which is like to Talck, or when Stones are found in it, in which there is red or brown Talck, even as *Sol* is contained almost in every Talck, nevertheless in some more, in other less.

All River Pebbles (which although outwardly they appear white, yet when heated red hot and broken, are stained with yellowness, and contain *Sol*) are in extracting sufficiently rich in Gold.

Green, yellow, or blue Stones, being transparent like horn [called in the *German* Tongue *Hornstein*] are also for the most part fruitfull in Gold. Also all red, dark-coloured and black Flints contain Gold, with which Iron is frequently admixed, which in the extraction is drawn out with the *Sol*, and weakneth the *Menstruum*, and rendereth it unprofitable.

All Quarries or rocky Stones, whether they be found in the Earth after the manner of Ducts, or whether they lie in the open Air, when they are coloured, contain Gold. Every *Hæmatites*, and that which is a kin to it, the *Smiris*, the Granate, and *Lapis Lazuli*, all contain Gold, nevertheless always one more than another, so that some of them are rich in Gold.

All Granates contain Gold, and besides Gold, also the first Ens of gold; but they are endowed with so hard a body, that *Aqua Fortis* cannot exercise its power upon them. But there may be a remedy found, by whose help their extraction may be instituted.

In every golden Stone called *Chrysocolla*, *Saphyr*, *Ruby*, *Amethyst*, and *Hiacynth*, there is gold, but difficult to be extracted. All Fluors or things fluxing, which are applied to the Mines of *Sol* and *Lune*, for the bringing their Oars to a flux or melting, whether they be of a violet colour, or purple, yellow, red, or green) are all endowed with unripe and volatile gold. Which if you shall make red hot, the colour evaporateth like a green, yellow, or red smoke, leaving the Stones white. But if any Man shall know how to intercept, and detain such fugacious *Sol*, he may therewith coagulate *Mercury* into gold. In like manner from all Stones, in which is the first Ens of gold, a green-water may be extracted by the help of Distiliation, in which *Mercury* coagulateth it self into gold. The Ancient Philosophers have called such a green-water, their *Green Lyon*, which devoureth gold, and of it prepareth a Tincture for *Lune* and *Mercury*.

Concerning this matter, I could indeed say somewhat more, did not the avarice and improbity of Men, who seek nothing but the damage of their Neighbour, restrain me. Hence all those in which any light of God shall arise, ought diligently to beware that they communicate nothing of it to wicked Men, although they put on the shape of an Angel. For Faith is now no where kept among Men, as these following words of a golden Alphabet do witness.

Soli Deo tu Confidas,
Promissis hominum diffidas,
Deus solus fidem servat
A mundo fides exulat.

In God alone repose thy trust,
With Mens pretence be not beguil'd;
God onely keepeth Faith, is Just,
Which from the World is quite exil'd.

If many years ago, I had known those things which I now do, it would have profited me much in being aware of the dissembled sanctity of impostours. But what is past cannot be recalled: Let these things at this time suffice to be spoken of the knowledge of Sand and Stones, every Man may look further for himself, and search out and learn more. If any Man findeth any good from what I have written in this Book, let him give God thanks, and be mindfull of the Poor; if not, let him look upon himself as unworthy to be partaker of it. For I have here written more perspicuously, than any Philosopher hath done before me, in which I rest. It now remains that we should say something concerning the easie way, and incomparable invention, by whose benefit *Sol* may be extracted from Sand and Stones, in great quantity and with a considerable gain. Which invention hath been hitherto unknown to the World, and it is almost impossible that a better should be found. But that the searcher into Art may see that this new invention of mine, is of all the most easie for the extracting of Gold from Sand or Flints, and that the World hath never known the like, I have thought fit to shew in what this *Compendium* consists, and it is thus. It is sufficiently known with what labour and costs the ancient Workers in Metals, and even those at this day, have extracted, and do extract Gold from Sand and Stones, *viz.* when first they burn the Oars or Stones, then grind it in peculiar Mills accommodated to that purpose, with *Argent-vive* and water, where the *Argent-vive* draweth to it self the *Sol*, and the Stone goeth away in the washing, and the greatest part of the *Argent-vive* is strain'd from the gold through Leather, which may again serve for the same use. Then in Iron Retorts they drive out the residue of the *Argent-vive*, which yet adhered to the *Sol*, which is saved; then they melt the *Sol*. In which operation they lose much of the *Argent-vive*, which in the grinding and washing goeth away: so that often times the charge of the *Mercury* is no less than the gain of the gold. Therefore by this way nothing can be gotten from a poor Mine. But this is the easiest way they have to separate *Sol* from its Oar or Stones.

Another way is, when they mix the washed Oar (which the *Germans* call *Schlicht*) with its weight of Litharge, and melt it with Bellows, then cupel the *Regulus* of *Saturn*, and so they obtain the *Sol* which was in the Oar. Which way of melting, is also dear, because much of the Lead is lost: But yet they are obliged to follow this way, who know no better. Now I will compare my way with this, that it may be evident which of them is the most easie and profitable. As for my method of extracting, it chiefly depends upon four singular *Compendiums*, by which the operation is rendred easie. The first of which is a water of small cost, which may be copiously prepared, without Distillation.

The second is a singular Metal, of which the Kettles or Pans are made, in which the Stones or Sand is boiled with the water of small cost, and yet are not corroded nor consumed. And when the water shall have dissolved and imbibed the *Sol* in the Sand, the Oar, Sand, or Stones, with the water are to be taken out of the boiling Vessel, and put into another Vessel adapted to this use, with a bottom all over perforated with small holes [like a Colender] and first covered with inside, with a thin Matt, then the water will drop down through the Sand and

and Matt into another Veſſel placed under it; moreover more hot water is to be poured upon the ſame Sand, and let to run through it, which water will alſo extract the gold which as yet remained in the Sand. And after this Elixiviation, the Sand, (which is now of no uſe) is to be taken out of the filtering Veſſel, and this labour to be continued ſo long, untill no more Sand is to be extracted.

The third *Compendium* is this, when the *Lixivium* of Gold, is collected to a juſt quantity, a ſingular Water of ſmall coſt, is poured into the Solution of Gold, whence all the *Sol* is precipitated from the Solvent, the Solvent by inclination is decanted from the *Calx* of *Sol*, and may again be uſed for the like extraction, ſeeing that it ſtill retaineth its ſtrength, being nothing weakened by the precipitation. Therefore we may uſe this Solvent a long time. And that which is loſt by pouring too and again, is of ſmall charge, becauſe it may be recruited again by the like cheap Water. But if one ſhould mortifie that diſſolvent with other contrary *Lixiviums*, to precipitate the *Sol*, as otherwiſe is wont to be done, and I have taught above, about the proving of Sand, what a loſs ſhould we undergo, if at every time we ſhould deſtroy our Solvent? Beſides ſuch an extraction is coſtly and laborious, when made in glaſs or earthen Cucurbits.

But this extraction is almoſt of no charge, ſeeing that it may be perfected in great Kettles, and the Gold thence precipitated without loſs of the Water. This extraction of Gold is like the extraction of Salt-peter from Earth, where the VVorkmen alſo elixiviate one part of the Earth, by the help of VVater, which Earth they then throw away, and in room of that put other Earth into the Veſſel, which they alſo elixiviate or waſh, and that ſo often till they have elixiviated all their Earth impregnated with Salt-peter. And by the ſame reaſon we elicit our Gold from Sand, as they make their Salt-peter.

The fourth *Compendium* is this, that the precipitated *Calx* of *Sol*, after the VVater is filtred from it, is taken out of the filter and dried, and by the benefit of a certain ſingular good flux, not at all coſtly, is reduced, ſo that in the melting nothing of the Gold is loſt.

In thoſe four *Compendiums* the whole work of our extraction conſiſteth, as a building ſtanding upon four Pillars, one of which failing, the whole ſtructure is ruined. He that knoweth thoſe four *Compendiums* may boldly enter upon the work, to extract *Sol* from Sand and Stones: for then it will be a work of profit to him, otherwiſe not, which I have declared for the information of every man.

But that I have made none of thoſe four *Compendiums* manifeſt, let no man wonder, becauſe I have been ſufficiently hurt by the ſlanderous Forgeries of cavelling Detractours. For when by reaſon of their dull apprehenſion, they could not underſtand nor perform thoſe things which I had written openly and plain enough, they falſly traduced my Writings, as abounding with lies.

Let theſe things ſuffice to be written at this time, concerning the extraction of Gold out of Stones, Sand or Flints: which I doubt not but will be of uſe hereafter to many indigent Perſons. For although all men ſhould apply themſelves to that extraction, yet they would in no wiſe incommode one another, ſeeing there are Sand and Stones every where obvious to all. And alſo the Salts for extracting are ſo plentifully afforded, that nothing is wanting but a man to put his hand to the work. But ſome one may here object and ſay: I do indeed believe *Glauber*, that in the Sand and Stones of the Eaſt and VVeſt *Indies*, *Africa*, *Spain*, *Italy*, *France*, and other hot Countries, much Gold may be found, but who will remove his dwelling thither to extract it? There is no need that any ſhould go dwell in *Africa*, or either *Indies*, thence to fetch us Gold, ſeeing that it may be had ſufficiently in *Europe*, and may be found in all cold places. It is well known, that in many parts of *Germany*, Gold is elicited from the Sand as well of ſmall, as great Rivers and Lakes. But that more Gold may not be had in *Germany*, which is temperate, than in cold *Norway*, or *Sweden*, and leſs in *Germany* than in *France* or *Spain*, I will not deny. Therefore we need no Commerce with thirſty *Africa*, or *America*, as that with great peril of body and mind, we ſhould ſeek Gold thence, ſeeing that we have it in every Countrey of *Europe*, and that not onely under ground in the Veins of the Earth, whence it is to be digged out with great trouble, coſt and labour; but it is alſo every where manifeſt upon the Earth, where it is much more largely and eaſily acquired. The moſt famous Monarch of Philoſophers, *Paracelſus*, in his Book of the Vexations of Alchymiſts ſaith: *That more Gold and Silver may be found above the Earth, than in its profundity, and that oftentimes a Countreyman throweth a Stone at a Cow, which is of greater value than the Price of the Cow.* Which thing indeed is certainly true, nevertheleſs whoſoever will not with *Glauber* believe it, let him remain in his unbelief. In *Eſdras*, we reade theſe words: *There is much Earth of which Potters make their Veſſels, but a ſmall quantity of Powder or Duſt of which Gold is made.* Which words are commonly thus interpreted, that, by the words powder or duſt of which Gold is made, the Writer hath underſtood the Stone of Philoſophers. The which is very agreeable to truth, but yet no Earth is found void of metals, nevertheleſs all are not ſo rich, as to afford any profit in the extracting. On the contrary all Stones and Sand (although every of them doth not contain corporal *Sol* ſo largely, as to be thence extracted with gain) rejoyce in the firſt Ens of Gold, or ſuch a *Calx* by whoſe benefit Gold may be made. Which powder, if we know how to extract from them, we may make it better than Gold it ſelf. But ſeeing ſuch an Aurifick *Calx* is very largely diffuſed in Sand or Stones, and cannot be thence hammered out, but is extracted by Art alone, therefore the blind Covetours of Gold, with the Ignorant, will not believe it, becauſe they know not how to perfect it. Hence an Art of this kind was by the Philoſophers kept moſt ſecret, where *Paracelſus* ſpeaking of the firſt Ens of Gold, ſaith that it may be elicited by ſublimation. *Baſilius* writeth that the preparation of the univerſal Tincture, may be compared to the diſtillation of a burning Spirit from the Lees of Wine. A compariſon ſufficiently perſpicuous! For even as in a great quantity of Wine or Beer, there is hidden but a ſmall quantity of good Spirit, and the reſidue is nothing but an unprofitable mud, but nevertheleſs that little Spirit, by the help of diſtillation is always extracted from the great quantity of unprofitable mud, with gain, and is concentrated into a very ſubtile penetrating Spirit, of which one ſpoonfull is more to be eſteemed than a whole pail full of Lees. By ſuch means the Philoſophers would have us extract

tract by Art, that firſt Ens or form of Gold being very far diſperſed in Sand and Stones, and concentrate or bring it into a ſmall compaſs, of which, but asmuch as the magnitude of a Peaſe, is of greater worth than a huge Mountain of unprofitable Earth. Moreover, this I will not conceal, that throughout all *Germany*, in and about the Rivers may be found Stones, which are ſufficiently rich in Gold and Silver, and moreover if you break them into pieces, you ſhall find within them little Hoſes and Caverns, which abound with a yellow or brown Powder, which if any one ſhall take out, and melt it together with Borax, he will acquire *Sol* mixed with Silver. But as yet, I never ſaw any man, who knew this ſort of ſtones, and much leſs that golden *Calx* which is hidden in them. Which thing without doubt they have paſſed by, by reaſon of their negligence, not loving or ſeeking to know the phyſical *Magnalia* of God. I have found many the like ſtones in the ſandy Hills about *Utrecht*, and in other Sand-pits of this Belgick Nation, but more about the Banks of the *Rhine*, and the Iſle, as alſo the Coaſt of the Southern Sea, ſome of which ſtones I have yet by me. Alſo in the rough places of *Walavia* you may find much Sand and Stones, which contain contain corporal Gold. But there is no man knoweth any thing of them. And this might be of great uſe to Children, if they were placed for a time in the Shop or Workhouſe of ſome Artiſt, of whom they might learn, whence in any caſe of neceſſity they might be able to ſuſtain themſelves. But the rich, relying upon their own fortunes, think that they have Wealth enough for their Children, but if any adverſe fortune ſhall chance to befall them, as their Houſes to be burnt, or their Ships robbed by Pyrates of their rich Merchandizes, or be caſt away by Tempeſts, or their Debtours break and run away in their Debts, then they know not which way to turn themſelves; and becauſe they have learned no Art, whereby to get their living, they commonly degenerate into men of a deſperate life. For one leaveth his Wife and Children, and goeth into the *Indies*, where not a few have become a Prey to wild Beaſts or Cannibals. Another, for a ſmall ſtipend or pay, ſelleth his Freedom to fight by Sea and Land, untill like a mad Dog he is miſerably ſlain. [*I have heard that it is a Cuſtom in* Germany, *that a man may play away, pawn, or ſell his Liberty or Freedom, which being once gone, he becomes a Vaſſal or Slave to the publick Service of the Prince or State, during his Life.*] Others, (after they have conſumed and waſted all their ſubſtance, and have learned nothing that is gainfull in their youth, whence they might honeſtly maintain themſelves and Families) betake themſelves to a vitious kind of life, till they periſh in it. To have truely learned Mechanick Arts, indeed helpeth much in fortunate times; but when the times happen to be troubleſome and difficult, and many men in the ſame City exerciſe one and the ſame Art, one often hurts another, by eating the Bread out of his mouth, and reduceth him to ſtraits. But if a Phyſician knoweth ſomewhat beſides the Profeſſion of Phyſick, by which he may obtain a Living, he will have no need to make ſo many Viſits to the Sick out of a preſſing deſire and expectation of getting mony for his diligent attendance. Therefore Hermetick Philoſophy and Medicine, with their Couſen *German* natural Alchymy, are the moſt excellent of all Arts, and will ſo remain to the End of the World.

Seeing therefore that ſuch great Treaſures (as we have heard) are hidden in the deſpiſed Earth, and in ſuch ſubjects as are every where trampled under foot, wherefore ſhould we not extract them, for an honeſt maintenance, and defence againſt the injury of the times? Why ſhould we not leave *India* to the *Indians*, and have regard to our own *Europe*, which abundantly affordeth whatſoever we need for the ſuſtentation of Life? I cannot but ſay again and again, that were I but ten years younger than I am, I would not ceaſe, but for the good of the publick, would publickly teach, and demonſtrate to the Eye, true Philoſophy, Medicine, and Alchymy. But my glaſs being almoſt run, I muſt commit the care of this labour to others who are younger and have greater ſtrength of Body. Therefore in the mean time, whatſoever good I can do my Neighbour by wholſome Writings, I will not omit. I intend ſhortly (God favouring my deſign) to publiſh many ſecrets, hitherto unheard of. Nothing now remains but to cloſe this little Treatiſe with,

The End.

Glory be to God alone.

An Admonition to the READER.

WHatſoever I have written in this little Book of the compendious extracting of Gold, out of Sand and Stones, is ſo true, that nothing at all is to be doubted concerning it: Nevertheleſs after this Treatiſe was gone to the Preſs, another way, and that much better came into my mind, by the benefit of which, Gold may be extracted with a much greater expedition, than by the help of the former. Becauſe for the operation of this laſt way, there is no need of any Kettles or Pans made of a certain ſingular Metal, but the extraction may be made in quantity without any boyling, in ſuch Veſſels as are every where in hand, and may be had, ſo that one man in one day, may by an eaſie buſineſs perform the extraction of a thouſand Pounds weight of Sand. Which method is indeed much to be preferred to the former. Wherefore I could not but alſo notifie this way of extraction. What ſeekeſt thou? If I ſhall find that thoſe my profitable inventions are gratefully received, I will not neglect officiouſly to ſerve the publick, in this preſent evil Age, and in the worſer to come, by publiſhing the ſame. With which, benevolent Reader, I commit thee to the Divine Care and Protection. Dated at Amſterdam *the 26th. Day of* July 1664.

A Spagyrical Pharmacopœa: OR DISPENSATORY.

Being an exact deſcription by what means, profitable, efficacious, and penetrating Medicines may be made, and prepared out of Vegetables, Animals, and Minerals; after an unwonted and eaſie method.

PART I.

To the well minded Reader.

SOME or other will perhaps wonder at, and fain know what the reaſon ſhould be of my deſcribing this Pharmacopœa Spagyrica, *or Chymical Diſpenſatory, eſpecially when they conſider that there are not onely found various preparations of divers Chymical Remedies in my Books that I have publiſhed, but alſo many ſuch innumerable Writings of ſuch kind of buſineſſes, are publick even from the days of old down to this very day, both profitable ones (of which the number is very ſmall) and alſo unprofitable ones (of which there are a great multitude,) inſomuch that it might ſeem altogether needleſs to commit to the Preſs any more matters of that kind. To ſatisfie ſuch a one that thus enquires, I judge it well worth my while to demonſtrate in this place, that it is not onely very profitable, but alſo highly neceſſary, well to diſtinguiſh between good and tried Medicines, and ſuch as are not proved ones, not becauſe you ſhould neglect, correct, reject, and ſuppreſs other Mens Writings, and to eſteem highly of mine. No ſuch matter, for I well know that none can give more than he poſſeſſeth, and if any one doth (out of a candid mind) bring to light any thing for the profit and benefit of his Neighbour, how vile ſoever, and mean the thing be, yet is it to be moſt thankfully accepted of; and therefore let no body be ſo proud, as to preſume upon the rejecting of the induſtry and labour of another Man, but rather extoll it with praiſes, though he himſelf could have done better. And ſo by what is here ſpoken, I would hint unto you that the very reaſon why I have publiſhed this ſmall Treatiſe, is this,* viz. *that my inventions may reach out an helping hand to poor afflicted mankind, and that I may aſſiſt them in a Chriſtian manner, according to the will and command of the moſt high. And although I have already deſcribed the preparation of many profitable Medicines, as well out of Vegetables and Animals, as out of Minerals, in my Philoſophical Furnaces, by the uſe of which in caſe of neceſſity, every curable Diſeaſe my be ſufficiently enough driven out and carried off; yet nevertheleſs it hath ſeemed expedient unto me, to ſet forth this little Work under three Parts, each of which parts ſhall contain ſingular Medicaments as for example. The firſt Part ſhall comprehend ſuch Medicines, as proceed from Vegetables, the ſecond Part, ſuch as proceed from Animals, and the third Part, ſuch as may be had out of Minerals. And this alſo is a primary reaſon why I have compriſed each kind of Medicaments in a ſingular Work or Treatiſe, becauſe of the envious know-littles, and fooliſh deriders, and deſpiſers of Art, who reject all Mineral Medicaments, (but they know not their properties) as unſafe at all times, becauſe not taken forſooth out of the wholſome Vegetables, (whoſe uſe and virtue [ſay they] hath been approved for many Ages) but out of the poiſonous Minerals and Metals, whereto no truſt is to be given, and the uſe of them too is to this day very rare, and their operation too vehement. Now that I may ſtop the mouths of theſe kind of Men, and that they may ſee and know, that I likewiſe am well verſed in the virtues of Vegetables, and their true preparations, together with their purification and fundamental Anatomy, and with their reduction into moſt wholſome and moſt ſafe Medicaments, I have purpoſed with my ſelf in my firſt part of my Spagyrical Diſpenſatory, to treat of no other things ſave onely ſuch Medicaments as are made out of known Vegetable Simples, without the addition of any other things, (either Animal or Mineral) as for inſtance, out of Herbs, Flowers, Roots, Fruits, and Seeds, their ſeparation by Art, and their reduction into a better form. In the ſecond part, we will treat of ſuch things onely as proceed from, and are prepared out of Man, and other Creatures, and ſuch as live in the Air, and alſo ſuch as live in the Waters. But in the third Part I ſhall not deſiſt from defending thoſe Medicaments of mine, which I publiſhed ſome years ſince, and were prepared of Minerals, and ſhall demonſtrate unto you, that they are not at any rate to be ſhunned or neglected, if rightly prepared and applied, but are to be preferred far before thoſe Medicaments that are prepared out of Vegetables and Animals. To them I will alſo adjoyn the uſe and preparations of ſeveral other things, which I never as yet made mention of. Nor do I doubt but that the eyes of the blind will ſometime or other be opened, ſo as to ſee the truth, and confeſs it and love it, to the doing whereof, I pray God, that Eternal, Immutable, and durable Light, the Father and defender of the truth to help us.* Amen.

THE

THE SPAGYRICAL PHARMACOPOEA: OR DISPENSATORY.

What Vegetables are, or what is meant by the name of Vegetables?

YOU are in the firſt place to note, that under the name Vegetable, comes all that which hath its Food out of the Earth, which grows or is encreaſed, be they Herbs, Shrubs, or tall Trees with what appertains unto them, as the Root, Stalk, Leaves, Flowers, Seeds, and Fruits of them, as well cultivated as wild, both of our own Countrey, and Forreign, as well the known wholſomes one, as the unknown and hurtfull, whatſoever name they are called by, the kinds, ſhape, form, property, virtue, and power; of which, may be found deſcribed by many ancient and later Philoſophers and Phyſicians, ſo that 'tis needleſs to make any farther rehearſal of them.

My purpoſe is onely to tell by what means, and by what moſt excelling way that innate virtue, operation, and efficacy, which God hath implanted into them, may, and indeed ought, by the dexterity and induſtry of Man, to be ſeparated from their dead Fæces and Husks, and be concentrated and applied in a convenient form to Diſeaſes, and be reduced into a moſt pleaſant and acceptable Eſſence. But ſome may object and ſay, what good is here in beſtowing ſuch a deal of labour and care to extract the virtues out of Herbs, and concentrate them, and ſo at laſt adminiſter them to the Sick? Will it not be all one, if any one know their natures, virtues and properties, (the which may abundantly enough be known by the large deſcription given of them, in the Books both of the Ancient and Modern Phyſicians) and ſo make uſe of them, green and dryed, according as they are at hand, or elſe firſt ſteep them in Wine, Ale, Water, or any other drink uſed at Meals, or elſe boil them therein, or omit the decoction, and drink the infuſion, and ſo adminiſter help. Will not that perform the very ſame effect, that the well prepared, pure, ſubtile, ſweet, and efficacious eſſence will? I anſwer that without queſtion, there is extracted ſome kind of virtue out of the Herbs, by ſuch a kind of infuſion in Wine, Ale, or ſuch other like drinks, and is together with the Wine carried into the Body, and effects no ſmall things, if it meets not with too much matter that is to be turned out. But yet no body will deny but that their virtues being extracted and concentrated, and taken in a ſpoonfull of Wine or Ale, will operate more ſpeedily, and be taken in more pleaſantly, and diſplay its virtues more effectually than the boiled Herbs, or its infuſion; wherein by reaſon of the virtue of ſome few drops as it were lying hid in a whole handfull of Herbs, we are conſtrained to drink down together herewith ſuch a deal of Wine or Ale, which too is rendred very unpleaſant and ungratefull by the Herbs: This the Ancient Phyſicians well obſerved, and made an accurate ſearch many Ages ago, by what means they might beſt of all prepare Herbs ſundry ways, ſo as to be taken inwardly with delight, and be encreaſed in their virtues. Thence it came to paſs that ſo many preparations are brought into the Diſpenſatories, which abide in uſe even to this very day: amongſt which there are diſtilled Waters, Oils, Balſoms, Ointments, Juices, Electuaries, Conſerves, and ſuch like; the which I do not by any mans reject, but onely mention how the virtues of Herbs may be adminiſtred to the Sick, in a far more pleaſant form. It is all one to me, if the aforeſaid and uſual preparation of Herbs be ſtill in beſt repute and ſo continue, for I neither ſow there, nor expect to reap thence. And ſhould I need their help (which God forbid) and that I had no better to ſupply my neceſſity, I would give God thanks, for his vouchſafing me a part of thoſe prepared Herbs, leſt I be conſtrained to make uſe of raw Herbs, in that manner that the Cows eat graſs, but yet that I have better, no Body can blame me, if I rather uſe them, and am willing to communicate them out of love and duty to my Neighbour. Verily no Body is compelled to do otherwiſe than as pleaſeth him, one uſeth Herbs in an infuſion of Wine, another eats them with Vinegar, Salt, and Oil, another takes them green as they are, and cuts them ſmall, mixeth them with Sugar, and aſſoon as they are come to a dryneſs, brings them into Powder, and takes them in ſome Broth; Another may thicken them with Honey, and Sugar, ſqueeze them in a Preſs, and ſo uſe them. And plainly 'tis no matter what way a Man takes in uſing them. Some there are that can't abide any Powders, becauſe they ſtick to their Gullet and will not paſs down into the Stomach, others can't endure Pills, and ſome you will meet with to whom all ſweet things as Honey and Sugar are diſtaſtfull. And you will find many too that can't endure Wine or Ale, wherein Herbs have been ſteeped but all night. Upon this account venerable Antiquity conſidered of ſo many preparations of Herbs, that if haply one way did not like them in adminiſtring them, the Phyſician might make uſe of another way, and ſo Men did year after year attempt more and more the preparation of ſweet Medicaments, and ſo trimmed and adorned their *Pharmacopœa*'s daily by little and little, and brought it to a better ſtate: And that is thus evident (I will now ſpeak onely of the Vegetables,) *viz.* there are to be found almoſt in all well conſti-

tuted

tuted *Pharmacopœa's*, burning Spirits, which are produced (by distillation) out of fermented Herbs, as likewise Salts, which are extracted out of calcined Herbs and again coagulated; also extracts, and (by the mediation of the Spirit of Wine) thickned Juices are extracted; also distilled Oils, and some coagulated into Balsoms. And many more preparations of this kind, and better sorts there are, which have not been of any very long standing, but have been by little and little added by good and faithfull Physicians, all which things do perform as much as they ought (or may be expected in the rank in which they are) nor ought any one to throw them clear off. But now if any one knows how ingeniously to extract the virtue of an Herb, and to concentrate it in such a manner, as that one onely drop shall be of as much efficacy as a whole cupfull of distilled Water, or as a spoonfull of Powder, Juice, Syrrup, or Conserve. Why I pray, should not one drop be in all likelyhood more willingly taken than a full Cup, or a spoonfull? That which may be done by a few, needs not be done by a great many. But haply some other will say, how can I be certain that there is a greater virtue in some drops of some good Essence, than in a whole spoonfull of dryed and finely powdered Herbs, or of green Herbs condited and beaten with Sugar, or than a Potfull of distilled waters; now this may be known by the virtue, odour, and taste, and that on this wise. If a few drops be put into a potfull of pure fountain water, and be stirred with a *Spatula*, the said water doth then exactly resemble the odour of the Herb when whole, and doth as to its taste agree with that water which is drawn out of the green Herb by distillation. If therefore the odour and taste be there, the virtue cannot be far off, besides the use will easily shew it, if both of them are in the proof compared together. And this now cannot be contradicted by any probable argument, for it is clearly evident to every one, that such a kind of Essence is an hundred thousand times more efficacious (respect being had to the quality and quantity of the same) than the Herb either green or dryed: Besides there also ariseth this benefit, that such a kind of Essence doth not at all lose any thing of its virtues though kept a great many years, whereas the other preparations and especially the distilled waters will grow musty and putrifie. But an Essence will (if warily preserved) eudure as efficacious above ten, yea an hundred years, as it was the very first day that it was made. Forasmuch therefore as these things are without controversie thus, we should rather mind the chusing of such things which being but small in quantity, are pleasanter and more efficacious than those that are of so great a bulk, which indeed are of little or no efficacy at all. There is no body will deny, but that the virtues of Herbs are widely dispersed and hidden in themselves, and for which virtues sake we are forced to take the whole Herb, that is, the dead body for that little virtue that lies hidden therein, just as if a Man instead of Bread should eat the crude wheat together with the stalk whereon it grows, which certainly would prove very hurtfull to the Stomach, and would together with its allaying our hunger corrupt the Stomach, and make it unfit for digestion. If therefore the Countrey-men who are the most sluggish and unapteſt Men of all others, have by a long course of time arrived unto and experimented this Wisedom and Dexterity, *viz.* that the Corn is not just as it comes out of the ground in its husk and stalk, at all fit for the use of Man, and do likewise well know that it is far more profitable (if the grain be first threshed out of the Eare, then ground small in a Mill, the husky Bran be separated, and then the pure Meal mixed with a little water and Salt, or ferment Leaven, and so the Past suffered to ferment, and afterwards be baked) than to use the crude Corn just as it grows, why should we not use also the utmost of our endeavours to extract the most pure Essence out of medical Herbs, and so to administer them to the Sick; than to use the crude Herb as it comes out of the Earth? And this I instance onely for example sake, that it may appear that a legitimal preparation exalteth a thing into a far better state than it was before. And this may be demonstrated by sundry examples, if need required, but sure here is no body that is such an unwise Tatler as to dare to oppose it. Forasmuch then as the case stands thus, that an extracted, pure, and subtile Medicine, operates far more speedily and safely, than when prepared after the common manner, I judge it much amiss to conceal the way that leadeth thereunto, and not to give directions for the use and profit of ones Neighbour. Nor indeed can I say that this invention of preparing Essences of Herbs did proceed first of all from my self, for 'tis unknown to me what another may either have done, or is able to do. But this I know, that no body hath hitherto mentioned the same either in Writings or otherwise, and that this preparation is no where known or in use. Well be it as it will, whether or no others know it as well as I, or have known it before me, yet it ought to be accompted a good thing, that I bring it forth to light for the sake of so many sick People. And it would have been much more acceptable unto me, if any body else had published it before me, and had eased me of this labour. But that I may return to my purpose; I will begin a brief but very clear description of the way whereby the virtue of Herbs is to be extracted and concentrated, that so by this means they may be more effectually operative in Diseases, and be more commodiously administred than the crude and unprepared Herb, and it is to be done as followeth.

The Preparation of the Essences of Vegetables.

TAKE of an Herb cleansed from the Earth, and its withered and putrified Leaves, both Root, Stalk, Leaves, Seed if they may be had, as much as you list, but however let it be at the least some fifty pounds weight, for the Fermentation will not succeed so well in a lesser quantity, as if taken in a due measure and plenty. Cut the Herb, *&c.* small, pour Water hereupon as much as is sufficient to fill your Copper Still, within an hands breadth of the top, urge your fire somewhat strong, and there will distill forth a clear and well smelling Water, together with a little Oil, which you must separate from the Water by a tritory or separating glass, and reserve it apart: then take out the Herbs remaining in the Still, put more of your Herbs in, and distil the VVater and Oil as before, this repeat so long, until you have distilled all the Herbs, always separating the Oil from the Water, and keeping it apart. Now then all the Herbs being thus distilled, pour water on them again, and put thereto a spoonfull of good new Ale yeast, and let them ferment together in a woodden Vessel covered over for some three or four Days: Then when the Herb begins to leave off working,

working, 'tis enough, and is fitted to ſend forth in a volatile manner by diſtillation its moſt pure parts, *viz.* Salt and Sulphur. Stir the matter well with a ſtick, that ſo both thick and thin may be well mixed together; fill your Still herewithal, give a fire by degrees, that the Herbs burn not too, and the Spirit taſt of an Empyreume. Diſtill it with a Refrigatory ſo long as the water hath any ſavour, the which you may eaſily find by taſting it often, when the water comes forth inſipid ceaſe from the Diſtillation, keep what is diſtilled forth in glaſſes: Then empty your Still and fill it again with more fermented Herbs, even within an hands breadth of the top, diſtil thence the Spirit, the which ſo long repeat until there remains nothing of the Herb undiſtilled. Then having cleaned the Still and Refrigatory, pour hereinto all your diſtilled Spirits, and rectifie them, take onely the ſtrong Spirits, pour out the inſipid water left in the Still; rectifie the Spirit again in an Alembick in *B. M.* and it will again put off an inſipid water; and if need be repeat this rectification yet once more in a glaſs Alembick, that ſo the Spirit being exalted by a farther operation may become very ſtrong and ſubtil, and its internal Vertue may be concentrated. So then, now take the Herb from which the Oil and Spirits proceeded, make thereof ſmall Balls which dry in the *Sun* or at the Fire, burn them unto Aſhes, from which Aſhes extract the Salt with the inſipid water left in rectifying your Spirit, and coagulate it: This Salt you muſt again diſſolve with more new water and filter, and coagulate it and then it is enough. To one part of this Salt, pour two parts of the rectified Spirit, and gently abſtract it in a *B. M.* and ſo the Spirit will receive into it ſelf aſmuch as it needeth of the fixed Salt, and bring it over with it ſelf by the Alembick: But the fixed Salt holds back the Phlegm, which as yet lurked in the Spirit. But now the Salt thus moiſt, if it be again fired (or calcined) is as good as it was before. To this Spirit thus concentrated even to the utmoſt, pour an half or a third part of the Oil you diſtilled before out of the ſaid Herb, mix them together by ſhaking them well, and the Concentrated and Alkalizated Spirit will in a moment devour his ſaid proper Oil, and will all of it be converted into a clear efficacious and pleaſant Eſſence. In which Eſſence the volatile Salt and Sulphur of that Herb are united with the fixed Salt, and are to be accompted of, as a pleaſant, penetrative, efficacious Eſſence, and friendly to nature; the which may be mixed and profitably taken with any Liquor: A few drops of which have more Vertue than a whole handfull of the crude Herb. And this Eſſence being taken into the Body, doth not onely operate more efficaciouſly in thoſe kinds of Diſeaſes which the Herb ſerved for before its being thus prepared, but doth alſo (by reaſon of its ſubtil purity) more ſpeedily diſplay its Vertues, and being externally applied, doth (by its Odour) corroborate the Heart and Brain beyond all other, how ſweet and odoriferous ſoever thickened Oils, prepared with Civet, Musk and Ambergreſe; all which if compared with this Eſſence, are to be eſteemed of as a dead Body: For in this Eſſence, the volatile Salt which is conjoyned with the Oil, doth preſently introduce (or lead it inwards) and make it ſubtil, even to Admiration. And ſo this Medicine ſerves as well for inward, as for outward Uſes. And certain it is, that the ſweet Odour of any Herb, ſuch an one as by which the Heart might be comforted, as it were in a moment, doth ſometimes effect more than another comforting Medicine taken into the Body. For the Heart of a Man lives of the Air, as a Fiſh doth in the VVater, the which being pure, the Heart becomes alſo well thereby, and ſo on the contrary ill. Why ſhould a Man love to ſmell a Flower, did not the ſweet Odour comfort his Heart and Brain, and were not his Spirits refreſhed thereby. If then the Flower and Herb effecteth thus much, where the ſweet and comforting Spirits are as yet encompaſſed, involved, wildly diffuſed, and tied to their dead Body; what will the Spirit do, being ſeparated from the Body, highly depurated and again concentrated. Beſides the daily, and (to all) well known experience, that a pleaſant Air refreſheth the Heart, but a corrupt and infected Air (as is evident in the time of the Plague, doth (on the other hand) debilitate it, and plainly ſuffocate it; It might be an eaſie matter to produce Hiſtories to prove and verifie the ſame, but that it would be too tedious But yet I muſt needs ſet down here one or two memorable ones, for the better confirmations ſake of my Opinion. *Joſephus de Acoſta* an acute and very expert Philoſopher, of the Order of the Jeſuits, wrote a Book of the Condition and Property of the Iſles of the Weſt *Indies* newly found out, and amongſt other things in the third Book, and ninth Chapter, ſpeaks of things no leſs incredible than true, concerning the nature of ſome Winds which (in ſome Provinces ſcituate beyond *Chili*) leap down as it were from the Tops of Mountains and Deſarts, and ſaith of them, that theſe Winds, do (by reaſon of the notable piercing cold) not onely caſt or throw down for dead, the Paſſengers paſſing that way, who not dreaming of any ſuch thing are not well provided againſt it, but doth alſo wholly kill ſome meerly from that moſt ſubtile Cold, ſo contrary and extremely inimicitious to the Spirits and Life of Man. For even as a pleaſant and temperate Air doth preſerve and cheriſh our vital Spirit, and nouriſheth it; ſo on the contrary an intemperate and cold Air, doth ſuffocate and kill it: The which thing is wont to happen to ſuch as ſail at Sea, for there the Air is infected by the motion of the ſalt Sea, and doth ſo affect and debilitate thoſe that are unaccuſtomed thereunto, and eſpecially their Brain, Heart, and Ventricle (as we ſaid above concerning the cold Wind, in the Deſarts about *Chili*) that it cauſeth men to vomit, their Head and Heart pains them, they loath both Meat and Drink, until they are accuſtomed to the Air, and can well brook it. Beſides this ſtory I will yet add another, to ſhew that an infected Air can bring more detriment to the life of a man, than any corporal Poyſon. For a corporal Poyſon invades the ſtomach onely, which by the help of Nature doth eaſily expel the ſame again, which is ſufficiently witneſſed by all well known Hiſtories, *viz.* that a man caſts out by vomit a Poyſon that is drunk down inwardly, but that ſpiritual Poyſons do haſten to the Heart, to ſuffocate the vital Spirit, unleſs a man be well armed, and this ſhall be inſtanced unto you by the following Hiſtory.

About ſome 30 years ago, there were two Mountebanks at *Paris*, that had their ſtations not much diſtant from one another, and they did each of them to their utmoſt commend their own Treacle which they ſold to the Inhabitants, thereby to diſparage each other, and each to allure the men to himſelf onely. But at laſt they came to a bargain betwixt themſelves, which was this, each of them ſhould defend himſelf with his own Treacle, againſt the Poyſon the one

ſhould give unto the other, and thereby defend the excellency of his Medicine. Well, one of them takes a huge Toad, ſwallows down one half, gives the other half to his Companion to devour, the which he alſo ſwallowed and neither of them hurt. The next day following, the other invites his Adverſary and uſed this Stratagem. He took a Viper, together with a Toad and put them into a Drum, adding hereto an handfull of Salt, and ordered the Drum to be beaten a while with Drum-ſticks, with which unwonted noiſe both the Serpent and Toad being enraged, breathed forth their ſpiritual Venome, and filled all the Drum herewith: This done, he bid his gueſt put his noſe to the hole of the Drum, which is uſually about the middle of it, for the letting forth of the ſound, who as ſoon as ever he had drawn in the ſpiritual Venome, fell backwards and died preſently, not dreaming any ſuch matter, nor underſtanding that the ſpirits either good or bad have as effectual operation upon the body, as a corporal Poyſon hath.

I have not inſerted theſe two ſtories, to fill the Paper up with words, but to ſhew, that Spirits being ſeparated and freed from their bodies, are in there virtue and operation an hundred times ſtronger than the bodies themſelves are, though conjoined with their Spirits. The which thing doth as well take place in ſuch ſubjects that are wholſome and friendly to Man's nature, as in theſe here rehearſed. It is abundantly known how many good and ſubtile Spirits I have deſcribed for the ſake of the Sick, in my ſecond part of Philoſophical Furnaces; yet few are here to be found that ſet about the preparation of them. Amongſt which Spirits, that of *Sal Armoniack* is not the meaneſt, which (becauſe of its penetrating and temperate heat) doth exhibit a moſt preſent operation, and is a Spirit worth all Men's knowledge, and worthy every where to be had at the Apothecaries Shops. Yet I have not as yet ſeen it any where to be had, though I deſcribed a ſhort eaſie way of preparing of it: But of this (if God will) more ſhall be ſpoken in the next part, where we treat of ſuch Medicaments as are prepared out of Animals. Such as are their volatile Salts, and fixed ones, wherein a great virtue lieth hidden, and are (in ſome caſes) to be far preferred before thoſe Medicaments that are made out of Vegetables. But yet though it be thus, I cannot but admoniſh here that good and ſubtile Medicines are to be circumſpectly uſed, and not to be adminiſtred to the Sick in a greater quantity than their nature will bear. Good and ſound Wine is able to comfort, and conſerve in health, the Heart, Brain, and whole Body of him that uſeth it aright. Whereas another that uſeth it immoderately, even the ſame Wine is able to inflame and infect his Lungs and Liver, to poſſeſs his Head, to bring a trembling into his Hands, and a Gout into his Feet, to weaken his Sight, and to fill his Reins and Bladder with the Stone; and for this end it was never given by God, nor gotten with ſo much labour, but was created onely to ſerve for the health of Man. O what curious ſecrets do lie hidden in the Wine onely (not to ſpeak of Corn and other Fruits) all which the World neither knows nor cares to know, and I have determined with my ſelf to publiſh, in my Vegetable Work, but yet it is at the pleaſure of God, whether he will permit ſo to do or not. It is ſufficiently manifeſt by Wine alone, that the abuſe of a thing hurts not the abuſed ſubject, and the ſame may be ſaid of other penetrating Medicines, whoſe operation is according as you uſe them. We do not ſuffer a Child or a Fool (neither of which are *compos mentis*, to meddle with a ſharp Knife, for fear leſt they ſhould hurt both themſelves and others too; but now a Wiſe Man uſeth it aright, and knows how to employ it both to his own and the uſe of other Men. If then one hurts another with a Knife, the fault lies not in the Smith that made it, becauſe he gave it ſuch a keen edge, but in him rather that uſed it amiſs.

Thus much I judged it worth the while to adviſe you of, leſt haply ſome of the Eſſences which I have deſcribed, ſhould undergo a wrong cenſure, as if they were too hot, but if they ſhould, it may be known what anſwer to give. For I confeſs that too much heat doth as well extinguiſh the Vital Spirit (ſeeing it is a temperate warmth that is its life and nutriment) as the cold, which is an enemy to nature: and therefore you are here taught not to drink down theſe fiery Eſſences as if they were your ordinary drink, but they muſt be wiſely adminiſtred, *viz.* 1, 2, 3, or 4 drops at a time according as the Patient is, in a ſpoonfull of Ale, Wine, or other liquors. And ſo the Medicine penetrateth through the whole body, and performeth that effect which God hath given it. But this is to be known, that the force and eſſence of all good and wholſome Herbs conſiſteth of heat, the which (by how much the more it is dilated and diffuſed throughout the body of that Herb, ſo much the leſs obſervable is it; and by how much it is contracted, by ſo much the more viſibly and ſenſibly is it apprehended. Whatſoever yields a temperate heat, is acceptable and wholſome to nature; and contrarily, whatſoever refrigerateth too much, all that is inimicitious and deadly, and this even every one, to whom nature is in any ſmall meaſure known, is enforced to acknoweledge.

The death and deſtruction of the life of Man, is no other thing ſaving a diſſimilitude and contrariety, whereby that which is alike and temperate is deſtroyed and diſſipated, whether it be done by too much heat or too much cold, 'tis both on the ſame manner. Too much heat doth exhauſt the ſtrength out of a Man's body, juſt as a great fire draws to its ſelf a leſſer. But a mighty cold drives the ſpirt and life of a Man to the heart, and is worſe than the heat, but yet more inſenſible, and this is clearly evident in Wine, which being ſet in a Veſſel at the Fire, the Sun, or ſome warm place, the heat draws to it ſelf the ſpirit and life of the Wine, and leaves behind an inſipid or unſavory matter, becauſe like covets its like; but if a Veſſel filled with Wine, be ſet in an intenſe cold, that cold doth not attract the Spirit as the Fire did; but hates it as being unlike it, drives it into a little room into the center of the Veſſel, ſo that having broken the Veſſel and ſeparated the Ice, the ſpirit will be found whole by it ſelf, which otherwiſe, and in the heat did aſcend and might be caught in a Receiver ſet hereto. So then, the Spirit is conſtrained as well by too much cold, as by too much heat to forſake its Soul and Habitation and leave it to the power of Death.

And many things might be ſpoken both of the nature of heat and cold which are underſtood but by few. There lies hidden therein great *Arcanums* which is not at all fit for the contemners to be acquainted withall. An hot and temperate Air, and the light of the day being diſperſed widely or afar of, are the graces and virtue of God. But the concentrated hot Air and Light of the Day, what can

can they be elſe but God himſelf, the Habitation of pure Spirits. The darkſome and cold night is nothing elſe, but the emitted and widely diſperſed or dilated curſe and wrath of God. But the concentrated and dark night is nothing elſe but the eternally mortifying power and center of all evil, and Habitation of evil Spirits, where is howling and gnaſhing of Teeth. Do but a little conſider, what is it that a little concentrated handfull as it were of the Sun will not do? will not the heat kindle Wood, as it were in a moment, and melt Lead and Tin? what would not the Sun do if intercepted the breadth of three or four paces? without doubt it would ſuffice to melt Iron and Copper. But it exceeds all underſtanding to gueſs if the ſhining Sun were concentrated a miles breadth what would it then do But yet it is likely that it would burn up the whole World in a moment, and make it vaniſh away in ſmoak, ſhould the Sun ſhine on it in this wiſe. This may be demonſtrated by the contact and union of the Sun's beams in Concave one a burning Glaſs. And if we are unable to behold the light of the Sun, when a little collected by ſome inſtrument becauſe the brightneſs thereof is ſuch, as to hurt the Sight; who is able to ſtand before the Sun it ſelf, (and yet he is but as an egreſs or out-gone virtue of God) much leſs before God himſelf who is the Center of light. And could the darkneſs be ſo concentrated as the light is, what an incomprehenſible and dreadfull monſter (ſuch as Death, the Devil, and the infernal Pit are) ſhould we ſee, which God in mercy prevent. For by how much the fairer, excellenter, and more unutterable the concentrated light is, (as being the divine preſence and clarity by ſo much muſt the concentrated darkneſs be the more horrible and more dreadfull, for theſe two are contraries. I may haply have made too wide a digreſſion, but yet theſe things are well worth your conſideration, that ſo it may even from hence appear how little the nature of man is able to abide the extreams and centers of either heat or cold, for either of theſe is a death and poiſon, but their temperature is the life of a man. Foraſmuch therefore as a Phyſician ought to be a Philoſopher and Spagyriſt, and ſuch an one who hath nature in his hand and power, it is not difficult for him to find out a true temperature, which may give to nature that which ſhe deſires and ſtands in need of. Thus now it is hereby proved, that my Vegetable Eſſences are not to be therefore ſhunned, becauſe they are in themſelves hot, for then we might upon the ſame account ſhun God too, who in himſelf is a conſuming Fire; but it lies in the Phyſicians hands to temperate and moderate theſe kinds of Eſſences with proper and ſuitable vehicles, according as beſt conduceth to the help of the Sick.

Moreover the external uſe of thoſe Eſſences is very notable in the cold affects of the members, in which caſe they are a preſent help: for the volatile Spirit is as it were a leading vehicle to the Oil and volatile Salt, and the uſe of them is pleaſant, if a little Cotton be herewith impregnated, and ſo put to the Noſtrils and ſmelt to. It doth moſt notably vivifie (in time of infected Air) and comfort the Spirits, preſerves the heart from the corrupt Air and contageous Vapours. It doth alſo correct and refreſh the pent up Air in Parlors and Chambers, *&c.* if the Glaſs wherein they be, be opened and expoſed to the Air, from whence the ſubtile Eſſence may be without ceaſing diffuſed into the Air, and make the room ſmell ſweet. So that whoſoever is already in the room, or goeth hereinto will be refreſhed with the friendlineſs of the Odour. Nor are they very dear neither to him that knows how rightly to prepare them, and is not to ſeek in manual operations.

But now this method (which I have ſpoken of) ſerves for ſuch Herbs onely as may be had freſh and plenty, and not ſo well for forreign Herbs, dried Spices, Woods, Seeds, and Roots, for they require another way which is as followeth.

Proceſs for Spices, &c.

FOraſmuch as that extraneous well ſmelling Vegetables are not every where to be had, as our home grown Herbs are, we muſt deal more ſparingly with them, and that on this wiſe. They muſt be powdered, and to every pound muſt be put five or ſix pounds of common water, and be macerated ſome three or four days in a warm place (whether it be Root, Wood, Herb, Seed, or the like) then put them into a Still and by Diſtillation draw according to Art ſome part of the water, and there will come forth together herewithall an Oil of that Herb or Fruit, which you muſt ſeparate from the waters and keep by it ſelf, untill you get the Spirit and volatile Salt alſo, the which are to be joyned with the Oil and be converted into a ſweet Eſſence. Then take out the water that remains together with the Vegetable out of the Still, put it in a wooden Veſſel, and add hereto the water you diſtilled and put thereto ſo many pounds of Sugar as the Vegetable weighed. When your Sugar is diſſolved in the Water, mix therewith new Ale-yeſt, and let it ſtand in a warmiſh place, and the Spice will ferment as if it were a new Herb; when it hath done working, put it into your Still, and it will yield a Spirit, like as the new freſh Herbs did, and ſuch an one as will both taſt and ſmell ſtrong of that Seed or Wood you diſtilled, the which you ought to rectifie as is ſaid before: the reſidue is to be burnt into aſhes, the Salt is to be extracted, and the Spirit to be thence diſtilled, with which the Oil is to be conjoyned according to the before preſcribed weight.

N. B. Now foraſmuch as the out landiſh Spices can ſcarce be diſtilled in quantity enough at one time onely, ſo as to yield Salt enough out of the remainder thereof, it will be well enough, to uſe the Salt of another Herb, inſtead of its own, or in defect of that too, you may uſe highly depurated Salt of Tartar as a ſubſtiture, but yet it is better to uſe its own proper Salt, provided it may be had.

This is the true and genuine deſcription, how the Eſſences both of our own home-grown Vegetables, and likewiſe of forreign and dry Vegetables are to be prepared. Now remains that we deſcribe the virtue and efficacy of the prepared Eſſences; and this I could do, would it not be too tedious, *viz.* to deſcribe the virtues and efficacy of the ſeveral Herbs. But ſeeing there are already Books that are full thereof, I look upon it as ſuperfluous to repeat the ſame, but refer the well minded Reader, to thoſe kind of Herbals which treat of the virtues of the ſaid Herbs. For whatſoever virtues the Herb either green or dry abounds withall, its Eſſence poſſeſſeth the ſame much more excellently, as being what is brought into a ſmall compaſs, and ſo multiplied: whereas otherwiſe a good part of the Herb goes to the ſaid contained vertues; eſpecially of our Herbs here in *Germany*, in which the vertue is widely diſperſed, and it is there-

fore

fore far more adviſedly done to collect them into a narrower room, that they may be the more commodiouſly adminiſtred. This moreover is well worth the noting; *viz.* that we can ſearch out the Vertues of all Vegetables by their Signature, far better than by reading thoſe Books that are compoſed of ſcraps from one, and ſcraps from another *&c.* Neither is it ſo well always to acquieſce in the Writings of the Ancients, who alſo remained ignorant of ſuch things as God taught them not, by nature. Pray what Maſter is there of knowledge that never erred from the truth? and who is it that you can in all things ſafely truſt?

O! I could wiſh, that we could but reade, and underſtand the Writings and Signs of the ſaid Herbs, by which it ſpeaketh with us, we ſhould not need ſo many ſeducing Books. Who I pray exalted *Moſes*, *Daniel*, *Joſeph*, *Solomon*, and many other Philoſophers, to ſuch an height of Wiſedom and Art? It was onely God, who yet lives and can at any time eaſily doe whatever he formerly could: who can doubt as touching him, when God minds the enlightning or bleſſing of any one with his Gifts, he makes no uſe of any Books, for this purpoſe, and ſo inſtruct out of them, nor doth he diſpute or controvert with him. We ſhould ſeek unto this Maſter and learn from him, and not out of the elegantly written *Arabian*, *Græcian* and *Latine* Books. But now the world is come to ſuch an height of pride and errour, that it can neither believe nor comprehend that any one can learn ought but in the Schools, and yet the moſt expert and moſt famous men that ever lived in the world, arrived to that famous light of nature without making uſe of the Schools, and the things that they wrote, they did not publiſh them in a ſtrange Language, but in their own Mother Tongue, as is ſufficiently evident. And this is the ſaying to this very day, *viz.* Whence hath this man his underſtanding, and was never bred up in the Schools? I knew him from his youth, and that he had nothing in him. Alas good Sir, you are very wiſe. Brought you with you into the World more than I did? Were not you born a naked Infant as well as I, and that skill which any one hath, received it he from his Parents, hereditary? Is it not the gift of God, whether it be much or little? Art doth not conſiſt in the variety of ſtrange Languages, but in experience. It is one Art to underſtand and ſpeak ſeveral Tongues, it is another Art to calculate the Courſe of the Sun, Moon and Stars, and to predict from them the Changes of Times and Seaſons. Again, it is another Art to prepare and purifie the Nature, Properties, Vertue and Efficacy of all the Vegetables, partly for the conſervation of the Life of Man, and partly for diverting accidental Diſeaſes, and to know how to uſe them as need requires. Beſides it is another Art, to get out of the Earth thoſe many rare kinds of the wonderfull Creatures of God, and thoſe Fruits of the Earth as the Minerals and Metals, for Man's uſe, (which is the End they were created for, and which we cannot want) and to depurate them by the Fire, to tranſmute them out of one form into a nother better form, and to have the knowledge, underſtanding and experience of them all.

As concerning the ſignature of Herbs, by which God teacheth us their hidden Vertues, many things might be ſaid, and it were to be wiſh'd, that ſuch a knowledge were earneſtly deſired, and ſought after by all thoſe that deal in Phyſick, and do thencefrom get their food, there would not then be ſo much need of troubling ones Brains with ſo many forreign and domeſtick Writings, where you ſhall find one gainſaying another, and ſo leave they as doubtfull what party we were beſt addict our ſelves unto and believe; but now we may eaſily find out the certainty and truth by their ſignature, and diſtinguiſh what is erroneous, and proceed on with more ſafety in all the practiſe, yea and in time too (by God's permiſſion) come into a far better State. And here you are to remember, that the ſignature of Herbs, do ſhew a Phyſician their Vertues as well as Books do, for indeed they rather trace by-paths, than walk in the way of truth. And here would be a very convenient place to treat of the ſignatures of Vegetables, but forasmuch as I have written a peculiar Book concerning them (which God willing) ſhall ſuddenly come abroad, let the friendly Reader have a little patience and expect it, wherein he ſhall find things wonderfull and unheard of.

But that there may appear ſome footſteps thereof in this firſt part, *viz.* by what means you are to meet with Diſeaſes by the Eſſences which I have deſcribed above, I could not omit the reckoning up of ſome ſpecifical ones, which I have proved by moſt certain experience to be good againſt ſome principal and well known Diſeaſes: That is to ſay, in the Gout, there is Hellebore but eſpecially Helleboraſter (which is a kind of Ellebore) the *German*'s Tobacco, and the Tobacco of the Weſt *Indies* are a ſingular ſpecifick and moſt notable aſſwager and helper in all Podagrical griefs. Now the Phyſician ſhould know and underſtand, what the reaſon is that Ellebore and Tobacco ought to be uſed in ſuch kinds of Diſeaſes. Then for the ſtone, I commend the Eſſence of the ſeed of the Aſh [or Aſh-keys] before all other ſtone-breaking Diuretick Medicines. For verily very many men have (by that ſame Medicine) been freed and reſtored to health, who have lain ſick of it many years, inſomuch that after their death there hath not been found (in anatomizing them) not ſo much as the leaſt footſtep thereof either in their Reins or Bladder: And yet before they uſed this Medicine, they were almoſt every day pained with the ſame. This ſpecifick is made of the ſeed of Aſh, which is uſually ripe in Autumn, the ſeed you are firſt of all to bruiſe well, and then mixing water therewith diſtil it into your Still, and ſeparate the Oil from the Water, and reduce it into ſmall Morſels or Troches with Sugar, for your daily uſe. But a whole ſack full, and as much as a man can carry, will ſcarce yield you an Ounce or two of Oil: and one Ounce of this Oil will ſuffice for two pounds of Sugar, for a greater quantity makes the Sugar too unpleaſant; for the Oil of the Aſh-keys is very unpleaſant and nauſeous, inſomuch that it will provoke to vomit, if too much of it be taken, otherwiſe it performs wonderfull effects in this caſe. But now if out of what remains behind, you do (by the means of fermentation) diſtil its Spirit, and after its concentration extract the fixed Salt out of the Aſhes, and unite it with the Oil, then will you have a perfect Medicine, and moſt high ſpecifick in the ſtone. And ſeeing that we treat onely of Vegetables in this part, it will not be expedient to mix herewith the Animal and Mineral medicaments, but in the ſecond part ſomewhat ſhall be mentioned of Animals, which doth efficaciouſly bring forth ſtony and gouty Humours. Inſomuch that the Urine of ſuch a ſick Perſon, doth (after the uſe of this Medicine) being heated at the fire, coagulate (like Cheeſe or Cows Milk) in the manner

manner of natural *Calx vive* that is made out of ſtones. There is likewiſe amongſt the Minerals, one of them that efficaciouſly drives out the ſtone and gouty Humours, which alſo we ſhall ſpeak of, in its due place, *viz.* in the third part. In ſome internal affects of the Liver and Spleen, and in all concreted Blood be it from a blow, fall, or any other accident, the Eſſence of St. *John*'s wort bears the chiefeſt note: For it baniſheth away all pains, reſolveth congeal'd Blood, and healeth an hurt (or wounded) affect provided the evil be not too inveterate. As for the Uterine affects of Women, when the Womb hath taken Cold and is moved out of its place, or otherwiſe hurt, the which produceth to Women many difficult and chronical Diſeaſes; the Eſſences of Tobacco, Henbane, (of all ſorts) being applied by means of a Spunge in a Uterine Inſtrument, are a moſt certain lenative and ſure Medicine: they reſtore the *Matrix* to its place and quietude, and heal all other infirmities. In weak decrepid and decayed men, what will not the true Eſſence of Roſes and Cinamon do? if often taken, it comforts the Heart and Brain above all other Medicaments: But this Eſſence muſt be prepared, and concentrated into a narrow room, that ſo one or two drops, whether put on the Tongue, or put to the Noſe, may corroborate the whole Body by its vertue, and the ſtander by may have enough to do to admire its ſweet Odour.

N. B. If any one hath a mind to make ſuch an Eſſence, it behoves him that he firſt gets the true Oil of Roſes, which is diſtilled out of the yellow Thrums on which the Roſes grow, and not out of *Lignum Rhodium*, and is gotten out by the mediation of water (but you muſt not ferment them before you have gotten their Oil) then afterwards ferment them with new Yeaſt, whereby you may get their Spirit, for if you obſerve not this method, you will effect nothing, the reaſon is this: becauſe if you ſet them a fermenting firſt, the Oil (as being the beſt and moſt efficacious part) is mixed and united with the Spirit, and ſo widely dilated, that it will be a hard matter again to concentrate it. Well, what ſhall I need ſay more of the vertue and efficacy of the vegetable Eſſences, ſeeing that the Nature and Vertue of them is enough known already: But yet thus much I muſt needs confeſs, that I have not in all my life time ſeen any thing done, which was more ſweet, friendly and efficacious, than theſe Eſſenſes of Vegetables. For if the Eſſences are but prepared according to this deſcription of mine, we can hardly be ſatisfied with their Odour, eſpecially if made out of well ſmelling Herbs, as Roſes, Violets, Clove-gilli-flowers, Bawm, Camomile, Pennyroyal, and other ſuch like. Beſides ſuch kind of Eſſences may be made out of Gums, when their Oil is driven forth by the Spirit of Salt, (leſt elſe they ſavour of an Empyreum, and become unpleaſant) but with this Proviſo that you uſe the Alcalizated well ſwelling Spirit of of ſome other Herb, whoſe Odour is not much unlike, for the Gums do not afford a Spirit. Now there's *Aſſa Fœtida*, or Benzoin, Storax, Maſtick, Camphire, Amber, and the like, nay even Civet, Musk, and Ambergreſe may be reduced into very fair and pellucid Eſſences, by an Alcolizated Spirit, and be rendered far more pleaſant than the common Musk, Ambergreſe, and Civet: For the volatile Salt contained in the Spirit, makes the Body volatile and ſpiritual, ſo that at the opening of the Glaſs, wherein ſuch an Eſſence is, the whole room will be filled with the ſweetneſs of the Odour: But more of this in the ſecond and next following part, wherein ſhall be taught, by what means a ſweet Odour may be extracted out of our ſmall Animals in *Germany*, not unlike to Civet. What ſhall I ſay more, methinks I have done enough, he that underſtands not this, would much leſs underſtand the things that are more ſubtil, ſhould they be deſcribed. And though I could ſhew a far more compendious way of preparing Eſſences, yet haply the ingratitude of the World being conſidered, this that I have already done is too much, and if any is minded to carp at theſe here, let him firſt give us better than theſe, but they will have a care how they attempt that. For he that is endowed with underſtanding, even he alſo underſtands that the labour and diligence of another man is not in the leaſt to be diſeſteemed, for the truth will remain truth though never ſo much expoſed to injuries. And as we have ſaid, that good and efficacious Eſſences, may be prepared out of pleaſant and well ſmelling Herbs: Even ſo by the ſame rule may ill ſmelling ones be made out of bad ſmelling Vegetables and Animals, which alſo have their uſe and are profitable, as in the ſuffocation of the *Matrix*, where, (for the moſt part) ſuch things that egregiouſly ſtink are applied to Womens Noſtrils, that (by their grievous ſmell) they may impead and repreſs the riſing up of the Womb: And this doth ſometimes ſucceed very proſperouſly; theſe are *Aſſa Fœtida*, *Caſtoreum*, burnt Rags, burnt Feathers and ſuch like, which yield a moſt filthy Odour: And if now the unprepared Body, in which the Odour lies largely dilated doth nevertheleſs perform notable Operations, what would it be think you if the Oil of ſuch bad ſmelling things were conjoyned with the volatile Alcolizated Spirit? I ſay it would do more than the crude Body, not onely ten, but twenty or thirty times more. But amongſt all the fetid and ill ſmelling things, which are not inimicitious to Nature, theſe I find the ſtrongeſt, *viz.* the black Oil of Tartar, which is drawn forth by diſtillation, and that too which is diſtilled out of Goats horns, Hogs hoofs, Birds feathers, and the Hairs of all Animals, all which do ſtink extreamly, and yet are not hurtfull unto man, as thoſe ſtinks are which proceed from rottenneſs, as from dead Beaſts, Fiſhes, rotten Eggs, and ſuch like, whoſe ſtink is wholly inimicitious to the Spirit of Life, do threaten its deſtruction, and are (as much as poſſible can be) to be ſhunned. For the Heart, Brain, and whole Body is therewith infected, and debilitated. But why ſuch ſtrong ſmelling Oils as thoſe are, that come from Beaſts horns, Hairs, and Hoofs, do not perform the ſame, ſhall be told in the following ſecond part, where we will treat of Animals and of ſuch parts of them, as may be made uſe of for Medicine.

And thus will I put an end to the firſt part of my *Spagyrical Pharmacopœa*, and would have the Reader admoniſhed that (if he would uſe this my Deſcription of Eſſences) he would have a watchfull Eye by whom they are prepared, and not truſt every Body that hath ſcarce ſaluted even the very firſt entrance of Art, and yet dares to make Medicaments, and adminiſter them to others. For under this covering will be exerciſed great deceit, for ſome will not for their gain ſake, beſtow ſo much Labour and Coſts, as to make Eſſences out of good and new Herbs, but ſcrape upany thing, that thereby they might onely bring forth ſomewhat or other that may reſemble the Odour and Savour of the Herb. And although ſuch Eſſences ſhould be pre-

pared of some of the best Vegetables, yet the covetousness of profit may cause that the Spirit be in too great a quantity mixed with the Oils, which may easily be done, if to one part of Oil, five, eight, ten, or twelve parts of Spirit be taken, because the Spirit is easier to be had than the Oil, (whereas according to my prescription two or three parts are to be taken onely) and therefore may you easily conjecture, that such Essences are far less efficacious; for the greatest virtue consists in the Oil, the which being by the Alcalizated Spirit, made volatile and penetrable, is introduced (or carried more inwards.) And besides this is not all, but there may be another abuse too, as when a Man willing to spare his own labour, doth not himself make the Oils, but buys them cheap from some sweet Powder-makers, which Oils may (and sometimes 'tis so) have in length of time lost their most subtile part, and are become rank and clammy, and so makes use of such, from whence no laudable matter can be effected, as is manifest to every Body. But admit it be so, that new Oils can neither be had nor prepared with your own hand, because of the defect of the Commodity, yet may such Oils as are never so old and never so much clammy be rendred usefull, if they are first distilled and then rectified in a Retort, by Spirit of Salt: For then they come over clear, and become fit for an Alkalizated Spirit to dissolve them, which such Oils as are old will not do. This I thought good to advise, lest haply he that thinks he enjoys a good Medicine, should impute the blame to me, or lay the fault to the Essence, when the effect answers not his expectation: For thus it hath hitherto hapned to my Medicaments, and doth even to this day fall out so, *viz.* that very many (in sundry places) do falsely pretend as if they knew my secrets, but 'tis untrue, and a meer diabolical couzenage, for they administer their own unprofitable Medicaments, selling them for mine, and especially my *Panacea* and Tincture of Antimony, which notwithstanding hath no affinity with mine, and what is more too they fear not to affirm that such Medicaments are made by my universal *Menstruum* (which they neither understand nor know how to use.) And because here falls in some mention of this *Menstruum*, 'twill be expedient to say somewhat of it, *viz.* what is to be understood concerning it, seeing there are so many various opinions of the same. Most People think that the Alkahest is a subtile water, whether drawn out of the Air by certain instruments, or prepared by subtile Distillations, but in this opinion, they err. But yet I will not deny but an efficacious water may be drawn, not onely out of the Air, but also out of the most intense light of the Sun, and thus I my self have sometime done. But this moist dry *Menstruum* which I call by the name Alkahest, is nothing else but the Salt of the Earth, and may be used both in a moist and a dry form, and thus much the very Etimology of the word signifies, if rightly lookt into and read, *viz. Alkali est*, for the word Alkahest is compounded of two words, of *Alkali* and *est*, where the *l* and *i*, by a transverse line are made one lettter, *viz. h*, and is then read Alkahest, but take away the transverse line, and then 'tis read *Alkali est*. Hence 'tis manifest to every body, that I have not rashly imposed that name upon this *Menstruum*, but have thereby openly named the subject. For this very reason it will be very expedient to suspend your judgment, and not to be so hasty in uttering your opinion and censure of such a thing as you do not at all know, but rather think thus, who knows if I understand what I say or not: I may happen to say somewhat unadvisedly which may easily be refuted, the which we see here to be done. For there have been various discourses of this *Menstruum*, as if I had given it a name so famous without any ground, seeing it ariseth from Salt onely, when as the Alkahest is a subtile water. But by what I have aboveсaid it appears that I have not given it an improper name, but have called it by its peculiar Title; the which I did for the sakes of such as contend, to prevent any future controversie about the name thereof, but how it is to be used as to those secrets contained in *Miraculum Mundi*, is not to be spoken of here. Let it suffice the well minded Reader that I do again, and again assure him, that all and every of the things I have there spoken, may without controversie be done by this one onely subject, *viz.* the Salt of the Earth. And so that Treatise doth rightly deserve the Title of *Miraculum Mundi*. But yet I do again by way of Summary as 'twere, Admonish, if any one should use this my Essence, and have it not rightly prepared, he throw not the blame on me, as that I had written unprofitable things, but rather let him that has not rightly prepared it, bear the blame.

But yet 'tis not to be doubted but that men of all states or conditions will in process of time endeavour the preparing of those Essences, not onely because they are a pleasant and efficacious Medicament, but withall because of their comforting, penetrating, and highly gratefull Odour. For the crude and cold Air in pent in rooms may not onely be tempered and rendred acceptable and friendly to nature, but it may also be happily and safely made use of in external cases and Diseases, as need requires.

It will therefore behoove everyone what way he may most profitably attain them by. The preparation is easie, so he use but diligence, and then may a good quantity of those kinds of Essences of all the Vegetables and Spices which are in use in the Shops, be easily gotten. Now such an one that hath conveniencies to prepare them himself, he verily best knows what he has, and may safely trust thereto. There is also great difference in the Essences according as they are prepared; one will happily prepare them very neatly, another but rudely, but the difference will easily appear as well by its efficacy as by its sweet smell; as for instance. That Essence which is rightly prepared according to the aforesaid weight and proportion, must necessarily be very subtile, sweet, efficacious, and of a strong Odour and Savour. But if it be otherwise 'tis a sign that the Oil was two sparingly added, and it can't be accounted of as a rightly prepared Essence.

N. B. The things which I have here spoken, of Odour and Savour which the Essences ought to have, are to be understood onely of well-swelling Vegetables, such as are Roses, Marjoram, Rosemary, Violets, Camomil, for the Essences that are prepared out of these, must needs be well-smelling and efficacious. But as for those Essences which are prepared out of those kind of Vegetables that have no such notable Odour, it can't be expected that the Essences prepared from them can afford more Odour than the Vegetable had, but yet do they excite a more present efficacy, as for example. The Essence of Wine which doth easily exceed all other comfortatives is notwithstanding void of any eminent Odour, nor haply doth it resemble any other than the flower of the Vine in Spring-

Spring-time: and therefore being taken into the body, it diſplays its Virtues, but not by its Odour; even ſo, neither doth the Wine it ſelf being taken into the body operate by its Odour.

And hitherto belongs the teaching how to come to get ſuch an Eſſence, ſeeing that it is not prepared after ſuch a manner as I have delivered for the general dealing with Vegetables, and that, becauſe the pleaſant Oil of Wine (without which [oilineſs] no Eſſence can be prepared) is hard to come by. I will therefore teach the way of preparing it, but what I now write is onely for the ſake of weak and decrepid old Men, and alſo the poor, but not for the wiſelings and unworthy Deriders. For I very well know that ſome or other after he hath read this Book, will out of the good conceit he has of himſelf ſay, this is no news to me, I knew this many years ago, *Glauber* doth not publiſh this of himſelf, but hath gotten it elſewhere out of ſome old Book or other: He that thus judgeth of me doth for no other cauſe ſay ſo, but out of envy and hatred to detract from my Writings: And the anſwer I make to ſuch envious men is this. That I do not know whether any one heretofore either had, or at preſent hath either ſuch or ſuch a ſecret which I have made mention of in my Writings, or no: It may be for ought I know that ſuch ſecrets were extant above an hundred years ago, and may be even at preſent in uſe with ſome, that I know not: however that's nothing to me: For it is aſſuredly falſe, if any ſay that I have borrowed from any one, or elſe out of any old Books, ſo much as one, much leſs moſt of, or all the ſecrets (according as the envious ſay) which I have publiſhed in my *Miraculum Mundi*, or in any of my other Writings: But I obtained them through the Grace of God by the many Trials I made, ſearching after them with my Coſts and Labour. And forasmuch as ſuch envy me, therefore do they privily ſcatter abroad their lies concerning me, which will in ſhort time (God permitting) be demonſtrated. But put caſe that I did take whatſoever I have written out of others, and out of ancient Books, will they I pray be either more or leſs profitable becauſe of that, than if they were my own: Is it not one and the ſame for any notable thing to be emitted, who writes it, or whom it proceeds from, ſo that it be, and may be exceeding profitable to very many. But becauſe of this envy and calumny which I undergo from wicked men, I do keep within my breaſt many things, which otherwiſe I would have communicated for the common good. And if ſo be that they cannot believe nor comprehend what is mentioned in my *Miraculum Mundi*, (and yet is not of ſuch deep ſearch as the unskilfull imagine) how will they believe, that I ſhould ſet before them far higher things? Well therefore may the old Proverb take place, *Secret things are for ſecret Men, and fooliſh things for fooliſh Men.*

Now followeth the proceſs of preparing a comfortable and pleaſant Eſſence out of the Oil of Wine, and its fixt and volatile Salt. I think there's no body will deny, but that hitherto there hath not been made any mention by thoſe that are wont to diſtil Wine of any ſuch thing as an Oil; ſave that by thoſe that have written, that the Oil of Wine is to be ſought for in Tartar and in the Fæces, and that a black Oil may be diſtilled both out of the dried Fæces of Wine and alſo out of Tartar, I think is ſufficiently known to all Chymiſts: But ſuch an Oil doth purchaſe to it ſelf (by this way of proceeding) ſuch an ungrateful Odour, that it is merely on that ſcore, uſed neither inwardly nor outwardly, though it be endued with good Vertues. For verily I do not yet know whether there can be found (amongſt all other things) any thing that ſtinks worſe than that Oil that is prepared out of Tartar, and therewithall may'ſt thou drive away both Men and Beaſts, becauſe the Odour that it emits, is in a manner intollerable. Whereas this which I here mention, is a pleaſant, friendly, clear and bright Oil, and is made thus. In the Vintage time, when the Grapes are preſſed forth, take ſome pure Muſt, let it ferment in a Barrel, until it becomes white, and the greateſt part of the Fæces ſettle to the bottom, which done begin your diſtillation, and draw out the Spirit, either out of a Copper Still tinned in the inſide, or ſome other diſtillatory Veſſel; of the Spirit will be no great quantity. After it hath ceaſed, take off the head, and pour that which remains into clean Glaſſes, let it ſtand for ſome days, and there will ſwim at the Top a white Oil, and ſometimes it will ſettle to the bottom, the which is to be ſeparated from the Muſt, and will ſerve for the making the aboveſaid Eſſence. But the Muſt, from which the Spirit and Oil are taken, may be mixed with your other Muſt, and it will again ferment and become Wine, but if you can't do thus for want of skill, make thereof a Vinegar. This is a moſt compendious and the moſt eaſie way of preparing the Oil of Wine, and although I know another way beſides this, and how ſuch an Oil may be had even out of the Autumn Seaſon, yet doth it ſeem to me not ſo well to publiſh all things together, and at once: This way of preparation that I have now taught will to many be hard enough to effect, though it be clear enough deſcribed. And you are to obſerve, that in this work the due time of diſtillation is to be regarded, *viz.* When the Muſt is ſo far fermented, as that its taſt is neither plainly ſweet, nor plainly vinous, but a midling between both; which if neglected the fault is none of mine, for I have adviſed you of all things to a tittle. If you begin your diſtillation too ſoon before the Muſt is ſufficiently diſſolved, it affords no Oil; if you tarry too long, the Oil precipitates with the Fæces, nor wilt thou get ought, and therefore all things are to be done in their due time. But how this Oil is to be reduced, with his own Spirit, and his fixt and volatile Salt, into an Eſſence, is mentioned before, what uſe this Eſſence ſerves for needs no deſcription. For every body well knows what a vivifying and comforting vertue there is in Wine, and yet the Wine is endued but with little Oil (though the Oil as we ſaid before is the beſt part of the Vegetable) and beſides, it is united with a great quantity of inſipid Water, and crude Tartar, but the Eſſence is freed from thoſe Crudities of Water and Tartar, and is compounded of a due proportion of the moſt pure parts, or of the three Principles, Salt, Sulphur, and Mercury, and may deſervedly be called the Quinteſſence or Soul of the Wine.

Whoſoever he be that hath it, will ſee what good it is endued with, and how to be uſed. To me it ſeems to be an Antidote againſt Poiſons; for ſeeing it is written of old, that a Serpent or other venemous Animal, cannot abide in the Vineyards at ſuch time as the Vine flowreth, therefore the Oil and Eſſence of the Wine reſembling this very Odour, the Eſſence may not unfitly be thought to be good in healing contagious Diſeaſes.

But this is to be noted concerning Eſſences, that they

they must not be stopt with such things that will be melted by the Essence, but be rather stopt in with a double Bladder, lest the volatile Spirit should fly away. For should this so be, the Oil would again be debilitated and let go its Spirit,and the Essence would be corrupted.

And because my purpose was to speak of the preparation of Vegetable Essences, but not make a description of their most ample use, I will now put a period to this business, leaving every one to be wiser as his own capacity is. But yet, would the present time have permitted, I would have mentioned some specificks, which may haply be elsewhere done But thus much I say, that in Wine, lies hidden very much which but few know, and which if one would reckon up, would stir up admiration. But it appertains not to this place, but to the Vegetable Work, which (if God permit) shall soon follow. But seeing I have made mention of Wine, I cannot omit to add in this place one thing, *viz.* what yet farther use the Essences of Herbs might be of, if always to be had ready prepared in the Apothecaries Shops: For one, two, three, or more drops of Essences, being put in a Cup of Wine at pleasure and stirred about, that the Wine may be united with the Essence, do presently make the Wine clear and pleasant, resembling the kind and nature of the Essence you put in; and by this means divers kinds of Wines may presently be made out of one and the same Vessel, to refresh and please your guests: And this way far exceeds the using of extracts, which make the Wine troubled, but this leaves it clear. It will be needless therefore to put different sorts of Wines in several Vessels in Cellars, where they will all of them by degrees wax weaker and weaker, unless they are kept always full; but one onely Vessel, is sufficient for to make various kinds of Wines at your pleasure; and this is a very profitable secret for great Men and others, who sometimes must have various Wines. It is a usual thing with many to drink a draught of Physical Wine in a morning on a fasting Stomach, to strengthen the weak Stomach, and to preserve it from hurtfull Air, if they can but get it, and if they use that which is usually made of the Reliques of the Wine, and such decayed stuff, such is void of virtue, and brings more hurt than benefit. But now, having these Essences of Herbs, you may easily impregnate generous Wine therewith and make it Medicinal, and by this way maist thou be certain that thou hast good Wine, and not such as is made out of the droppings and refuse, which is usually employed to make Medicinal Wines of, and from whence gripings and other incommodities do frequently exist: But that which is composed of generous Wine, and a well prepared Essence deserves the name of wholsome Physical Wine. These things I was willing to add to this first part of my *Spagyrick Pharmacopœa* by way of Ornament, and do request the well minded Reader, that he think well of my Labour, Diligence, and Intention. There shall follow (God permitting) in the two next parts, more good Medicines.

The End of the First Part.

THE

THE SECOND PART OF THE Spagyrical Diſpenſatory.

Concerning the preparation of Animals, Vegetables, and Minerals, by an Univerſal Diſſolvent.

Wherein is clearly demonſtrated and exactly deſcribed, that Niter is the true Univerſal Diſſolvent, and how all Vegetables, Animals, and Minerals, are therewithall diſſolved, corrected, and their venemous and obnoxious property changed into wholſome Medicaments, contrary to the opinion of many ignorant Men.

What Animals are, and what is underſtood or meant by them.

I do here underſtand by the name of Animals all ſuch things as have life, and a vital motion, as Men, all kinds of Beaſts, Worms, and Inſects, either in the Earth or above the Earth, the Fiſhes in the Water, the Birds in the Air, and all the Creatures that can move themſelves, and that do partake of a viſible life. Amongſt theſe living Creatures, there is this difference to be obſerved, *viz.* that ſome of them ſerve for the uſe of Medicine; other ſome of them are not fit for Medicine; for all thoſe Animals which nouriſh mankind and ſuſtain his body, have not a medical but nutritive power, ſo that out of them can't be prepared Medicaments reſiſting Diſeaſes. For although that out of ſome Animals (as Oxen, Sheep, Goats, Hens, Birds, and ſuch like) a good Eſſence may (by the benefit of Art) be extracted, ſo as to reſtore and ſtrengthen a body that is debilitated by ſickneſs (as you may ſee in my Book of the Kitchin Art) yet that labour doth appertain to the Kitchin, and Cooks, rather than to the Apothecaries. Therefore in this Treatiſe nothing elſe ſhall be mentioned, but concerning ſuch Animals onely as do not nouriſh the body of Man, but (being eaten or any ways entring into Man's Belly, or other parts of his body) do by their venome moſt greatly hurt: But being inverted or turned in and out by the Spagyrical Art do become excellent Medicines, and (without that bettering them) would remain venemous and hurtfull: ſuch as theſe are Vipers, Serpents, Toads, Scorpions, Spiders, and other venemous Inſects; the which being ſpoiled of their venome or changed by Art, do become Medicines of a penetrative efficacy. Indeed a Serpent, a Toad, and other like venemous Creatures being onely boiled in common water, are barred of their Poiſon, and may be eaten without any hurt, ſeeing that their Poiſon conſiſts not in the Fleſh, but in the Spirt, and vaniſheth by a bare decoction. Many examples do confirm this thing, and 'tis evidently known that Serpents have been oftentimes boiled and eaten inſtead of Eels. It is no new thing in *India*, that that People do feed on great Serpents boiled, inſtead of Food, and contrariwiſe other Animals there are which do not depoſite or lay aſide their venome by a bare boiling, but do retain it, ſuch as are Scorpions, Tarantula's and ſuch like. But now, if to ſuch kind of Vermine that are endued with ſo hurtfull a Poiſon, a water or liquor of a ſtronger efficacy be added, wherein they may be digeſted, their venome is turned into a wholſome Antidote, and is a reſiſter of Poiſon, as ſhall be proved anon. This is certain, that the omnipotent God hath not created ſo much as the leaſt Worm in vain, which cannot bring ſome profit, though by the under ſort of Men, it be contemned and plainly neglected. But foraſmuch as almoſt all ſuch Vermine and Inſects, are (by reaſon of their Poiſon) rarely uſed in Medicine, and ſcarce any one knows their occult virtues, from that ſignature God hath given them, or cares to know, the uſe of them remains unknown and in the dark. Nay it is well done, that (ſeeing the way of correcting ſuch Poiſons, or turning them into Medicine, hath lain hid from the greateſt part of the Learned ones) their uſe was thrown out of the Apothecaries Shops. But yet in proceſs of time, ſome of thoſe kind of Vermine were admitted by the Phyſicians, as the Scorpions, Cantharides, and ſuch like. The Scorpions being ſuffocated in Oil Olive do tame their own proper Poiſon; Cantharides, great Worms, and Milli pedes, or Pigs-lice, are uſed to provoke Urine. But yet not without danger, becauſe of the venome they abound with. Nevertheleſs Men have dared to uſe them, and many times they have proved very pro-

firable But had their bettering been known ; and had they (being thus corrected been made uſe of, they would (without all fear of danger) have procured a greater honour to thoſe that uſed them. Now the uſual way of all ſuch as know not the manner of correcting them, ſuch little Animals are dried, and (crude as they are) beaten into a powder, and ſo adminiſtred to the ſick, and do ſometimes (though with mighty hazard) perform great cures. Were the ſignature of ſuch Vermine well examined, and their uſe in Medicine well known, and they were afterwards tranſmuted and changed (by the help of an univerſal Diſſolvent) into a ſafe Medicament, they do then become ſuch ſafe and effectual remedies, as to take away moſt grievous, (and in the accompt of ſome plainly incurable) Diſeaſes, and do in many Degrees exceed the weak operations of Vegetables. For the Animals which God hath gifted with life, are of a far greater efficacy than the Vegetables, and this any one will not be over hard in believing of. You will find many wonderfull things in my Book of the ſignature of Animals, Vegetables, and Minerals (which ſhall ſhortly come forth to light) nay and beſides their ſignatures, as well their unknown and occult Vertues as their known Vertues ſhall be herein declared. But in this Treatiſe, ſhall onely be mentioned ſome of the principal ſmall Animals of uſe in Medicine, *viz.* by what means they may be reduced into moſt excellent and moſt ſafe Medicines, by the help of the univerſal Diſſolvent. As for their Vertues, and Efficacy, the well minded Reader may ſearch for them in my other Writings. And although I have met with admirable Vertues in ſome hitherto neglected Vermine, and would have alſo deſcribed them for the profit of my Neighbour, and ſo purpoſed to have made a large diſcourſe concerning them ; yet the love to my Neighbour (whom I would not willingly lead about in many erroneous Turnings) hindred me from performing it. For all the Vertues that are apart diſperſed amongſt all the Vegetables and Animals, are all of them concentrated in one Mineral, and found perfectly united, ſo that there's no need of uſing ſo many diſtinct Medicines of Vegetables, Animals, and Minerals, and therefore I refer the Reader thereunto. But yet for ſatisfactions ſake of ſuch who abhor ſuch Medicines as are made of Minerals, and dread them as if they were a Poiſon, I will detect the Vertue and Power of ſome of the moſt principal ones in Medicine.

Of the Signature, Property, and Medicinal Vertues of the Bull-like and Horned Scarabæus *or Beetle.*

I Have known ſome of the biggeſt and flying *Scarabæus's* that have weighed half an Ounce, or a whole Ounce, and of a Cheſtnut Colour, and they will firmly ſtick to any thing by reaſon of their ſharp Feet, and are furniſhed with double Wings, the upper ones are hard and ſmooth like an horn, the under ones are very thin and tranſparent, and ſhew like the dried leaves of Poppy. The Male is for the moſt part bigger than the Female, and is armed with two horns, which in their branchings reſemble the Figure of Stags horns, hard and ſmooth like horn, and hollow on the inſide, without any marrow, with theſe he defends himſelf. If you put one of them on a Table, and ſmite him often with ſome ſmall twigs, and enrage and provoke him to anger, he doth not run away like as other Animals do, but ſets upon his Enemy, with his upright and variouſly branched horns, as if he would revenge himſelf for the injury done him ; and whatſoever you reach out to him, he preſently ſnatcheth with his horns, and holds it ſo faſt, that 'tis a hard matter to get it from him : If the thing be too heavy, he then leaves it, and goes his way without it: But if it be light, he carries it away with him, and afterwards unlooſeth his horns from it and lets it fall. The Females two horns are leſſer and crooked, which open and ſhut like Pincers ; whatſoever they ſeize on, they hold it moſt firmly, and if you expoſe to its horns any thing that is not hard ſhe doth gripe it ſo long, till the tops of her horns touch each other. Being hanged at a Cats or a Dogs Ear ſhe preſently pierceth it through, and ſo holds that the Dog can't caſt her off with her Feet, but (not knowing what is happened to him) runs to and fro, howling and crying out, as if he implored help from ſome body elſe, ſuch is the innate anger and malice of this ſmall Creature. They feed not upon Graſs and the Leaves of Trees as other *Scarabæus's* do, but are nouriſhed with the Juice of the thin ſoft reaſinouſneſs which is in Summer Flowers out of thoſe Trees that bears fruit with ſtones in them, ſuch as Nuts, Cherries, Plums, Pruens, Peaches, and ſuch like. Theſe Trees they ſticking faſt on, do by ſucking out the Roſin thence flowing, ſupport their lives withal. Theſe ſmall Creatures are truely Martial, and as if they were endued purpoſely by nature with Weapons, and armed. Some men do break off their horns, and carry them about them, as if they were a ſafeguard againſt the invaſions and being ſet upon by wild Beaſts, but I count this as ſuperſtitious. Some (I know) do reduce them with their Wings into pouder, and make uſe thereof, and have healed the inward pains and prickings of the Body : And have cured Quartanes, yea have in all Feavers hanged it about the Neck ; but yet I believe it would bring more profit, if it be duely prepared and ſo taken into the Body. But what effects they will perform in the other parts of the Body I know not, nor have I hitherto tried or known them to have been uſed to any other intent than before mentioned. But I am certainly aſſured, that there is a moſt wholſome Vertue in this inſect, becauſe of his thus living on, and being nouriſhed by thoſe reſinous Juices which flow out of ſuch Trees as bear thoſe kinds of Fruits that have Stones in their inſide : Wherefore I think that their whole Body is of a balſamick Nature, and I do judge by their ſignature, that they may be profitably uſed in curing all inward and outward hurts ariſing from beating, wounding, ſtabbing, and ſhooting, if they are firſt reduced into an Eſſence according to my method. The horns and thoſe hard wings, may be reduced into a Magiſtery, apart by the univerſal Diſſolvent, and ſerve for inward Uſe. And the body being on like manner prepared, may be applied and made uſe of for the allaying of all griefs, or pains both externally and internally. Without doubt it aboundeth with many other hidden Vertues which are unknown both to my ſelf and other men.

Of the Pilular or Globular Scarabæus.

THERE are other *Scarabæus's* uſed in Medicine, *viz.* the black and globular ones, uſually abiding in Horſe dung, and alſo thoſe that live in Oaks, and be of an aſhy Colour, and are pleaſant food to Poultry,

Poultry, who by feeding on them do lay abundance of Eggs, but the black ones they abſtain from, and do not eat them. I know not whether or no theſe laſt mentioned (*viz.* the Oak ones) are any thing at all helpfull in Medicine. But yet thus much they do, if they are bruiſed and applied to the bare skin they cauſe Puſtles, and ſo do thoſe too that are called golden *Scarabæus's* that are uſually on Roſes, and Elder-flowers. Both theſe ſorts have this property internally and externally, and ſo have the *Cantharides* or thoſe green Flies called Spaniſh Flies, and do moſt vehemently provoke Urine. If now theſe are by Art changed, and their venemous quality taken away, they are profitably uſed, and ſafely, in curing the Gout, Stone, and other grievous Diſeaſes and bring a great deal of benefit. The black and globular ones are martial, and are not much unlike to the horned *Scarabæus's*; the aſhy ones are of a Saturnine nature, the green ones of a venereal Quality, and the red and little ones are of a ſolar property. Theſe laſt mentioned, are by the *Germans* called Golden and God Almightie's Birds, and ſome do boaſt that they have gotten out from them good Gold, and put it to the Teſt, which to me doth ſeem unlikely. I will not deny but that there lieth hidden in them a ſtrengthening Cordial (as they call it) properly for corroborating a man's heart if a preparation or correction preceed, I ſhould be unwilling to make uſe of them crude and unmended. Beſides the aforeſaid reckoned up *Scarabæus's*, there is yet another kind of black ones which creep along the Graſs in the Months of *May* and *June*, and cannot flie as the above mentioned ones can, and yet have little Wings. Theſe are exceeding ſlow creepers, and being put upon ones hand, do turn out a ſtrong ſmelling Liquor, and are called *May* Birds, and the Worms of Fat by the *Germans*; the *Latines* call them the uncteous *Scarabæuses*. They operate moſt efficaciouſly, and are uſed by many for curing thoſe moſt grievous Diſeaſes of the Gout, Stone, Leproſie, French-pox, and Dropſie, one two or three Grains of them being reduced into powder, are uſually adminiſtred, in ſome proper Vehicle. They do moſt vehemently expel Defilements, by vomit, ſtool, and Urine, inſomuch that the Urine of the Gouty, Leoprous, or thoſe that are afflicted with the Stone will be coagulated like Milk, or will become tenacious, and wax hard like a ſtone, the which event may well aſtoniſh any one to conſider of. I know very many that have had the Gout, and been cured of it thereby, though I confeſs it is a Medicine ſomewhat hazardous becauſe of the force of its operation. But if it be firſt corrected by the Univerſal Salt, it may be moſt ſafely afterwards uſed in the curing of the ſaid Diſeaſes. *Wierus*, a very learned Phyſician, did heretofore publiſh a Treatiſe of the wandring Gout, and highly commended this *May* Worm, ſo called by ſome: And likewiſe the great common Earth-worms, for curing it. Neither is it without ground that this Worm [or *Scarabæus*] we mention, far exceed all the reſt of them that are endued with Virtues, healing Diſeaſes. The *Cantharides* come far ſhort of it, and the sky coloured Flies, which are formed onely in Carkaſſes, are far ſhort of the *Cantharides*. In the next place follow thoſe greater Flies, that uſually ſtay in men's houſes, and keep buzzing about till they can find ſome raw Fleſh, whereon they caſt their filth in the likeneſs of ſmall Eggs or Knits, which become VVorms in a days time. And I do believe that there is ſcarce any Creature endued with a ſmelling ſo acute and ſubtile as this Flie, and upon that account I do not queſtion, but that it would ſhew its Virtues in hidden Diſeaſes. Yet I would not be any man's Authour or encourager to make uſe of him, becauſe nature her ſelf cannot by any means endure (when a man by chance eats the fleſh that is defiled with their Excrements) their filth in the Stomach, but doth preſently caſt it forth by vomit as that it were a Poiſon. I aſcribe to theſe Flies a mercurial Nature, and I likewiſe affirm that there are in the common Worms medicinal Virtues. For they do ſtrongly expel by Urine and Sweat, and being made uſe of, crude as they are, they provoke to ſtool, and cauſe vomiting. But I verily believe, that being corrected by the univerſal diſſolvent and tranſmuted into a ſweet Eſſence, they will become an excellent Specifick againſt Impotency, and a notable corroborative to ſuch that are tired with the venereal Sport. Their ſignature is teſtimony enough, and the Figure of their Bodies, for they will ſometimes ſtretch out themſelves at length, otherwhile contract themſelves into a ſhortneſs, one while become thicker, then preſently, and as often as they p'eaſe can they extenuate themſelves or become ſmaller, nor can any Animal do thus beſides themſe'ves. Nor know I any Animal that doth (in Coition) more firmly adhere to the Female, than this Worm, whom I have many a time ſeen, in the Spring Seaſon when the Cold is aſſwaged and the Earth again open, to join himſelf to the Female (not under the Earth) but to creep out of the Earth with half his Body, and ſo apply himſelf to the half part of the Female, who likewiſe creeps out of the Earth, and he ſo long labours with her, till there is made a thorough conjoining of both their Bodies. And theſe two Worms are ſo pertinacious or earneſtly bent on this action, that they will rather ſuffer themſelves to be ſlain than be ſeparated. This venereal Labour being finiſhed, they do each of them betake themſelves into their Caverns or Holes. Such Hens as feed on them do plentifully lay Eggs daily, and ſometimes two on a day, the which thing no ſort of Corn will make them do. That Earth-worm is endued therefore with a venereal Nature and Property. There are beſides theſe, other ſmall Vermine that are far more prone (and approach nigher) to a venereal Nature, and they are a ſort that have ſix Feet and run moſt nimbly, and have wings but do not make uſe of them. They are ſmall and broad, and are in great companies in old VValls, and old rotten Boards of Stables, and lay their Eggs in the Walls and VVood. They come abroad onely in curious VVeather, and in a rainy and cold Seaſon do betake themſelves to their Holes, and in fair weather out come they again, and obſerve no order in their coupling. The Female going, carries the Male along with her ſitting on her back, another Male being ſtronger throws him off, and himſelf gets up upon the Female, and he again being thrown off in his room comes a new trader, and thus ſpend they the day in this riding kind of Sport, and the Female is exerciſed with an unceſſant Change of Males. They are not ſeen to eat any Food. Some of them I ſhut up in a Glaſs ſo that they could not get away, yet (in this captivity) they betook themſelves to this venereal Act, and at length ſetting upon each other, would rather periſh with Famine than be ſeparated. They are ſo ſmall that an hundred of them will but weigh an Ounce: Their wings are red and ſpotted with black. They run exceeding

ceeding ſwiftly, I never could find any thing written of them. I gave them to Cats and Dogs to eat with their meat, and I found wonderfull things. Hens and other Birds will not eat them, haply becauſe they cannot brook the too vehement operation of them. They muſt needs be endued with ſingular gifts, he that will make trial, may ſo do, but yet ſo as not to uſe them but corrected, becauſe (amongſt all the Vermine that I know of they do moſt excell, and abound with the greateſt venereal Venome. There are yet beſides theſe, other Worms (or Vermine) that are profitable to make Medicine of. The food and nutriment of the *Aſelli* or Pig-lice is rotten Wood; if you touch them they rowl up themſelves into a round Ball. They are for the moſt part uſed for repreſſing of the Stone. The Cimexes, or Knats, or Flies, are of a red colour, and do vex and diſquiet a Man at night, they ſuck his bloud, and uſually quarter in old Pine-wood, and in ancient Chambers, and are deteſtable things becauſe of the ſtinch they emit. And beſides them, there is another kind of ſuch Vermine that are of a green colour, and more venemous, aud yield a more filthy ſtinch than the red Worms do. This Inſect has wings, and is four times bigger than the Cimex, and live in the Graſs; but when the cold Winter approacheth, they then live in hollow Trees, or hide in the Chinks that be in Walls. If an Ox or Cow do by chance in eating Graſs ſwallow down ſuch a kind of Vermine, they ſwell up, and ſometimes die of it; but yet they do ſo well know how to ſhun them, that the Beaſts ſeldom ſwallow them. I do from hence gueſs, that there lies hidden in this kind of Animal, ſome ſingular matter, becauſe of its wonderfull diſpoſition it hath: For I have tried by certain experiments that it can either retain, or emit its ſtinch as it pleaſeth. It is a notable ſubtile and fallacious Creature, and this I could confirm by wonderfull ſtories. It doth exactly imitate the perverſe diſpoſition of all Turn-Coats, Luſtfull, Venereal, and Beſtial Men. It doth preſently depoſite or loſe its ſtinch in the univerſal *Menſtruum*, but what it will (being thus prepared) perform, I having as yet omitted farther inquiſition, cannot tell. Infinite is the number of theſe and ſuch like Inſects, and without doubt they were not created in vain, they proſecute each other with a mutual and deadly hatred, and do by laying ſnares endeavour to deſtroy each the other. I have known one little ſmall Worm or Inſect, that by ſucking out the juice and ſtrength of the great Earth-Worms do wax fat, and is in all places his Superiour or Maſter. In the Spring-time he is a ſmall lean Worm, and is not ſo big as the Blatta, that live upon Meal, but in Summer time he doth ſo fatten himſelf with the Earth-worms, and becomes ſo unwieldy that he can hardly creep: He is black as a Coal, and moves himſelf by the many ſhort feet he has, is about the thickneſs of a Quill, and about a fingers length, and under the earth ſhrewdly bites the poor Earth-worm, and ſucks from him his beſt juice, which ſaid Earth-worm being no ways able to defend himſelf, doth out of meer pain creep out of the Earth, and brings out his faſt adhering Enemy: he ſticks on to him ſo cloſe, that he can't be driven off, and ſo long ſucks, untill being well ſatiated and full, he at length falls off of his own accord. I have often ſeen theſe Earth-worms ſo long vexed with them and twined themſelves to and fro till this little Vermine hath pierced the Worm through, and divided him in twain, but yet cloſable together again, if he can but onely get into the Earth. You may ſee evident ſigns of the malice of this ſmall Vermine, upon ſome of the older Worms, that have had ſeveral ſuch bitings, and yet cloſed together again. For I know no enemies the great Earth worms have, ſave onely the Mole, and this ſame Worm. This black and martial Worm having done with one, preſently ſets upon another Worm, and ſo ſucks out the beſt juice, and leaves the body of the ſaid great Worm deſtitute of any ſtrength. He is of great virtue and as to his excellency is to be preferred far before all other Worms if but well prepared: As for Spiders, there are many talks of them as if they were poiſonous, but I could never as yet find any ſuch thing in thoſe that grow in the ſpace of one year, and then vaniſh away again; they are ſuch that make their Webs on Trees, Buſhes, and the like to catch Flies in, and are croſſ-bearing Spiders, becauſe they have on their backs the figure of a Croſs. Every month they put off their old skin, and ſo do thoſe too that make their Webs in the corners and holes in Houſes, and will live three months without either meat or drink befor they die. Theſe are ſomewhat worſer than the former, and yet not ſo poiſonous as the report goes, and as is believed. All the green ſort of Spiders, that live in the Graſs and among Leaves are void of all Poiſon, (and all others) ſave thoſe which abide in cold places, as Cellars, and moiſt Vaults, and nouriſh themſelves with Inſects, and are covered over with a black and roughiſh skin like black Silk or Velvet, are ſlow paced, and as being the Kings of all Spiders, do kill the others by their biting, and devour them if they can but get them within their power. If one Spider be thrown into the Neſt of another, the ſtronger drives out the weaker, but they cannot any of them abide theſe black Spiders, abhorring their preſence, and running away as faſt as they can. Nay more, neither the Black-bird, nor other Birds (whoſe food's the other Spiders are wont to be) will eat them. They grow old very ſlowly, and live in a Cellar many a year, as being patient endurers of the cold, and do not renew their skin as the reſt do. Thoſe likewiſe that devour the Flies in ſtores in the Winter, or at leaſt-wiſe are nouriſhed with the ſweet fume or vapour of Hony, Sugar, and ſuch like things, and arrive to an old Age, are alſo venemous. All theſe are rarely uſed in Medicine, there being indeed no need of them amongſt ſuch plenty as there is of good Medicaments. This one benefit I have obſerved in them that they ſo purge ſick Hens, as that they recover their former health, and do preſently after get ſtrength and wax fat. Emmets that live by the juices and Roſins of Trees, are alſo uſed in Medicine, but yet do no great matters. Locuſts, Grylli (a kind of Graſs-hopper) and ſuch like Inſects, (though they are endued with hidden virtues) are notwithſtanding neglected, foraſmuch as there is one onely Mineral that can effect more then all the bigger or leſſer Animals, Worms, and Inſects, and therefore well may they be deſpiſed. There are alſo ſome things that are taken from the bodies of the bigger ſort of Animals that are uſed in Medicine, as the Stomach, Inteſtines, and Teeth of the Woolf; the Lungs of the Fox: The Gall, the Hair, the Skin, the Excrement, the Horns, *&c.* of other Animals; but yet no great matters have been hitherto done by all this ado, becauſe they are parts or Members of ſuch Animals, as being altogether void of Poiſon, are uſually Man's Food, or may ſo be.

Whereas

Whereas were they the parts of Animals that would alter our nature, or were they the Teeth, Bones, Horns, or other parts of venemous Creatures, and then changed and reduced into good Medicaments, ſomewhat might be done by them. By ſuch as alter nature I mean, the Teeth of Dogs, Wolves, Bears, Lions, and ſuch ravenous Creatures; the Bones and Horns of the Elſe, Goats, Kids, Does, Stags, Elephants, and the Hairs of Men and other Animals. Amongſt the venemous Animals, the Teeth and Skins of Vipers, Serpents, Toads, Salamanders, *&c.* In the third degree are the Teeth of the Sea-dog, and Whale, and of the horned Fiſhes, and thoſe which the *Dutch* Marriners call Walruſſen, and others the Unicorn: the Horns of them, and of other ſuch like Sea Monſters, whoſe Fleſh is venemous, and therefore their Teeth muſt neceſſarily be endued with medicinal Vertues, provided they be changed and converted into a convenient Eſſence. Beſides in the Excrements of all Animals, lies hid a ſingular medicinal Vertue, nor is the volatile Salt (but eſpecially of thoſe that are poiſonous) to be contemned. The fixed Salt being the ſubduer of many Diſeaſes, doth not a little help to the making of Medicine. But I am not minded to treat of theſe at preſent, but will onely demonſtrate by what means all Animals are to be diſſolved by the univerſal *Menſtruum*, and Poiſon to be converted into moſt wholſome Medicine. The Vertues of them are already known, nor is ought more required ſave a due preparation, the knowledge of which I am minded to manifeſt in this Treatiſe. It is apparently evident that the Teeth, Horns, Skin, Hairs, and Claws or Hoofs, are by ſo much the better and more efficacious Antidote, by how much the greater and more preſent Poiſon their Fleſh is endued withal, and this we ſee by experience. Such as deſire to know more, of ſuch like venemous Animals, may read my Book, of the ſignature of things, wherein they will find many profitable things and worthy of conſideration.

The preparation and changing of all venemous Animals and Worms, &c. into ſafe and efficacious Medicaments.

AS touching what belongs to their preparation, it doth not conſiſt in the way that hath been hitherto uſed as to the preparing of Animals for medicinal Uſe, the which have hitherto been either reduced into Powder, or elſe have been converted into Spirits, Waters, and Oils, by decoction in a B, or elſe turned (by Calcination) into Aſhes, that ſo their fixt Salt, may be extracted, or (by ſublimation) paſs into a volatile Salt. I do no wiſe contemn theſe, and other hitherto uſed ways and methods of preparing Animals for the uſe of medicine, for in very deed they are good and profitable. But foraſmuch as I have the knowledge of a better and more compendious way of doing all theſe things, I neither would nor could any longer hide the ſame, but communicate it for the good of mankind, and for the help and comfort of the ſick. And now that the well minded Reader, may percieve a difference between the old way of preparing theſe Medicaments and my way, I will briefly declare and demonſtrate the ſame. I have not hitherto heard or read of any other way than this which followeth, *viz.* The Animals are either wholly or elſe ſome part of them, dried in the Air, then powdered and adminiſtred in Powder in ſome appropriate Vehicle, or elſe ſome Honey or Sugar is added to the Powder, thereby to make it into an Electuary; or elſe the Animals are digeſted (whilſt new or freſh) in Oil, then preſſed out, and changed into a Balſam, that ſo they may ſerve either for inward or outward Uſes as neceſſity requires. Or elſe they are made up into other Medicines, and ſo confected and kept for uſe. Or, being new, are diſtilled by a B. in water, the reſidue is by Calcination burnt into Aſhes, and the fixed Salt, is (by the benefit of diſtilled water) extracted out of the Aſhes. Some do diſtil the bodies of Animals, dry, or moiſt, in a Retort, and do get a ſtinking Spirit, Oil, and volatile Salt, which parts they Sever from each other, rectifie them, and keep them to uſe in time of need. Others do put the venemous Animals alive into Oil, or into ſome other Oil drawn out of an Aromatical Vegetable by diſtillation, and ſo ſuffocate them herein; and do afterwards uſe that Oil for outward and inward Uſes, as is evident in the Oil of Scorpions. Theſe are the ways hitherto made uſe of for the preparation of medicaments out of Animals, nor have they been fruitleſly uſed. But whereas I ſaw, that the Animals being prepared the aforementioned ways are venemous and crude, but eſpecially when they are but onely dried and powdered, and ſo uſed, and that the adminiſtring them to the ſick is not without danger, becauſe they ſet upon nature with too much vehemency, if any (nay the ſmalleſt) errour be committed in the Doſe: and beſides, they do (by their ungratefull and loathſome ſavour) beget a nauſeate, and withal conſidering, that the Spirits, Oils, and Waters drawn out of Animals by diſtillation, do for the moſt part ſmell of an *Empyreum*, and are extremely diſtatefull to nature; and that though the volatile Salt, and the fixt, which contain the greateſt Vertues of the Animals, and may more commodiouſly be taken into the body than the Oil, which is plainly intolerable to ſick Perſons becauſe of its ſtinch; yet foraſmuch as in ſuch an Operation the chieſeſt Virtue is burnt up, and corrupted, and that therefore the Medicament ſo diſtilled is leſs profitable than the crude Body of the Animal; this way and method cannot at all be accompted of as worthy the being ranked amongſt the beſt ſort of Medicines. Seeing then and well percieving all theſe Circumſtances, I counted it wholly neceſſary to bethink my ſelf of a more profitable and better way, and ſuch a way too, as by the help whereof, every Animal, or at leaſt ſuch a part of it according as is requiſite, may (without any ſeparating of the whole body into divers parts) be diſſolved, and changed in its whole ſubſtance by a certain diſſolving and correcting Water poured upon it, and ſo its venome be converted into Medicine. Now the diſſolving Water, and the diſſolved Medicine ſtand in ſuch a poſture, as that it may be again abſtracted and ſeparated from the diſſolved and corrected body after its diſſolution and correction, and this ſo corrected or purged body may be adminiſtred in ſome convenient Vehicle to the ſick, or elſe alone by its ſelf, as ſhall be more clearly manifeſted in the following diſcourſe.

A univerſal Menſtruum *by the help of which all Vegetables, Animals, and Minerals are diſſolved, corrected, and reduced into a moſt pure and moſt ſafe Medicament.*

I have in my *Miraculum Mundi*, taught and told you that Niter is the true univerſal diſſolvent, and is operated withall three manner of ways.

1. As it is in its own proper nature and form.

2. When it is changed into a fixt and fiery Liquor.

3. When (by the benefit of the fire) it is diſtilled into an Acid Spirit. With theſe three inſtruments are diſſolved all whatſoever is in the nature of things, are amended, and tranſmuted into a better and purer ſubſtance. But the manner how this is done ſhall clearly be taught in this Treatiſe, and explained, inſomuch that all ſuch as have either out of groſs Ignorance, or conceited Pride, or meer diabolical hatred and envy, hitherto contemned, deſpiſed, and traduced it as a thing impoſſible to be done (as *Farnerus* for one) may be confounded with ſhame, and be driven to confeſs, that their meer ignorance, pride, and envy, cauſed them to oppoſe the Noon-day light, and attempt the extinguiſhing, blotting out, and obſcuring the ſame. And although that I have deſcribed the preparation and uſe of the univerſal *Menſtruum*, both in my *Miraculum Mundi*, and in its explication, as likewiſe in my Apology againſt *Farnerus*; yet notwithſtanding many perſwade themſelves, that that deſcription is too much clad over with darkneſs, and that without a more accurate and plainer declaration or explication, it cannot be underſtood, and conſequently not made uſe of. Therefore that ſuch Men may have their food ready chewed, and thruſt into their mouths, and may have no farther cauſe of labour and conſideration, I will give a plainer declaration and make (in God's name, for whoſe honour, and for the benefit of all mankind, I have thus purpoſed to do) an initiation, and perfectly demonſtrate, that Niter is (by the three aforementioned ways) able to diſſolve, and alter all whatſoever is in the nature of things, and to reduce them into a better ſubſtance. Theſe are the weapons wherewith I enter the liſt with all deriders and haters of the truth, and do demand, if they have any better and more powerfull thing, than this univerſal diſſolvent out of Niter, if ſo, to produce it; if not, then to let this alone. Every man has his liberty, (if he hath better) to publiſh it for the common good; but if he can't produce a better, he may well ſubmit himſelf to the truth. Verily would any man diſcover a better univerſal diſſolvent, he would do me an acceptable thing, and I would moſt readily acknowledge any errors I have committed in this matter, and would refuſe my own proper writings. But that ſome ſuch will ariſe and do this thing, I do not in the leaſt fear. If ſuch an one ſhould come, we will hear and ſee him, and recieve him with a decent reply. In the mean while we will addreſs our ſelves, to the preparation of good Medicines, to the honour of God, and benefit of our Neighbour. The bettering and correcting metals, which is to be accompliſhed by the ſaid Niter, is exactly deſcribed and demonſtrated in the ſecond, third, and fourth part of the Treatiſe of the proſperity of my Countrey; in this place we have purpoſed to treat onely of medicines. But as for the way of reducing Niter into a fixt and fiery Liquor, and alſo into a Volatile, Acid and fiery Spirit; we have already taught in other places of our writings, ſo that it is a meer needleſs thing, here again, to repeat the ſame. But becauſe it is profitable to the lover of Arts, that he find both the preparations here conjoined, I have deemed it neceſſary to ſet them down both to your view.

The Proceſs of turning Salt-peter into a fiery Liquor.

TAKE of pure Salt-peter, and ſuch as is free from all common Salt one pound, put it into a ſtrong and well burned Pot or Crucible, with a Cover to it, put it into a VVind Furnace, urge it ſo long with Coals till it be a bright red hot, and all the Niter flow; which being molten and in flux, caſt in a little Powder of good Char-coals, that ſo it ſwimming at top of the Salt-peter may burn up. This Coal Powder being conſumed, throw in ſome more of the ſame, and proceed on thus with caſting on Coal Powder ſo long till the Coal Powder you caſt in will not take Fire any more, and the Salt-peter appear of a greeniſh and sky-colour. Then pour it out thus molten into a warmed Mortar or Baſon, (for if you throw it into a cold Veſſel, it will leap up into your Face) and there let it lie till it be cold. If you touch your tongue with ſome of this Salt, you ſhall find it fiery like the Salt of Tartar. Beat this Salt into a Powder and put it into a Glaſs, or elſe ſet it in ſome moiſt or cold Cellar, and in few days, nay, or hours, it will be diſſolved into a clear and fiery liquor, which ſtrain through Cap Paper or a Filter (as they call it) and ſet it up for uſe.

The uſe thereof in the preparation of ſuch Medicaments as are made out of Animals, and alſo Vegetables.

FOraſmuch as the uſe of this *Menſtruum* is already demonſtrated in my firſt Apology againſt *Farnerus*, and in the firſt part of this *Spagyrical Pharmacopœa*, wherein the Eſſences of Herbs are taught. But in this Treatiſe ſhall mention be made onely of ſuch Medicaments as are preparable out of Animals. I will here ſet down the way and manner of operation, whereby not onely Animals, but alſo Vegetables my be corrected and tranſmuted into ſafe Medicaments. And here it is to be noted, that the uſe of this *Menſtruum*, takes place onely in correcting ſuch Herbs and Animals as are ſtrongly operative and as it were venemous, whoſe malice is to be neceſſarily removed. For thoſe Herbs that are good, and uſed in the Kitchin, and without any hurt in them, need not any correction, except one will make out of them, an extract by Spirit of VVine, or make of them a burning Spirit, and Oil, as alſo a fixed Salt, and conjoin them by the benefit of Art, and make them into ſweet Eſſences, which labour is accurately deſcribed in the firſt part of my *Spagyrical Pharmacopœa*. In this place we treat onely of turning Animals, Vegetables, and Minerals into ſweet Medicaments, by the benefit of Salt-peter: And in other places of my Writings is ſufficiently enough taught by what other ways, and thoſe various ones too, ſeveral Medicaments may be prepared, and that without the help of this univerſal diſſolvent, whereto I refer the well minded Reader, and proceed on here to teach the preparation of the ſaid Medicaments by that hitherto often named fiery diſſolvent, which (without any additions) is of notable effect.

The

The Preparation of Animals and Vegetables by the fiery Liquor of Niter, their Diſſolution, Correction, and Tranſmutation into wholſome Medicines.

TAKE any Animal or Herb, what you pleaſe, if it be new, cut it ſmall; if the Animal or Herb be dry, beat it into Powder, and pour thereto the liquor of fixt Niter, that it may well moiſten the Animal or the Herb, and may cover it all over; ſet the Glaſs in a B. and digeſt the venemous Animal or Herb for one day and night, in which time the liquor of Niter will ripen the venemous Animal or Herb, and tranſmute it, and make a Medicine of the Poiſon. After the Cucurbit is cooled in the Balneo, take it out and pour forth the liquor, together with the corrected Animal or Herb into another Glaſs having a long Neck, and pour thereon the beſt Spirit of Wine, or burning Spirit of Corn, and ſuch as is well purged from all Phlegm, that it may ſwim on the ſolution the height of two fingers. Note well, that the liquor of Niter, and likewiſe the burning Spirit, muſt be well freed from all Phlegm, ſo that the Spirit may not conjoin it ſelf with the Niter, but ſwim on the top of it. For if both of them be watery or phlegmy, there would be a conjunction or commixion of them both, and your labour would miſs the event hoped for, and this is well to be obſerved. Therefore ſeeing that ſuch a commixtion, is prevented by removing of the aquoſity, the burning Spirit will attract to it ſelf, the true and corrected Eſſence of the Herb or Animal, and leave the fixt liquor together with the unprofitable Fæces of the Herb or Animal. Separate the burning Spirit thus impregnated with the Eſſence, and ſo much that it can attract no more, by pouring it off from the liquor, and pour more Spirit thereupon, repeating this labour ſo long and ſo often, untill all the Eſſence ſhall be extracted out of the liquor of the Niter. Then take all theſe extractions which contain the tranſmuted or corrected venome of the Herb or Animal, and put them together in a Cucurbit, in a B. M. and draw off the burning Spirit with a gentle heat, that ſo at length the remaining liquor, may be of a thick and dark coloured reddiſhneſs Note well that the beſt part of the burning Spirit may be alſo ſeparated in a B. and reſerved for farther uſe, but its remaining and weaker part may be taken out with the extract, out of the B. M. and be evaporated in a Glaſs Veſſel, over a vaporous B. to the thickneſs of Honey. For in ſo doing, there's no fear of burning the extract in the Cucurbit, if the B. ſhould be over hot; and this you are to have an eſpecial regard unto. But if the evaporation cannot be done in Glaſs Veſſels, by a vaporous B. then when the Eſſence is brought to ſuch a paſs in a little Cucurbit, pour thereto ſome of that burning Spirit, that came firſt over, and preſently ſhake it well about, and mix it well, and this will again forthwith extract the pureſt part of the Eſſence, and leave behind a few Fæces, with a little of the fixt Niter Liquor, from the which, the burning Spirit together with the Eſſence, is to be forthwith ſeparated, by pouring it off, leſt it ſhould (by any longer ſtay on the Fæces) draw alſo to it ſelf the Salt, and ſo not get the ſweet Savour and Odour of the Eſſence. But if any one doth yet deſire to make the Eſſence more pure and more ſweet, he may extract it yet a third time after the aforeſaid manner, and after this third labour there will remain again ſome more Salt, and the Eſſence will become ſweeter. If a diligent regard be not had hereunto, there will (for the moſt part) ſome of the fixed Salt abide with the Eſſence, and render it of an unpleaſant ſavour: this admonition therefore is not to be neglected, but ſuch a one that covets the obtaining of any good muſt beſtow his labour with all kind of diligence.

This is an exact deſcription of the manner of preparing moſt efficacious Medicines, out of the moſt venemous Herbs and Animals. Furthermore this is to be noted, that when the Eſſence is extracted by the burning Spirit, out of the Alkalizated Herb or Animal, the remainder is to be boiled in an earthen or glazed Pot even to drineſs, and afterwards to be made red hot, that all the impurity may be conſumed by calcination, and the pure fixt Niter may remain alone, which if you ſet in a Cellar, and do again let it diſſolve into a liquor, it will be of the ſame virtues as before, and thus will it be many a time, and ſo may the Spirit of the Wine be uſed for the like operation.

Now although this fixed Niter doth change as well venemous Minerals, as Animals and Vegetables, and reduce their venenoſity into wholſome Medicine: yet is it more fit for the ſulphureous Vegetables, Animals, and Minerals, than for mercurial ones; and for ſuch the Acid Spirit of Niter is more fit, though it doth alſo diſſolve, correct, and tranſmute Vegetables, Animals, and Minerals; the which is chiefly obſervable in the Minerals, for therein may be learned the wonderfull property, and the all-things-changing efficacy of this Fire. For Niter crude as it is in its body, being mixed with combuſtible Animals and Vegetables, and enkindled, burns up all things, and drives them with the flame up into the Air, inſomuch that nothing ſave the fixt Salt onely is left remaining: And therefore this crude Niter is altogether unfit for Vegetables and Animals, if you would have any good from them. But in the venemous Minerals it performeth its office better than the fixt Niter, or than the volatile corroſive or Acid Spirit, as ſhall be afterwards ſhown where we treat of Minerals. This I thought expedient to adviſe you of, and have thus done to this end, that thoſe that are deſirous of the Art may learn the divers operations of Niter. The crude Niter doth (by its flame, diſplay its virtues upon the venemous Animals, and changeth them in few hours ſpace into ſafe Medicaments) Being reduced into a fixt liquor, it diſſolveth all ſulphureous Vegetables, Animals, and Minerals, the which thing the common or crude Niter, as alſo the acid and corroſive Spirit will never do: As this fixt liquor of Niter alſo diſſolveth wholly the ſulphureous Minerals, and leaves nothing behind ſave the onely Fæces. So the acid Spirit of Niter diſſolveth all mercurial Minerals, that nothing remains undiſſolved. From whence 'tis evident, that every nature doth lovingly embrace its like, and is willingly conjoyned therewithall, and eſpecially if ſuch natures are pure and clean, and not mixed with any other things. But that you may yet better underſtand theſe things, hearken a little farther. There is no Herb, no Animal, no Mineral, that conſiſteth not of its three firſt principles, *viz.* Salt, Sulphur, and Mercury, but yet are theſe very unequal: for in one ſubject, the Salt is moſt powerfull, in another, the Sulphur, in a third, the Mercury: But when in ſuch ſubjects conſiſting of the three principles, there is not too much inequality, and that no principle bears ſway over another, then either the acid Spirit,

Spirit, or the fixed Salt of the Niter will alike diſſolve them, as is evident in many Vegetables, Minerals, and Animals, which being compounded of well tempered Principles, do admit of Solution and Correction, both by the fixt Liquor, as alſo by the volatile acid Spirit: For example. I take ſome Herb, be it *Napellus*, or *Mandragora*, or *Opium*, or ſome Animal, as a Spider, Scorpion, or Golden *Scarabæus*, I deal on this Subject now with fixt Niter (as I afore taught) and the whole will be diſſolved, changed, and become a ſafe Medicament, (for they conſiſt of well tempered Principles.) If now I pour upon either Subject the acid Spirit of Niter, it will be diſſolved therein, changed,and corrected, and put on the nature of an wholſome Medicine, as well as when diſſolved in the aforeſaid Liquor. Now though both Liquors, *viz.* the fixt Liquor and the acid Spirit do ariſe out of one Root, yet do they exceedingly differ in their nature, and do proſecute as it were each the other with a deadly hatred: And that becauſe the fixt Liquor, as well as the acid Spirit, are in ſome ſort as yet adverſaries, and do not abſolutely bear ſuch ſway as if they were in one Nature For they are from one ſubject, and are by the fire drawn out of common Salt-peter, and reduced into two contrary parts and into Enemies oppoſing each other. But they are again conjoined, that they may mutually ſet upon each other, with that enmity they have received from the fire, and may overcome and kill each other, then neither the fiery Liquor, nor the acid Spirit is any more diſcerned, but they return unto that which they were before, and from which they were born, *viz.* unto Niter or common Salt-peter. Excellently well therefore ſay the Philoſophers, make the fixt Volatile, and the Volatile fixt. *Hermes* alſo ſaith, that our Dragon dieth not without his Brother and Siſter, many things might be ſpoken of this matter, but they belong not to this place, but to the fourth part of the Proſperity of *Germany*, in which is treated of the Concentration of Gold and Silver into Tinctures, but if ſo be that one of the aforenamed Principles,whether it be Sulphur or Mercury (for the Salt is not to be here conſidered) do bear overmuch ſway in any ſubject, then both the diſſolvents cannot alike diſſolve that body, but that diſſolvent onely which is appropriated to the nature of that Subject: As for example. The ſeed of any Herb (though it hath a mercurial Salt) yet the Sulphur hath the predominancy, and therefore admits of diſſolution by the fixt Liquor rather than by the acid Spirit. But if the Oil be ſeparated from the mercurial Salt, either by expreſſing it or diſtilling it out of the Seed, then the fixt Liquor hath a greater efficacy of operation upon its like, and diſſolves all the Oil, without leaving any part thereof behind. But contrariwiſe, the Oil being ſevered from its mercurial Salt, which admitteth of the acid Spirit onely, the acid Spirit hath no power at all to diſſolve it, though he be ariſen from the very ſame Subject, as his brother the fixt Liquor is. So then the Siſter anſwers not the brother in the like operation, and 'tis impoſſible for the Siſter to accompliſh thoſe things that the Brother doth. But when both brother and ſiſter are mixed together, they do again beget Children like to their Parents, *viz.* *Hermaphrodites*, from whence themſelves had their Original, returning to ſimple and crude Niter, out of which there do again proceed the like Procreations and Generations of the maſculine and feminine Sex. And ſo one birth tranſmutes it ſelf into another, augmenteth and bettereth each other and that even to infinity, if it do but get its own conjugal bed, and be dealt withal in a Philoſophical manner. And what we have ſaid of the vegetable Sulphur, the ſame may likewiſe be underſtood of the Animal and Mineral. For ſuch a Sulphur as is ſevered from its Salt and Mercury, the acid Spirit of Niter will not diſſolve, but its ſulphureous Liquor doth readily perform it, and this doth wholly diſſolve the common mineral Sulphur, whereas the acid Spirit leaves it untouched. But ſuch a Subject as participates of both Natures, *viz.* of the ſulphureous and mercurial one, doth admit of diſſolution both by the fixt Liquor, and by the acid Spirit, whether it be a Vegetable, Animal, or Mineral. Therefore the extreams, *viz.* the beginning and the end, the firſt Ens and laſt Eſſentiality, the volatile and combuſtible, and the fixt and incombuſtible, are to be compared with each other, (as thus.) Let the common combuſtible Sulphur and which adheres to Minerals and Veins of Metals be accompted of as the beginning, and let Gold be accompted the end. The fixt Liquor now diſſolves the Sulphur wholly, but cannot do ſo with the ripe Gold; but the acid Spirit diſſolves that, and cannot at all diſſolve the Sulphur. But now ſuch as are middle Subjects and do partake of both natures, *viz.* of a ſulphureous and a mercurial, ſuch as are *Saturn*, *Jupiter*, *Mars*, *Venus*, *Mercury*, *Lune*; for they are diſſolveable by both, *viz.* by the fixt Liquor, and alſo by the acid Spirit. But by how much the more either of them partake of combuſtible Sulphur, by ſo much the eaſier doth it admit Solution by the fixt Liquor. So this Liquor doth eaſily diſſolve theſe Minerals, *viz.* Antimony, Auripigment, common Sulphur, red Arſenick, *&c.* and of metals theſe, *Mars*, *Venus*, *Jupiter*, *Saturn*, difficultly; *Lune* more difficultly; *Mercury* moſt difficultly; but for *Sol*, which is the laſt and beſt of all, it doth in no wiſe diſſolve, becauſe it is plainly freed by nature from its ſuperfluous, extraneous, and burning Sulphur, and is waſhed, purified, and maturated into a moſt pure mercurial Subſtance. Contrariwiſe the acid Spirit (if it be ſtrong enough) doth diſſolve all, even from the ſupreameſt metal, to the loweſt Mineral, Sulphur onely excepted, which it can't diſſolve. Yet doth it more eaſily diſſolve one Subject than another according as it is of more affinity with, or remote, from its own Nature. And therefore every Chymiſt may eaſily know the Nature and Properties of every metal and mineral by the diſſolving them, with theſe two, *viz.* Liquor and acid Spirit. Note well, I have (by this means) found out what Metals and Minerals are of neareſt Affinity with Gold, and this kind of enquiry is far more certain and ſafer than the reading of many Books; nor will it be hurtfull to him if he did underſtand the ſignature of metals and minerals, and thereby know how to learn their Nature and Property; but my intent is not to treat of that, in this place, but will refer my labour to the ſecond part of my Treatiſe of the Proſperity of *Germany*, where we will ſpeak of the Concentration of Metals and Minerals. But that I may trifle out no more time in the diſcourſing of the difference of metals and minerals, I will go on and deſcribe how the venemous Subjects of Animals and Vegetables are to be diſſolved by the acid Spirit of Niter, to be tranſmuted and ripened thereby, and converted into ſafe Medicaments.

The

The Proceſs and Preparation is as follows.

TAKE either *Nux Vomica*, or venomous party-coloured Toads, Scorpions, Cantharides, or ſuch like venomous Vegetables or Animals. Cut your Vegetables, but take your Animals whole as they are, that ſo dying (in the *Menſtruum*) they become greater and ſafer Medicaments, put them in ſome glaſs: As for example. Take one Ounce or two Ounces of the Spirit of Niter; put it in a glaſs with a narrow neck, that ſo it may be ſtopped, and put into that Spirit ſuch Vegetables as you would diſſolve; which being diſſolved into a Liquor, then put yet more Herbs, thus doing ſo long till the Spirit grows thickiſh, and can diſſolve no more. After the ſame manner may you proceed with the Animals if dead; but if alive, then to the Spirit add ſome water before you put the Vermine thereinto; for the too too vehement force of the Spirit, is to be ſo allayed, that the Vermine being put in alive may not preſently die, but may kill himſelf with his own proper Poiſon. For if the Spirit be too ſtrong, ſuch kind of Animals will die in leſs than a moment, and not know what hath happened unto them. But now they live longer in the milder Spirit, and when they ſee that they muſt needs die, they are extreamly enraged, do prick, and bite, and kill themſelves with their own Poiſon, inſomuch that the venome is increaſed, and the Medicine acquires the greater Virtues. So then thoſe which thou haſt put in being diſſolved, add more untill the Spirit becoming thick, can diſſolve no more; ſtrain this Solution through a thin Linnen Cloath into another glaſs, and pour thereon by little and little, or drop by drop, the fixt Liquor of Niter, that it may kill the acid Spirit, and they both having loſt their ſtrengths return into Salt-peter as they were before, and the corrected Vegetable or Animal may be precipitated to the bottom in the form of a Powder. When you have ſo done pour on ſome more freſh Water, or Rain-water, that the Salt-peter may be the better diſſolved. Then pour out all the Solution, through a thin Linnen Cloth placed in a glaſs Funnel, into another glaſs, that ſo the Salt-peter, which before was partly an acid Spirit, and partly a fixt Liquor, and is again become Niter, may (being diſſolved with the water poured thereon) run through the Cloth, and that corrected Vegetable or Animal may ſtay behind in the ſame, the which by pouring on ſtore of fair water, is to be freed of all Saltiſhneſs, and afterwards to be put together with the Cloth upon Cap-paper ſeveral times doubled. This Paper will drink up all the moiſture, and the remaining Animal or Vegetable Powder will ſtay behind: which being thus dried is to be lay'd up for uſe, and may afterwards be uſed either *per ſe* in the form of a Powder or be reduced into Pills, which before this preparation could not be ſafely uſed, nor without much danger. There is beſides, another way of turning Animals and Vegetables by the acid Spirit of Niter, or by the fixt Liquor into wholſome Medicaments: and the manner thereof is thus.

Thoſe Subjects which refuſe to be diſſolved by the fixt Liquor, are diſſolved by the acid Spirit, and precipitated with the fixt Liquor, or contrariwiſe thoſe which are not diſſolveable by the acid Spirit, are diſſolved by the fixt Liquor, and precipitated by the acid Spirit. All being precipitated, and the Diſſolvent ſufficiently ſlain, let ſome more of the fixt Liquor be poured thereupon, ſo that it may much exceed in quantity the acid Spirit. This done, let the Phlegm be drawn off in a vaporous B, and to the remaininging Liquor, let be poured as much burning Spirit as is ſufficient, that ſo it may by extraction extract all that is to be extracted. This burning Spirit operates upon, and attracteth to it ſelf, no other thing ſave the onely Eſſence of the Herb or Animal alone, and leaves the Diſſolvents untoucht. But this Eſſence is no ways inferiour neither in virtue or efficacy, to that which was prepared after the before deſcribed manner. And thus much let ſuffice to have been ſaid of the preparation of Vegetable and Animal Medicaments. And now we will betake our ſelves (in God's Name) to ſpeak likewiſe of Mineral and Metalline Medicaments, and ſee what good thing the Omnipotent God beſtoweth on us by the benefit of theſe things.

The preparation of Metalline Medicaments is almoſt a-kin, and like to the precedent preparation of Vegetable and Animal ones, and doth herein onely differ, that the moſt part of Minerals and Metals, are diſſolved, corrected, and converted into ſafe Medicaments by crude and purified Niter, as the following manner demonſtrates.

Take of powdered Antimony and purged Niter each alike, mix theſe equal parts in a covered Pot leaſt the Maſs leap out, calcine it, after Calcination pour it forth, and reduce the Maſs into a Powder, and waſh off the Salt-peter with Water and dry the Antimony, which hath now loſt its black Colour, and is become white. Mix it again with an equal part of Salt-peter, calcine it, and waſh it, and repeat this Labour a third time. This done, the Antimony hath laid aſide all its venomoſity and blackneſs, and become white, and ſuch a medicament, as may be moſt ſafely adminiſtred in expelling all Diſeaſes by Sweat, the Doſe from two, three, four, even to ſix Grains. Note well, if you uſe the *Regulus* inſtead of the Crude Antimony, it will preſently, in the firſt operation become a white Diaphoretick, and to be adhibited in the ſame Doſe. Even after the ſame manner may you deprive poiſonous Arſenick, Auripigment, and ſuch like Poiſons of all their venomouſneſs, and tranſmute them into moſt ſafe Diaphoretick Powders. But foraſmuch as the preparations of them do not correſpond with every ones mind, yea and may eaſily injure the ignorant and unskilfull, my advice to ſuch men is this, that they abſtain from medling with them and betake themſelves to Antimony onely, and to fix him well, for that they may uſe him with far more ſafety. But that I ſpeak here of thoſe moſt highly venomous Objects, I did it for this end, that every one might know, that even the chiefeſt Poiſons may be corrected and tranſmuted into Medicines, merely by the help of Niter alone. But he that deſires yet farther to render Antimony ſafer and better, let him uſe the following preparation: Take the aforeſaid Diaphoretick Antimony, fixed by the help of Niter, diſſolve it up in ſtrong *Aqua Fortis*: and being diſſolved, precipitate it with the fixt Liquor of Niter, that it may ſettle to the bottom like a ſnowy Powder: Pour off the moiſture, vapour away ſome part of the humidity, and ſet by the remainder that the Salt may ſhoot, and ſo will you have your Niter again. As for the Powder, dry it and waſh it well with water, and it may well be ſtyled a *Bezoardicum* Mineral, being a moſt excellent Medicine to expel all Diſeaſes by Sweat, the Doſe of which is one, two, three, four,

ſix, even to twelve Grains, according as the Diſeaſe and Patient is. But I have ſufficiently enough treated of this Medicine at large in my other Writings, and therefore needs not to be repeated in this place. So then all, Metals, Minerals, Stones, and whatſoever is in the World, may by theſe three ways be diſſolved and corrected by Niter, either crude, fixed, or acid, and be tranſmuted into Medicines void of all kind of danger. Thou maiſt diſſolve all the Metals (Gold onely excepted) with the acid Spirit of Niter, and if thou put thereto a little *Sal Armoniack*, or rectifie it with common Salt, then it will likewiſe diſſolve common Gold. But the Minerals are diſſolved with the fixt Liquor of Niter, and precipitated, and then waſhed with common water, and being waſhed are uſed to make Medicine with. They yield ſubtile Powders, according to the nature and property of their Metals and Minerals. The Powder of Gold is yellow, and is called *Aurum Fulminans*, of Silver, Aſhy, of Copper, Green, of Iron, Red, of Tin, and Lead, White, of Antimony, white; of *Lapis Calaminaris*, *Tutia*, and *Cadmia*, Aſhy: But the common Sulphur, and all the precious and common Stones, it (*viz.* the acid Spirit) cannot diſſolve, but leaves them for her Brother, the fixed Liquor to diſſolve. So then what the Siſter cannot do, that the Brother can perform with eaſe, and that which the Brother can't effect, that the Siſter undertakes the accompliſhment of; and what neither of them can poſſibly perform, we ſee it poſſible to be done, by their Father and Mother, *viz.* the crude Niter, inſomuch that to this ſubject is a power given of doing what you pleaſe. But that I may perfectly demonſtrate, that Niter is able to diſſolve all the things that are in the World, and may withall ſhew, how thoſe ſubjects, which yields not to a Solution by the acid Spirit may come under the power of the fixt Niter, I will proceed on, and begin with the common Sulphur.

Take Sulphur reduced into Powder, one part, of fixt Niter two parts, put them in a Cucurbit, pour thereon twice as much water as they both of them weigh, *viz.* ſix parts. Boil them about one hour in Sand, in which boiling the Liquor of the fixt Niter, will diſſolve the Sulphur into a red Solution. Strain it through Cap Paper, and precipitate it by the acid Spirit, then waſh it, and you ſhall have a white and ſubtile Powder, profitable in the Diſeaſes of the Lungs. And now it remains that I ſhew you Flints, Sand, Cryſtal, all kinds of Stones both precious ones and common, (which the acid Spirit is not capable of diſſolving) may be diſſolved by the fixt Niter, and diſplay their Virtues, the which is thus done. Make the Flint, Cryſtal, Marble, or any other Stone that is meltable in the Fire into a Glaſs, very red hot, and preſently ſquench it in cold Water, and dry it, that it may be powdered with eaſe. Take one part of this Powder, and three or four parts of fixt Niter, mix them well, put them into a Crucible, and cover the Pot, and melt them with a ſtrong Fire in a Wind Furnace, that it may become a tranſparent Glaſs. Then turn it out, Powder it, and ſet it in a Glaſs Veſſel in a moiſt Cellar, that the Stone may be turned into a Liquor; or elſe having powdered the ſaid molten Glaſs, pour common Water thereupon, which will diſſolve the Powder. If now you pour the ſaid acid Spirit of Niter on the clear Solution, then the fixt Niter being deprived of its fiery virtue and force, will let fall the diſſolved Stone in the form of a Powder, which is to be waſhed with ſtore of Water, and be dried, and it will be the Magiſtery of that Stone, which this operation is beſtowed on. Theſe Stones may likewiſe be digeſted and diſſolved in a ſtrong Glaſs ſet on Sand, with the fixt Niter Liquor, but this moiſt way is more ſlow and tedious than the former dry way which is done by melting. And beſides, the Glaſſes themſelves cannot long endure this liquor, but are therewith alſo diſſolved. Now theſe Magiſteries or Stones thus prepared are profitable in the Stone, the which they do not onely expel out of the Reins, but likewiſe out of the Bladder, if it be not too much hardned. If you deſire to make this Medicine yet better, then do thus. Take the Liquor of the Flints or Cryſtals, that are diſſolved in a Cellar after their having been melted, put it in a Vial having a long Neck, whereon pour twice as much Spirit of Wine, but ſee that the Belly of your Glaſs be but half full; then let ſome body or other ſhake the Glaſs in their hands ſtrongly up and down, and commix the Liquor and Spirit of Wine well, then will the Spirit penetrate, diſſolve and render it ſweet. Note well, this agitation is neceſſary, becauſe if it be not thus toſſed to and fro, the Spirit of Wine will ſtand at the top of the Liquor, and not attract the fixt Niter to it ſelf. Now when the Spirit of Wine that you poured firſt on, is ſharp enough, pour that out and pour on more, and when that is ſharp enough, decant that alſo, and pour on more, repeat this operation ſo often, untill the Liquor of the Stones be rendred ſweet. Note well, the Spirit of Wine muſt be void of all Phlegm, for if there be in it any water, the Liquor of the Stones would be precipitated into a Powder. But he that proceeds well and rightly will obtain a noble Medicine againſt the Stone of the Microcoſm.

N. B. After that the Liquor of the Stones is brought to a ſweetneſs, it is to be covered over with the Spirit of Wine, in the Glaſs you keep it in, that ſo the Liquor may abide in its Liquidity, otherwiſe it will in a few days ſpace be turned into a Stone in the Glaſs. When you would uſe the Liquor, ſtop the mouth of the Glaſs with your Thumb, and turn down the Glaſs that the Spirit of Wine may (as being lighter) give place for the Liquor to flow out by your Thumb, and thus may you take out as much Liquor as you pleaſe. I have been the more curious in deſcribing this preparation in this place, that ſo no error may be committed, ſeeing this labour requires an expert Man, and not ſuch a rude and inſipid Sot as *Farnerus* is. Experience teſtifies that the Liquor, and the Magiſtery of Sand, Flints, Cryſtals, and ſuch like Stones, are endued with one and the ſame virtues. Any one may chuſe which in his opinion is beſt. I commend the common white Flints, that are in the Sands of Rivers. The Magiſtery of theſe are notably conducive to weak Stomachs, nor is any thing corrupted by the ſame, whatſoever Diſeaſes they be uſed unto. The Doſe of the Powder is 4, 8, 12, 20, 30 Grains, of the Liquor, 1, 2, 3, 4, even to 10 Grains. This Liquor, whereſoever it comes, adheres to every matter it meets with, if it be kept in a dry place, it becomes a natural and tranſparent Stone. In Man's Body, it attracts to it ſelf its like, and carries it off with it ſelf. There lie hid in it many other ſecrets, which foraſmuch as they pertain not to this place, are to be found in my other Writings. Moreover there are Stones found which do not admit of Solution either by the fixt Liquor or acid Spirit, and they are to be thus tamed. Take

that

that Stone which yields not to a Solution by the fixt Niter Liquor, nor by the acid Spirit, beat it into Powder, then mix it with three times as much of the Powder of pure and well dried Niter. Then with this mixture fill a Crucible half full, take up a Coal with your Tongs, and put it into the matter, and hold it hard on, leaſt the flame throw it clear out again. So the Niter being kindled by the Coal doth (together with the Stone) flame and burn up, and cauſe ſuch a ſpeedy and vehement Fire, that the Stone is thereby penetrated and opened, and may (after this operation) be diſſolved with common Water. This done, the Solution which hath imbibed (or which contains) the diſſolved Stone, is to be purified by paſſing it through Cap Paper, and to be precipitated by pouring in of the acid Spirit, that ſo the Stone may ſettle down in the form of a Powder, the which is to be waſhed with Water, to be dried and kept for uſe. Thus now have we diſſolved all the Metals, all Stones, all Vegetables, and Animals, and tranſmuted them into Medicaments. And were there yet any other thing in nature beſides theſe ſubjects, or could there be found any thing elſe, I would have taught its Solution by this my univerſal *Menſtruum*. But foraſmuch as I find nothing elſe beſides Vegetables, Animals, and Minerals, as likewiſe all kinds of Stones, yea and Glaſs it ſelf, nor can find ought beſides, it will deſervedly remain an univerſal *Menſtruum*, and Diſſolvent (though the moamiſh deriders, and brethren of ignorance, and haters of the truth, ſplit for anger) conſtant, unconquered, and incomparable, as long as the World ſtands. As to its efficacy in bettering and correcting Metals, the ſecond, third, and fourth Parts of my Treatiſe of the Proſperity of *Germany* will teſtifie, for therein we treat of the concentration of Metals. But as for ſuch other myſteries as concern true Hermetick Philoſophy, and that lie hid in this wonderfull ſubject, they are accurately and ſuccinctly deſcribed in my Treatiſe of the Nature of Gold, and of the concentration of the Elements, in which Book the ſtudious Reader may delight himſelf with divine and humane Miracles. So now we have proved and demonſtrated, that Niter is an univerſal *Menſtruum* and Diſſolvent, ſeeing there is nothing in the nature of things that is able to reſiſt its diſſolving virtues; nor can its like be found out. Well therefore may it moſt deſervedly remain, as in very deed it is, and as 'tis accounted of both by my ſelf and all skillfull Chymiſts. But now if any one ſhall object and ſay, that the before produced proofs are no ways ſatisfactory to him, neither do demonſtrate that this diſſolvent is alſo profitable as to the Philoſophick Work, I do not intend to anſwer him, nor will I ſo open my Boſom to ſuch Adventerers as *Arnoldus* did to *Lully*, but leave ſecret things in a ſecret place. I have ſpoken enough, and do alſo ſpeak much in my Treatiſe of the concentration of Heaven and Earth. He that underſtands not my ſayings, and doth as yet deſpiſe them, has no reaſon to reckon himſelf amongſt the Adeptiſts and Sons of *Hermes*, but rather is of the rank of the *Farnerians* ſodality, and muſt remain at the Hogs Trough.

The Uſe, Power, and Virtues, of the Medicaments out of Vegetables, Animals, and Minerals: The Compoſition whereof we taught above.

AS concerning Vegetables, ſome few of them there are that need correcting by the univerſal diſſolvent. For ſuch things as are in their own nature whole and ſound, need not any Medicament. For Roſemary, Fether-few, ſweet Marjoram, Sage, Thyme, and ſuch like Herbs needs no correction, but may be reduced into their ſweet Eſſences, according to the ways that I have preſcribed in the firſt part; but thoſe Herbs that are more ſtrongly operative, and uſed in medicinal affairs, are not without danger, ſuch as are *Henbane*, *Hemlock*, *Mandrake*, *Opium*, *Tobacco*, *Napellus*, *Levant-Berries*, *Nux Vomica*, &c. theſe muſt be amended by a good correction, or elſe can they not be ſafely taken into the body. If they be diſſolved by the fiery operative *Menſtruum* and corrected thereby, (as we ſhewed in the foregoing diſcourſe) then may they be taken into the Body moſt ſafely, and without any danger, and will perform things wonderfull in Medicine. And whatſoever was a Poiſon before is afterwards rendred a Poiſon-ſubduing Antidote. For Example, *Henbane*, *Mandrake*, *Opium*, have by their nature a ſtupefactive power, and do ſuppreſs the vital Spirit, do infect, or deſtroy, the *Humidum Radicale*, do procure overmuch Sleep, yea, do cloſe up the Life in perpetual Sleep. But now thoſe Herbs being corrected by the force of the fiery Water, and being diſſolved of their Poiſon, do no more hurt, but allay all inward and outward pains, do paciſie the vital Spirits being provoked and enraged, do compoſe all diſquietudes with a ſweet pleaſant reſt, do expell venemous humours out of the Body by Sweat, and do by reducing all things into a quiet State, heal many Diſeaſes. The *Cicuta* or *Hemlock*, *Napellus*, *Levant-berries*, *Nux Vomica*, &c. do not onely cauſe a moſt deadly Sleep, but do alſo provoke moſt vehement vomitings, and make moſt accute prickings in the body, and deprive Men of their Scences and underſtandings, and do at laſt bring on Death, if they be admitted into the Body in too great a quantity, and are not drawn out from thence again by ſtrong vomitings. But ſuch Herbs being corrected, and changing the Poiſon into wholſome Medicaments, do no more cauſe ſuch horrible and dreadfully painfull Symptoms, but by penetrating the whole Body in a harmleſs and inſenſible manner, do take away all obſtructions, and caſt forth all hurtfull things out of the Body, by ſweat, urine, and ſtool, and frees the inward bowels by purging them from all impure humours, and do happily take away occult Diſeaſes. And now if they did before load the head with a very great heavineſs and render it mad and unſound, it doth now mundifie it, and purge it, and free it from grievous and obnoxious Vapours, and do comfort the Brain and make Ingenuity or Memory better. So that what they did corrupt (before their correction) they do now (after their being bettered) amend and refreſh it. But however you are to have good regard, that you be carefully provident in the uſe of theſe Medicaments, that you exceed not a due meaſure, and ſo commit an errour, for it is not lawfull to play with ſuch kind of penetrative Medicaments.

The ſtrongeſt purgative Medicaments, as *Eſula*, *Cataputia*, *Staveſacre*, *Gummi Gutta*, and ſuch like, being diſſolved in this *Menſtruum*, and precipitated, do loſe their vehement, and as it were venemous quality, and become ſafe and gentle purges. *N. B.* You are here to obſerve (as concerning this Solution) that foraſmuch as the Seed of *Eſula*, *Cataputia*, *Staveſacre*, as likewiſe *Guttæ Gambogia*, and *Scammony*, are of a fat and reſinous nature, are not to be diſſolved with the acid Spirit of Niter, but with its fixt

fixt Liquor, or better with the Spirit of Wine corroborated and alkalizated by fixt Niter, and to be precipitated with the acid Spirit. And ſo with the ſame Spirit of Wine, being made more ſtrong by the addition of the fixt Niter, all Gums that have a fat quality (may be thus dealt with) and contrariwiſe ſuch as are not fat may be diſſolved with the acid Spirit, and precipitated with its contrary Liquor. So likewiſe all bitter Juices, as Aloes, Myrrh, and the like, being therewith diſſolved and corrected do acquire a more ſweeter and more gratefull Savour. It is alſo very fitting, for the grievouſly ſmelling Gums, as *Aſſa Fœtida* is, and for correcting other ſuch like ſtinking things ariſing from Animals or Vegetables, and ſo ſpoil them of their grievous Odour, and for correcting them into a gratefull ſmell. Inſomuch that ſome things that emit even almoſt an ungratefull ſtinch may be ſo tranſmuted as that they may afterwards yield a pleaſant ſmell. And although that I made ſome mention of this Work or Operation ſome years ago in the firſt Book of my Philoſophical Furnaces, where mention is made of the Spirit of Salt, yet will I not leave it off ſo, but deſcribe more, yea and compendiouſer ways too in my third part of the *Spagyrical Pharmacopœa*, for effecting ſuch matters, and thereto refer the ſtudious for the preparing of pleaſant and efficacious Medicines.

As for ſuch Animals as ſerve for the Kitchin, as Beef, Mutton, Pork, Hens, Geeſe, and ſuch like, alſo Fiſhes and Birds, they need not much correction. Thoſe of them that are a year old or more may be boiled with Water, Salt, Spice, Wine, and Vinegar, *&c.* the younger may be roaſted on a Spit. Theſe are not hurtfull to ſuch men as are in health, if they feed on them and drink after it a good draught of good Wine or Ale, that ſo they may thereby waſh down into the Stomach any ſuch matters as might ſtay by the way in the Throat, *&c.*

If now any one would make uſe of venomous Worms, and Inſects in Medicines (for ſometimes they perform far more in Medicine than Vegetables can, as experience witneſſeth) they are not to be adhibited without correction. But I do not here underſtand the Kitchin correction, which is done by Wine, Sugar, and Spices; but ſuch an one as in which all the parts remain together, and are corrected and amended by the fiery *Menſtruum*, and that without the addition of any other thing as we taught before. And being on this wiſe corrected, they do not onely ſafely conduce to a Medicinal help in deſperate Diſeaſes, but do alſo become of greater affiſtance and comfort to many a ſick Perſon, and purchaſe to their Authours a greater honour. It is well known even to blind Bayards and Barbars what effects ſometimes the great Earth-worms, *Scarabæus's*, *Cantharides*, *Aſelli* or Pigs-lice, and ſuck like Urine provoking Inſects do effect, being adminiſtred to the ſick, crude, dried onely and ſo powdered; he that deſires to procure a good quantity of Earth-worms, let him but thruſt a ſtick into the Earth, and ſtir it to and fro thereby to diſquiet the Worms, for they will preſently gueſs that the devouring Mole is at hand, and will for fear creep by heaps out of the Earth, ſo as you may then eaſily take them. If any one loaths the Worms themſelves, let him take that Earth which the Worms do caſt out to the top of the ground, after a warm Rain in the Spring time, and is like ſmall bunches; as if they ſhould ſay, give us our lives for this Earth's ſake; and from thence you may extract an Eſſence, which will be as profitable to you as if you took us: *N. B.* The *Merulæ* or Blackbirds ſeeks after this Earth and carries it to her young ones lying in the Neſt, which thing they would not do, did it contain no good in it, but would rather take the Worms themſelves and carry them. A Dog which hath devoured many bones ſeeks out for ſome clean place to dung in, either on a ſmooth ſtone, or on the graſs, as that he ſhould ſay, This do I give you by way of thankfulneſs for the food which you have beſtowed on me, keep it and uſe it according to your knowledge. *N. B.* The greateſt Vertues of Animals are placed in their Excrements, and not in their fleſh. Next the Excrements are the ſuperfluities of the bodies, which (in men) are, the Hair, Teeth, and Nails: In Beaſts, the Hairs, Teeth, Hoofs, and Horns: In Birds, the Claws, and Feathers, *&c.* And that the *May* Worm frees from the Gout and Stone, See Doctour *Wierus*, he hath written a peculiar Treatiſe of the Gout, and of the wandering or moveable pains of the Joints, and of the intrinſecal and hidden Scurvy, and other ſuch like Diſeaſes, and which are commonly accompted of as uncurable; all which he teacheth the removal of, by the means of the *May* worms, or unctious *Scarabæus's*. Nor indeed is it without ground, that there is ſometimes more effected by ſuch abject and contemptible Vermine, than by the moſt precious and highly eſteemed Compoſitions and Vegetables: This now they do crude as they are, and uncorrected. But if the great Earth-worms, and principally their Enemies, *viz.* thoſe black, ſmooth, and many footed Vermine, that ſuck from the Worms their Juice and Strength; and likewiſe thoſe broad, and party-coloured, venereous ſmall Vermine, which we have before mentioned (if all theſe I ſay) be corrected by the fiery *Menſtruum*, they would not onely drive forth Urine, and the Stone, ſafely and without hurt, but would withal moſt notably ſtrengthen the nature of Man, and be a great comfort to many debilitated Gallants. The green *Scarabæus's*, the *Cantharides*, and green Flies, being all of a venereal Nature, do (being corrected) not onely drive forth the Stone and Urine, but do alſo wonderfully ſhew their efficacy in the Feet Gout, wandring Gout, and other grievous Diſeaſes which have already gotten deep rooting: But that black and ſlow creeping *May* worm, or unctious *Scarabæus* doth operate the moſt efficacious of them all, and may be plentifully enough had in the Months of *May* and *June*. The whole knack of the buſineſs doth conſiſt in this, that ſuch Vermine be well corrected with the Liquor Alkaheſt, and ſo prepared before they be made uſe of. As for thoſe great and horned *Scarabæus's*, that live upon the Juice and Roſins of Nuts, Cherries, and Plums, and are wholly of a Balſamick Nature, if they be corrected, I do highly encourage the uſe of them both inwardly and outwardly, *viz.* when the internal and external Members are tormented with moſt vehement pricking Pains and Torments. As for Emmets or Ants they have a wholſome and efficacious Balſam, and are healers both of inward and outward Dolours. But the chiefeſt of them are thoſe that live in Woods wherein are ſtore of Pines, and Fir-trees, and do there feed upon the Roſins of the Trees, and do not as the others do, live upon leaves and graſs, but do in the Summer Months ſtore their little Holes with the ſmall Grains of thoſe Roſins for their Winter food. And this the Inhabitants of thoſe Woods know full well, and do

ſeek

ſeek after it and ſell it the Druggiſts inſtead of Maſtick. For it anſwers to the Maſtick that comes out of *India* in efficacy, vertues, form, and odour, and haply we might not need that Gum, knew we but how to get and uſe this. There is great variety and plenty of ſuch like Inſects as theſe, which without all queſtion may be of great uſe in medicine; but ſeeing they can't be gotten in ſuch plenty as the Vegetables and Minerals may be, the uſe of them is forborn, and rarely are they ſought after. Nor indeed is it neceſſary to ſeek after and fetch from far, ſuch things as we have preſent before our Eyes. The drift of my writing is this primarily, that I may demonſtrate, that there are in the univerſal *Menſtruum*, ſuch vertues as are able to correct all venemous Animals, and deprive them of their Poiſons, and to convert them into wholſome medicaments, for the honour and renown of it, was I even conſtrained to write theſe things. And as to its energetical Operation on venemous Minerals, it is ſufficiently enough known, and doth moſt clearly appear even in its effect upon Antimony alone, the which being burnt twice or thrice with common Niter, is wholly deprived of its blackneſs, and cloaths it ſelf with a moſt white colour, and becomes a Diaphorerick and an all-evil-reſiſting Powder. So is it to with Arſenick and Auripigment, thoſe moſt vehement Poiſons, which may be ſo changed in a few hours ſpace, as that they may be taken afterwards into the Body without any hurt or danger, and will ſubdue and expel the greateſt Poiſons, though indeed there's no neceſſity of making uſe of thoſe venemous Subjects, ſeeing there is plenty enough of other means. 'Tis ſufficient that we have ſhown, that Niter hath ſuch notable vertues, as to be able to invert the venemous Nature of every Vegetable, Animal, and Mineral, and of tranſmuting the Poiſon into a wholſome Medicament. Now becauſe the Animal vertues are more efficacious than the Vegetables, and that the Minerals exceed them both, therefore by good right are thoſe Minerals of greateſt uſe in medicine, which be moſt efficacious, moſt ſweet, and moſt ſafe. But yet we would willingly have the Animals and Vegetables to retain their own dignity and ſtation: And for the better diſcovery of the difference betwixt theſe, and that my Neighbour may be the better and more ſincerely ſerved, neceſſity doth even require a larger explanation. This therefore is generally to be obſerved, that by how much the riper the Minerals be (and ſo 'tis with the Animals and Vegetables) by ſo much the nearer they are to the Sun, and abide therein, ſo much the ſafer and ſecurer may they be taken into the Body. All Herbs, Vermine, and Animals, that delight in a warm Air, and love to abide therein, are never infected or impregnated with ſo great a Poiſon as thoſe are that delight rather in obſcure, ſhady, and darkſome places. For *Napellus*, *Mandragora*, *Cicuta*, and ſuch like Herbs are never, or at leaſt moſt rarely, to be found in other than dark places that are ſhaded over. And ſo the moſt venemous Animals and Vermine, do moſt willingly take up their abode in holes of the Earth, in cold and darkſome Dens; and by reaſon of the want of the warm Air remain venemous, aud do neceſſarily hurt mankind. But being digeſted by the Liquor of fixt Niter, they depoſit their venemous quality and become wholſome Medicaments. So then all the maturation of things conſiſteth in heat, but Poiſon conſiſteth in cold, witneſs Wine and the Fruits of Trees, the which being ripened by the ſolar heat, men may feed on them without hurt, but if they be eaten raw and unripe they corrupt their Stomachs. Now as we have ſaid of Animals and Vegetables, the ſame is alſo to be underſtood of the unripe minerals and metals. By how much the unriper and cruder they be, ſo much the more do they hurt, and are unfit for the making of medicine. And as for metals, they do by little and little, and ſtep by ſtep go on towards their perfection, and end: Like as an Infant doth by little and little arrive to its higheſt degreee of age. And as there is more to be found in a man that is arrived to man's Eſtate than there is in an Infant, ſo is there in minerals and metals that have in long ſucceſs of time attained to their maturity. And foraſmuch as in them may be found, moſt ſafe, ſweet, and efficacious Medicines, I have deemed it neceſſary briefly to detect their dignity and degrees, and ſhew the Ladder as it were, or Scale, wherein the metals ſtand in order, and how by their ſignature that perfection which they have gradually arrived unto, may be known. I do reſemble the mines of metals to a Tree, thus, *Saturn* is the Root, *Mars* the trunk or body, *Jupiter* the bark that covers the Tree over, *Mercury* the Juice that ſticks between the bark and the trunk, *Venus* the green leaves, *Lune* the flower, and *Sol* the fruit. The ancient Phyſicians or Naturaliſts, compared the ſeven principal metals with the ſeven Planets, the which compariſon ſquares notably well with them. For the Planets and Metals have a mutual correſpondency with each other. The Chymiſts aſcribe Lead to *Saturn*: Tin to *Jupiter*: Iron to *Mars*: Copper to *Venus*: Quick-ſilver to *Mercury*: Silver to *Lune*: and Gold to *Sol*: And even as the Planets do excel one the other in brightneſs, vertues, and other things; even ſo do the metals, and this their nature informs us of, and their different ſignature demonſtrates. Verily when the ancients would mark out to us a perfect thing, they deſcribed it under the form of a round Circle: And by how much imperfecter the thing was, by ſo much the leſs rotundity did they give unto it. The Character of the Sun is *Sol*, *viz.* a Circle with a point in the midſt: The Circle denotes the Golds perfection, the point in the middle of the Circle ſignifies the Original of perfection. The ſign of Silver or the Moon was this *Luna*: which conſiſteth of two half Circles, and tells us of its half perfection: So is it with the other ſigns, and ſignatures of the other metals. How much the nearer they approach to a roundneſs, ſo much the nearer are they to perfection, and ſo on the contrary. The Sun being the nobleſt amongſt all the Stars, doth alſo yield and make the nobleſt metal, *viz.* Gold, the which is likewiſe to be obſerved of the other metals. But by how much perfecter the metals be, ſo much excellenter are the medicaments that proceed therefrom. *Saturn* or Lead, is not much profitable for the inward uſe of the body, except it be in the Plague, and in other moſt hot Diſeaſes. Being outwardly applied it dries up the moiſt affects of the body, and moiſt Ulcers, and healeth heat and all the external affects ariſing thencefrom. *Jupiter* or Tin is ſomewhat hotter than *Saturn*, but yet is withal very dry. *Mars* or Iron is hot and dry. *Venus* or Copper is hot and moiſt. *Mercury* or *Argent vive* is hotter and moiſter. *Lune* or Silver is of a midling heat and moiſture. *Sol* or Gold is at length of temperate heat and moiſture. If now any good thing be made out of Gold, it corro-

borates the heart as being the moſt noble member of the body of man. And ſo in like manner, Silver doth the brain: *Argent vive* the Liver: Tin the Lungs: Iron the Gall: Lead the Milt or Spleen: and Copper the Reins. Thus have the ancient Philoſophers and Phyſicians diſtributed the metals and diſtinguiſhed them, the which I leave as I find it, though perhaps ſome of them may yet admit of another diſtinction. But ſo long may they remain (as they are) until *Elias* the Artiſt, ſhall by his coming releaſe us of our Errours. Amongſt the Minerals Antimony is the chiefeſt, in whom the Vertues of all the Vegetables, Animals and Minerals, are collected and concentrated into one, as its ſignature declareth. For the Philoſophers have ſigned it with a round Sphere (by which the Earth is deciphered) and on it a croſs put, and is without doubt for this reaſon, becauſe the Earth never produced any fitter Subject for medicine, and this is atteſted by all true Chymiſts, as may be read in their Writings; but eſpecially in *Baſil Valentine*'s triumphant Chariot of Antimony, being a Treatiſe he wrote in honour of this Mineral. The ſame thing doth that Philoſopher teſtifie, ſaying, common Gold and Silver doe not effect it, but their firſt Ens does it. Now that Antimony is the firſt and true genuine Ens of Gold, is not onely teſtified by all the Philoſophers, but alſo daily experience it ſelf witneſſeth the ſame, from whence it is as clear as Noon day, that Antimony is rarely to be found in any other places but in Gold Mines, nor is there (beſides) any Antimony but what is pregnant with Gold, but yet ſome Antimony contains more Gold and other ſome leſs. Nay farther, amongſt the very Veins of Gold it ſelf is Antimony often met with, and may therefore undeſervedly be ſtiled an unripe Gold. I my ſelf have ſeen a piece of golden Vein, which was digged out of the Gold Mines, and contained ſome pounds weight, in one ſide there was pure Gold, mixt with the hard Flint, on the other ſide was a black Vein of Antimony. There is a place in *Germany* called Gold Granack, nigh which in the *Sudetis* Mountains called *Fichtelberg* by the *Germans*, was found heretofore much Gold, but now at this day is there digged out onely Antimony, cleaving on to the hard Flints and Rocks. And herewithal is immixed a golden Marqueſite, which being ſeparated therefrom, and prepared after a due manner, becomes a moſt excellent Medicament, of which we ſhall hereafter make mention. Further, had we not this teſtimony of a daily experience, yet have we the witneſs of the true Alchymy, which doth moſt aſſuredly affirm, that true Gold may by the help of Art be extracted out of Antimony. Nay more, this incomparable Art, doth not onely perform this, *viz.* of bringing Antimony to the true ripeneſs of Gold, but doth alſo ſo change the Gold (by extracting its Soul) that it is no more Gold, but is plainly indiſtinguiſhable from any *Regulus* of Antimony both as to the form, volatility, nature, and properties of the ſame. And although an infinite number of men will contradict theſe ſayings of mine, yet ſhall they never draw me from this my opinion, for I believe but what my Eyes have ſeen. One Eye-witneſs is of more value than ten hear-ſay ones. Such as do gainſay theſe things, do build on no other foundations ſave ſuch as they have gotten by reading or hearſay, and what will not at all correſpond with experience. Well, I will remain ſtable in my opinion and in very truth demonſtrate, that there is no ſubject to be found in the nature of things, that may be preferred in Medicine, before Antimony, ſo that it be but duely brought into its true Eſſence. I confeſs that whilſt it is crude and as yet unprepared, it is a mere Poiſon, and the uſe thereof is accompanied with a great deal of danger. And ſuch as do uſe the common glaſs of Antimony, and other Medicaments made thereof after a rude manner, and ſo hurt the ſick, muſt impute the blame to themſelves and not the Antimony.

I have mentioned in my *Miraculum Mundi*, and in my firſt part of my *Spagyrical Pharmacopœa*, the preparation of a Medicine out of Antimony, and have called it a *Panacæa*. This now out ſtrips the capacity of very many rude and ignorant men, to whom it ſeems unlikely and impoſſible, that a Medicine of ſuch wonderfull efficacy ſhould lie hidden in ſo contemptible and baſe a thing as to deſerve ſuch a Title as a *Panacæa:* but eſpecially ſeeing ſome unskilfull men, have inſtead of it, adminiſtred to the ſick crude Antimony, and by ſaying it is my *Panacæa* have with a wicked boldneſs deceived men, and have hereby brought an *Odium* and contempt amongſt very many men, upon this true Medicine of mine. Amongſt theſe is that faithleſs *Farnerus* none of the leaſt, yea rather is more eminent or ſtandard-bearer to the reſt, and ſuch a one as may rightly be termed the blot and ſcandal too of other men. For my part, he that liſts may perſecute Antimony with as much hatred as he pleaſeth. But whereas I have already praiſed it, and the thing doth withal concern my Neighbour's profit, I could not omit yet farther to magnifie and exalt it with greater praiſes, and in very deed confirm this truth, *viz.* that ſuch a Medicine may be made thereout of as I have deſcribed, and therefore every one that judgeth of the truth without prejudice muſt confeſs, that there is not a better, an effectualler, or a more harmleſs medicament, and purchaſable by a meaner price, inſomuch that both rich and poor may enjoy the ſame, if ſo be it be but prepared and uſed as it ought. But that he who is ſtudious after good medicaments may withal ſee, that I have not ſpent my labour altogether on Antimony, but on other Subjects too, I will adjoin the deſcription of the preparation, uſe and efficacy of other Subjects, and will take care for the preparation of thoſe medicaments for the benefit of mankind, and of the ſick, and for the diſtribution of them amongſt the needy. For by this means ſhall I ſatisfie my conſcience and ſhall not be accuſed thereby of burying the Talent given me, out of envy and hatred to my Neighbour. And whoever he be that hath any good thing, let him make it common, and being moved with pity and commiſeration become ſerviceable unto his Neighbour. But if he neither hath, nor knoweth ought better, let him deſiſt from contemning this, and omit deſpiſing the things he is ignorant of. And let him not deprive the miſerable poor ſick people of ſuch things as himſelf cannot give, that ſo he may remain an honeſt and pious man. But as touching the Medicaments, which are here treated of, they are indeed but few, however they are ſuch as may next God be ſafely confided in.

I have formerly written of preparing a *Panacæa* of common Antimony, and taught its way of making. But whereas the deſcription is diſperſed in divers tracts, and is obſcurer thereby, and haply one man may not have all thoſe Treatiſes, I have judged it expedient to repeat that deſcription in this place, and to mention it in this Treatiſe.

The

The preparation doth for the moſt part conſiſt in the Calcination by Niter, which corrects and changeth the venome and immature Quality of the Antimony. Then afterwards the pure part is extracted by Spirit of Wine, and becomes a tender and ſpadicious (or light-red) Powder, and can effect thoſe things, which I do here aſcribe unto it. It may be taken in a morning before you eat, either in Wine, Ale, or ſome hot Broth, or in a ſoft poached Egg, or roaſted Apple, and faſting ſome hours after it untill its operation be finiſhed. The Doſe is $\frac{1}{4}$ or $\frac{1}{2}$ of a Grain, or 1, 2, 3, or 4, Grains at moſt for one time, regard being had to the Age and Diſeaſe, concerning which, the well minded Reader will find more written, in the firſt part of this *Spagyrical Pharmacopœa*, and in my *Miraculum Mundi*, but yet I will here likewiſe annex it for the benefit of the ſick.

Of the common uſe of this Medicine.

THIS Univerſal Medicine may ſafely and without any kind of danger be uſed in all the natural Diſeaſes of new born Infants, as well as in thoſe of years, and ſtrong people, and may be uſed I ſay without any danger, and in ſo ſmall a doſe as may not move in any one either a loathing or a nauſeate, as theſe large Cup-fulls of the common Potions are wont to do when they are drank down. For that doſe exceeds not 1, 2, 3, or 4 Grains at the moſt, and may moſt eaſily be taken down in a ſpoonfull of warm Broath, Wine, Ale, Water, or Milk, as the neceſſity of the ſick requires. For if this preſcribed doſe be obſerved, it operates after an inviſible manner, and ſtrengthens the radical Moiſture, and purgeth and expelleth out after a wonderfull manner, every hurtfull thing (by little and little) out of the whole body, if it be daily uſed, (or every ſecond or third day) once each day according as the condition, or neceſſity of any one requireth. It defendeth every body from all hurtfull Cauſes and Diſeaſes, and admits not the leaſt venomous Air, but if the Doſe be augmented, it doth alſo diſplay its vertues, by a viſible operation, and drives out by Sweat and Urine, or Spittle, ſometimes upwards and downwards, every noxious thing, and operateth even as you will have it, according as your doſe is either more or leſs, and as your Diſeaſe needeth. A doſe that is very ſmall and void of any viſible operation, is wont to heal many Diſeaſes, yea and the greateſt part of them. But ſome Diſeaſes there be which have deep rooting, and do therefore require a viſible operation, foraſmuch as they cannot be expelled with a ſmall and inviſible operating Doſe. Every one therefore that prepareth and adminiſtreth this Medicine, muſt accurately obſerve this direction, that ſo (having regard to the Diſeaſe) he neither exceed nor come ſhort in the adminiſtration of this Medicament, but by a right uſing of the ſame, he may obtain praiſe and glory.

But that the whole matter may be the better and more clearly apprehended, I will ſet down the uſe of the ſaid Medicine, according as my ſelf have experienced it, in the moſt grievous Diſeaſes, that ſo the ſick may be inſtructed and helped, and the leſs Errours committed.

In the Plague and other raging burning Diſeaſes, and contagious Feavours, this Medicament doth (next God's help) preſerve every one that takes it daily, in this proportion, *viz.* to Infants $\frac{1}{2}$ a Grain, to thoſe of a midling Age, 1, 2, or 3, at moſt. But if any one be infected by either of thoſe Diſeaſes, then the doſe is to be doubled according to the parties age, or trebled, that the ſick being well covered may ſweat. If one time ſufficeth not to free him of this Diſeaſe, the doſe of the ſaid Medicine may be repeated the day following, or the third day, and ſo is it to be proceeded on with, till the Diſeaſe being weakened is caſt forth.

This way of preſervation and curing is not onely to be obſerved in the Plague, but in all contagious Diſeaſes that aſſaults with heat or cold, and in all kind of Feavers whatſoever. The ſick need not any other Medicaments, for this is powerfull and effectual enough; provided you pray ſeriouſly therewithal, that it may (by the help of God) drive away that abominable and deteſtable Diſeaſe the Plague, and the pricking paining Pleuriſie, with the other Feavers. Nay farther, there is no Medicament, no not of the beſt that performs what this can.

In the Epilepſie, or Convulſions of Children, of whom a great Number deſtitute of ſuch help die, this *Panacæa* is a moſt experienced and certain remedy for them, and is to be adminiſtred to a little Infant preſently after its Birth, the quantity of the $\frac{1}{8}$ part or $\frac{1}{4}$ part of a grain, in a little Milk, or elſe in ſome warmed freſh Butter, and is to be repeated again the third and eighth day following. But if it ſhould be ſo, that after ſome days, weeks, or months, the fits do again come, then let your Doſe be ſomewhat ſtronger if the Child needs it, and be ſo often reiterated untill the Diſeaſe be wholly ſubdued and carried off. I do moſt highly commend this Medicine to all Mothers, for that abundance of Infants (otherwiſe healthfull and ſound enough) are without any help, ſnatched away by the violence of Death. And here the error of ſome Phyſicians deſerves to be taxed, who adminiſter to the poor little Babes, whole Glaſs-fulls of the Water of Pearls void of all kind of Virtue. Alſo the Powder of *Bezoar* Stone either with, or without the Water, together with the infuſion of ſuch like unprofitable things.

Such Men as are of riper years, may daily uſe the Doſe of one, two, or three grains, and it will profit them. If not daily then may they repeat it every third or fourth day at leaſt, and ſo continue untill the Diſeaſe being ſubdued paſs away: 'Tis needleſs for them to uſe any other kind of thing, onely to obſerve this direction, *viz.* that day that they do uſe this Medicament, let them ſhun the cold Air, and abſtain from Food three or four hours at leaſt.

In the Leproſie, and other like deteſtable Diſeaſes of whatſoever name they are called by, and in every kind of Scabbineſs, there is not to be found any Remedy, whereby thoſe affects are more eaſily and without any trouble or labour, taken away better than this, which never fails your hoped event, provided the ſick be ſo ſtrong as to brook the Cure.

In that deteſtable and venemous Diſeaſe of Whoredom uſually called the French Pox, there is nothing can be adminiſtred ſafer and ſecurer than this Medicament, if the Doſe be but ſo much augmented, as not onely to cauſe Sweat ſtrongly, but alſo to provoke Vomits and Stools; and you are ſo long to go on with uſing this Medicine every other day, untill the Sick be well, which may be in ſome eight or fourteen days.

He

He that is overwhelmed with the Dropſie, may take one Doſe every Day, and for bear eating (for ſome hours) after the uſe of this Medicine, (the which is neceſſary to be done in other Diſeaſes alſo) but let him that takes it ſo as to work ſtrongly, proceed gradually from one grain to two, *&c.* untill it cauſeth a kind of nauſeate (but without vomiting) in as big a Doſe as is needfull, and as the Patient can well bear. Which being thus done, the Doſe is afterwards to be leſſened one or two grains, and the leſſening to be continued untill all the Water be caſt forth by Sweat, Urine, and Stool, and the Sick become as healthy as he was before. Nor is there any reaſon why any one ſhould doubt of radically taking away this Diſeaſe, (except it be plainly deplorable or deſperate) by this my *Panacæa* onely, foraſmuch as experience demonſtrateth it more clear than the Noon-day Light.

In the Gout (a Diſeaſe accounted by the common Phyſicians for incurable, as well as the Leproſie and Dropſie) doth this Medicament perform wonderfull things, and doth effect more in a ſhort ſpace of time than any one would either imagine or believe, provided it be rightly adminiſtred. For it doth in a ſhort time draw back the affluence of noxious humours, and brings them forth out of the Body after an inviſible manner; ſo that, Day after Day, the pains do by little and little remit and abate, the tumours leſſen, and the Fit becomes more tolerable, comes the ſlower, and at length vaniſheth for altogether. As for the Doſe, you are to obſerve the ſame inſtructions that we gave you but now for the Dropſie, *viz.* that you daily make the ſame addition unto one grain ſo long till you cauſe a nauſeate (but no vomit) and then muſt you again leſſen it one or two grains. The Patient muſt do thus daily on a faſting Stomach, (and keep himſelf warm and abſtain from Food four hours, after the uſe of this Medicament) as long as need ſhall require. Haply the things which I here mention, will meet with many incredulous Men, and ſuch as will not believe it poſſible, for ſuch a Diſeaſe as hath been hitherto eſteemed incurable by almoſt all Men, to be rooted out by the aforeſaid Medicament; the Opinion of ſuch Men I confeſs that I cannot take in bad part, foraſmuch as even I my ſelf was but a few years ſince (before I had experienced the wonderfull efficacy of this Medicament) of the very ſame Opinion But after my experience had taught me to judge otherwiſe I do truly and faithfully affirm, that this Diſeaſe is in no wiſe incurable, but may (provided it be not too inveterate, and that the ſtrength of the Sick, either through old Age, or Debilities, hinder not the Medicines operation, or that God himſelf withdraws not his own bleſſing) by a good and ſutable Medicament, be, if not radically rooted out, yet for the greateſt of it expelled. Now it is not to be thought, that he who uſeth this *Panacæa* may be at his choiſe to live as he liſt, *viz.* either ſoberly, or to ſtuff his Stomach daily with hurtfull and forbidden Food, and to ſwallow in Wine as he pleaſeth. No ſuch matter, ſuch Men err moſt hugely, for even the Philoſophers Stone it ſelf, that is, the ſo much famed rooter out of Diſeaſes would not help there. For whatſoever thoſe moſt excellent Medicines do mend in the Fore-noon, and correct, the After noons Surfeiting and Gluttony, and the ſo large exceſs of Meat and Drink, will again deſtroy and corrupt. Nor is there any room for the Opinion of thoſe Men that think to be freed of this Diſeaſe, by a bare Abſtinence from Wine: No, this Diſeaſe comes not always from drinking of Wine, for it is moſt evidently known, that ſometimes even the pooreſt of Men that never drank Wine are afflicted with this Diſeaſe. And therefore the fault is not wholly to be imputed to the Wine. Every kind of repletion or overfilling whether with too much Wine or Ale, may procreate and encreaſe a Diſeaſe, but that is not the onely or ſole cauſe. For there are many other cauſes, from whence this Diſeaſe is wont to ariſe. Verily, often being wrathfull doth moſt vehemently diſturb the Family, as it were, of the internal Bowels. Luſt, and an often uſe of Venery (which is the uſual attender and follower of Drunkenneſs) doth vehemently enervate and debilitate the ſtrength of the body. From hence nature being enervated and debilitated, is not able to expell out of the body the copious relicts and excrements, remaining of the too much abundance of meat and drink, and therefore thoſe excrements abiding in the body and exerciſing their powers without controll, do produce moſt grievous Diſeaſes. For that part which nature is weakeſt in, there doth the Enemy make his firſt attempt, according to the uſual *German* Proverb, every one climbs over the Hedge in that place where it is loweſt The ſame doth for the moſt part fall out in the procreation of this Diſeaſe, *viz.* when the body is loaden and filled with overmuch Food and Drink, for the body being overwhelmed with overmuch Wine, and then an immoderate coition or act of venery preſently following thereon, doth moſt exceedingly weaken the body. For nature being by this means weakned, hath not ſtrength enough to expel thoſe remaining excrements, which ſoon get Head, to the great hurt and detriment of the whole body, and do make themſelves a fixed ſeat, the which is to be well heeded in this Diſeaſe.

Beſides this Medicament doth reſiſt all the obſtructions of the Milt and Liver, (which corrupt the Blood, and ſtir up moſt grievous Diſeaſes, as the Scurvy, Joynt-Aches, Eriſipelas, continued Headachs, weakneſs of the Limbs, a Stinking Breath; and in Women a ſuffocation of the Matrix, a ſuppreſſion of the Months, panting of the Heart, Swounings, the Lipothimy, and many ſuch known, and unknown Diſeaſes) far more efficaciouſly than all other Medicaments do. All theſe aforementioned Diſeaſes are healed by the ſaid Medicine, being taken oftner or ſeldomer every Week according as the Diſeaſe is, and you will ſee wonderfull effects produced.

I commend alſo this Medicament to all thoſe that employ themſelves in Surgery, that they reſpect it as the chiefeſt Remedy that they can get. For being daily given in a ſmall Doſe to thoſe that are wounded, it heals all new wounds in the Fleſh, without the aſſiſting help of any vulnerary potions, and external applications of Emplaiſters that are compounded of ſo very many ſimples. For it withholds all Symptoms, and advanceth healing even from the very bottom, and ſo to the external parts, and doth alſo conſolidate; but this is to be underſtood of thoſe wounds in which are no hurt or broken bones, for as for theſe the manual Art is requiſite, which may again ſet the Bones in their due order and place. Likewiſe deep Stabs are to have Tents uſed to them according as the Chirurgeons order is to apply them. But no external thing need to be uſed beſides, ſave onely the Patients own Urine and Salt-Water, wherewithall the wounds are to be waſhed, and after waſhing, to be

be covered with pure or clean Linnen, that the coldneſs of the Air hurt them not.

But if wounds be dangerous and over great, then may alſo be applyed ſome vulnerary Balſam, and Plaiſters made of the Flores of Minerals and Metals, and done up with Wax, Turpentine, and Oil: (Such Emplaiſters I have taught the compoſition of in my other Writings.) So that there's no need of ſo many Oils, Unguents, Emplaiſters, and ſuch like, to be applyed to new wounds, if this medicament of mine be daily adminiſtred to the wounded Patient.

This medicine doth operate even to admiration in open Fiſtulaes, rotten and ſtinking Ulcers, nor is there any need of outward remedies, ſave haply ſome Mineral Balſam to keep the Ulcer clean, and ſome Plaiſter made of common Wax and Turpentine to keep off the cold Air. For this Medicament doth begin its healing even from the very bottom, and carries it on very ſucceſsfully even to the outer Skin, and doth throughly conſolidate and perfectly cure all Ulcers, without any other external remedies than aforeſaid.

Having then well conſidered theſe things, and that every one cannot prepare the preſcribed Medicine, and yet very many may be found that would willingly partake of the ſame; It ſeemed good unto me to adjoin this admonition, that they that know how to prepare it, be entreated not to count it burthenſome, but rather being moved by a Chriſtian compaſſion, readily make ſuch as are ignorant of the manner of preparing it, partakers of the ſame; And not to mind wholly their own profit, according to the cuſtome of this perverſe world, and the ſcraping up of ſtore of wealth, but to be well content with an honeſt and juſt reward for their charges and labour which they have beſtowed. And foraſmuch as the often ſpoken of Medicament, if ſent abroad either in a Liquid form, or in the form of Powder, into other parts, cannot be in due manner uſed by every body, becauſe an Error may eaſily be committed in the meaſuring of Drops, and in weighing of Grains, and ſo more or leſs be given. I have therefore deemed it very neceſſary to reduce it into Pills, that ſo the leſs Errors may be committed in its adminiſtration; and one Pill weighs one Grain, and two Pills two Grains, and ſo on; ſo that the Patient needs neither to meaſure or weigh, but onely to uſe them as the diſeaſe requires, and as I have before preſcribed, 1, 2, 3, 4, or more Pills at one time.

Theſe now are the principal Vertues of my *Panacæa* made of Antimony. As for the reſt that are beſides theſe, and are (for brevity ſake) omitted, they may be eaſily underſtood and known by every Judicious man, from the before deſcribed circumſtances. I do therefore yet again teſtifie, that all the things that I have aſcribed to this Medicament, yea far more than they, can be done and effected thereby, if it be rightly prepared and adminiſtred; And principally, if the Name of God be ſeriouſly invoked. For prayers and a truſt in God do ſtrengthen every Medicine, and make it happy by his benediction, though the wicked will neither believe it, nor hearken thereunto. Indeed ſome Medicament may, by God's permiſſion, reſtore one (without prayers) to his former health; And ſo may Bread allay hunger without giving thanks, and this we ſee daily done amongſt the unreaſonable Creatures: But this enjoying of the gifts of God is beſtial, and not humane. But this now is truely Chriſtian-like when (in our diſeaſes) the help of God is invoked, and then after that, the Medicine uſed. And this way of uſing of Medicaments is neceſſarily accompanied with an happy event. But if thou wouldeſt perſwade thy ſelf, that every Diſeaſe, how inveterate ſoever, may, by the help of this Medicine, be certainly removed without any difference, thou extreamly erreſt. For we ſpeak here of thoſe Diſeaſes, natural Remedies are able (by God's help) to heal. For ſometimes Man's inward bowels or parts, are ſo ſtuffed and obſtructed with groſs humours, that they cannot be freed by even the moſt efficacious Medicaments. Sometimes the Lungs and Liver are almoſt wholly corrupted, e'er the true place of healing is ſought after. And who, I pray, is able to reſtore the things that are loſt? For Man's inward bowels and principal members do not again grow, being once loſt, as the Crab's ſhells and Spider's feet that are broken off and loſt, doe. Farther, ſometimes God inflicts a diſeaſe upon a Man, whom he will not ſuffer to be cured: Such like Diſeaſes as theſe cannot be taken away with natural remedies. With God all things are poſſible; who alone is able to bring help and remedy in ſuch kind of diſeaſes, whenſoever pleaſeth him? but beſides him alone none can help. There are therefore ſome incurable diſeaſes, which cannot be cured by any *Panacæa*, yet not the Quartane, Leproſie, Gout, Epilepſie, and Dropſie, as moſt men think, though Experience (or the being put on trial) ſhould witneſs the contrary. And although that all humane diſeaſes be, in proceſs of Years and Ages become worſe, and more troubleſome, and doe, together with the augmentation of ſins, encreaſe; Yet the moſt bounteous God hath alſo beſtowed thus much, that there are more and more efficacious and natural Remedies to be found out (by the Divine inſtinct) by diligent men.

It happened ſome few years ago, that an honeſt man's child, of about ſome ten years old, had its Tongue perforated with many Exulcerations, which pained it very much day and night. To cure which, the Parents ſpared for no coſts nor pains, and conſulted with divers of their neighbouring Phyſicians, but they uſed all their Labour and Skill to no purpoſe, for the Exulcerations daily encreaſed with much pain, and grew worſe and worſe; and the poor child, being deſtitute of all help, waſted away. Then, at laſt, they called me to adviſe with them, and having told me how many, and otherwiſe famous Phyſicians, could not by all the labour and pains they beſtowed for full two years do any thing to the purpoſe, but had at laſt left the poor child deſtitute of help and ſuccour. I ſeeing the effect, conſidered that this was nothing elſe but a Corroſive Catarrh ariſing from infected bloud, which did ſo poſſeſs the Tongue, and perforate it, and was the cauſe of this burning, eating, and cancrous effect, and ſo hitherto refuſed any kind of healing, and gave the Parents ſuch an anſwer, that in my opinion there was no better way to meet with this evil, than by ſome purging Minerals, which were capable of working upon even the fix'd humours, and of bringing them away, and that to be done principally by an Antimonial Vomit. The Parents aſſented to my opinion, and requeſted me to begin the cure, the which I did, and firſt I gave a ſmall Doſe of my Antimonial *Panacæa*, not doubting but that it would ſtir up one Vomit at the leaſt; but yet it fell out otherwiſe, for there ſucceeded no ſenſible operation at all: The following day I gave again the ſame Doſe, but without any ſenſible operation too, but yet nevertheleſs all the pain vaniſhed,

and the Child could again move its Tongue, and uſe it, and alſo ask't for Meat, which it had not done in a year before, but was forced to be content with Broths, becauſe its Tongue could not brook any ſolid food. The third day I adminiſtred the ſame Doſe again, and ſo the Exulcerations began to be conſolidated, and all the whole Tongue was throughly healed in eight days ſpace, inſomuch that there ſcarce appeared any place where it had been ulcerated; and the Child daily grew better and better, its natural Colour returned, the which drew all that knew it into admiration as well as my ſelf. By this Cure that I have told you of, the vertue and efficacy of my *Panacæa* did farther manifeſt unto me what I knew not before to be in it, nor ſhould ever have believed it, (had I not perceived a manifeſt operation) *viz.* that the Bloud ſhould, by the help of ſo little Medicine, which was not in all above ſix grains, be able in ſuch a ſhort ſpace of time to effect ſo much; And afterwards I perceived the ſame effects in other Diſeaſes likewiſe, and found that the daily uſe of this Medicine did not onely ſhew its operation upon the Tartar in the Reins and Bladder not as yet coagulated, but did by little and little leſſen the already hardned Sand and Stone, and in length of time expell it: And did alſo in ſucceſs of time reſolve and root out even Podagrical inveterate humours.

But thus much may ſuffice to have been ſpoken of the common Antimonial *Panacæa*. This name *Panacæa* hath made ſome envious men ſtare, and ſuch as judge this Medicament unworthy ſuch a name, ſeeing it is prepared out of ſo vile a ſubject, and doth withall ſometimes (when too unskilfully handled) ſtir up vehement Vomitings, which is not the property of a *Panacæa* to do. That I may anſwer ſuch, I ſay, that the name *Panacæa* denoteth ſuch a Medicament as may profitably be adminiſtred in all Diſeaſes, the which thing the *Panacæa* of Antimony is alſo wont to doe as daily experience teſtifies. But as for its being taken out of ſuch a vile and (by many brethren in ignorance) deſpiſed ſubject, that doth not at all derogate from its Name, provided that the Medicine thence drawn performs thoſe things that are ſpoken of it. Pray what brought *David*, that contemptible Shepherd, unto a Kingdom? was not he of a low name, and low birth: the ſame is to be underſtood of this Medicament. It is its moſt noble efficacy and operation hath given it this name, and not its vile birth, nor contemptible nativity and abject form. Neither is this any lett thereunto, *viz.* that it is prepared out of a mean ſubject, and ſuch a one as the ignorant contemn and deſpiſe, and which (before its preparation) was a Poiſon; for the Poiſon is now tranſmuted by the help of Art, and of the fire, into a wholſome Medicament, and the more ſtrong operation thereof, ſuch as to cauſe vehement Vomits, is not to be imputed to the Medicine it ſelf, but unto the abuſe of it. For ſo the beſt Wine and moſt fragrant Spices, are a poiſon to ſuch as do abuſe them. Abuſe may turn the beſt Medicine into Poiſon; and Art and Fire, both can and uſually are wont to turn Poiſon into a Medicament. That which I have often ſpoken, I do here again repeat, and call God and the Truth to witneſs, that I never met with any ſubject, that might with more profit be tranſmuted into a wholeſome Medicine, than the vile and contemptible Antimony; The which I will take care to ſee it prepared ready for the Poors uſe: And as for the Rich, to them I commend the Golden Purple-coloured *Panacæa*, which hath the ſame efficacy as the former has, but herein differs from it, *viz.* it operates more gently, and is leſs ſenſible in the operation, and may be far more ſafely adminiſtred unto Infants and old Men, and may be doubled in the Doſe. Some few years ſince, many men of high and low degree have by the help of this Medicine been freed, not onely from the Gout, but from other grievous and inveterate Diſeaſes: Nor have I ever heard ſince the time I have prepared it, for my Neighbours benefit, that the uſe of it wanted ſome good effect: Nor is there any cauſe to fear offending by the abuſe or exceſs thereof, as is in the vulgar Antimonial Medicament. But this Golden Medicine will rarely ſtir up Vomiting in the ſick, unleſs a due meaſure be by a wanton abuſe exceeded, or the Doſe too too much enlarged. For this reaſon I will hereafter have by me, for ſuch as need the ſame, this Golden Medicine, in the form of a Purple Powder, and the common Antimonial (becauſe that it being like a red Powder may be eaſily counterfeited, and ſo ill-prepared Antimony may chance to be ſold to the ſick inſtead of a *Panacæa*) ſhall be ready made up in Pills, and in that form onely, each of which ſhall contain one Grain, that ſo being ready weighed the ſick that uſe them may receive no detriment by weighing and ſo taking them. Theſe now may be uſed by ſuch men as are of a midling age, or elder; but to thoſe that are Infants, and aged, and weak perſons I commend the Golden, as operating more gently and ſafely. The Antimonial *Panacæa* made up in a Pillular form, may be moſt exceedingly profitable in thoſe long *Eaſt* and *Weſt-India* Navigations, in which the Souldiers and Mariners are ſo extreamly troubled with the Scurvy, and debilitated thereby, and yet have ſo little benefit or help from the Medicaments which they carry with them. Now this Medicine is able ſo far to help them, as that they may make their Navigations with a more courageous and more cheerfull mind. For I have not hitherto met with any ſubject in the whole nature of things, that can oppoſe it ſelf with greater efficacy againſt all the corruption of the bloud, and oppilations of the inward members, than this Medicine; the which both Souldiers and Marriners may have with them, it being not very dear, nor eaſily corruptible, and ſo make uſe thereof in neceſſitous Caſes. There is not to be found in the whole World a more commodious and more wholſome Medicine, as well for the Marriners that ſail for many Months in the vaſt Ocean, as for the Souldiers lying in Camps, that undergo troubles and diſcommodities of all ſorts, and lead a diſorderly life. And therefore if Chyrurgions that be in Ships and Camps were furniſhed with this Medicament, they would verily preſerve the lives of many Marriners and Souldiers, and would with one onely Ounce, which is of no great price, out of which may ſome Hundreds of Doſes be made, eaſily effect far more than with a whole Cheſt full of ſuch Medicaments as are but of ſmall virtue. If a Phyſician or Chyrurgion, that follows the Camp, had by him ſome Ounces, he would preſerve the Lives of many Thouſands of men, which would otherwiſe miſerably periſh. It is a Medicine of eaſie carriage, and as eaſily kept, which is a thing deſervedly to be accounted of, ſeeing it much concerneth him who is a Commander, to have at hand ſome preſent remedy for his Souldiers that are uſually oppreſſed with the Plague, Scurvy, Dyſentery, malignant Feavers, and other ſuch like diſeaſes, with which whole heaps of them periſh, as Flies do in a cold ſeaſon. This incomparable

comparable Medicine doth eaſily reſiſt all thoſe diſeaſes. Upon this account I will have ready by me for time to come, good ſtore of this Medicament, and ſuch as need the ſame may ſeek it from me, and be made partakers thereof. I will perform the office of a good Chriſtian, who being not born onely for himſelf, but for his Neighbours too, ought to be helpfull unto them, even as the hand helps the hand, and one member he'ps another, the which thing verily every one ſhould neceſſarily (and well worthy is it to be) obſerve more carefully.

Next this Antimonial Medicine, in the form of Pills, and the Golden *Panacæa* (of a Purple Colour) follows, my *Nepenthes*, or Anodine medicament, allaying all Pains, and is made of corrected *Opium*, extract of Saffron, and the Volatile Sulphur of Vitriol. Every one knows that *Opium* is ſtupefactive and ſoporiferous, becauſe ſo much mention is made of the correcting and preparing it, and the way, deſcribed by many, of ſo doing; For they well perceived, that it being ſometimes imprudently adminiſtred, did not onely cauſe ſleep, but brought alſo the brother of Sleep too, *viz.* Death, inſomuch that the ſick being caſt into an everlaſting ſleep, could not be awakened any more, (for it is a praiſe-worthy Medicament, and ſuch an one as will beget credit enough;) and therefore they not knowing how to take away this Poiſon, did bend their ſtudies thereabouts more and more, to correct the *Opium*, and to tame the venomous force it had. Therefore they dried it throughly, and reduced it into Powder, and diſſolved it with Spirit of Wine or Vinegar, and extracted it, and by diſtillation abſtracted theſe *Menſtruums*, and brought the extracted *Opium* to the conſiſtency of Honey, and thereto admixed a certain portion of the beſt Saffron, wherewith they endeavoured to tame and correct the venomous quality of the *Opium*. Others mixed that Powder with Oil of Anniſeeds, Liquid Storax, or extract of Saffron, (which are Simples that will procure Sleep without *Opium*) and made it up in a Maſs, and accounted it a moſt excellent confection, as being every-where hitherto in the Apothecaries ſhops, and uſed by the Phyſicians with good ſucceſs, ſometimes in many deplorable diſeaſes: And is even to this day (and deſervedly too) in uſe, for there could not be found a better and more ſafe one. But now foraſmuch as a better and ſafer way is found out, 'tis but juſt to admit of this, and omit the other which is not ſo good. Since the time that I knew the uſe of the Univerſal Diſſolvent, or moiſt and cold Fire, I found out and corrected many Subjects by the help of the ſame. And amongſt others, I diſſolved *Opium* in the Liquor of Niter after my way, and prepared it, and perceived wonderfull effects therein, but eſpecially when I adjoined to it the Volatile Sulphur of Vitriol, which is of it ſelf an excellent and incomparable Somniferous Anodine, allaying all Pains with a wonderfull ſucceſs. I alſo hereunto added the Eſſence of Saffron, a wonderfull ſtrengthener of the Heart. *Opium* being uncorrected, is a vehement Saturnine ſtupefier, which doth by its immoderate ſtupefying property conſtringe as it were and choak the Vital faculties, inſomuch that the often uſing the ſame make men pale, and to ſleep (for the moſt part) with their mouths and eyes open, and they can hardly be awakened before the operation thereof be over: And therefore many do deſervedly abhor the uſe of the ſame. The adding of the Oil of Anniſeed and Saffron, may in ſome ſort reſtrain the cruel rage of it, but cannot throughly ſubdue it; But yet even this may be done with eaſe, when being reduced unto Powder, it be diſſolved with the Volatile Spirit of Vitriol, inſtead of the Spirit of Wine or Vinegar, and ſo ſtrained through a Paper, and precipitated with the contrary (or different nature) Liquor of Niter, and be waſhed with common Water, be dried and prepared into a Maſs with the Eſſence of Saffron, in which operation the Narcotick Sulphur of the Vitriol adjoins it ſelf to the *Opium*, and this is far better, and corrects it by its ſulphureous and acid Spirit. But that the Spirit of Vitriol is moſt fit for this effect, I will ſhew the well-minded Reader. The common Vitriol doth, for the moſt part, conſiſt of a Sulphureous Salt, and of an Earth containing Iron or Copper. But when it is diſtilled by the Fire, the Spirit of the Salt carrieth up with it a Volatile and Sulphureous Spirit out of the *Mars*; the which being precipitated with ſomewhat that is of a contrary nature, affords you a ſubtile Narcotick Sulphur, very little in quantity, but of a moſt wonderfull efficacy, the which I have made mention of in the Second Part of my Furnaces. But if now there be added to the Calcined Vitriol an equal weight of Iron filings or Iron cinders, ſuch as are ſmitten off from the red-hot Iron on an Anvil, and half a pound of Salt-peter, and a water be diſtilled out of theſe matters thus conjoined, the Spirit of Niter will bring over a great portion of the Spirit of *Mars*. This Volatile Sulphureous Spirit is to be ſeparated from the Corroſive Spirit by rectification, and to be diſtilled into a Receiver that has in it a little fair water. This Volatile rectified Spirit, and not that corroſive one that was left behind in the rectification, is to be uſed for the diſſolving and correcting of the *Opium*. And although that many diligent Chymiſts have before now underſtood ſomewhat of this Narcotick Vitriol, as I my ſelf did, yet we have done but little as to the preparation thereof. But at length when on a certain time I had added Filings of Iron to Calcined Vitriol, to diſtill thence from an *Aq. Fortis*, my Retort being very red hot, did by chance break, ſo that the matter fell out into the fire, out of which proceeded ſo ſulphureous a fume, and ſo much, and ſo filled all the Laboratory that I could not ſtay in the Room; therefore I took the live Coals out of the Furnace, as ſpeedily as poſſible I could, becauſe of the ſuppreſſions and difficulties (of breathing) which that Spirit overwhelmed me as it were withall, and hardly got my ſelf out of the Laboratory-door, but having got a little freſh Air, I preſently came to my ſelf again, and perceived that the whole Houſe was filled with the fume, and therefore to let it out, I opened all the windows and doors of the Houſe. When I had thus done, preſently hapned another danger, for the burning Coals that I had pulled out of the Furnace, had kindled the other Coals that were next them; There being danger of fire, and that I might prevent it (being deſtitute of water, and in the night-time hapning) I ran to the reſt that were ſleeping in the Chamber, to get them to ariſe and fetch water, and to help me quench the fire. But they ſlept ſo exceeding ſoundly, that though I called and did my beſt to awaken them about quenching the fire, yet was I forced to go about it my ſelf, and do it as well as I could. Having quenched it, away go I into the Chamber to ſee what they were doing of, and I found them all oppreſſed with a moſt heavy ſleep, yea and the ſweat dropped from all their faces, though it was Winter-ſeaſon. When

it was light they awoke and aroſe, to whom I told the danger I was in, and that I could not awaken them. They all of them confeſſed that they dreamed that they were oppreſſed with ſome heavy thing, ſo that they could not ſtir themſelves. From this miſchance, learned I two things, the firſt is this, *viz.* that in Vitriol and Iron lay hid an highly Narcotick Sulphur: The other was this, what the cauſe is that ſome Men but eſpecially melancholy Men do in the Night Dream, that they are ſo oppreſſed with ſome thing, and yet cannot be awakned. For the Sulphureous martial and ſaturnine Vapours which caſt the Brain and Heart into ſuch ſtraits, and do bind as 'twere the vital Spirits with a Cord, do cauſe ſuch Dreams. This breaking therefore of my Retort, diſcovered to me an excellent Medicine, and the Diſeaſe ſubject to the ſame, ſo that there is nothing ſo evil out of which ſome good doth not ſometimes ſpring up. I judged it worth my labour, to gratifie thoſe that are ſtudious in Medicine by adding to the aforegoing things, this ſtory, hoping it will not be a thing tedious to any. Beſides this is worthy of conſideration, that hapned to one of the Children ſleeping in the ſame caſe, whoſe head was much troubled with phlegmineſs, but the Catarrs were ſo diſſolved and looſened by the efficacy of this fume, that it was ever after of a ſound head. From hence did I conjecture that there was more to be found in the Sulphur of Vitriol than can be believed, and this did I conjoyn with the corrected *Opium*, by the often uſe of which Medicine, I have freed many Children from the Epilepſie or Convulſions, and found beſides that it was moſt exceedingly profitable for old Men, and ſuch as were of riper years; But with this proviſo, that my Antimonial *Panacæa* be firſt adminiſtred, to thoſe of a midling Age, and my golden *Panacæa* to Infants and old Men, which being premiſed or firſt uſed, this moſt excellent *Nepenthes*, can by ſo much the better and more commodiouſly diſplay its virtues. By this Medicine all internal pains, a diſquiet mind, and light headedneſs in Fevers, are allayed, a quiet and gentle ſleep procured, the Winds and Gripes of Infants and elder Men, that afflict their Bellies and Inteſtines are driven away, a good ingeny and chearfull mind is procured, all wild and unquiet Spirits that moleſt the Heart and Brain are reſtrained and laid a ſleep: The vital Spirit being overcome and ſuppreſſed with corrupt humours is reduced to its former liberty, and the loſt ſtrength and vigour of the Body ſo happily reſtored, that a moſt evident help is preſently perceived, and principally if the *Opium* be well corrected by the help of the volatile Spirit of Vitriol. It may likewiſe be profitably corrected by the fix'd Liquor of Niter, extracted with Spirit of Wine, and be reduced into an Eſſence. But if this correction be made by the acid Spirit, it is better and more profitable, than that made by fixt Niter. For in correcting it by the fixt Niter, the corrected Eſſence is to be extracted by Spirit of Wine, which makes the powers of the *Opium* too volatile and penetrative, the which thing we ſeek not after in this place, being it is far better, that the *Opium* ſets upon his enemy leafurely and not too ſtrongly; and this experience ſufficiently teſtifies the neceſſity of. This moſt excellent medicine is one of the four Cardinal Pillars, whereon the whole fabrick of medicine is built. The Antimonial *Panacæa* is a moſt excellent and ſafe purge, moſt fit to drive out all the evil humours out of the whole Body. The golden *Panacæa* is the beſt and moſt excellent Diaphoretick and Sudorifick. But the corrected *Opium* and vitriolate Sulphur is the moſt eminent Anodine and Somniferous Medicament.

A Diuretick and Nephritick, extracted by the help of a certain proper Vegetable Spirit, and endued with excellent Virtues.

TAKE of Cantharides one ounce, *Aſelli* or Hog-Lice two ounces, put into a Glaſs, and pour upon them three ounces of the Spirit of Niter, and diſſolve the Vermine in a gentle heat, that they may be reduced into Water, which will be in few hours, or elſe leave them in a Cellar for ſome days and nights, and they will be diſſolved as well as in the heat. Afterwards add to this Solution three ounces of Earth-worms and leave them yet for ſome days more in the Cellar. When they are all diſſolved ſtrain them through a fine Linnen Cloth, put in a Funnel of Glaſs, that the Solution may be ſeparated from the Fæces, which if many, ſqueeſe well the Cloth with your Fingers, that the whole Solution may be ſeparated from the Fæces, then throw away the ſaid remaining Fæces And to the Solution that you ſtrained through the Funnel into the Glaſs, pour the Liquor of fixt Niter by little and little, and ſo long untill all the ebullition ſhall have ceaſed, and a thorough precipitation be made. All things thus done, ſeparate the Liquor by pouring them off from the Vermine, and coagulate it, that it may be again made Salt Peter, and be uſefull for more occaſions. Waſh your precipitated Vermine well with common Water, thereby freeing them from all ſaltiſhneſs, and dry them in a gentle heat, that they may be reduced into a pillular form, or into an Electuary: The which medicament may be moſt ſafely and without all danger uſed in the Stone, of the Bladder and Reins, being given from one, two, four, ſix, eight, and twelve grains at moſt, according to the condition of the Sick: For it brings forth the Urine and the Sandineſs and Tartar; that is, as yet uncongealed, and not lumped together in the Reins and Bladder. If any one deſire to have them ſhew their Virtues more ſtrongly, he may then extract the diſſolved, precipitated, waſhed, dryed, and corrected Vermine with ſome burning Spirit of Saxifrage, Parſly, Juniper-berries, Aſh, or ſuch like Stone expelling Herbs, that ſo there may be yet again a ſeparation of Fæces, and the Spirit may draw unto it ſelf the pureſt Eſſence. This Spirit being ſeparated by a gentle heat in a B leaves in the bottom an Eſſence like a red Balſam, which is far ſweeter, profitabler, and pleaſanter in the forenamed Diſeaſes, than it was before the extraction, when in the form of Powder, Pills, or Electuary. *N. B.* If a venereal Medicine be to be prepared out of the Earth-worms, then the Cantharides and *Aſelli* are to be omitted, and an half part of thoſe venereal Vermine, which are in the Summer Months in Gardens, and adhere to old Seats, and old Walls in abundance, to be added to the Worms, and to theſe is to be added one fourth part of a Stags Pizzle and all to be prepared after that manner we have taught and preſcribed. The Worms are to be gathered at ſuch a time as the Earth firſt opens it ſelf after the cold Seaſon, and may be dig'd out, that ſo you may have the Worms before they creep forth out of the Earth, and have enervated each other by their coition, for when they are thus gotten they are endued with wonderfull virtues, and are far more efficacious than they

be

be afterwards. Theſe Worms being diſſolved, precipitated, and well waſhed with common Water; if they are yet once extracted by the burning Spirit of Satyrion, Hop, or Sparagus-roots, and reduced into a ſweet Eſſence, do become a preſent and effectual Medicament againſt impotency.

All Diuretick and principally Earth-worms being maturated and corrected, have a power to ſtrengthen the venereal faculty. But the correcting of them muſt not be after the uſual Kitchen way of Women, where Wine, Sugar, Spices, and ſuch like things are added to correct any ſubject by. No, but it is to be done by the benefit of Fire, after a Philoſophical manner, without the addition of any other things, not with the Kitchen Fire, but with that Philoſophical, moiſt, vaporous, digeſting, altering, penetrating, ripening, amending, conſerving, and in one degree always abiding Fire, the which is to be ſought after in Niter. Great is the errour that is committed in the decoctions of Vegetables, when Herbs, Flowers, Seeds and the like are boiled in ſome Liquors, as Water, Wine, Ale, and the like, and being boiled the decoction is given the Sick to drink, as if it had extracted all the virtues of the Herbs; nor is it in the mean time conſidered that in ſuch decoctions, the penetrating and effectual Spirit, and ſweet Oil vapoured away with the water into the Air, and yet may this be eaſily ſmelt, for the Vapour that goes out in ſuch boilings is always endued with a ſweeter Odour than the remainder left behind is, and which they uſe in Medicine, and this can be denied by none. Why I pray are the Waters in the Shops, where abundance of them are uſed, and ſold, wont to be diſtilled now, not any more in a B. *per ſe*, but for the moſt part, in a Copper Still with common water added, to prevent burning too; of which waters it is likewiſe ſaid, that they are as good as thoſe that be diſtilled in a B. *per ſe*, without Water, and this is agreeable to truth: For in the diſtillation, the moſt ſubtil moiſture of the herb onely riſing up, and the common Water (as being the heavier) ſtays behind in the bottom of the Still, and therefore they have a certain ſign in the diſtillation of the ſaid waters, *viz.* when the aſcending water, taſts no more of the diſtilled herb: Then do they deſiſt from farther operating, and caſt away the remaining herb with the water in the bottom. But ſuch whoſe ſtudy it is to make ſweeter and more efficacious Waters, do take the water which came off in the diſtillation, and pour it upon more of the freſh herb, and do again diſtil it, and draw off the moſt pure part of the herb, and make their Water more efficacious, which way of preparing the Waters of Herbs, is good and profitable. Beſides every one knows, that the Spirit and Oils of Vegetables, are to be diſtilled by a Copper Still by the appoſition of a great deal of Water, as we have taught in the firſt part of this *Pharmacopœa*: It is therefore manifeſt, that the common decocting of herbs in water is of no value, and that the beſt part vaniſheth away into the Air in boiling, and that the leſs ſweet, and moſt efficacious part alone remains behind. Some skilfull Cooks know this full well, and never put in the Spices into the Pot to boil, but let the fleſh be firſt boiled, and already ſet at the Table, by which they take care of loſing the beſt Odour of the Spices by boiling them. If you go by the Ale-Brewers when they are boiling the Hop, and the Houſes of the Apothecaries, you ſhall meet with a far ſweeter fragrancy, and what doth more comfort the heart, than what remains behind, and is given men to drink? And this cannot be otherwiſe, by the fore alledged reaſons, for the chiefeſt and beſt part go away in boiling. Therefore I do here again repeat what I ſaid before, and do affirm, that that Decoction which is done in the cold by the univerſal fiery Water, is to be preferred far before that otherway. Now it is ſufficiently enough known that the greateſt part of the food we eat, whether Fleſh, Fiſh, or Pulſe, are wont to be boiled in the Kitchen by the help of Water to preſerve them from burning, that thereby they may be the better digeſted and concocted by the Stomach. And why are not medicaments prepared after the ſame manner? Now though in the decoction of Fleſh, Fiſh, and Pulſe, there goes off ſome of the vertues of the ſame, yet that is a matter of no great moment, for the remainder is what ſtuffs the Stomach from whence the body may get its nouriſhment. But in medicinal decoctions, no ſuch great quantity is to be adminiſtred, but a little of them given to the Sick to drink of; and therefore they muſt neceſſarily have their vertues left in them, and not be deprived of them by decoction, and yet this Curtation of theirs cannot be ſhunned when the decoctions are done over the fire with common water in open Veſſels. This way therefore of mine, by the fiery Water is far to be preferred before that other way. For in this decoction there can't be loſt ſo much as the leaſt vertues of the herb or Animal, ſeeing it is done in the Cold. But all abide together, in the watery or fiery Water, are ripened, bettered, and changed into medicine, and muſt neceſſarily be tranſmuted, whether they will or not. There is no way for the vertues to go off as is in that other decoction, where the moſt noble vertues vaniſh away in the Air. Therefore this digeſting, conſerving, ripening, and amending Fire and Water ought to be highly eſteemed by the Phyſicians, wherewith they may prepare their medicaments, or at leaſt for the preparing of ſome few good ones which cannot elſe be gotten, as is apparent in Diureticks, which being ſo inverted by this Philoſophical water, do not onely afterwards expel Urine, and the Stone, and all things pertaining thereunto; but do alſo corroborate, even as all things that have a hot ſubtil and penetrating Nature whether ſimples or compounds are wont to do: Inſomuch that they do not any more cauſe torments and pains by a forceable expulſion of Urine and the Stone, but do gently and ſweetly ſtir up to a caſting them out, and do withal ſtrengthen and conſerve the virile Nature: But contrarily thoſe immature and crude Simples, do by their Crudity and Wildneſs hurt, and not onely expel Urine, but even ſtir up pains. This diſcourſe and propoſed matter, concerning the watery Fire and fiery Water (by the benefit of which venomous Vegetables, Animals and Minerals may be (as I have taught) turned into wholſome medicaments) will haply create in many ſome diſagreeable Cogitations, and may ſeem to them as if it were a ſtrange thing, that I ſhould call the Liquor of fixt Niter, and the Spirit of corroſive Niter, fiery Waters, and watery Fires, whereas there is in them no apparent viſible Fire. Well, to remove this Scuple from their minds, I do in the firſt place judge it expedient to demonſtrate that Niter is no other than a mere Fire; For put but Niter on a live Coal, and 'twill all flie up and burn away in the Air; this now is evidently ſeen in Gun-powder, in which the Salt-peter is together with thoſe other added matters diſcharged all of

it into the Air. Niter being brought by Calcination to a fixity or conſtancy in the Fire, or elſe by diſtillation to a corroſive Water, hath not for all this loſt its fire, but hath it as yet perfectly with it ſelf. And that this is true is hereby cleared, *viz.* that both thoſe Liquors the fixt and the corroſive volatile one being mixt together, do depoſit thatnature they got from the Fire, and do return to their form, or Salt-peter nature. Hence may it be manifeſtly proved that both theſe Liquors as well the fixt one as the acid Spirit may and ought to be called fiery Waters, ſeeing that they do in very deed demonſtrate their fiery vertues. For they do yet retain their Fire, and do melt all things and reduce them into Water, whatſoever you put into them. This demonſtration I hope is a ſufficient ſatisfactory teſtimony to ſuch as have any underſtanding though not ſo well skilled in the light of nature. But that I may yet meet with the moſt unskilfull of men, who are for the moſt part wont to meaſure by their moſt unskilfull fancy, ſuch things as are to them wholly unknown, and that I may ſet it moſt clearly before their Eyes, that the ſaid Waters are mere true Fires; I would perſwade them that for trial of the truth they would put one little drop onely or one ſmall piece of a Grain upon their Tongues, and ſee whether or no they will not in leſs than a moment of time find, and ſay that that Fire is hidden in the Water, and is juſt as if their Tongue had been touched with a Coal of Fire. But if they would ſee the very flame it ſelf, they may coagulate or concenter either both or either Liquor, either by Antimony or *Lapis Calaminaris*, by which all Corroſives do chiefly love to be concentred, and to put off their adjoined Waters. Therefore when you have a mind to ſee a flame pour upon your concentrated acid Spirit, or on your fixt Liquor of Niter, the pure Spirit of Wine, and what is ſeparated from all Phlegm: By which pouring on, the hidden Fire of the concentrated Niter, will forthwith manifeſt it ſelf, and will kindle and burn up the Spirit of Wine. If he would yet farther try the truth of this thing, let him fix Niter by *Regulus Martis*, and coagulate it into a fiery Maſs, and keep it in a ſtrong earthen Veſſel well ſhut, that ſo the Air enter not therein, and that the Fire may remain ſo long hidden as he pleaſeth. Now if he would have it grow hot, let him pour in a little water into the Veſſel, which done the hidden Fire will become preſently manifeſt, and make the Veſſel ſo hot, that it cannot be held in ones hand: By how much the more the Water is that is poured thereupon, ſo much the hotter the Veſſel becomes, ſo that by the too much effuſion of water, there is danger of the Veſſels breaking into Pieces. A mean therefore is to be obſerved in the pouring water on, if you would have your Veſſel endure the longer, and give a laſting heat. This ſecret doth not onely teach the Miracles of Nature, but is likewiſe profitable for ſuch as journey in the Winter Seaſon, whether in a Wagon, or a Ship, day and night, in exceeding cold Weather, for by the help of ſuch a Veſſel may they heat themſelves. For if they have a Veſſel containing about one or two Pounds of this concentrated Fire, it will keep heat for 24 hours: And ſo in caſe of neceſſity ſuch as Journey may have with them greater and more Veſſels, and not be ſcantied of this Fire. And if in the extremity of cold they want water, they may heat the Veſſel by ſtirring up the ſame Fire with their own Urine. How vile ſoever this ſecret appears, yet lies there in it a great myſtery, and what is ſerving to true Philoſophy, and in which ſuch a Fire lies hid as was buried by the Prieſts, mentioned in the *Maccabees*, and after ſome hundreds of years again digged out and found. For ſuch a kind of Fire being fenced againſt the acceſs of the Air, remains uncorrupt for 100, yea a thouſand years, and this verily is a thing moſt worthy of diligent conſideration. We have by what has been ſaid ſufficiently demonſtrated that fixt Niter is a mere Fire, and that it manifeſts it ſelf ſo to be whenſoever any one is ſo minded as to try. The acid Liquor doth the ſame, and hath a far different nature and property from the fixt Niter, the which nevertheleſs doth alſo produce to light its occult Fire according as the Artiſt pleaſeth, and is on this wiſe done. Diſſolve in it Iron or *Lapis Calaminaris*, and draw off the moiſture by Fire, *N. B.* You ſhall have nothing elſe come over or evaporate ſave onely a ſweet water void of all taſt, and the fiery part will concenter it ſelf in the Iron or in the *Lapis Calaminaris*, and become a fiery and dry Earth, the which being preſerved againſt the ingreſs of the Air, will remain dry, nor will it ever change it ſelf into water. This fiery Spirit thus concentrated in this Earth is ſo burning hot, that if it be put to the Tongue in no bigger a piece than a Hempſeed, it will burn it juſt as if you had touched it with an hot Iron. And if you would have fire thereout of, pour in ſome Spirit of Wine, and you ſhall ſee the flame break out: But if you would warm your ſelf with that heat, as we before ſpake of in the fixt Niter, then put in a few drops of water, which done, the hidden and concentrated Fire will become manifeſted (as in the fixt Niter) and continue a long while, if there be not too much water poured thereupon. If you would quench your Fire and have the Veſſel cool, then ſhut it, and if you would have it again hot, then open it and pour on a little water. Thus therefore ſhalt thou have this Fire moſt ready for thy uſe whenſoever thou haſt a mind to employ it. So then all theſe things do moſt abundantly confirm that the acid Spirit of Niter is a cold and hidden Fire, for if you put into it a little piece of Iron or *Lapis Calaminaris*, it will make the glaſs ſo hot, that you cannot hold it in your hand. We hereby learn that from this Original do the Baths ariſe, and is thus. When an acid mineral Spirit joins it ſelf in the Mountains to ſome Fountain of ſweet Water, and doth together therewithal paſs through ſome Mines of *Lapis Calaminaris*, or Iron, it becometh ſo hot that it breaks out like water heated in a Copper. Nor are Baths any where to be found ſave in Mountains, and in places that abound with *Lapis Calaminaris* or Veins of Iron, as may be ſeen in many places, but eſpecially in that of *Aquis Granum*, where the moſt curious or braveſt Baths of all *Europe* are found to be, and the Mountains that lie round it do abound with Iron, and *Lapis Calaminaris*. But as concerning thoſe other profitable and gallant Secrets, that lie hidden in this concentrated Fire, 'tis not expedient to ſpeak of them here. We have revealed to you enough already, and he that learns nothing hencefrom, ſhall have nothing, nor is it given him of God to know the unſearchable properties of this Fire, and to open the Gate of true Philoſophy and Hermetical Medicine. Here then the Son of Art ſees what a concentrated Fire is able to effect, and how its many vertues are as yet impeded by reaſon of the Earth, (conſiſting of the Iron *Calaminaris*, and Antimony) wherein it is included

cluded and hindered from anſwering the event that may be hoped for from it. For an impure body is able even to make a pure Soul inhabiting in it, ignoble and impure, yea and plainly to kill it; and this may be underſtood as well of Men as Minerals. Now it may be eaſily conjectured what ſuch a pure Soul, and which is ſeparated from all Fæces is able to do. Things incredible and almoſt Divine may be effected by ſuch a Fire. The Fire of common Wood and Coals, if concentred will perform things wonderfull. But I pray what then will the concentred Fire of the Sun do, which is a thouſand times purer than that. Next after God, is the Sun, next the Sun the Fire of Coals and Wood, is of all things in the whole World, the moſt noble. Were it lawfull openly for me to declare my opinion of the Fire for the rude and unskilfull to underſtand, I ſhould enlighten many a dark Corner. For the Elementary Sun, which beſtows upon the whole World all Light, and all Life, is nothing elſe but the Garment and Covering as it were of the omnipotent God. If then the Garment and Covering be ſo noble, ſo efficacious, and ſo potent, in its Eſſence, how great then is and ever will be the Majeſty of God, that Eternal Light and Center of all Lights? We cannot ſo much as look upon that Garment, *viz.* the Sun without hurting our ſight, nor ſearch out its wonderfull virtues and properties by all our ſpeculations, and as I may ſay, Philoſophations. Why then are Men ſo fooliſh to ſpeak, and think ſo lightly of God, and yet know nothing of him? Hence is it that almoſt every one feigns to himſelf a peculiar God, and worſhippeth and adoreth him, which horrid impiety, the true and onely God abominates. The Ancient Phyſicians attributed the round fiery Sphere that hath its riſe from God, unto the Sun, and figured it out by the ſign of perfection, *viz.* a Circle with a prick in the middle, whereby the Center is deciphered. But ſeeing that in all things, the Center is far more noble and excellent than the circumference it ſelf, which hath its birth from the Center, but the circumference it ſelf doth by ſo much the more differ from the Center, and is more unequal to it, by how much the farther off it is from it: And contrariwiſe, is to be judged ſo much the equaller to it, by how much the nearer it approacheth thereunto: What then ſhall the prick in the Sun be, ſeeing that the Sun it ſelf being but as the circumference to that point, be ſuch a moſt noble and excellent Eſſence? What name ſhall we call that point by? To whom is it lawfull thus to do, (*viz.* to deſcribe that name) in this perverſe World? I even conſtrained, though againſt my will, to forbear farther diſcourſing thereabouts, and to refer it to my Treatiſe of the concentrating of the Heaven and the Earth. But thus much I ſay, that our Terreſtrial Fire which we daily make uſe of, is the firſt degree of that Ladder whereby we aſcend to God, ſo as to comprehend (or lay hold on) this omnipotency, to perceive and ſearch into it, to Love, Fear, Worſhip, and at laſt to ſee and be rendred (through Divine Grace) partaker of the Divine Majeſty: Seeing then that the common Fire and which every body knows is as I will yet again ſay, the firſt degree in that Scale or Ladder, whereby we may aſcend to God and his Myſteries, and yet the property thereof is ſo much unknown unto us: What I pray ſhall we think then of the ſecond and third degree, the which we know nothing of, though we think our ſelves to know ſo much. I do therefore affirm here, and that boldly, that our knowledge is as nothing, and there is not one amongſt many thouſands that knows the ſecond, (much leſs the third) degree. But haply hereafter I ſhall ſpeak and demonſtrate more things of this nature.

A Cordial and Comfortative to be uſed in great and continual Diſeaſes.

TAKE the Flowers of Marjoram, Sage, Roſemary, Mace, two ounces, Nutmegs, Cardamoms, Zedoary, Galangall, one ounce, choſen Cinamon eight ounces, extract the Tincture with Spirit of Wine, then diſſolve in rectified Spirit of Salt, and which is acuated by an addition of Niter, one ounce of Gold: Pour this Solution to the Spirit of Wine, which is impregnated with the Tincture of the ſaid ſimples, and put them to diſtill in a Glaſs Retort in a dry B. There will firſt come over the Aromatical Spirit of Wine, not onely ſweet but withall clear, which when it begins to come white and troubled, take off the Glaſs that you received your Spirit in, and put on another, and draw off all the moiſture in a gentle heat, till there comes out no more Spirit of Wine, and an acid Water of an unpleaſant Taſt follows. Then take out all the Fire from under your Retort, that it may cool. In which (when all is cool) and the Solution taken forth, you ſhall find the Oil of the Spices ſwimming on the top, which is as red as blood and is impregnated with the Tincture of the Gold: The which being ſeparated by a ſeparating Glaſs from the Spirit of the Salt, you muſt add to the Aromatiſed Wine that came firſt over, which will preſently imbibe the ſaid Oil, and be tinged with a moſt curious red. As for the remaining Gold, which the Oil of the Spices hath not attracted to it ſelf, you may precipitate into a tender and bright Calx, and waſh it well with water and add it to the Aromatiſed Spirit, and Oil with a ſufficient quantity of Sugar Candy, that the Spirit may be rendred ſweet and pleaſant. So ſhall you have a moſt efficacious *Aqua Vitæ*, the which doth wonderfully corroborate and refreſh the Sick, in all kinds of weakneſſes. But this precipitation is not to be made like as the common is, in which the Powders that are precipitated do loſe their Metalline form as Gold, which being changed into a yellow Powder is called fulminating Gold, and being put upon a Plate, and heated, gives a noiſe like a Gun, the ſound it gives is very loud, and the blow ſtrikes downwards, ſo that the bigneſs of a ſmall Pea being kindled in a ſilver Spoon will make a little hole. But you are to precipitate the Gold on ſuch wiſe as that it may retain a Metalline form, but ſo tender and fine that it may be well brooked even in the Eyes. Neither muſt all the Gold be precipitated, but onely the moſt noble part, and as it were its Soul, which as to its colour is much fairer and ſublimer than common Gold is. But the more vile part is to be ſeparated by a peculiar precipitation, and to be reduced by fuſion. To this pale part is its former colour to be reſtored by Antimony, ſo that no loſs may be made. If then the former part being precipitated, is better than pure common Gold, the latter part muſt neceſſarily be (being reduced by fuſion) more vile, or thus, if the latter be baſer than common pure Gold, the former ſhall be better than it is, and will therefore be more profitable in Medicine, foraſmuch as it will (being digeſted and conſumed in the Stomach) diſplay its virtues, which the common filed Gold,

Gold, or yet the Leafe Gold will not do. I purpoſely tried this matter, and found the things I tell you of, to be true. But if ſo be as any doubt as yet of this thing, concerning the firſt precipitated Gold as being the beſt part thereof, and which we bid you to add to the Aromatized Spirit, he may melt it down with ſome *Borax*, and compare it with the latter precipitated Gold, and then he will eaſily perceive the wide difference that is betwixt them. The firſt will as to its Colour, far exceed the Gold of the beſt Duckats or Roſe Noble, but the latter will be far worſe. That firſt being again diſſolved and precipitated after a Philoſophical manner, that half of it may again ſettle down, it will become more noble, and again leave behind it a particle of pale Gold. Which operation is verily moſt worthy admiration, by the help whereof, Gold certainly may be at length haply ſo concentrated, as to be able (when reduced to the higheſt nobility, colour, efficacy and vertue) to give colour to the other metals, and amend them. But this is not what I have hitherto, for want of time, tried: But I hope (God permitting me) ſhortly to ſhew ſuch a Gold to the ſtudious of Art, ſeeking after it merely for this cauſe, that I might thereof make an excellent medicine. I will treat more plainly and more fully in my fourth part of the Proſperity of *Germany*, concerning the Artificial and Philoſophical Concentration of Gold and Silver into good Medicaments ; but that I may here give the Lovers of Art ſome ſmall Teſtimony how ſuch a precipitation may be effected, take with you theſe few things. The precipitation may be done as well in the dry as moiſt way, but there the moiſt way is uſed, which is requiſite in the making of this Medicine, but yet it is troubleſome and hazardous, becauſe that ſometimes the glaſſes break, and the Gold falls amongſt the Aſhes. But the dry way and which is void of any danger, belongs not to this place but to the fourth part of the Proſperity of my Countrey. I mention it for this end onely, that it may be ſeen and conſidered, that it is poſſible to make ſome Separation in Gold as well as in the meaner metals. For he that knows how by the benefit of Art to make a Separation in ſome metals of the beſt part from the worſt, hath a profitable amendment of the metal. We teach in the ſecond part of the Proſperity of *Germany*, how the volatile and unripe Minerals, may by Niter be reduced into malleable Metals. In the third part we ſhew the way of turning the common and imperfect Metals into perfect Gold and Silver. Then at laſt in the fourth part we ſhew by what means Gold and Silver may be avanced into more than perfect Bodies and appertaining to medicine; concerning which Separation more ſhall be ſpoken in what next follows. Nor hath any one reaſon to make any Scruple and imagine that I contradict my ſelf, ſeeing that in the aforeſaid medicament I make uſe of precipitation and tender Gold, and yet have openly in many places ſpoken the contrary, *viz.* that corporeal Gold cannot be concocted and digeſted in the Stomach, and this I have moſt often tried. For the Gold which we teach the precipitation of here is much better and more noble than the common Gold, and upon that accompt is not to be accompted of as corporeal, but for the very Kernel, and Soul thereof as it were, which being digeſted in the Stomach of a man, doth produce its vertues into open light. *N. B.* That the ſaid golden *Aq. Vitæ* being to be uſed, you muſt firſt ſhake the glaſs a little wherein it is kept, that ſo the moſt ſubtil Attomes of the Gold may commix themſelves with the *Aq. Vitæ* ; then afterwards ſome few drops of the ſame according as the Perſon and Diſeaſe is, are to be adminiſtred in ſome convenient Vehicle. If you make trial with one or two ſmall drops, you ſhall experience its wonderfull heart ſtrengthening Vertues, and its moſt profitable uſe in all weakneſſes.

Another Metallick Medicament prepared by the help of Nitre, out of a Vein of Lead containing Silver, and moſt profitable in all the Sickneſſes or Diſtempers of the Brain.

TAke a Vein of Lead that is rich in Silver, nor hath either Copper or Iron mixed with it, but by how much the richer it is with Silver, ſo much the better and more beneficial is it for this work. Separate from this Vein all the Sulphureity or Brimſtony ſtinch by Niter, according to the Spagyrical Art, that ſo the moſt pure, moſt ſubtile, and moſt highly Volatile and fluid Mercurial part may remain. Waſh off the Niter as carefully as you can, and ſeparate it, that a bright ſnow coloured heavy Powder may remain. This moſt exceeding fluid and Volatile Powder is the *Mercury* of *Saturn*, 1, 2, 3, 4, 5, even to 12 grains thereof, being adminiſtred in convenient Vehicles, doth exceeding quickly yield help in all grievous affects of the Brain, in the Plague, Pains of Children that are troubled with Worms ; it quencheth all internal heat, and withholds the groſs Vapours from aſcending up into the Brain, it opens all the obſtructions of the Liver, exhilerates the melancholy, reſtores the Lunatick, fooliſh and phantaſtick Ingeny, eſpecially if their Bodies be firſt prepared by my Antimonial *Panacæa*. Nay more, this Cephalick medicament will operate yet better, if after the firſt preparation by Niter it be again waſhed, and made more ſubtil, yea and plainly fixed, that ſo it may exerciſe its vertues and power with the greater efficacy. Laſt of all, it is yet rendered moſt efficacious, if this *Mercury* of *Saturn* be in the laſt Operation driven over in a Retort and ſo converted into a ſweet Milk, demonſtrating the truth of that Philoſophical ſaying, *The Fire and Azoth do waſh the Laton.* Niter is the true Azoth of the Philoſophers, and beſides it, is no other to be found : It is the Scope of the wiſe men, the univerſal Bath of Metals ; The ſaid ſweet Milk may be coagulated, and fixed into a tranſparent and fluid Stone, which again coagulateth and fixeth common purged Mercury. But I have not as yet ſo brought it to ſuch paſs as to undergo *Saturn*'s trial in the Cupel as they call it; yet am I doing it, and hope to bring it to paſs. But although the Stone is yet volatile, yet doth it penetrate the imperfect Metals as *Mars* and *Venus*, and makes them eaſily fluxible and volatile; but ſeeing it does ſo now, what would it do were it reduced to a fixity, this any one may eaſily conjecture what effects it would have. Haply this work is not much different from the work of the little Countreyman. But ſeeing that purification is not different from this matter, we think it worth while briefly to teach, what it is, and in what it conſiſteth: But principally becauſe all my writings tend to this end, *viz.* the ſeparating of the pure from the impure, from which ground have we given this Book its name. Few are they that know the way and manner of Separations, and therefore we deem'd it highly neceſſary to ſpeak ſomewhat thereof in this place:

place. For all the Philoſophers do cry out with one voice, make the fixt volatile, and the volatile fixt. An hard and fixt thing doth by laying down its Earth become fluid and volatile, and this is a Philoſophical ſeparation and operation; after it comes ſublimation and diſtillation, by which a thing is yet again made more pure, being ſeparated from its groſs Fæces. For by how much the oftner any thing is diſtilled or ſublimed, ſo much the purer doth it become, and by how much the purer it is, ſo much the more efficacious and penetrative it is found to be. Now again if the moſt pure part of that thing be brought to ſuch a paſs as that it will reſiſt the moſt violent and all things conſuming forces of the Fire, every one will eaſily conjecture what may be obtained by ſuch like operations as theſe. Theſe things we have ſpoken do ſhew the metallick purification, effected by the benefit of the Spagyrical Art. The ablution of Vegetables, Animals, and Minerals is threefold; The firſt waſhing carries off by the help of Water the adhering impurities, as Sand, Powder, and Earth. The ſecond ſeparates the thin and watery parts from the earthy ones, by diſtillation, and doth the ſame thing as ſublimation is known to do in the ſeparation of Metals. The third ſeparation is performed by the Fire, *viz.* when the ſubject that is to be purified is made red hot in the Fire, that ſo the combuſtible Sulphur being inflamed may be conſumed, the Mercury may go away in fume, and the fixt Earth onely with the Salt ſtay behind, the which is to be underſtood of Vegetables and Animals. The caſe ſtands otherwiſe with the Metals, whoſe three principles are ſo knit by nature with ſo ſtraight and radical a tie, into ſuch an homogenial matter and ſo hard, that they very hardly admit of ſeparation, but do either very ſlowly and by little and little aſcend together by Cohobation, or elſe abide conſtantly together in the bottom. And albeit that ſome black Metal, be either by ſublimation elevated into Flores, or by calcination reduced into white Aſhes, yet after reduction the Metal is found to be as before of the ſame form, and endued with the ſame properties, which it had before calcination, ſo that theſe operations do no ways deſerve the name of Philoſophical Purgations. How many have deceived themſelves, by thinking if they turned *Mars* into a red *Crocus* they ſhould therewithal make *Lune* fixt, not conſidering that that *Crocus* returns by reduction to its own former nature and Iron ſhape. Common *Mercury* is precipitated into a moſt fair and moſt red Powder, and returneth by reduction to its firſt running nature. *Saturn* being calcined by common Salt becomes red Powder, or a *Minium*, which being reduced is the ſame Black-lead as it was before. Hereupon may ſuch an one be deſervedly ſaid to waſh the Black-moor that beſtows his labour on this work. The ſame *Saturn* being waſhed with Vinegar or any other corroſive liquor, gives indeed a white Ceruſe, but it is but a borrowed colour, and he covers his black body over with a white Robe, but yet for all that is preſently diſrobed of the ſame by *Vulcan*: The true Philoſophers do nothing eſteem of this ſophiſtical Purification. *Saturn* is by all the Philoſophers accounted for a black and leprous Gold, for they openly ſay, that there is in *Saturn* what the Philoſophers ſeek: Read but *Paracelſus* his Book of the vexation of the Alchymiſts, and there he mentions more. Nor is it without cauſe that that old Symbol or Proverb is uſed amongſt the Chymiſts. *The Fire and* Azoth *do waſh* Laton. *Azoth* is Niter, and *Laton* ſignifies the matter of the Stone. Some do aſcribe *Laton* to *Saturn*, I will forbear, onely thus much is to be obſerved, that the word *Laton* ſignifies the matter of the Stone, which is to be waſhed by *Azoth* or the *Aceturn* of the Philoſophers that is Niter. Verily I well know that beſides the common *Saturn* and Antimony, there is another, more eaſily waſhed by Niter; but becauſe we here treat of the Vulgar, or the firſt Ens of *Lune*, and the reducing it into a good Medicament by Niter, we will acquiſce in what is already ſpoken, & put off the explication of the ſaid matter to another place.

A Uterine approved Medicament.

FOraſmuch as I have hitherto taught the preparation of ſome notably efficacious Medicines by the help of Niter, and yet have not in the mean while made any mention of the Sickneſſes familiar to the Feminine Sex. I judged it wholly neceſſary to help this weak and infirm Sex (which is appointed for the propagation of mankind) with ſome ſingular Medicament: For (beſides thoſe Diſeaſes whereto the Women are ſubject as well as the Male Sex) they are yet afflicted with many Sickneſſes that do ariſe out of the Matrix, wherewith all as well Maids as married Women, and theſe laſt alſo are troubled not onely before Child-bearing, but afterwards, *viz.* when the Matrix is not well purged after Child-birth, and ſo begets various Sickneſſes, Pains, Winds, Inflammations, Suffocations, the aſcending of evil Vapours unto the Heart, or elſe by obſtruction of the Menſtrues, do cauſe a ſwelling Belly, Weakneſs, Debilitation of the Strength, a ſtraightning of the Heart and Brain, moſt vehement Griefs, and laſtly Death it ſelf: Or elſe the Matrix may be moved out of its place, in Child-birth, its Bonds broken, and the Matrix it ſelf ſo much repleated and debilitated with overmuch moiſture, that it has not ſo much power as to be put and retained firm in its due place, but ſome are conſtrained to leave it hanging out, to their great detriment, and are extreamly tormented with this ſo great a detriment, the Matrix preſently ſlips down out of the Body by either vehemently walking, or any other violent motions, and are neceſſitated always to carry about them a peſſary framed to the intent of keeping the ſaid Matrix up in their bodies, and that to their exceeding great trouble. Now then for the meeting with, and reſiſting theſe aforenamed and other ſuch like diſcommodites, but eſpecially ſuch as are overwhelmed (as it were) with them, I will ſet down the way and manner of ſo doing. As concerning the Matrix and its Diſeaſes which do ariſe after Childbirth, if ſo be that the Matrix be not rightly cleanſed, even the Women themſelves know their own Remedies, and do for that reaſon plant thoſe Herbs that are uſefull thereunto in their own Gardens, or gather them in a fit ſeaſon and ſo keep them by them, till they have need to uſe them in expelling the remains and traſh left after Childbirth: Such as theſe are *Pulegium*, or Penny-royal, Mother-wort, Mug-wort, Savin, and the like Herbs, which have a powerfull expulſive virtue, and there are waters too in the Apothecaries Shops diſtilled to this intent, concerning which it is needleſs to write any more in this place: Thus much onely we would adviſe, that ſuch Herbs and Species as are uſed for ſuch effects, are to be rendred firſt more ſubtile by ſeparating the pure from the impure, that they may afterwards operate more ſpeedily and better. The which thing may be moſt commodiouſly done on ſuch wiſe and manner as I have taught,

and preſcribed in the firſt Part of this *Spagyrical Pharmacopœa* concerning the Eſſences of Herbs. But the obſtructions of the Matrix, and ſtoppage of the *Menſtrues* are not ſo eaſily unlocked by bare Medicaments thus barely taken in, for they penetrate not ſo far with their Vertues, but rather, as experience teacheth, is effected by ſuch Medicaments as are applied beneath, and that more eaſily, and which we have already mentioned in the Second Part of the Furnaces in the Ch of Spirit of Urine, where I have manifeſted a peculiar inſtrument by which ſuch neceſſary Medicaments may be intromitted into the Matrix. I have therewithall hitherto performed many happy Cures. But foraſmuch as I have ſince that time found out a far fitter inſtrument for ſuch diſeaſes, I will clearly deſcribe it for the ſake, comfort, and help, of ſuch Women as are obedient to their Husbands, and chaſtly obſerve the bands of Wedlock, *viz.* both how to prepare and how to apply the ſame. You are to get an Inſtrument made of good Silver (not of Copper) its figure to be round, and like a ſmall Cane, and ſhut in the fore part, and to be a little longer than a man's finger, and about that bigneſs; You are likewiſe to get another a little ſmaller ſo as to go into the other, which other or bigger one muſt have three little edges on its inſide all the length of it, thereby to keep the ſmaller inſtrument about the back of a knifes breadth from each ſide of the bigger one, that ſo it may not touch it. In the hinder part let be a Cover made which may ſhut the Inſtrument tight when the Medicine is put in, leſt the ſpiritual vertue of the ſame fly back out of the body, and ſo order it that it may perform its operation on the Matrix through the Inſtrument, which is to be perforated (towards the top) with holes. To the hinder part of this Inſtrument let a Thread be tied whereby it may be plucked out when its operation is over: Therefore like as the diſeaſe is, ſo ſhall a ſuitable Medicament (and what is made exceeding Spiritual) be applied: On this wiſe let a ſmall piece of fine Sponge be embibed therewithall, and let the inner ſmall Pipe be filled therewith, and be ſo put up to the Matrix. If the *Menſtrues* be obſtructed, then the moſt approved remedy is the concentrated Spirit of Urine, which by its ſubtile, penetrating, warming, mollifying, and opening vertue opens the little Veins of the Matrix, and gives an Exit to the obſtructed *Menſtrue*. But if the Matrix labour not with this diſeaſe, but is onely beſieged as it were with cold and tenacious humours, then the hot and penetrating Oil of Tiles or Wax, rectified moſt ſubtilly, is to be applied, which being ſmeared on ſome Sponge, is to be conveyed in by the Inſtrument into the cold and watry Matrix, the which will thereby be warmed, dried, and freed from the greatneſs of its moiſture. But if ſo be the Matrix ſhall be moved out of its place, or its cords broken, or too much relaxed, or any other way affected, and ſo not be capable of retaining the Matrix, and keeping it from ſliding forth out of the body; Then muſt aſtringent things be uſed, which may conſtringe the too much looſened bands, and may heal and tie the Matrix again in its due place, and ſtrengthen it. Such as theſe are the diſtilled Oils out of mens hair, out of the Wool of Sheep, and ſuch-like Animals, out of the Horns of Goats, Claws of wild Beaſts, and Feathers of wild and ravenous Birds, and ſuch-like things, which being laid upon the Coals, do draw themſelves up together, and do by that contraction ſhew to us as it were their uſe. But the manner of diſtilling and rectifying theſe Oils we have already taught in the Second Part of our Furnaces, ſo that it is plainly needleſs to repeat the ſame in this place. I ſay, and that truely, that if ſo be that theſe three kinds of Medicaments be rightly applied in thoſe three affects of the Matrix, that they will perform things even wonderfull, and many pious Mothers might be preſerved ſound, a longer time amongſt their poor Children, were they but help'd by ſuch remedies. For it cannot be that much help ſhould be brought to the ſick and hurt Matrix by the Potions that are drunk of, or the hyſterial watry Medicines that are injected by a Syringe. For ſuch Medicaments as are taken in at the mouth cannot penetrate with their Vertues home to the Matrix, ſo as to help it, to open, to purge, and to heal it, or to heal the diſſolved and relaxed bands. And as for Waters and Decoctions that are applied beneath, and there injected, they preſently ſlide out again, and do help the Matrix but little, or nothing at all. But now theſe Oils of mine and Spirits are commodiouſly applied by means of the Inſtrument, and diſcharge their office moſt efficaciouſly. But there is yet one thing neceſſary here to adviſe you of, *viz.* that ſuch as deſire to uſe the Spirit of Urine, Oil of Tiles, or Wax, or Oils out of Horns, Hairs, or Feathers, for curing of the ſaid defects of the Matrix, do prepare them themſelves, or commit them to ſuch to prepare them, as are skilled in the Art of diſtillation, and verſed in rectifying ſuch Spirits and Oils, thereby exalting them to the higheſt ſubtilty. For if ſo be that any would buy in ſome Apothecaries ſhop, thoſe things that he knows not how they are prepared, and haply ſuch as are corrupted already, and not fit for uſe, will be groſly miſtaken. For it is not ſufficient (if a thing is to be made uſe of) that it hath a bare name onely, and be deſtitute of the Vertues themſelves, and which are no ways effectual) for the ſaid Sickneſſes of the Matrix are here taught to be cured not with corporeal, but with ſpiritual and efficacious Medicaments. It is therefore neceſſarily requiſite, that the Medicines we have ſpoken of, *viz.* thoſe Oils and Spirits, be excellently well prepared, and ſo as to exerciſe their Vertues by emitting or ejecting their inviſible odour and vigour onely. The Spirit of Urine is to be ſo volatile and very ſubtile, as that it will vaniſh away out of an opened glaſs, and therefore there needs a greater diligence in preſerving and keeping it; It is to be well preſerved in glaſſes cloſe ſtopt, for if the Spirit vaniſheth away, there remains onely an unprofitable Water void of all kind of Vertues. I have therefore taught the making of peculiar Glaſſes, which will not let go the Spirits, the ſhape of them are deſcribed in the Second Part of my Chymical Furnaces, in that place where I treat of the Spirit of Urine. In like manner the ſaid Oils are to be well rectified, and to be made exceedingly volatile, ſo that being expoſed ſome few hours to the warm Air, they will vaniſh away; which if they will not doe, neither will they effect ought. I muſt needs confeſs that all the time in which I have lived, I never found a good Spirit of Urine, nor well rectified Oil of Wax or Tiles. I will ſay nothing of the Spirits of Hairs, Horns, Feathers or Quills (for there's no uſe of them.) I have indeed found amongſt many, a bare worthleſs, ſaltiſh Phlegm, but the very true Spirit of Urine it ſelf I have not met withall. The Oils of Tiles and Wax are indeed found in all Apothecaries ſhops, but are for the moſt part corrupted by their long lying,

and

and are old, thickiſh, red, tenacious, and deprived of their due odour, are ſtinking, and ſpoiled of all their vertues. For 'tis very rare that ſuch Oils are rectified, but are ſold, ſuch as they be, when they come firſt out of the Retort, with a ſaltiſh kind of Acrimony adjoined unto them, which in the rectification abides in the bottom, and is at laſt ſeparated from the Oil. Such Oils are of no value, and appertain not to this curing, for they will do juſt nothing; and thus much I could not omit adviſing you of. For haply when ſome ſick perſon or other readeth here in this my book, that ſuch Oils do moſt highly conduce to expell the ſaid defaults of the Matrix, and yet perceive no comfort or help by the uſe of them, without doubt the fault will be laid on me, as that I had written a lie, and not upon the ill-prepared Oils. This therefore do I affirm, that except your Oils be good, you will never have from them the hoped for event. And how (indeed) ſhall the ſick man know if the Oils be good or not. The Merchant or Seller of them won't confeſs them to be old, ill-prepared, and deprived of their odour. So oft times the fault is laid upon the Authour, and he's condemned for writing unprofitable things, and which are not agreeable to the truth. But the fault verily can light on none ſave upon the Magiſtrates, who (by winking at ſuch things) do permit it. And when any one goes to be furniſhed with theſe things which are requiſite, in ſome Apothecaries ſhop, and the Apothecary haply ſells but few Wares, and all the reſt wax old as they lie, and are corrupted; and if haply ſometimes one or two ſuch and ſuch Simples or Medicaments be ſought for but once or twice, it may be, in a whole year, he delivers the things he has by him, which if helpleſs as to the ſick buyer, yet are helpfull to the Apothecaries purſe. But yet this is an unjuſt thing, and a thing contrary to the love that is due unto our Neighbour, and what will burthen the Conſcience. The ſick man thirſting for help, puts the hope of his help and comfort in the Medicine exhibited him, which if not good the diſeaſe prevailing, the ſick man dyes, but had good and profitable Medicaments been uſed, inſtead of the unprofitable and evil ones, he might have recovered. He therefore that is guilty of ſuch evils, let him look to it, what account he will at laſt give unto God for his tranſgreſſion; That which I have aforeſaid, doe I again repeat, and do yet firmly alledge, that the beforementioned Spirit of Urine, as likewiſe the Oils of Tiles and Wax, and thoſe other Oils of Horns, Hairs, and Feathers, and their moſt efficacious Spirits may be made uſe of in the expulſion of the affects of the Matrix of what kind ſoever, both in the younger Maids or Women, and in thoſe that are of riper years, and that with moſt high admiration. It is therefore a juſt and right thing that they ſhould be found in all the Apothecaries ſhops, and that they ſhould all of them be prepared after a due manner. For they are not onely good in thoſe diſeaſes that afflict the Womb, but do likewiſe operate miraculouſly and doe things incredible in many other diſeaſes and affects of the Body if well and rightly prepared and duely adminiſtred inwardly and outwardly; Concerning which we have written more at large in the Second Part of the Furnaces, *viz.* how they are to be prepared and made uſe of. Any one that is endued with underſtanding will perceive eaſily that a living Spirit is far more efficacious than a dead Body and exanimated Carkaſs. Foraſmuch therefore as you have here heard that ſuch grievous and incurable (ſo accounted at leaſt by almoſt all Men) diſeaſes of the Matrix, by which ſo many Women are ſwept away without any help, are to be cured by the alone application of ſubtile Spirits, and ſo few know the preparation of them, I will teach for the ſake of that weaker Sex a better and more effectual Medicine, and withall will prove it by an example, that all ſubtile Spagyrical Spirits may be concentrated and augmented in their Vertues by the help of Art, and that one Spirit hath the power of concentrating another. And becauſe this Treatiſe, and all the Medicaments therein propoſed, aim onely at this end, to ſhew the wonderfull Vertues of Niter; And it hath been beſides ſhown, how all the ſaid Medicaments ought, by the help thereof, to be prepared; the ſame ſhall likewiſe be done in the demonſtration of this Medicine.

I taught in the Second Part of my Furnaces to prepare a Spirit of Urine and *Sal Armoniack* by the addition of Calcined Tartar; But yet the already concentrated Urine or *Sal Armoniack* may be mixed with double the quantity as its own weight is, of fixed Niter, and ſo be diſtilled, for ſo thoſe Spirits will be more ſtrong and more efficacious than if Tartar were added unto them. And if the Oil of Tiles or of Wax, which is made by the addition of Earth, ſo heated as to imbibe the Oil or Wax, be yet once more diſtilled by the concentrated Spirit of Niter, it will be brought to the higheſt ſubtilty, and 'tis to be done after this following manner.

Diſſolve in one pound of the Spirit of Niter, four ounces of *Lapis Calaminaris*: Put the Solution in a Glaſs-Viol upon a vaporous or dry B, that the Phlegm may evaporate by little and little (for the *Lapis Calaminaris* holds all the Spirits, and permits the Phlegm to go off) and the Spirit of Niter will remain behind in the Viol-like Oil. Take one part of this concentrated Spirit of Niter, and half a part of Oil of Tiles or Wax, put them both in a glaſs Retort well luted, and force them out (by a diſtillation in Sand) from the concentrated Spirit into a great Receiver; and by this operation it will be far more penetrative than it was before. For the Spirit of Niter being by concentration by the *Calaminaris* freed from all its Phlegm, and ſeeing it is thereby become the more attractive, and can find nothing elſe that it might attract, it aſſociates to its ſelf all the humidity that lies hidden in the Oil, and which could not be ſeparated by the former diſtillation, and hereby brings to paſs that the Oil doth neceſſarily become more ſubtile and efficacious, yea ſo penetrative, as that it performeth wonderfull things, eſpecially in the effects of the Matrix, the which nought but very ſubtile Spirits can heal, and which thoſe concentrated Spirits are wont to do far more certainly and ſecurely than all the other Medicaments in the whole world: After the ſame manner is the concentration and purification of the other Oils to be performed. And now that none might ſcruple as to Waters being mixed with the ſaid Oil or Wax, which have no affinity with Water, the ſeparation of which from the Oils, I have here taught; I would have ſuch an one to know, that much fatneſs, as the expreſſed Oils of Vegetables are never without an aqueous moiſture, though it be inviſible, and cannot be perceived. For the fire can make it manifeſt by diſtillation: As for inſtance; There's Oil-olive, one pound of which is wont to yield ſix or ſeven Lots of Acid Water by diſtillation; and thus do all Oils, Wax, Turpentine, Roſin, Gums, Pitch,

Pitch, Amber, and all combuſtible fatneſſes. Yea even the very burning Spirit of Wine it ſelf, and ſuch others as are prepared of Vegetables, can never be throughly rid of their Phlegm, unleſs they be poured on ſome Calcined Salt, and ſo rectified, they leave their humidity therein, and become more ſubtile. But this is to be noted, that by how much the drier and more attractive that Salt ſhall be, ſo much the readier will it attract the moiſture out of the winy Spirit and hold it. Therefore the Salts of Vegetables, Calcined Tartar, and principally fixed Niter, ſerve for ſuch a rectification. The other Corroſive Salts, as fixt *Sal Armoniack*, Calcined Vitriol, and ſuch like, do rather love to hold and retain the Phlegm of their own peculiar Volatile Spirit than of the Spirit of Wine. And thus much let ſuffice as to making ſubtile Oils more ſubtile, that they may perform wonderfull things in Medicine. And now having deſcribed in this my Second Part of the *Spagyrical Pharmacopœa*, ſome of the moſt neceſſary Medicaments, that are preparable by Niter, and have ſhewed the way of uſing them, and which may ſafely be given in chief diſeaſes as well for preſervation as cure: I could to theſe add many more, and ſo encreaſe the number of them. But becauſe there are not a few of ſuch good kind of Medicaments in the writing I have hitherto publiſhed, *viz.* in the firſt, ſecond, third, fourth, and fifth Part of the Furnaces, in the *Miraculum Mundi*, and in the Mineral-Book, and there ſhall yet follow more in the following third Part in this *Pharmacopœa Spagyrica*, in the Vegetable work, as alſo in the ſecond, third, and fourth Parts of the Proſperity of my Country, I judged it needleſs any longer to dwell on theſe here, but will onely by way of concluſion, and for (as it were) ornaments ſake, yet add one onely Medicament of Niter, which will be none of the meaneſt. But foraſmuch as this is not a common preparation, but comprehends in it great Myſteries, it ſeems not good unto me to ſet down its preparation before the eyes of the perverſe world. Let it therefore ſuffice to give onely ſome hint, that the Common Niter, which to our Eyes appears moſt white, doth contain in it a Soul of a deep red Colour, which by the benefit of the Vulcanick Art may be thence educed. For when *Vulcan* hath reduced that old Dragon, bound in Chains, unto a moſt high ſtreight by his Iron and fiery Mallet, and yet cannot plainly kill him; *Neptune* coming in to help, meets the Baſilisk with a clear Looking-glaſs, and turns on him his own peculiar poiſon, and ſo ſlays him. As ſoon as he begins to die, and ceaſeth to vomit forth fire, *Neptune* laying aſide all fear, approacheth boldly near him, and puts a Sheeps-skin over his Jaws, and receives his Bloud and Soul, and precipitates it into the Salt-ſea, wherein being drowned and choaked, he lays off all his venome and all his filth, and is converted into a moſt fair and moſt red Medicine. One onely drop of this Soul of Niter can tinge an ordinary glaſs full of Common water with a golden Colour. But he that can turn this Bloud of the Dragon by the help of fire into a fire-reſiſting Salamander, he may deſervedly be compared with the happy *Jaſon*, and obtain moſt great Honours, Treaſures, and Riches. From all theſe things may a ſtudious Artiſt eaſily ſee what Myſteries lie hid in Niter. The things which I have hitherto deſcribed are onely as it were ſmall ſparklings of thoſe kinds of Myſteries that lie hidden in Niter. There ſhall be deſcribed in the fourth Part of the Proſperity of my Country, and in the following third Treatiſe of this *Spagyrical Pharmacopœa* more and eminenter Metallick Medicines, and which are preparable by Niter: and this is done to the intent, that every one may know, how wonderfull and excellent a ſubject Niter is, the which is notably hidden by the Antients, and never wont to be called by its true name, but by Enigmatical Riddles. From hence has ſprung up even infinite names, as, a dry water, a water not wetting the hands, an Hermaphroditical *Mercury*, a *Balneum Regium*, the Soap of the Wiſe men, the flying Dragon, the Urine of Boys, a Dunghill, Azoth, the waſher of Laton, a moſt ſharp Vinegar, the Stygian-water, the Death of the Living, the Life of the Dead, the Purgatory of the imperfect Bodies, the Baſilisk, the forked Serpent, the moſt great Venome, the Venome of Herbs, the *Menſtrue* of Women, and ſuch like infinite names, whereby they have wrapped over its true hidden name in Cimmerian darkneſſes, but is now by me revealed, and is ſet before the eyes of the whole world, and it ſhall farther be revealed and detected in the three remaining Treatiſes of the Proſperity of *Germany*, which ſhall very ſhortly follow, and ſo its wonderfull power and moſt efficacious vertues, which it performeth in the bettering of Metals, and in preparing Metalline Medicaments may be manifeſted and laid open before the whole world. I will not onely declare this in writing, but alſo will (God permitting) very ſhortly ſhew, even manually and in very deed in a convenient Laboratory, the making and uſe of all my Furnaces, hitherto publiſhed in my writings, and the preparation of many excellent Medicines, as alſo the truth of the metalick Tranſmutation. Nor will I do thus to the end that I may advance my own profit, but will rather do it for this intent, *viz.* that the health and ſafety of many thouſands may be provided for that are afflicted with various ſickneſſes, and that the whole World may ſee, believe and confeſs, that the Tranſmutation of Metals by the abject Niter may be effected. But becauſe in ſuch a like demonſtration, if the Laboratory be frequented but for one years ſpace onely, and daily laboured in, and the confecting of ſo many Medicaments be ſhown, ſuch a great quantity of various Medicaments as I ſhall have by me, cannot be all uſed by my ſelf, nor can they be of any uſe if laid up, and therefore they ſhall be ſold to any one for a ſmall and vile price, that ſo they may each that needs them uſe them in their neceſſity. It is not Covetouſneſs that driveth us thus to doe, thinking thereby to get great riches, but onely to get juſt as much as may ſerve to pay for all the neceſſary matters, as Coals, Glaſſes, and other things. So then by this ſo good and laudable a work, there will not onely be laid open to the whole world, the occult Myſteries of Nature, to the honour of God: But withall, the moſt miſerable poor Sick will eaſily obtain good Medicaments, and recover their former health. Nay farther, not a few of ſuch as have been in want will be able by the moſt profitable uſe of Niter in tranſmuting the inferiour Metals into better, be able to ſuſtain themſelves better and more quietly. But that the whole world may ſee and conſider that my own peculiar profit and gain is not ſought, but that my Neighbours profit is out of a Chriſtian affection onely aimed at, there ſhall be adjoined at the end of the following third Part, the price of every Medicament; from whence every one may eaſily conjecture, that there is not expected any gain or large profit, but onely the recovering

recovering of my disburſements; ſeeing no one is to be found who, beſtowing great coſts in teaching others, would willingly loſe both his Expences and Labour too. I will with a willing mind teach others, but I will not lay out my Money and run the hazard. The World is wiſe enough, and great is the number of thoſe ſick people that need help: And therefore this publick Laboratory will (by God's help) be able to bring abundance of profit to all mankind; In this Laboratory there ſhall be all the Furnaces and all the Inſtruments whereof I have made mention in the Writings by me publiſhed, but the reſemblances of them not pictured, becauſe there's no occaſion for that to be added; And withall, thoſe Furnaces, Preſſes, and Inſtruments which we have mentioned or ſhall mention in the firſt, ſecond, third, and fourth Part of the Proſperity of my Country, and in the Vegetable work, and my other Writings ſhall be there to be ſeen, the which certainly will be exceedingly helpfull to moſt men that abhor not to labour, to procure them food and ſuſtenance in their neceſſity.

Furthermore, foraſmuch as all my Writings hitherto publiſhed, are very negligently and faultily printed here and there by other men, againſt my knowledge. I will again ſend them forth corrected, amended, adorned, and encreaſed with the figures hitherto omitted. And this I was unwilling to conceal from the Lovers and Students of Arts. Herewithall will I conclude this Second Part of my *Spagyrical Diſpenſatory*, and ſhortly add the Third Part, onely wiſhing that this Work of mine may ſerve for the comfort and aſſiſtance of very many ſick perſons. *Amen.*

The End of the Second Part.

THE THIRD PART OF THE Spagyrical Pharmacopœa.

Wherein is taught, how by Salt and Fire, the Vegetables, Animals and Minerals may by a *Spagyrical* way and method be Mundified, and how from them, Medicaments wonderfully penetrating and moſt ſpeedily operating may be prepared.

AS for the manner of reducing Vegetables, Animals, and Minerals, by Diſtillation into good and pure Medicaments, by the help of the Spirits of Salt, thus ſtands the caſe: The manner and way of diſtilling Vegetables, Animals, or Minerals *per ſe*, after the common manner or way into Oil, Spirit, and Volatile Salt either in a B. Sand, or naked Fire, which hath been long ago, and alſo is at this day in much uſe, I cannot in all reſpects commend, becauſe that ſuch Spirits, Oils, and Volatile Salts, (whether from Animals, or Vegetables) do all of them ſtink, and though they be often rectified, yet do they not totally loſe that innate ſtink gotten in their Diſtillation, but do always retain a kind of an ungratefull *Empireum*, and are thereby loathſome to the Sick (and that not without cauſe too) whereas otherwiſe they have abundance of virtues; but being rectified with Spirit of Salt (as I have taught in the ſecond Part of my Furnaces) they become pure, and loſing their ſtinch are gratefull and acceptable, but not at all ſo without that rectification. Now all Men know, eſpecially the Spagyriſts, that the chief virtues of Vegetables and Animals are placed in their Oils and Volatile Salts, (for you muſt note that in Minerals the contrary is found, for their mercurial parts are moſt virtuous) but both Oil and Salt do in diſtilling by a Retort paſs over aduſt or burnt, and therefore are not made uſe of, and (the more's the pity) are ſerviceable to none. For all ſuch as diſtill the Oils of Vegetables, by the appoſition of common water, in Copper Stills, do know how very little a Portion is obtained by ſuch a proceſs, and that the greateſt part of them (Oils) do abide in the Still, and are of no profit, becauſe common water can't be made hot enough, to drive out the fatneſs, but it gives onely ſome little portion, the reſidue is made thick and tenacious by the boiling, and remaineth in the Herbs: Hereupon ſome

Men knowing this thing, do add to the Herbs common Salt, and Tartar of Wine, whereby the water being rendred one degree hotter, gives more Oil: This is a way that I do indeed approve of, but yet the one half part of the Oil will not aſcend, and therefore diſtilled Oils are commonly very dear, eſpecially if made out of dear things. Whereas if the Oils were diſtilled by this method of mine, they would have much more Oil, whereby the poor might alſo buy them. I will inſtance in one ſimilitude whereby it ſhall appear, what great profit may be made by diſtilling of Oils according to my method, and what a vaſt difference there is betwixt my method here deſcribed, and the common uſual way. Suppoſe therefore that I ſeek after an excellent Medicine for the Stone, and that I do certainly know that it lies in the Aſh, (as I have clearly enough diſcovered in the firſt and ſecond part of this *Spagyrical Pharmacopœa*, certainly knowing, that the Oil diſtilled out of its Seed doth (by manifold experience) far exceed all other Medicaments againſt the Stone.) This Aſh indeed yields a prety quantity of Seed, but much of that Seed yields but very little Oil, becauſe 'tis reſinous, and doth not diſtill over with the water, and upon that account is prepared but by a few, and ſuch poor Men as are ſick, can't partake of it becauſe of its dearneſs, and this is much to be bewailed, that the Omnipotent God ſhould ſet before our Eyes this Medicine in ſuch plenty and yet no body enioy it. Beſides this is to be obſerved, that if ſome diligent Phyſician ſhould diſtill ſuch an Oil, and yet not know how to correct it according to my method, he may ſometimes do more hurt than good, becauſe that Oil brings over with it a certain volatile Salt, which (infects or works on) the Copper Veſſel it is diſtilled in, and the Copper refrigeratory which it paſſeth through, and is uſually thereby rendred yellowiſh, or green, and hath been by many diſcreet Men made uſe of without any regard thereunto, and (by reaſon of the Copper) hath put a nauſeate and debility of Stomach upon the Sick, and hath been more hurtfull than beneficial. But now if they had rectified it with Spirit of Salt once, or at leaſt well ſhook it in a Glaſs with the ſaid Salt Spirit, that ſo the Copper might have been extracted by the Spirit of Salt, and ſo have adminiſtred it, they had done well, and would have gotten a moſt excellent Medicine, though I confeſs ſomewhat dear, (proceeding this way) becauſe that a Sackfull of the Seed, and as much as a Porter can carry at once, will ſcarce give two ounces of Oil, and this is too dear for the Poor Man's Purſe.

For the ſake therefore of all ſick People as well Poor as Rich, I will diſcover my way that I uſe in getting the Oils, Spirits, and Volatile Salts out of all the Vegetables, and that in good quantity, and with very ſmall Coſts, that ſo all Men may partake of the gifts of God, and may all have occaſion of giving thanks to the Creator of all good things.

Take therefore in Gods name whatſoever Vegetable you liſt, and fill a great Glaſs Retort therewithall, and by degrees diſtill over all that will come. Separate the Oil from the Spirit, and the Spirit by rectification from the Volatile Salt; rectifie alſo this Volatile Salt, and the Spirit upon its own *Caput Mort.* or upon ſome other Salt of Aſhes being firſt fired and calcined, and ſo they will become pure and loſe that fetid ſtinch that they got in the Diſtillation: If one rectification is not enough, add a ſecond or a third, always provided that it be done on the fixed Salt of that Herb out of which you drew the Spirit. Now though the Oil be alſo depurated by a rectification upon the *Caput Mort.* yet that depuration and rectification is not comparable to this of mine which I mention here, and therefore well do we prefer this way, and 'tis thus.

Take your black diſtilled Oil, put it in a Glaſs Retort with ſix or ſeven times as much rectified Spirit of Salt, and give firſt a gentle Fire, then a greater as the thing requires, ſo the Oil will paſs over pure with the Spirit of Salt, and the ſtinch together with the blackneſs, will ſtay behind with a part of the Spirit of Salt. If now you will have that Oil yet purer, then rectifie it again with new Spirit of Salt untill both the Odour and Colour thereof pleaſe you. As for the Oil that ſtayed behind and did not aſcend, ſeparate it from the Spirit of Salt, and 'twill be ſomewhat thickiſh like to a black Balſam, and hath great virtue both inwardly and outwardly, but its inward uſe we need not, for we have enough of the pure Oil for that purpoſe. But that I may be yet farther ſerviceable to my Neighbour, and that he may underſtand me more thereby, I will make uſe of this ſimilitude or example. Put caſe, that I have ſome four, five, or ſix pounds of the Seed of the Aſh, which falls from the Trees in the Month of *September* or *October*, I do fill a Retort with the ſame and by it diſtill the ſaid Seeds, and I uſually have about one or two, ſometimes three, four, five, or ſix drams of black Oil, ſome ounces of Volatile Salt, and ſome pounds of Acid Spirit: Now foraſmuch as I ſeek for the Oil onely, I ſeparate this from the Spirit, and rectifie it with Spirit of Salt untill it becomes pure, and this I keep for my uſe; and I make of the Spirit either a certain Eſſence, as I have taught in the firſt part of my *Pharmacopœa*, or ſugered Tablets, (or Lozenges) or what I pleaſe: And by this way do I get more Oil out of five or ſix pound of the Seed of the Trees, than otherwiſe by the *Veſica* or common hot Still, out of 100 pound, and that which remaineth after rectifying is profitable for external uſes, if it be prepared as follows, *viz.* Separate this thick Oil from the Spirit of Salt and mix it with Wax, that ſo it may be made ſomewhat thicker, ſo as to be ſpread like an Emplaiſter, the which put upon the Reins, and uſe the diſtilled Oil inwardly, and thus this Emplaiſter will perform as much outwardly as the diſtilled Oil operates inwardly, and ſo the Patient is thereby doubly repaired and helped. And if you deſire yet a third way of healing, then rectifie the acid Spirit well, and diſſolve the Volatile Salt by ſubliming it with the Spirit, and uſe this Spirit every day (beſides the inward uſe of the diſtilled Oil) on this wiſe: Heat it a little, and dip in it ſome Linnen Cloaths and therewith waſh or bath the Back and Reins putting on the Emplaiſter afterwards, and hereby the Sick Perſon will in a ſhort time (unleſs God doth in a ſingular manner put a ſtop thereto) certainly recover.

Note well, after this manner may you diſtill all other Vegetables into Oils, Spirits, and Emplaiſters, and make uſe of them in this Diſeaſe, ſuch as are Saxifrage, Parſly, Cumin, Carraways, and ſuch like other Herbs and Roots: Neither is it always neceſſary to have the Aſh Seed, unleſs you pleaſe: For that this Tree is not to be had in all places, and it yields alſo at ſome Seaſons but little Seed? *N. B.* Here ſome may demand and ſay, you have taught us the manner of preparing Oils, Spirits, and Balſams out of the Seeds, but now if ſuch a Medicine could

could be made out of the Herbs it would be ſomething, for whence ſhall ſo much Seed be had? I Anſwer. If thou haſt not ſo much Seed, thou may'ſt make the Medicine out of the whole Plant, as the Root, Stalk, Flowers, and Leaves: And the reaſon why I mentioned onely Seed, was this, becauſe the chief virtue of all the Vegetables, is occultly placed and concentrated in the Seed, elſe the whole Plant may (as aforeſaid) be made uſe of, which although it yield not ſo much Oil as the Seed does, yet may we even this way receive a good quantity: And if we ſhould neither take Seed, Herb, Leaves, or Stalks, yet would the Root alone afford much Oil; but in Trees, as in Aſh, Linden, Nut, Cherry, Peach, and the like, the very bare Wood it ſelf will abundantly ſupply, if diſtilled *per deſcenſum*, or by a Fire of ſuppreſſion (of which afore,) ſo that a little Aſh if rightly handled may afford you ſome pounds.

Nor are you to ſuppoſe that this way of plentifully preparing the Oils of Vegetables and clarifying them by Spirit of Salt, ſerves onely for ſuch Vegetables as are good againſt the Stone, becauſe I have onely inſtanced them as examples; No, but even all Vegetables, ſerving for every Diſeaſe, may be by this aforeſhown way reduced into moſt ſweet Medicaments. Nay not onely Vegetables may, but alſo Animals and Minerals too, but with ſome difference and diſtinction, which we ſhall mention in what follows.

There remains yet one thing more to be mentioned about the Oils of Vegetables, and the Diſtillation of them, and 'tis this. Some or other may reply and ſay, that haply ſuch Oils as are prepared firſt by a Retort and *per deſcenſum*, and then rectified and clarified by Spirit of Salt, are not equivalent in their virtues to thoſe which are diſtilled in a Copper by the help of Water. For prevention of this Quæry, and the removal of ſuch needleſs cares, we do in the firſt place demand, in what the virtues of the Animals and Vegetables do conſiſt, whether or no in their connate and occult property, or in the Odour, Savour, and Taſt. For anſwer, the greateſt virtue of moſt Herbs, and living Creatures doth for the moſt and greateſt part conſiſt in their Co-nate or Co-born nature and property, and not in the Odour or Savour, as is ſufficiently evident in ſome Plants, which have ſcarce any Odour or Savour, and yet are found notably efficacious in Medicine, and ſome there are both of a ſweet Odour and Savour, which have no Medicinal uſe, and ſome that have an ungratefull Odour and Savour, and yet have no mean Medicinal Virtues. And many there be of things which both ſmell and taſt ſweet, and are alſo profitable in medicine, becauſe God hath created them ſo or to that intent. I muſt needs confeſs that ſometimes an Odour or Savour of ſuch an Herb as hath but little virtue is notably refreſhing and comfortable to the Vital Spirit, nay more, the very ſeeing of a fair and comely thing is capable of comforting the Heart, and an ugly thing of debilitating it; a notable example hereof we have in a friendly man, and in Gold, as being things which by the very beholding of them do refreſh the Heart, whereas contrariwiſe, an angry man, and a venemous Creature do terrifie it, (*viz.* the Heart) and as 'twere make it Sick, yea and ſometimes kill outright. Beſides, not onely the ſeeing of ſuch and ſuch objects do profit or hurt, but even the very voice of a man, or of a living Creature do hurt, weaken, and kill, if proceeding from a malignity. Farther, the bare imagination can effect good or evil, heal or hurt; but this belongs not to this place, but ſuch things are treated of in my ſhort Treatiſe of things natural and ſupernatural. That which I have here ſpoken is to this end, that the unskilfull might know, that the virtues of Vegetables do conſiſt more in their Co-born Nature than in the Savour or Odour, and that this Diſtillation by a Retort, and rectification by Spirit of Salt, can neither add to or diminiſh from their virtues, becauſe their virtue remains always unhurt, in what manner ſoever the Diſtillation be made, provided that that which is diſtilled be diligently depurated, and all the ungratefulneſs removed therefrom which it got in the operation, that is to ſay, when Oils are aduſt (or Savour of burning) by their being diſtilled in a Retort, then that accident may be taken away from them by rectification with Spirit of Salt, and this now I add for the ſake of the Ignorant.

Moreover as it is with Vegetables, ſo likewiſe muſt you order your diſtillation of the Oil, Salt, and Spirit of Animals: Neither need you to proceed farther or otherwiſe. As for the Vertues of both Animals and Vegetables, the Phyſician ought to know them by their Signature, and not by the books of Writers, becauſe the Signature doth ſhew us the Vertues of all things much clearer and righter than many Writers, who write many things meerly from hear-ſay, whenas themſelves do in truth know very little or nothing at all. And thus for this time I omit to ſay any more, for that the preſent occaſion will not admit of a more prolix diſcourſe hereabouts. What I have done is for the Sick that are poor, that they might know my method of purifying the Spirits of the Acid Salts from Vegetables or Animals, by Spirit of Salt, and of bringing them into wholſome Medicaments: And this cannot be accompliſhed ſo plentifully without this Medium; and now this way being ſhown, the Poor may alſo enjoy the benefit of them, and be able to pay the Apothecary, whenas before even the Rich could hardly have any of the good (in them) Note well, you are yet farther to obſerve, that indeed the Animals are firſt to be diſtilled by a Retort (as we ſpake before concerning the Vegetables) that ſo their Oil, Spirit, and Volatile Salt, may paſs over together; and their Spirit and Volatile Salt may be rectified and purified the aforeſaid way. But the Oil will not come over by a bare Spirit of Common Salt, or of Niter, but that Spirit muſt be firſt concentrated with *Calaminaris*, and then it brings over the Oils of Animals, elſe not. But as touching the Concentration of the Acid Spirit for this rectification, we ſhall ſpeak of it anon, and will therefore firſt ſet down (for better inſtructions ſake) one certain proceſs of diſtillation and rectification, leſt any might err, and that all might rightly apprehend my meaning; and 'tis this: Take ſome pounds of Turpentine, diſtill thence an Oil, and the Fæces of the Turpentine will ſtay behind. This Oil though it be rendred by Diſtillation purer than 'twas before, yet it hath put on another nature by means of the Fire, *viz.* an hotter nature, and therefore ſerveth not for every effect which the Turpentine before ſerved for, becauſe the Turpentine is not very thick nor very thin, nor too hot or too cold, nor too ſubtile or too thick or groſs, but is of a temperate eſſence and property, which now by Diſtillation it poſſeſſeth no longer, but becauſe of its heat and ſubtilty, it is unuſefull. Well, what of all this? Why ſome or other might have objected to me

that

that indeed things are by diſtillation rendred more pure and ſubtile, but doe thereby get an hotter nature and vertue, and therefore that way of purifying doth not doe well in all ſubjects. Well, to prevent this objection, and that the diſtilled Oils may after their purification be reſtored to the ſame degree of thickneſs, rarity or thinneſs, colour or frigidity, that they had before, and yet retain the purity they got by diſtilling: the method is eaſie, and is thus done. Suppoſe that Turpentine be (as it is Turpentine) hot and ſubtile in the firſt degree, but being diſtilled it arrives to the third degree, and being rectified to the fourth. I muſt now needs confeſs that that ſubtile Oil is to be uſed onely in cold affects, and in no others, whereas it might before have been employed about other accidents. To this I ſay, and yield, that if it be proceeded with after the common and known way, 'tis ſo: But my way is far otherwiſe to be reckoned of: For though hereby the things diſtilled doe, together with a purity, get a ſubtile heat, and doe in ſome operations become too thin and hot, yet in rectifying by the Acid Spirit, ſuch qualities are broken, divided and diſſipated, ſo that it is in part rendered of a like thickneſs and tenacity as it was at firſt, and a part of it remains ſubtile. So that you may have out of one ſubject, both thin, hot, thick and temperate parts together, but both of thoſe parts pure, as ſhall be evinced by this Example.

The Spirit of Salt, or of Niter is indeed inwardly a mere Fire, but externally a mere Cold, by which all thin things do ſtiffen and wax hard. Therefore as the diſtillation doth induce heat, expels and extenuates, ſo the rectification doth by the acid Spirit compel or drive the ſame inward, thickneth it, and reduceth it into an equal temperature: For the Oil in the firſt diſtillation is plainly hotter and ſubtiller both within and without, than 'twas before, but by rectifying it with the acid Spirit, the moſt ſubtil part comes over firſt, then the middle part, and the thickeſt reſides in the bottom, which is of an equal degree of heat and thickneſs as the Turpentine is, and is as uſefull both inwardly and outwardly as the Turpentine it ſelf is. And I have over and above that middle Oil, and that moſt ſubtil Spirit burning and penetrative, the which I can make uſe of for thoſe effects, which require ſuch ſubtilty, or if I liſt, thicken it with what I left remaining of it ſelf behind, which is thick, but yet purified, or elſe thicken it with ſome other convenient thing. And thus may I reduce one Subject into as many Degrees as I pleaſe, whereas the Turpentine had before but onely one Degree: From hence may the friendly Reader ſee what *Baſis* this my diſtillation and rectification by an acid Spirit hath: Whereby not onely a great deal, yea 3, 4, or 5 times more Oil comes over than by the common hot Still; but alſo the Volatile Salts and the Spirits, and ſharp Vinegars may be hereby gotten out of Vegetables and Animals, and beſides a pretty quantity of thick Oil to be externally uſed, and which otherwiſe in diſtillation by water in a *Veſica* or hot Still, would remain wholly behind. The benefit therefore of this diſtillation and rectification, doth not onely conſiſt in the getting a far greater quantity of the pure Oil, but alſo in getting the Volatile Salt, (which as to its uſe is equivalent in vertue to the Oil) and withal, an acid Spirit which abundantly ſufficeth both inwardly and outwardly according to its Office. I do therefore earneſtly demand of all skilfull Spagyriſts (for 'tis in vain to appeal to ſuch as are yet ignorant what the Art of Fire is) whether or no this diſtillation is not to be preferred before the others, and to be made uſe of for the benefit of mankind. I hope that the well minded Reader will follow this rule, and will apprehend from this one proceſs onely, ſo much as to be afterwards eaſily able to reduce every diſtilled Oil into its former hardneſs, by the help of an acid Spirit. Let us conſider Amber onely, 'tis indeed a fine tranſparent kind of ſtone, which was before (or at firſt) ſoft and fluid as Turpentine was, an Oil or a kind of thin Bitumen, but now ſo hardened by the ſalt Water that it may be beaten to a Powder, yet may it be diſtilled and ſo ſeparated and cleanſed from its earthly Nature: And the pure Oil may be reduced into its former hardneſs, by the help of Spirit of Salt onely: For it became at firſt hardened by Salt, when it flowed thin out of the Rock: But of this enough, we ſhall ſay more of it in another place.

Now follows the Proceſs of purifying Minerals by diſtillation or ſublimation, and of depurating them even to the utmoſt, by rectifying them by an Acid Spirit. To exemplifie which, I will inſtance in Common Sulphur, according to which rule the other purification of Minerals may be inſtituted.

Take common Brimſtone, ſublime it the uſual way into Flowers, or by it ſelf in a Coated glaſs retort, or let it be mixt with decrepitated Salt, for ſo will it be freed from its moſt crude terreſtreity, and be rendered fit for a farther Mundification by an Acid Spirit. Take one pound of theſe Flowers of Sulphur, and put it into a ſtrong Glaſs Body coated, then pour in one or two pounds of the Spirit of Niter, or of common Salt, and place it in an Earthen-veſſel in Sand: Put there under a Fire, encreaſing it gradually untill the Spirit of Salt boils in the Retort, and the Sulphur melts, and there will ſwim ſomewhat like Oil on the top of the Water: *N. B.* An Alembick is to be put on the Body, leſt the Spirit of Salt aſcending up, goes away in fume; but in the Alembick it will be refrigerated, condenſed, and may be ſaved. This boiling is finiſhed in ſome five or ſix hours, and ſo the Sulphur is mundified, and becomes as clear and tranſparent as Glaſs. For the Spirit of Salt attracteth the Metalline Parts, which are in the Sulphur, whether it be Copper, Arſenick, Auripigment, Vitriol, or ſuch-like impurities which are commonly adherent, and ſtickers on to the Sulphur, and would otherwiſe have remained in it, and done more hurt in Medicine: And this *Paracelſus* knew, and adviſeth to beware of; For certain it is there lye hidden in Sulphur incredible Vertues, and ſuch as its common Flowers do not ſhew or diſcover, as being yet infected with Mineral venenate Spirits, which may be taken thencefrom by the *S*pirit of Salt. And if then either the Flowers be ſublimed out of it, or that it be diſſolved in a Balneum with Spirit of Juniper, or of Turpentine, or be by any other way reduced into a Liquid form, it doth much good in Medicine, nor is there any more fear of its venomous nature, for the Spirit of Salt hath took that away. I could indeed here mention ſome preparations of Common Sulphur, into efficacious Medicaments, but that I have intended to proceed no farther with it here, than onely as touching its purification by the Spirit of Salt: the reſt we will leave to another time.

As Sulphur may be proceeded with, ſo likewiſe may you deal with the other Minerals, and firſt mundifie them by a Retort, and diſtill them into black Oils, then may the Oils be clarified with Spi-

rit

rit of Salt, and be reduced into ſweet Oils and Balſams. Nor will any man eaſily believe what notable Vertues there are hidden in the mountainous and terreſtrial Minerals, and yet not uſefull at all inwardly, becauſe of their Arſenical nature, which may with eaſe be taken away from them by Spirit of Salt, and be thereby more ſecurely uſed as to Medicine. And had I not purpoſely tried it, I would not at all have written of it. For information therefore of the unexperienced, I will tell you a ſtory, whereby it will appear, that thoſe Minerals do uſually lodge in them evil and venomous Arſenical Spirits.

In the County or Province of *Erbach*, ſcituate between the *Mæne* and *Neker* in *Franconia*, is found plenty of a Sand knit as it were together by a fluid Mineral, and grown together into huge heaps like little Mountains of a duskiſh colour; which if you lay on burning Coals, emits a ſweet odour altogether like Amber. When I ſaw it, I put ſome into a Retort, and diſtilled an Oil thencefrom, wholly like the Oil of Amber both in colour and ſmell, and had uſed it in its ſtead, had I not ſhortly after tried another knack: For ordering the Chambers to be ſumed with the Sand, becauſe it yielded ſuch a fragrant odour, I very ſeaſonably obſerved that that ſume was unwholſome and venomous, for it cauſed pains of the Head, and a kind of nauſeate, 'twas alſo offenſive to the Stomach, and this made me leave off my Fumigations, and ſet about rectifying the Oil thence diſtilled, by the Spirit of Salt, and by this means I got a clear and pure Oil, and the Spirit of Salt attracted to it ſelf the Arſenical Eſſence, which being purged and rectified, yielded me at the bottom real Arſenick, whence I perceived that all thoſe Minerals are very Arſenical, and no ways fit for internal uſe, unleſs they be firſt mundified by the Spirit of Salt. Many ſuch kinds of Minerals are to be found, which we neither care for, nor know: ſome of which are as hard as a Stone, ſome thin, ſome fluid like Oil; ſuch an one is that Fountain about *Baccharach* that boils up in the middle of the *Rhine*, and fills the whole *Rhine* for about three miles ſpace and an half with its fatneſs, and yields a moſt fragrant odour, is of a duskiſh colour. For as I was ferrying by it, I took up ſome of the water in my hand, and queſtionleſs the Fountain of it muſt needs flow very plentifully, foraſmuch as the whole River *Rhine* is filled therewith as far as you can ſee, and yet ſcarce one Man amongſt a hundred or a thouſand doe in their ſailing by it take notice thereof. Doubtleſs this Fountain hath its efflux and riſe out of the Mountains which border on each ſide the River. Did it break out at the top of the Earth, it would be worth Gold and Cedar, but lying ſo deep, 'tis of no uſe. Were curious Men inhabitants there, they would doubtleſs find out this Fountain; For on this part of the *Rhine*, where the City *Baccharach* lies, is a high Mountain, where grows pretious Wine, and is in Foreign parts ſold at a dear rate, becauſe of its moſt ſweet ſavour and odour, and by the Inhabitants is called Muſcadel, and 'tis a ſort of Wine produced onely in this Mountain; nor can the neighbouring adjacent places make the like. Hence I preſume that this Fountain at *Baccharach* ariſeth from a Mineral Oil, flowing out from this Mountain into the *Rhine*, and that hence alſo ariſeth the goodneſs of the Wine. And whereas this Mountain affords not ſuch a quantity of Wine as the Inhabitants wiſh, they bethought themſelves of a remedy for this ſcarcity, caſting in Herb-ſcarlet into the common Wine, from which it got the ſame kind of taſte, and became almoſt Muſcadel. Nor let it ſeem ſtrange to any one for the Wine to attract a ſavour from the Earth lying about it, for 'tis very certain, and I my ſelf have tried it; And ſince it is ſo that this matter affords me opportunity of ſpeaking of theſe things, I will give you my opinion more clearly in what follows.

Below *Frankford*, ſome four miles from the River *Mæne*, there lies a Village called *Hohenheime* under the *Moguntia* Elector, and there's a Mountain which yields very good Wine, though not of ſo delicate a ſavour as that of *Baccharach*, yet 'tis of a ſweet ſmell, whereby it exceeds all the Rheniſh Wine, and is therefore dear; The cauſe of this, I attribute to the Soil, in which the Vines grow, which Soil brings forth Stone-Coals, and were heretofore digged hence, and are now again ſought after, which Coals have in them a ſweet Mineral Oil, as I ſhall ſhew you. Farther, there lies a high Mountain at the River *Mæne* about the Caſtle *Klingenberg*, ſcituate between *Odenwall* and *Speſſart*, where that Earth is found too, ſuch as I above mentioned, which yields a ſweet Oil in diſtillation. And this Mountain doth likewiſe produce ſweet and good Wine, ſo that it yields not a whit (in its kind) to that of *Baccharach* or *Hohenheime*. But now whether or no the Mineral Oil that is not far off to be here found, be wholly the cauſe, I doe not affirm, but I believe it, for my part, ſo to be, let another follow his own opinion. There is alſo a great Mountain at *Herbipolis*, at the *Steine* ſo called, that yields pretious Wine, but not of a ſavour like theſe three. Hence aroſe that Proverb: At *Baccharach* on the *Rheine*, *Herbipolis* on the *Steine*; *Klingenberg* on the *Mæne*, and *Hochheime* on the *Rehn*, are the four beſt Wines.

I confeſs there grows good Wine every-where on the River *Mæne*, but yet theſe four do far exceed all the others, and that haply becauſe of that ſweet ſavour which they attract out of the Earth where they grow. For it is certain that the Vine doth draw an odour and ſavour (more than all other Plants do) out of the Earth, whence it hath its nutriment: So that it is not very difficult for a good Phyſician to communicate to the Vine any ſavour that he liſteth (which will be) according to the nutriment which is put to the Root. I make no doubt but that there will be ſome Zoiliſts that will make a mock of theſe Reaſons of mine, as concerning the ground and riſe of the taſte of the Wine at *Baccharach*, *Herbipolis*, *Klingenberg* and *Hochheime*, and will not attribute the cauſe to the Soil, but ſay that my Reaſons are invalid ſhallow ones, the which deriſion I ſhall patiently undergo: ſuch kind of Men will rather drink the good Wine even to exceſs, than produce any reaſons whence the ſavour proceeds. But I ſpeak experimentally, and ſay that the Vines do attract a ſavour from the Soil whence they are planted; the which I have many a time tried and found ſo to be. Verily the Gardiners know, that Man's dung will give a nutriment or encreaſe to Flowers, but yet will put an odd ſmell upon them; And therefore do they carefully ſhun the putting it to the Roots of ſweet-ſmelling Flowers, but uſe it rather to ſuch as are void of odour, as Tulips and ſuch-like, that ſo they may grow the ſooner. 'Tis alſo evidently obſerved, that if the Root of the Vine be planted in ſuch a place where Man's dung lieth, it acquires an unpleaſant odour, and the Grapes are thereby ren-

dered unfit to be eaten. Beſides, the moſt curious Vine-dreſſers have long ago attained to this experience, that if the Scarlea or any other odoriferous Herb be applied to the Root of the Vine, it will beſtow its Odour on the Grapes, (but it ſerves for no more years than that onely) whereas if they pour upon the Root an Oil of a ſweet and ſtrong Odour, that Vine will produce Muſcadel for ten years and more, the which I have handled at large in the Vegetable work, and do mention it herein briefly upon this account; Becauſe that a Mineral Oil lies hid in the Earth in abundance, the which being incorporated in Plants, but in Vines eſpecially, produceth excellent Fruits, whereof but a few Men have the knowledge.

But now that I may yet demonſtrate this more clearly to the unskilfull, and conſequently incredulous, *viz.* that there is a moſt great ſweetneſs in the Minerals, which may here be extracted by diſtillation and rectification with Spirit of Salt, I will inſtance this example: 'Tis well known to all Men that the Stone Coals which are in many places digged out of the Earth, doe (being burnt) emit an ungratefull Odour, and are hence uſually eſteemed of as venomous; but in thoſe places where they are plentifully digged, they are daily uſed in coction, nor doth any hurt ariſe therefrom: So that it muſt needs be acknowledged, that they do not ſtink of themſelves, but that the Fire onely is the cauſe of the ſtink, and that their innate fatneſs is of a ſavoury and ſweet-ſmelling nature, yea ſo ſweet as any Vegetable, as I can eaſily evidence. You have an Example in Roſes, or any other Vegetable, which if diſtilled by a Retort, loſeth its ſweet odour, and puts on a ſmell of burning too: What hinders from being ſo in Minerals, as in Pit-Coals, and the like? I grant indeed, that if enough Oil would come over out of the Vegetables by an hot Still, there would be no need of this diſtilling by a Retort, and rectifying by Spirit of Salt, becauſe it requires a great deal of labour; but foraſmuch as there doth not diſtill enough over, 'twill behove us to acquieſce in this method. Nor fear I to affirm, that if it were poſſible to diſtill an Oil out of ſuch Coals by a hot Still, it would give place to no Aromatical Oil whatſoever in the ſweetneſs of the ſmell. From whence, I pray, ſhould ſo many kinds of Herbs draw ſuch various Odours and Savours, were there not lying hid in the Earth an Univerſal Sulphur or Balſam?

But to put an end to this diſcourſe, and that I may ſhew that the Pit-Coals do contain in them an Oil or pretious and wholſome Balſam, no whit inferiour as to its Vertues to any of the moſt pretious Oils or Balſams brought us out of the *Indies* obſerve but this proceſs.

Fill a Retort with Coals, and diſtill a black Oil, the which ſeparate from the Acid-water that came over the Helm with it, and rectifie it by Spirit of Salt, and ſo there will firſt of all come the clear and pure Oil, then a yellow Oil, not ſo ſweet as the former, and the thick and black Oil remains behind, and ſerves for to be mixt with Emplaiſters; for 'tis a wonderfull healer, by reaſon of its innate ficcity; now the yellow Oil may be yet farther rectified once more by Spirit of Salt, that it may become pure, white, and fair: But if you are yet farther minded to make a difference betwixt theſe pure Oils, and will again rectifie them with new Spirit, then ſhall you take the moſt pure part by it ſelf, which as to heat, ſubtilty, and ſweetneſs, is fully equal to the true Oil of Peter; and which being kept apart, and uſed for cold accidents, both inwardly and outwardly, will do the ſame, yea and much more than is attributed to the Oil of Peter. Nor is there any fear at all of theſe Oils being Arſenical, for the Spirit of Salt hath took off all the Arſenick in the rectification, and if you pleaſe you may uſe the Oil which comes next after the moſt ſubtile Oil in mixing it with Balſams, or it may be ſafely uſed by it ſelf, either inwardly or outwardly, and 'twill perform wonderfull things, and ſuch as exceed belief, foraſmuch as in Pit-Coals lieth a moſt great Balſamick vertue; If the depurated Sulphur which we ſpake of afore be diſſolved with this Oil, and reduced into a Balſam, thou ſhalt have a Medicament, which may deſervedly be ſtyled an Univerſal terreſtrial Mineral Balſam, and doth both as to inward and outward uſes far exceed all other Balſams: And therefore 'tis in my mind to prepare this Balſam in great quantity, for the benefit of Mankind: The moſt notable Vertues thereof ſhould I deſcribe, the very deſcription would amount to a particular Treatiſe, but that belongs not to this place, but it ſufficeth me to have at this time explained the manner of the preparation. I may haply (if God pleaſe) more largely teach concerning its Vertues, another time, as likewiſe the Vertues of the reſt of my Medicines.

And thus will I put an end to the Third Part of my *Pharmacopœa Spagyrica*, in which I have (in my opinion) mentioned ſufficient enough; and although it be but a ſmall Book to ſight, yet do great things lie hidden under it, which one amongſt a thouſand will ſcarce comprehend. But that the well-minded Reader may underſtand, what reality there is lies hidden in this Treatiſe, I will here teach by way of an Appendix one Proceſs onely, whereby it ſhall evidently appear how noble the Art of Purging things by diſtillation is. This operation is well enough known in the Vegetables and Animals, *viz.* that always from the thing you diſtill, the purer part comes over firſt, then the more vile part, but the unprofitable earthineſs abides in the bottom with the fixed Salt. Now in Metals this Proceſs is not ſo well known, nor will it be ſo ſoon made publick and common, nor indeed is it expedient, for this world is not worthy the knowledge thereof. But that I may ſatisfie my promiſe, and ſhew, that Metals may by diſtillation be made Spirits, and purged in the higheſt degree. I will make uſe of this following Example: 'Tis known to every one, that if any dry thing is to be diſtilled by the fire, ſome moiſture muſt be mingled therewithall, which may attract to it ſelf the groſs and heavy part, as you may ſee in the common diſtillation of Herbs, to which Herbs (when dry) Water is added, with which their ſavour and vertue diſtilleth over: And to every dry thing there is requiſite its proper humidity, which muſt of neceſſity have a Communion or Affinity with the dry, if it be to bring over the dry with it ſelf. Now common Water is able to carry over (in diſtilling) the odour and ſavour of Herbs, yea and of Salts, but not of hard Sulphureous or Mercurial Minerals, much leſs of the fixed Metals. But foraſmuch as Metals are Homogeneal, and cannot be purged by any force of Fire, nor ſeparated from the impure part, unleſs they be diſſolved by agreeable and convenient *Menſtruums*, and be rendered apt by diſtillation, for always that which is brought into Flores doth (if reduced) yield ſuch a Metallick

body

body as it at firſt came from. Thence aroſe an opinion of an impoſſibility of ſeparating the pure part from the impure. Indeed to the blockiſh and unskilfull all things ſeem impoſſible, and therefore from them is not to be lookt for any judging of good ſecrets.

But to return to my purpoſe, and ſhew that a Golden Eſſence may be diſtilled and ſeparated out of the crude Metals by Diſtillations, I will make uſe of a common Example. Diſſolve in a Common *Aq. Fortis*, made the uſual way of Niter and Vitriol, one Ounce of pure Silver; which being wholly diſſolved and reduced into pure Water, pour out the Solution gently into another Glaſs, that ſo if haply any Gold were mixt with your Silver it might ſtay behind, and not be diſſolved, or mixed together, leſt the Experiment prove fallacious. Then ſome common Salt is to be diſſolved in common Water, the Salt to be in weight equal to your Silver; and this Water is to be added to the diſſolved Silver, aud to be ſo long poured out of one Glaſs into another untill it be well mixt, then let it ſettle, and let the pure Water be poured off, and a white Powder of the Silver will remain, which is again to be macerated with pure Water ſeveral times, untill the Calx of the Silver be freed from all Saltneſs and Corroſivity; Then dry it, and you ſhall have a white and tender Powder, and very fuſile, ſo that it will melt even with the flame of a Candle, and is not unlike to a *Mercury*, but may well be called the *Mercury* of *Lune*, but the Chymiſts uſually call it the horned *Moon*, for being molten it reſembles the ſhape of an Horn, and with this may be wonderfull things effected both in Medicine and Alchymy; but belongs not to this place to ſpeak of, and therefore are to be but juſt hinted. And like as we have ſpoken of *Lune*, ſo likewiſe muſt we proceed with *Saturn*; and he will alſo yield you a white Volatile and fuſile Powder, as eaſily melting, yea eaſier than the *Mercury* of Silver, and is deſervedly called the *Mercury* of *Saturn*. Theſe two are willingly aſſociated to a third, *viz.* to Common *Mercury*, and do fix him, and ſo is that Axiome of the Philoſophers fulfilled, *Nature rejoyceth with Nature, Nature overcomes Nature, Nature retains Nature.* Farther, theſe *Mercuries* do admit of diſtillation and a ſeparation of the pure part from the impure, no otherwiſe than as doth a Vegetable. But the way of doing this is not to be ſo haſtily written, I ſpent a whole year in ſearching after it, till I found it, and ſo let another ſeek; and if God grants it him, he may enjoy it; And if God vouchſafeth him ſo much, he will alſo give him the knowledge how to uſe it: If the *Mercury*, which in it ſelf is white, volatile and fuſile, is rendered more white by diſtillation; 'tis alſo a neceſſary conſequence that it will become likewiſe more volatile, more fuſile, and more pure: but of this enough.

But to come yet nearer to the matter, and to ſhew that Metals may be ſo ſeparated by diſtillation as to become golden, take this Example: Take two Ounces of the aforeſaid horny *Lune*, and reduce it into Corporeal or pliable Silver, and ſeparate it by a Cupel, for then thou art aſſured that no other thing is in it but Silver: Diſſolve this Cupellated Silver again in common *Aq. Fortis*, and it will leave a good part of Golden Calx. Now it may be demanded, whence comes this Golden Calx? Comes it from the Silver, or the *Aq. Fortis*, or from the Salt-water, all which three were in uſe in the precipitation? I anſwer, that the Spirit of Niter brought over with it ſelf, in the diſtillation, a certain Goldeniſhneſs from the Iron and Copper which were in the Vitriol, and that in the form of a Spirit, and aſſumed its Body from the *Lune*. Now if any other Body concludes it to be otherwiſe, *viz.* that the aforeſaid Gold comes from the *Lune* onely, and not from the *Aq. Fortis*, I do but ask him this Query, Why the very ſame ſort of Silver, being diſſolved and precipitated out of the *Aq. Fortis* with Salt of Tartar, or by Copper Plates, be not equally as golden as this is which is precipitated with Salt-water? But ſome may yet urge farther, that this Gold proceeds onely from the Salt with which the Silver is precipitated, and not from the *Aq. Fortis* or Silver, becauſe the Silver being diſſolved in *Aq. Fortis*, and precipated with Braſs Plates, or the Liquor of Salt of Tartar, yields no Gold; but that onely gives Gold which is precipitated with Salt-water. To anſwer this Objection, and clearly to demonſtrate that this Gold owes its Original to them both, *viz.* the Tincture to the *Aq. Fortis*, but the Body to the Silver, and not to the common Salt, (for though there lies hidden in all common Salt a certain Golden power, which may be thence drawn by Art, yet that is not to be done this kind of way, but by another, which we mention in our Book called *the Conſolation of Sailours*) I do certainly know, that this Gold proceeding from the precipitated Silver, doth ariſe from the Vitriol and Silver onely, and not from the Salt: And this may be clearly obſerved thus; If you add to the Vitriol and Niter a Verdigreaſe prepared with Sulphur and Salt, the *Aq. Fortis* will be twice more Golden than if 'twere made of onely Vitriol; the reaſon is this, becauſe the Iron and the Copper are fixed in the Vitriol, and do not eaſily yield Gold; but if the Copper be firſt reduced with Salt and Sulphur into a Volatile Calx, and be added to the Vitriol and Niter, then is this kind of Labour done to profit, elſe not: This which I write is onely to demonſtrate the poſſibility. And ſhould you add to the Vitriol and Niter, or to Allum and Niter, other Species containing Volatile Gold, as *Calaminaris*, *Zinck*, and ſuch like, the Water will be rendered ſo much the more Golden: But if you add to the Niter and Vitriol ſuch Species as contain in them Volatile Silver, ſuch as are *Cobolt*, *Biſmuth*, *Arſenick*, then the *Aq. Fortis* is rendered more Silvery, and makes part of the Copper in the Solution purely Silvery, like as the Goldeniſh water when 'tis in the Solution makes part of the Silver Golden. By which it is demonſtrated, that crude Metals are depurated by diſtillation, and may be made Volatile, and that by that means of Solution, Corporal Gold and Silver may be precipitated out of the Metals, according as the Diſſolvent is prepared out of Golden or Silvery Subjects.

This Example I account ſufficient to evidence, that the crude Metals may be purged by Diſtillation ſo as to become golden. If then it be ſo with the crude and impure Metals, what then may be done with the pure ones if they be made by Diſtillation, yet more pure; without all queſtion a moſt excellent medicine might be from thence prepared, and far to be preferred to Gold or Silver. This diſcourſe do I here make uſe of to the intent that it may be ſeen, that even fixt metals being after a due manner opened and made volatile, are capable of ſending out their beſt part, and of being ſeparated by Diſtillation from the more crude part. But this Treatiſe appertains not to Alchymy but to Medicine, and yet I thought

thought good to induce this argument, *viz.* (that out of crude Vitriol, may a volatile Gold be drawn by Diſtillation and be incorporated with Gold and Silver) to this end that all men might know of a certainty, how much good may be done in metals by Diſtillation, and what a pure ſubſtance may be thence drawn. Nor doth *Baſil Valentine* that *German* Philoſopher, doubt expreſly to write that the Philoſophers Stone is full as eaſie, yea eaſier to be prepared out of Vitriol than Gold. If therefore the higheſt univerſal medicine both for man and metals may be prepared out of common Vitriol, why may not the ſame be poſſible to be done out of the purer metals if they were reduced into Vitriol, and ſo as to admit of Diſtillation, whereby the pure may be ſeparated from the impure.

If now the common Vitriol of Copper and Iron, do in Diſtillation yield volatile Gold, why ſhould not the Vitriol of *Lune* do it much more and yield it nobler, as being indeed the true and onely metallick Vitriol of the Philoſophers, which *Baſilius* appoints to be taken for his Work, and doth truely deſerve the name of Vitriol. For if you would have your common Vitriol tinge, you muſt add Galls thereto, but this Vitriol doth truely blacken all things without Galls. But you muſt not imagine that I do here intend ſuch a Vitriol of *Lune*, as is by ſolution (in *Aq. Fortis* reduced into a white Cryſtal, or ſuch as is precipitated by the water of Salt out of the Solution (in *Aq. Fortis*) no ſuch matter? For this reſembles not Vitriol, becauſe it may be again reduced (into Silver.) But the true Vitriol of the Philoſophers is prepared out of *Lune* without *Aq. Fortis* or ſuch like Corroſives, and is not reduceable in the ſtrongeſt Fire, but remains a Vitriol, tingeth the Tonge, is aſtringent, and yields a golden Water, which diſſolveth Gold and fixeth it therewith. Such a Vitriol will we make uſe of in medicine and Alchymy, and leave the common Vitriol for the Dyers. The Ancients called their Salt Vitriol, on this account, becauſe that it did as to its external Figure reſemble Vitriol, but though they ſo called it, yet they took not the common Vitriol, which every wiſe man may be eaſily perſwaded to believe. So then let the *Lune* be the Earth, Gold the Seed, and *Mercury* the (Water, but not the common *Mercury*) with which it is to be watered, and let the reſt be committed to God and Art. Thus far have I declared to you my opinion, let every man follow his own. But thus is confirmed the aſſertion of that excellent Philoſopher *Baſil Valentine*, who affirms, that even out of common Vitriol may be extracted a certain goldenſhneſs; how much more credible then is it, that a Vitriol prepared out of the more pure metals may yield a better goldenneſs. Every one may believe what I here write for I have oft times tried it, but yet I have received more Gold ſometimes than at other ſome according as I ordered my proceſs, and reduced my precipitated Silver; for you are to know, that ſuch a kind of Silver as is precipitated out of *Aq. Fortis*, by the Water of Salt is wholly volatile, nor melteth it like to a Calx of *Lune*, but goes away partly in fume, and part is reduced into an horny Stone, and yet by a peculiar Diſtillation doth all come over, but enough of this. Hereupon is Salt of Tartar to be added to this volatile Calx, leſt being molten it vaniſheth away in fume, for Borax doth not prevent it. But it melteth better if it be help by that notable fluxing Powder, made of Niter, Tarter, and Sulphur, and it be kindled by a little Coal and burnt up, but then all the Silver doth not melt, but part of it goes away in fume. *N. B.* If you catch this fume which is a thing eaſily done, it reſembles the form of a red Powder, and will abundantly recompence your pains, nor may that ſaying of *Paracelſus* be unfitly applied hereunto, *viz.* to corrupt is totally to perfect, becauſe theſe Flores of Silver are not loſt, but are of a greater price than the Silver was. He that well knows this labour (for indeed experience is the beſt maſter) will not labour in vain. And if he learns nothing from this little here taught, neither will he find out ought from a greater. For I have in theſe few words revealed much, yea haply more than I ought to have done. All which we do in the firſt and chiefeſt place attribute to God, next him to Niter, which renders Metals ſo fluxible. From hence may the well minded Reader percieve that there is in Niter, not onely a power to fix all volatile Minerals and Metals (of which I have treated in my ſecond part of the Proſperity of *Germany*) but alſo of making them wholly volatile, ſo that they may be diſtilled and purged, as is ſufficiently evident in the aforegoing example: Beſides, there is another way of making Metals volatile, as well as by Niter, but ſo as that they be not wholly diſſolved, but are by a moiſt nitrous Fire reduced ſo far as to retain the form which they put upon themſelves in the ſaid moiſt Fire, and yet they become ſo volatile, as to ſuffer themſelves to be wholly diſtilled and ſublimed, and will in the *Proba* give Gold, the which the gradatory Water hath made in them. But of theſe things more at large in the fourth part of the Proſperity of *Germany*: Thus with what hath been ſaid, will I finiſh the third part of my *Pharmacopœa Spagyrica.*

The End of the Third Part.

THE

THE FOURTH PART OF THE Spagyrical Pharmacopœa.

Treating of the four principal Pillars of Medicine, *viz.* Sulphur, Vitriol, Antimony, and Mercury, but chiefly of the great harmony between the Superiour Elementary Sun and Moon, and the Inferiour and Terrestrial Gold and Silver, and the magnetick way of attracting the Virtues of *Sol* and *Lune* by the Air, and of rendring them palpable and visible.

READER,

After that I had intended to publish in the Fourth Part of this my Spagyrical Pharmacopœa, *some singular and excellent Medicines, and such as might much exceed all others, and so must consequently be prepared of choice and excellent subjects and matters; I accounted it my task in the first place to shew you out of what subjects such efficacious Medicines may be drawn and extracted,* viz. *out of Gold, Wine, and Antimony, as likewise out of Vitriol and Mercury, but not the vulgar Mercury.*

Now although most Men are blinded with a thick darkness, but principally those that prosecute the truth with a deadly hatred, and do prate much, and by reason of their blindness and ignorance do affirm, that Gold being a thick and compact body is not at all fit to admit of such a preparation as thereby to display its most efficacious virtues in Man's Body: And as for Antimony and Mercury, that they are most present Poisons, and can't serve as Medicines without great danger; but as for Wine, that it is indeed fit to be drunk, but is of no validity in Medicine, not knowing how to imploy it about any Medicinal use, but are rather ready and skilfull Artists at swallowing it down in full draughts; however though they thus chat yet these objections are frivolous, and do proceed from their ignorance which is wrapped about with most thick Clouds, and which I refute by this brief and strong Reply. But I do not at all deny, that Gold reduced even to the smallest Powder, and so made use of (as 'twas wont of old to be by the Ancient, yea and latter Galenists, and is even too at this day) by mixing it with such Medicines as are for the comforting and strengthning the Heart and Vitals of Men, cannot contribute so much as the least Iota *to the health and preservation of the body of Man: And so I say of Antimony and Mercury, that they are not at all salutiferous to Man's Body, but contrariwise are deadly and destructive Medicaments, untill (by a due preparation) they are deprived of all their Venenosity, and thereby rendred fit to be safely made use of. So Wine it self being taken* per se *as it is, is a restoring and refreshing Drink for Man, provided it be moderately used: But contrarily is a causer of many Diseases if it be frequently and in large quantities swallowed in, and doth operate in Man's Body more hurt than good, this daily experience doth sufficiently testifie, and renders it evident, that being so immoderately taken, it fills all the Members of the whole Body with Tartar, and makes obstructions and stirs up intolerable Pains, and principally in the Bladder, Reins, and other parts of the Body,* viz. *if coagulated in the Hands, Knees, and Feet, whereupon it doth not easily suffer it self to be exterminated, unless by such Artists as well know the properties and nature of Tartar, but of such Men there is at this day a great scarcity, and therefore that proverbial Verse still takes place.*

Solvere Nodosam Nescit Medicina Podagram.

The Art of Physick can't root out
(Thy dire Disease) the Knotty Gout.

But he who is ſo well skilled as to ſeparate the fiery, penetrative, wholſome, and true Medicinal Spirit of Wine; Yea its true Balſam from its Fæces, he will eaſily expel out of the Body of Man all tartarous impurities and defilements, and will perform things wonderfull in the Stone and Gout. But now foraſmuch as the educing ſo wholſome a Medicine out of groſs crude Tartar is known but to a very few, no wonder that there hath been ſo little or rather nothing at all performed by Phyſicians in ſuch like moſt grievous tartarous Diſeaſes that have gotten deep rooting in the Body of Man. But the way how you may be rendred Poſſeſſors of ſuch a Spirit of Wine ſhall be ſpoken of afterwards. Yet I would not that any one ſhould perſwade himſelf that my meaning and intention in this place is about the common Spirit of Wine, or either that which is gotten out of Tartar by the uſual known way of Diſtillation. No, there's a vaſt difference betwixt that Spirit which I here make mention of and the other. For in this Spirit the crude Tartar is firſt to be waſhed by common Water from all its Defilements, and that without the addition of any other things, ſo as to ſhine like Snow, then to be afterwards made black by putrefaction, and out of that blackneſs the ſaid Balſam is to be drawn off, of which we ſhall hereafter make a more ample Declaration. This now is that Spirit which doth Anatomically reſolve the compacted Body of Gold, and converteth the venemouſneſs of Antimony into a wholſome Medicine, and doth perform things wonderfull in all tartarous Diſeaſes. 'Tis the true Wine of Health, and the very Aq. Vitæ *of the Philoſophers, and hath a great familiarity with Gold and Man, and may be excellently compared with the coagulated ſolar beams.*

Therefore as it is evidently known to every body, that Gold and Wine are advanced on to maturity, by the heat of the Sun, and that Men do notably love and deſire both of them. So may any one conjecture what Gold and Wine would do if a Man could but have them reduced to a ſpiritual eſſence. Hence now it ſeems neceſſary unto me, that before I paſs on to the preparation of the ſaid Medicine, I do in a few words deſcribe the harmonial love that is between the ſuperiour and inferiour Sun and Man, that ſo it may appear, what a bond or tie of love and neceſſity there is betwixt theſe three moſt noble Creatures of God, to one another.

CHAP. I.

Of the Harmony and Agreeableneſs between the Superior Elementary, and Inferiour Earthly Sun, with Wine and Man.

'TIS well known even to the blind Bayards and Barbars, that the Sun in the heavenly Firmament, is the moſt noble and moſt eminent Creature God made. For it is that onely light which makes all the Stars partakers of its Splendour, Light and Brightneſs. 'Tis alſo the onely Fountain and as it were Father of all the Creatures, becauſe if they are deprived of it, they are in the dark and die: Nay even man himſelf cannot live without the help of the Sun, and all things would periſh, ſhould the Sun be but one moment withdrawn from them. For all things that are do receive their Life and Augmentation from the Sun; and he was (according to *Moſes* his Doctrine) the firſt and chiefeſt that did proceed forth by God's creating, and will doubtleſs be the laſt when all things ſhall be diſſolved, and paſs into a better State at the final Deſtruction of this worldly Fabrick. The Sun ſupplies the place of a heart in the wonderful Structure of the Macrocoſm: And in like manner the heart it ſelf in man's Body is aptly compared to the Sun, as being the firſt liver, and laſt dier in the humane Fabrick; and this is known to every body. And therefore amongſt all the Creatures indued with life and motion, man doth in nobility and magnificence excel them all, as having gotten his body from the earth, his Spirit and Life from the Sun, and his Soul from God.

But as to the inſenſible Creatures the higheſt Degree of Nobleneſs is attributed unto Gold, the which is likewiſe generated by the Sun. Theſe three admirable Creatures, *viz.* the Sun, Man, and Gold are coupled with a bond of wonderfull Neceſſity and Friendſhip, and are conjoined by the inſtinct of Nature her ſelf. Men do deſire the Light of the Sun, as alſo its heat in a dark and cold Seaſon, for thence-from proceeds all life, and all the encreaſe of life, becauſe the Suns beams do perform the office of the univerſal Spirit, and Life in the Conſervation of the Life of Man. But now as touching Gold, men do partake of that in a particular way onely, and one man is uſually ſtored with a bigger Portion, another with a leſſer, not by the inſtinct of nature, for ſhe beſtoweth it on us onely for our uſe, but by reaſon of the abuſive malice, avarice and the unſatiable Covetouſneſs of men; but yet this way is not the right manner of loving Gold, nor genuine, but falſe and oft times very hazardous. We ſhould rather love it becauſe of its wonderfull Vertues which it poſſeſſeth, hidden in its body, and may afford a moſt notable Comfort to man's ſickneſs and infirmities. Verily the Ancient Philoſophers were not ignorant of the incredible Vertues, which the Gold hides in it ſelf, it being truely no other thing than a body conſiſting and compacted of the coagulated and fixed Beams of the Sun, and this was well known to thoſe men who were moſt skilfull in the nature of all things. Seeing then that the Sun's beams being as yet unfixed can beſtow on all things life and encreaſe, why may not the ſame be accompliſhed by them when fixed, and made conſtant, if ſo be they be rendred ſpiritual, and thereby be capable of diſplaying their Vertues in a viſible and palpable efficacy, which thing they could not do if they retain their corporal Coagulation, nor can diſplay their occult Vertues.

Many

Many men have induſtriouſly attempted with great Labour, artificially to open Gold, and to reduce it to a ſpiritual Nature, and to render it living and efficacious, but few there have been that have been Maſters of their deſires, but ſuch as at length had thereto attained, did perform things wonderfull in the ſickneſſes of mankind, and this is witneſſed by many moſt true Hiſtories, as for inſtance, by the *Turba* of the Philoſophers, and by the *Theatrum Chymicum*. The which Books do indeed deſcribe ſuch a notable ſecret, but ſo obſcurely and intricately, as that no body can therefrom learn its preparation, unleſs God reveals it to them, or it be manifeſted by ſome good friend or other that knows the Art. 'Tis no wonder that amongſt many thouſands of Searchers, ſo very few do arrive to the knowledge of the ſame. For God hath barred up this ſo great a ſecret with ſuch firm bolts, that all wicked and malicious men are eaſily excluded from the knowledge of finding it out. Verily I muſt needs ſay (but I boaſt not of it) that I ſee by what means thoſe bonds are to be looſed, and that precious Pearl may by removal of thoſe bolts be taken forth. But yet I profeſs not my ſelf to be a perfect and abſolute Maſter, and ſuch an one as perfectly knows its preparation, and would make it publick by deſcribing it. No! the Crumbs ſerves my turn, and the Fragments of the Bread, with which hunger may be allayed as well as with the Bread it ſelf.

I have I confeſs taſted ſomewhat of the Crumbs of what pertains to ſo worthy a Medicament, and with what great Vertues they abound. And ſuch things as my experience have adminiſtred unto me I have here purpoſed to reveal them, for the comfort and ſake of my Neighbour, as far as the time and occaſion will permit; but yet with this *Salvo*, that I caſt not Pearl before Swine, and ſo incur the Philoſophers Curſe. To whomſoever the things that I ſpeak ſhall be more obſcure, let him wreſtle earneſtly by his Prayers to God for light, and refrain from troubling me with multiplicity of entreaties, for I have firmly reſolved with my ſelf not to reveal for the time to come more than what I have opened in the preſent deſcription.

CHAP. II.

Of Gold, and the Compariſon betwixt it when living, and when dead.

IT is ſo well known as that nothing can be more known, that Gold being ſo compact and corporeal and without any opening, doth not when uſed inwardly to man's Body emit any Vertues at all. I will inſtance in one Example of Mercury; This being living and unbroken and undiſſolved, doth not, though uſed inwardly in a great weight, bring any hurt, but paſſeth out again as 'twas before taken in without any alteration of the Body. But if it be ſublimed with Salt, or ſhall be diſſolved by ſome other corroſive Water, and be adminiſtred to a man to drink the quantity of 1, 2, or 3 Grains it will ſhrewdly hazard his Life, becauſe the Salts have made its hidden lurking Poyſon manifeſt. Thus ſtands the caſe with Gold, which cannot ſhew forth its hidden force and vertues as long as it remains bound and tied with the fetters of its own compaction, but (on the other hand) diſplays them, aſſoon as ever it ſhall be releaſed from its bonds, be vivified by Salts, and rendred efficacious. You ſee in a black Coal, whiles it is not fired, there is not any heat at all perceived, but being kindled, and being by the Air rendred living, it diſcovers the fire and heat being therein hidden, the which you may likewiſe conſider of concerning Gold.

CHAP. III.

Of the Preparation of Gold, and its Diſſolution into moſt tender Atoms apt for vivification and profitable application to Medicinal uſe.

GOLD doth not by any way more eaſily admit of being turned into moſt tender and moſt ſubtil Attomes than by this following.

Diſſolve pure Gold in *Aq. Regia*, and being diſſolved pour thereto as much of the Water of Tartar as is ſufficient: So the clear Gold, and clothed too with a golden Colour, will precipitate it ſelf to the bottom of the Veſſel, nor will it be a darkiſh Powder, as 'tis wont to be if precipitated by *Lixiviums* or by the Spirit of Urine: But it is light and tender, and ſhews in brightneſs like little golden Stars, yea becomes ſo very tender and ſubtil, that it ſwims as 'twere in the Water and ſettles to the bottom exceeding leaſurely, and is thereby ſo much worthier than all other *Calxes* of Gold how ſubtil ſoever they be, that they may be accompted of (if compared with this) but onely as a groſs Earth; whereas theſe ſhining golden little Stars are made ſo tender and ſo ſubtil, as that they may eaſily diſcover and demonſtrate their Vertues in medicinal uſe very notably, by the help of other things, and by being diſſolved ſundry ways.

CHAP. IV.

By what means this moſt pure Calx of Gold is to be farther opened, whereby it may be inverted, made volatile, and rendred like to a Vegetable.

THIS tender *Sol* or *Calx* may be brought to ſuch a paſs, without any corroſive in 24 hours ſpace, as that it ſhall not remain a fixed metalline Body, but become wholly volatile as it was at its beginning. Now this is effected by the help of the Salt of Nature onely, which is to be found every where, and may be gotten by the poor as well as by the rich. Yea ſo eaſie as that it is ſcarce credible, ſhould it be manifeſted openly and clearly, and which thoſe Brethren of ignorance and proud Court-like Flatterers would entertain with ſcorn and deriſion, and accompt the truth it ſelf to be a lie, as hath been oft times done hitherto. 'Tis better therefore to paſs over ſuch things in ſilence, than by benefitting others to injure ones ſelf. For ſuch Arcana's are to be wrapt up in ſilence, and not to be caſt before ſuch Hogs. But yet to the Adept ſhall be revealed ſuch things in the end of this writing or treatiſe, as they have been hitherto ignorant of.

CHAP. V.

Quæry, *Whether or no theſe moſt ſubtil Atoms of Gold are capable of performing any thing in Medicine, and of diſplaying their hidden Vertues like Vegetables, without any other unlocking of them.*

FOR anſwer, I ſay no. For the Stomach is too weak to diſſolve and get thence that efficacy as it doth

doth from Vegetables, though it be thus reduced in a moſt tender and ſubtile ſubſtance. In vain therefore is it adminiſtred to the ſick, becauſe it paſſeth out again with the Excrements ſo as 'twas taken in, and that without any remarkable efficacy.

CHAP. VI.

Quæry, *Whether or no the Stomach may not be ſo help'd as that it may be able to diſſolve and conſume Gold as well as Iron and Copper.*

FOR anſwer I ſay, yes. And foraſmuch as the moſt thin filings of Iron and Copper, being given any one to drink, are digeſted and conſumed by the natural acidity of the Stomach, or are by diſſolution there turned into Vitriol, which (ſaid Vitriol) doth vehemently ſtir up the Body by Vomit, and by Stool (according to the quantity of the exhibited Metals) and killeth the Worms both in old and young folks, and caſteth them forth, and coloureth the very Excrements as black as a Coal; hereby evidently demonſtrating, that being diſſolved and conſumed by the Stomach, it hath brought out, together with it ſelf, the ſlain Worms; Any body may eaſily conjecture that the Acidity of the Stomach was ſufficiently ſtrong to ſet upon the two aforeſaid Metals, being of a Salt nature, and of an eaſie Solution, and to reduce them ſo far as to cauſe them to diſplay their hidden Vertues. But now the Stomach is not endued with ſo ſtrong an Acidity, as to be able to ſet upon and diſſolve Gold and Silver, being Metals as 'twere void of Salt, and admitting no Solution there. Hereupon it uſually happens, that they being uſed inwardly in Medicine, do come away with the Excrements in ſuch form as they were adminiſtred in. Thence do the unskilfull conclude (but falſly) that there are no Vertues in Gold and Silver, becauſe that being brought into a moſt ſubtile Powder, and adminiſtred to the ſick, they are notwithſtanding deſtitute of any kind of Vertues. The reaſon why they do not operate at all is, becauſe the Acidity of the Stomach is not ſufficient enough to work upon them, and to ſtir them up to operation. But being diſſolved by Acid Spirits, *viz.* the Gold by Spirit of Salt, and the Silver by Spirit of Niter, they doe evidently ſhew their Vertues in Medicine, being inwardly taken, and do purge the Body no leſs than Copper and Iron doe, and do withall colour the Excrements black, and kill the Worms both in old and young: Neither indeed will any find a more preſent remedy for killing the Worms, which do oftimes deſtroy many Infants and Children deſtitute of any kind of help, than the Vitriol of Gold and Silver, about which ſhall be written a peculiar Chapter anon.

But foraſmuch as the diſſolved Metals, but eſpecially Gold and Silver, do by their ungratefull ſavour offend the Palate, and dye the Tongue and Lips of a black Colour; Men do abhor to uſe them, although they might be very helpfull in Medicine: But however theſe diſcommodities may be prevented, by rendring the ſaid Metals acceptable to the Palate, and ſo ordering them as that they ſhall no more Colour the Lips, but evidently ſhew forth their Vertues, and perform great matters in Medicine. This now may be done divers ways, ſome whereof ſhall be here deſcribed and declared.

CHAP. VII.

By what means Gold may be brought to ſuch a paſs at that (being inwardly made uſe of in Medicine) it may diſplay its virtues and be ſtirred up to operation by a guider (or leading Card as 'twere) added thereunto.

GOLD being reduced by the way now ſpoken of into moſt tender (Atoms, may be ſtirred up divers ways, ſo as that being inwardly adminiſtred, it may manifeſt its virtues and that notably and efficaciouſly.

As firſt when ſuch Salts are thereunto added as do corroborate the Stomach, and augment its acidity, ſo as to make it ſtrong enough to work upon the tender Gold and diſſolve it, and to turn it into Vitriol in the Stomach, in which caſe my *Sal Mirabilis* is very excellent, but yet other Salts are not to be deſpiſed, to each of which I give the honour due unto them.

Then farther, the ſame may be done when ſuch Mineral Species are added to the ſaid Golden Calx as do by their natural propriety expell by Sweat and Urine: For a Mineral Medicine, as ſoon as ever it begins its operation in the Body, whether by Sweat or by expulſion by Urine, doth alſo ſtir up the Gold to operate, ſo that it works too after the ſame manner as the Medicament adjoyned to it is wont to operate, juſt as 'tis uſually wont to be in ſome kind of Fraternity or Conſortſhip; If one begins to ſing, to dance, to be enamoured with a Virgin, to brawl, or to play, he preſently ſtirs up others to do the ſame, who would otherwiſe have abode ſtill. Now as to the Minerals, amongſt the many inciters there, Antimony obtaineth the firſt place, and doth ſtir up to operate with himſelf any ſuch things as are thereunto adjoined, whether they be Gold or Silver, yea though they be dead. And ſo a Mineral being purgative, or Diuretick, being mixt with Gold, doth perform its operation much more ſafely and efficaciouſly than if it were alone and uſed *per ſe*, inwardly, without any addition of Gold thereunto. For the tender Gold is ſtirred up and driven as 'twere to Cooperate together with the operation of the Mineral Medicament, which otherwiſe, and without ſuch an impulſion and incitement would have remained as dead, and void of any kind of operation, and ſo paſſed forth together with the Excrements.

CHAP. VIII.

A better way of making Gold and Silver living and efficacious.

GOLD and Silver may be made living and efficacious after another and better way and manner, thus. If they be diſſolved in ſuitable Waters, and made Spiritual, and ſo uſed in Medicine, for they are by this means fitted to operate and diſplay their Vertues after their manner, and according to their preparation.

The manner of making ſuch well opened and unlocked Golden Water, I taught ſome years ſince, and publiſhed it under the title of *Aurum Potabile*. For I then knew a way of reducing Gold into a white Water by ſome certain Medicinal Salts, and have it now

now by me at all times, as being better and far more excellent than that former *Aurum Potabile*, and may ſupply the place of an Univerſal Medicine; and that on this account, becauſe it doth operate univerſally in all curable diſeaſes, and doth withall excell all the other Medicaments that I know of in its wholſome operation, for it doth by little and little expell every obnoxious thing out of the whole body. I confeſs that the ſame things are performed by my Golden *Panacæa*, or my Purging Gold, and Diaphoretick Gold, but in ſome caſes I prefer this white *Aurum Potabile* of mine, as I now prepare it, before them, for it hath an inviſible and contrary or different operation from my Purging Gold, or Golden *Panacæa*, which do, for the moſt part, work viſibly. And whereas I have formerly divulged thoſe Medicaments in my Treatiſes, I will omit their ſuperfluous deſcription here, and onely add thus much, That theſe three Medicaments of mine, *viz.* the Golden *Panacæa*, my Diaphoretick Gold, and my white *Aurum Potabile* are ſo abundantly ſufficient both for the preſerving from, and curing of all diſeaſes, that whoſoever will onely uſe them, need not at all any other Medicaments.

But foraſmuch as Men are delighted with variety, and that ſometimes ſuch or ſuch a coloured Medicine, or ſuch an Odour or Savour is far more acceptable, I have judged it worth while to add for the ſake of the ſick yet two or three excellent Medicines more, and ſuch, as to the beſt of my knowledge, were as yet never divulged. 'Tis at every ones liberty to make uſe of ſuch an one as beſt likes him, or now and then to try this Medicine or that, and ſo to make uſe of that which beſt pleaſeth him.

The incomparable *Paracelſus*, the Monarch of Philoſophers and Phyſicians, ſuppoſed, that theſe four Minerals, *viz. Sulphur*, *Mercury*, *Antimony*, and *Vitriol*, did prop up the whole Medicinal Art, like ſo many Capital Pillars, and that by them mought all things be prepared, as were neceſſarily requiſite for any kind of cure. And indeed the thing it ſelf (or the effect) ſufficiently proves the truth of this opinion, and ſo doe thoſe four Minerals themſelves too, if they be but diſſected, purged, and prepared according to Art, elſe they are of no worth, but doe more hurt than good, becauſe if they be not duely prepared, they are not deprived of their Venenoſity, and are not turned into wholſome Medicines. But as for ſuch as are ſet to ſale in our days in the Apothecaries ſhops, they are verily but of ſmall moment. For the Antimony which (being turned into Glaſs) they ſell, hath never as yet admitted of any ſeparation of the good from the evil.

And as for *Mercury*, they turn him into a Sublimate, abounding with Venom, and likewiſe into a red Precipitate, both of which are ſufficiently hazardous both in external and internal Medicinal uſes; For the vulgar *Mercury* never deſiſteth from his malice, unleſs it be exalted by a ſafer and better preparation. It is ſufficient (to ſay) that being prepared after the aforeſaid uſual ways, it ought to be wholly ſhunned, and ſo it will not create any danger.

As for Common *Sulphur*, although it be exalted into Flores, and thoſe exceeding ſubtile too, ſuch as are at this day in uſe, yet ſhews it no wonderfull matters; for there is not as yet made any ſeparation of the pure part from the impure, neither is it thoroughly opened by Sublimation, or rendered ſubtile or fit, to operate upon the Body of Man; for as it was taken in, ſo it paſſeth out with the Excrements: For the Acidity of the Stomach cannot diſſolve it; ſo far is it from yielding to the Stomach any efficacy, for a ſtrong *Aq. Fortis* cannot diſſolve it.

As for *Vitriol*, it yields the Workmen an auſtere or ſowr Oil, and a ſharp Spirit, little availing to Medicinal uſes, this onely excepted, *viz.* the mixing it with cooling Syrups and Conſerves, gives them a gratefull ſowriſhneſs; the which Spirit of Salt well rectified, would perform much better. Hence it comes to paſs, that theſe four Minerals, according as they are at this day uſed, and ſold by the Apothecaries, cannot be accounted for the four Pillars of the whole Body of Medicine, and poſſeſs that title, which *Paracelſus* exalteth them by, unleſs they are prepared after another manner than they have hitherto been

As for *Sulphur*, I bring it to the higheſt purity by a due waſhing, and do by ſuitable and proper Salts turn the ſame, together with Gold, into a clear water, that ſo our Nature may aſſume it to it ſelf, as is to be ſeen in my *Aurum Potabile*.

I draw from Antimony its purer part, and I implant it in exceedingly well prepared Gold, that it may make the Gold efficacious, witneſs my Purging Gold.

Inſtead of the common *Vitriol*, I uſe the *Vitriol* made of Gold, the which is wont to perform ſuch effects in Medicine as the common *Vitriol* never will, as ſhall be taught by and by.

Inſtead of the common and poyſonous *Mercury*, I make uſe of a *Mercury* prepared out of a good Metal, or artificially extracted by a certain Magnet from the beams of *Sol* and *Lune*, as ſhall be taught anon. And this *Mercury* is rightly called the Univerſal *Mercury* of the Philoſophers, becauſe being as yet an inviſible thing, is extracted out of the Air, and made viſible and palpable, and is the effector of wonderfull things in Medicine and Alchymy, as we ſhall hear anon.

But before I proceed to *Vitriol* and *Mercury*, I count it fit, firſt to ſet down a good Medicine prepared out of Silver by the help of Antimony, that ſo every body may know, that even Gold and Silver (how thick and compact ſoever they be) may, by the addition of other Medicinal Subjects, be quickned and ſtirred up, and be brought to ſuch a paſs as to emit their Vertues, as we have afore mentioned more at large. The preparation of this Medicine out of Silver and Antimony is as followeth.

CHAP. IX.

The manner of preparing a good Medicament out of Silver and Antimony.

IN the firſt place prepare out of the Mineral or Oar of Antimony an *Acetum* by diſtillation, according to Art: Then take one part of the beſt Antimony, and two parts of the Calx of Silver; which being well waſhed, mix it with the Antimony, by grinding them very well together, that they may be changed into a grayiſh or ſomewhat a blackiſh Powder. Put this Powder into a ſmall Glaſs, Cucurbit or little Retort, and pour thereupon ſo much of the Antimonial Vinegar as may ſerve to bring the ſaid Powder into a thin Pultis or Pap. Put the Glaſs in Sand, and diſtill off the ſaid Vinegar, this pouring on, and drawing off let be ſo often repeated untill the Antimony ſhall have loſt its blackneſs, and the

Silver its whiteneſs, and be both of them turned into a red Stone, like to *Cinaber*, which is uſually done in the third or fourth Cohobation.

Note well, if ſuch an errour ſhould be committed as that your fire being too ſtrong ſhould when you draw off the *Acetum* melt the maſs in the Glaſs, it would be rendred wholly uncapable of admitting or drinking up the *Acetum*, and then you muſt of neceſſity break the Glaſs and take out the maſs and reduce it again into ſmall Powder by grinding, and repeat the operations according to the aforeſaid way. This Medicament being turned into a red Stone, and ground upon a Marble into a moſt ſubtile Powder, is called by me purging *Lune*, and may be made uſe of in all Diſeaſes as a kind of *Panacæa*, (like as my purging Gold may be) with great fruit and good ſucceſs. For this Medicine of Silver doth operate very gently, expelling all evil humours out of all the Members of the whole Body of Man, and this ſcarce any other Medicine will do ſave my golden *Panacæa* For it leaveth no impurity in the Body, (but expels it) not onely by purgation, but alſo by Sweat and Urine. If you ſhould chance to err and take too big a Doſe, it will alſo cauſe vomiting, but eſpecially with ſuch as abounding with Choler are prone to Vomit. To Infants under four Weeks old may a Doſe be given of about the bigneſs of a Rape Seed, and be mixt in a Spoon with a little of its Mothers Milk, and ſo given them It conſerves them free from the invaſion of the Epilepſie, and frees them. If you find that they are infected with the Small-pox or the like, within a years ſpace, the Doſe is to be augmented, and a fourth or eighth part of a grain may be adminiſtred to them, the which will bring out of the Infants all the impurities by Stool, and preſerve the Face untouched. Thoſe that are from one to two, or twelve years of age, and being troubled with the Worms, do fall into acute Feavers, (and hereby a great many periſh deſtitute of all help) may have the Doſe augmented if need be, and that as their age is, from $\frac{1}{2}$ a grain to two grains, for ſo the Worms will be killed, and the Feaver ſent packing. Nay farther, if the Feavers in Children, be they Boys or Girls, do not proceed from the Worms but from other cauſes, yet may ſo much of this Medicine be adminiſtred to them as may be requiſite to purge and ſweat them, and by this means will they be (without any hazard of their lives) reſtored to their former health. There can ſcarce be found a more profitable and more preſent remedy againſt the Plague and other Feavers in young men, middle aged men, and old men than my golden *Panacæa* or purging Gold, and this ſame purging *Lune* here deſcribed, the Doſe is from one grain to five or ſix grains with reference to the age and Diſeaſe. Such a Dyet is to be obſerved as I have preſcribed in the uſe of my *Panacæa*, *viz.* that the Sick (after the taking of this purging Silver) do abſtain from Sleep and all kind of Food for three or four hours at leaſt, and beware of the cold Air, and have an eſpecial regard to keep a good Dyet. This Medicine of mine, together with my *Panacæa Aurea* (or golden univerſal Medicine) may be ſafely, and without any fear of danger made uſe of in the French Pox, Dropſie, Leproſie, Stone, Gout, and other ſuch Diſeaſes, whatever name they are called by; inſomuch that men may (next their truſt in God) ſafely confide therein. And beſides by this Medicament may very many things be performed in metalline affairs, the diſcovering of which we ſhall at this time omit, contenting our ſelves with having ſhewn the things that appertains to the uſe of Medicine. Furthermore it is likewiſe notably efficacious in curing of external Wounds and Ulcers, provided it be diſcreetly adminiſtred inwardly, and the external defects of the body be kept ſweet and clean. There will in a ſhort time be much more benefit received therefrom, than from ſuch a deal of Ointments and Emplaiſters as are frequently uſed. Praiſe God and give him thanks for ſuch great benefits.

CHAP. X.

The preparation of the Vitriol of Gold and its uſe in Medicine.

DIſſolve Gold in ſome acid ſulphureous *Sal Mirabilis*, and not alkalizated, *viz.* by the moiſt way, paſs the ſolution through a Philter, and abſtract the unprofitable Phlegm ſo far untill there appear a thin skin at the top, which appearing, ſet the remainder in the cold, and you ſhall get a green Stone like to an Emrald. That part of the Liquor which is not ſhot, evaporate again even ſo long till a skin appears, that ſo you may get the reſt of your Vitriol: So all the Gold will together with the *Sal Mirabilis* ſhoot into a Vitriol, reſembling the greenneſs of Graſs, (and ſo green) as nature never produced the like. In this Smaragdine Table are found written (or engraven) many wonderfull things, which will neither be read nor underſtood by every body. I will hint ſome few things concerning it, and ſuch as appertain to Medicine: And in the firſt place, what kind of Vitriol this ought to be, and what notes and marks it is to be diſtinguiſhed by, (as thus) a little of it being rubbed with your thumb, on pure or cleanſed Iron, doth guild it of a golden colour, whereas the common Vitriol makes the Iron look of a coppery colour. This is a ſign of this golden Vitriol's being prepared after a due manner, which ſaid Vitriol will effect thoſe things in Medicine which I am about to aſcribe to it. Beſides, it makes Copper and Braſs ſhew of a golden colour and performs wonderfull things with Mercury, if digeſted with it, in the moiſt way, but for brevity ſake I omit theſe things. For it grows like a little Tree, and ſends forth golden Sprouts.

As touching its Medicinal Virtues ſuch of them as I have found out, are here briefly deſcribed; without queſtion there lie hid in it yet more and more excellent Virtues, which as yet are unknown unto me, but will come to light in proceſs of time.

But the chief efficacy and virtue of this golden Vitriol as far as I know, doth conſiſt in purging and bringing out all evil and noxious humours out of the whole body of Man, and withall in corroborating and ſtrengthening him. And as to this office it outſtrips all other Medicines whatſoever. Nay more, it performs its operation ſpeedily, yea more ſpeedily than any other purge doth. For as ſoon as ever it ſhall be taken into the body it doth preſently begin to work, becauſe the Salt is ſoluble, and therefore ſuch bodies as are not opened, can't at all compare with it, for they muſt neceſſarily lie in the Stomach at leaſt half an hour, or a whole hour before they begin their operation. And becauſe every common Vitriol is a capital enemy to all the Worms of the Belly, and the Feavers ariſing therefrom, wherewith a very many Infants both Boys and Girls do die, void

of

of all kind of help, I do moſt highly commend this Vitriol of Gold to all ſuch Fathers and Mothers of Families, whoſe Children are dear unto them, that they at all times have it in a readineſs, to be made uſe of in caſes of neceſſity. For verily I never found any better or certainer Remedy againſt the Worms than this very ſame, becauſe it not onely kills them, but alſo caſts them out, and doth by ſtrengthening the Sick, take away all the Feavers both of old and young. It is alſo a moſt great ſecret in the Plague, in which Diſeaſe verily, a longer delay or abiding of a Medicine in the Body (without working) is hurtfull. Beſides, it is not onely a certain and ſafe curative Medicine, but likewiſe a preſervative too in the Plague, and in all acute and contageous Feavers, as well of young as old, the like to which is ſcarce, yea very rare to be found. For this Vitriol doth ſpeedily and ſwiftly draw back from the heart every Poiſon, and every burning heat, and being drawn back from all the Members of the whole Body, doth drive it forth by all the Emunctories of the whole Body, but principally by Stool and Sweat. Furthermore, if the Diſeaſe require it, and the Patients ſtrength permit it, it may be adminiſtred in a bigger Doſe, and then 'twill provoke to Vomit, and powerfully expel Choler. It doth in the *Lues Venerea* ſhew it ſelf moſt efficaciouſly virtuous, and powerfully caſts out Tartarous Fluxes and acute humours out of all the whole Body: By which operation it likewiſe brings much help and comfort to ſuch as are troubled with the Stone and Gout, it removes the Epilepſie both from young and old, and frees the Hydropical of the Water betwixt the Skin. And that I may compriſe all as 'twere in one word, 'tis ſuch an univerſal purge as that it roots out of the whole Body whatſoever is found to be hurtfull and offenſive therein. It hath not its fellow as to Remedy the Feavers of Children whether proceeding from Worms or from a corrupted Stomach, the which kill ſuch abundance of Infants of both Sexes, without any help left. Nor do I think that there can be found a better Remedy in the Plague, and in all other acute Feavers which uſually kill Men ſuddenly, than this Vitriol of Gold, if it be but rightly made uſe of. The Doſe is ſmall, and is eaſily made pleaſant to Childrens Palats, by putting a little Sugar thereunto, or ſome ſuch like ſweet things. To Infants newly born, you may give ſcarce an eighth part of a grain, againſt (or to prevent) the Epilepſie, or Convulſions. To ſuch as are from one year old, to 10 or 12 years of age, the Doſe may be one, two, or three grains, according as their age is, the which Doſe may be augmented in ſuch as are older, according as the age and condition of the Sick requires. Where the Diſeaſe is Worms, there the Doſe muſt be ſo ſtrong as not onely by well purging to kill them, but alſo to caſt them forth when killed. For from thoſe ſlain Worms, if they abide in the Bowels, other new Worms uſually breed. I hope that by my thus revealing this Medicament, I ſhall ſo bring it to paſs, as that for the time to come, ſo many Infants both Boys and Girls will not be deſtroyed by Feavers ariſing from Worms, but very many will be ſafely preſerved from ſo immature a death.

But here, ſome or other may ſay or at leaſt think within himſelf, what is the reaſon that I have ſuch an eſpecial regard to Infants and Children, and am ſo very ſolicitous of preſerving them from an untimely end. I anſwer hereunto, that nothing is more neceſſary than to afford ſome comfortable due help to Infants, and poor innocent Babes, who do evil to none, and whoſe loſs their Parents do ſadly brook. For it is certain and without all kind of doubt, that (amongſt Diſeaſes) the Epilepſie or Convulſion is the firſt that ſets upon new born Infants and ſweeps them away. Then preſently follows Meaſels, Small Pox, and ſuch like, and theſe kill not a few. Then comes the Worms, and they cauſe Feavers which afflict them with a continual burning, whereby they loſe all their Appetite to eating, and covet nothing but drink, and the Parents uſe no remedy to ſuppreſs them, being ignorant that ſuch gueſts are lodged there, and do not perceive them when the poor ſick Babes Bellies do not ſwell. But further, when by the ſwelling of their Bellies, they do know that they have the Worms, and though they deſire to uſe ſome Remedies, yet can they hardly make their little ones to take them as being ſo averſe to them. Nay more, though ſometimes they do adminiſter common Worm ſeed, or ſome other Vegetable Powders good againſt the Worms, yet there's ſcarce one in ten that is help'd, and the poor ſick Children grow worſe and worſe: And at laſt when the Diſeaſe hath gotten ſuch head as that the Parents ſee that death is at hand, then is the Phyſician ſent for, who (if he knows the Diſeaſe to ariſe from Worms, and be furniſhed with a good Medicine) doth preſently help the Sick, and free him of the Diſeaſe. But if he be deſtitute of a good Medicine, and attempts to refreſh or cheriſh the Sick with his ſweet Syrups, *&c.* he widely erreth, for by ſuch kind of ſweet Juices he gives Nutriment to the Worms. Neither doth it at all avail to put Linnen Cloaths, dipped in Roſe water, to the Head, thereby to allay its burning heat, and to little purpoſe are the gentle purging drinks preſcribed. For as ſoon as ever the Worms do perceive any thing given to the Sick, which is contrary to them, they preſently hide themſelves (or run to holes) and do wreath themſelves into a kind of Ring, and paſs out with the Excrements. But if they perceive any ſweet thing which is pleaſant to them to be given to the Sick, they do receive their nouriſhment thencefrom and remain alive. And if by ſome hap or other it doth ſo chance that one or more is hurried away with the Excrements, yet the reſt of them remain unhurt, and the Diſeaſe is not taken away, but prevaileth more and more, and at laſt deprives the Sick of Life. He therefore that endeavoureth after the happy curing of ſuch Feavers as ariſe by reaſon of Worms, muſt of neceſſity (in defect of this golden Vitriol) give his Patient ſuch things to drink for three or four days as do cauſe a bitterneſs in the Stomach. And although bitter things are unpleaſant to the Palate of poor Sick Infants, yet are they enemies to the Worms, and do kill them. Such bitter things therefore being drunk for three or four days, the Worms do ſometimes in ſome Sick Children die the firſt or ſecond day, but in other ſome 'tis the fourth day e're they die.

Now then as concerning ſuch bitter Medicaments, which I here write of, that they may not be bitter in the Mouth, but be made ſo in the Stomach, I ſay, that the Metals are ſuch, and eſpecially Iron, Copper, Gold and Silver, the which being diſſolved do obtain a very bitter and ungratefull Savour. But the reaſon why Gold and Silver being taken into the body, when they are filed and ground moſt exceeding ſmall, do not operate any thing at all, comes from thence, *viz.* becauſe the Acidity of the Stomach

mach is too weak to ſet upon them: And therefore 'tis neceſſary that they be firſt converted into Vitriols, if you would have them operative in the Stomach, as I have taught you concerning Gold. But foraſmuch as every Body cannot be Maſters of ſuch a golden or ſilver Vitriol, it ſeemed expedient to me to reveal to the poor, a certain and never failing Secret, by the help whereof the Worms both in old People and young are killed.

It is not unknown to Phyſicians that every common Vitriol wherewith Dyers uſe to dye their black Colour, doth (being adminiſtred to young People) kill the Worms and caſt them out too. But becauſe of its unpleaſant and odd taſt 'tis a hard matter to make Children take it. But now if you do a little more accurately examine the properties of common Vitriol, you will find it to be nothing elſe but a mere acid Salt, by which Iron or Copper, or both together are diſſolved in the Earth, by nature. If now we are ſo minded, we can alſo make a Vitriol in the Stomach, which will be equally as operative as that which is made by nature and taken in at the mouth, and 'tis done thus. If we give moſt ſmall filings of Iron or Copper to little Infants in a due weight, theſe now may be eaſily adminiſtred unto them, as containing no ungratefull taſt. For, being reduced into thin or curious filings, and being a metal eaſily admitting of Solution, as ſoon as ever it comes into the Stomach, the Acidity of the Stomach doth meet with it, by which 'tis eaſily diſſolved, and turned into a Vitriol, and ſo endued with the very ſame operation as that is, which is prepared in the Earth by Nature.

But you are here to obſerve the difference that is betwixt the filings of Copper and Iron, and that is this, the Copper works ſtrongly, and the Iron much milder. Beſides the Copper makes the Stomach vomit, but the Iron cauſeth no Vomits, and doth very rarely diſturb the Stomach, and when it doth, 'tis onely in this caſe, *viz.* when 'tis adminiſtred in too great a Doſe. Therefore amongſt all ſuch Medicaments, Iron is the beſt, the ſafeſt, and the leaſt coſt, though to proud men it may appear ſufficiently vile and baſe. Nor is it to be queſtioned but that the brethren of ignorance will entertain it with deriſion, and ſay; if *Glauber* knows no better remedy for the Worms than this, which conſiſts of the groſs filings of Iron, he had done a great deal better to have kept it onely to himſelf: And if Iron abounds with ſuch Vertues there's no reaſon for him ſo to praiſe his pretious Vitriol of Gold with ſuch a deal of commendations. To this I anſwer, that my aim in teaching the preparation of the Vitriol of Gold is not directed for the Worms in Children ſo much. But I have added this remedy of Iron to the deſcription I have made of the vertues of the golden Vitriol, to this end, that I may demonſtrate it ſelf alſo is ſo excellent a remedy againſt Worms, and for the removal of thoſe Feavers as are cauſed by them. But becauſe their cure can be more eaſily perfected (as we juſt now ſpake about the filings of Iron) 'tis worth the while to have regard to the way that is moſt compendious. He that pleaſeth may adminiſter of the Vitriol of Gold, but I commend Iron to ſuch as are poor, for they may have that even every where. There is no Village ſo ſmall but hath a Smith living in it, who can when your neceſſity requires ſupply you with ſome filings of Iron.

But that my mind may be fully underſtood, I judg it neceſſary yet more clearly to give you a Declaration of this thing, *viz.* in what manner and with what conveniency the filings of Iron may be adminiſtred to the ſick Infants. And 'tis thus done. Whilſt the Infants are unweaned, ſome Grains of the ſaid filings from 2, to 6 or 8 Grains, may be mixt with a little Sugar and put into their mouths, and then preſently give them ſuck, that ſo thoſe filings may be ſuckt down together with the Milk into the Stomach. Do this three days together and the Worms will be deſtroyed, and the Feaver vaniſh. But if any body will make uſe of any other Vehicle than what is the Child's ordinary food, he may do ſo if he pleaſe. But as for ſuch as do not ſuck, but do drink out of a ſucking Bottle according as the uſual cuſtom is, you may eaſily give it them, on this wiſe; Put a little into the Bottle and ſtop the hole of the Bottle with your finger, and ſo turn it upſide down that the filings may ſlide down to the hole, and ſo let the Infant ſuck it down, and 'twill paſs with the drink into the Stomach. To ſuch Boys and Girls as are bigger, and have more underſtanding, it may be given eaſily and any way you pleaſe, onely telling them that they will be reſtored to their former health. To ſuch as are 10 or 12 years old a quarter part, or an half of the weight which we uſually call Quintlein [from 10 to 20 grains] may be given ſafely, for 3 or 4 days. But in the mean while let not the meats they uſe be of hard Concoction, but made of Pottage, Prunes, and ſuch like mollifying and looſening things, which may help forward the operation of the Iron, and ſo the ſick will become the ſooner well. I could not refrain from highly commending to all tender Mothers that love their Children, this moſt ſafe and not at all coſtly Medicine againſt all the Feavers proceeding from Worms, which do kill ſo many poor little ones deſtitute of all kind of help. Let no body matter its vileneſs, but rather think with himſelf, that God hath alſo endowed vile and contemptible things with great vertues. Verily this Cure, and thus taking away the Worms, and the Diſeaſes ariſing therefrom, is ſtrongly founded on natural reaſons, or arguments. For ſeeing that the common Vitriol is a Poyſon to Worms, but becauſe of its bitter and nauſeous taſt 'tis exceeding unpleaſant to the Palate, they do very well, that ſubſtitute Iron as being void of all Savour, in the room of the common Vitriol, that ſo being given to their Children it may be converted to Vitriol in their Stomachs, and ſo kill and drive out the Worms. I my ſelf have tryed many experiments about the Cure of the Worms in my Children, but never found any thing ſafer and better than contemptible Iron.

A Story of a Child that had Worms.

I Will tell you an inſtructing Story, concerning a great and eminent man's Child in ſuch a Diſeaſe proceeding from the Worms, in which my ſelf was concerned. A certain rich man did on a time conſult with me, (or ask my adviſe) about this Child's Diſeaſe. I gave him as much filing of Iron as was ſufficient for one Doſe, for his Child to drink. It ſeemed an abſurd thing to the good man, to give an Infant filings of Iron, upon this conceit he omitted to uſe it, and having called two Phyſicians he ſhews them the filings, and askt them whether they would adviſe him to adminiſter it to his Infant. They earneſtly diſſwaded him from uſing it, ſaying that if he uſed it his Child would be killed, and that it was a

Medicine

Medicine onely fit for curing of Horſes, and that they would preſcribe a far ſafer and better one. They ſaid there was no danger in the Child of Worms, and therefore they preſcribed it a cooling and purging Syrup, thereby to take away the Feaver, and they alſo added confections of Pearls, with other cooling Waters. Death deſpiſed theſe kind of Potions, and ſnatcht away the Infant: The Child being dead, there crept out of his mouth great Worms, and clearly teſtified to the Parents their unſeaſonable rejecting my adviſe, haply becauſe the Medicine I preſcribed was not coſtly, but prepared out of a vile Subject. But it repented the Parents too late: The Mother coming afterwards into the Houſe of a certain Neighbour, gave that filings which I had delivered them, unto an Infant troubled with a Feaver and the Worms, who upon the taking of that one doſe onely became better, and by little and little returned to its former ſtate of health, I was willing to ſet down this hiſtory to the end that I might demonſtrate, that vile and abject things are many times capable of performing more than Pearls and precious Stones can.

And ſo I conclude this ſo very neceſſary a diſcourſe concerning Worms, and the Feavers ariſing from them, whereby great multitudes of poor Infants are deſtroyed. I hope that no body will take it amiſs that I have made ſo-long a diſcourſe concerning Worms. For I judged it neceſſary to ſhew the cauſe from whence ſo many little ones do dye in the flower of their Age. He that refuſeth to believe what I ſay, let him try the thing by his own loſs.

CHAP. XI.

Of Mercury and its excellent Vertues, both Medicinal and Chymical, I mean not the common and well known Mercury, but the Mercury of the Philoſophers, the which is extracted by the Vulgar and well known Gold and Silver, (but they are to be firſt rendered Magnetical) out of the Beams of the ſuperiour Sun and Moon, by the help and aſſiſtance of the Air.

IT is well known to thoſe that have looked over the manifold Writings which are extant at this day, how many and how great ſearches have been made, and how various and many opinions there have been abroad for many Ages, concerning the Philoſophers Mercury; as many men ſo many minds, one man concludes with himſelf to prepare it out of ſuch a matter, another out of ſuch a thing, and 'tis hereby come to ſuch a paſs as that, there's no more faith left for any ſuch Mercury, and 'tis lookt on as if there were no ſuch thing in nature, nor is at preſent any where extant: Becauſe ſo many thouſands of men have been occupied in the ſearch thereof, and ſo moſt exceedingly ſmall a number have been maſters thereof.

Others have opinionated, that the moſt pure ſubſtance is to be extracted out of Gold and Silver, but not in the form of a running Mercury, but in a watery form, and to be coagulated and fixed by the help of the Fire into a medicinal Stone.

Otherſome have perſwaded themſelves that Gold and Silver being ripe and fixt, are no ways fit for ſo great a work, but 'tis rather to be ſought for in ſuch Subjects as never aſſumed to themſelves any ſhape, but do as yet lie hidden in that great and univerſal *Chaos* the Air, becauſe they ſaw that the life of all things lay hidden in the Air, and that out of it every Creature of God doth daily and without intermiſſion attract it unto it ſelf after a magnetical manner, both for its own life and augmentation, and that it is ſo too with the ſeeds, abundance of them (and they moſt different ſorts too) being ſown in the ſame Earth, do each of them (according as its nature and property is) acquire to it ſelf both life and augmentation thencefrom, *viz.* the Air.

So likewiſe may it be brought to paſs, that even the Metals may according to their nature and propriety extract their encreaſe out of the Earth or Air, knew we but how to get the true Seed, or true Magnet which might get out that augmentation. For why ſhould not God have as well given a Seed to theſe his Creatures for their encreaſing, as well as to the other Creatures? So then there are very many ſundry Opinions ſprung up, concerning the *Mercury* of the Philoſophers, and very many men have to their uttermoſt ſearched after it, yet but a very few have obtained the ſame. Though it be thus, yet the fault is not to be imputed either to Nature or Art, but to the ſearcher after it, becauſe he errs and ſeeks not in the due place. Verily I did very many years ago exceeding ſtudiouſly apply my ſelf to the ſearch of ſuch a ſpiritual and Gold and Silver attracting Magnet, but I could not hitherto attain to the true Scope, until I at length by chance found that a true living and running *Mercury* might, by the benefit of Art, without any Addition of Mercurial things, be extracted out of the fugacious and imperfect Metals, ſuch as are Lead, Tin, Bizmuth, Zink, and Antimony. And although I had read many Philoſophers affirming this thing, yet did I always doubt of the ſame, and indeed not without cauſe; for in my youthfull days, ſerving a man of great note in Chymical Labours, I tried in two years ſpace two hundred ways of making the *Mercury* of *Saturn*, and not ſo much as one of them ſucceeded. Now my ſaid Maſter was ſtirred up to the ſearch of this Saturnine Mercury upon this occaſion as follows. He had ſome familiarity with many noble Perſonages that were alſo addicted to the ſtudy of Alchimy: One of them knew how to make running Mercury out of Lead, and to turn it into the beſt Gold, and he ſent unto my Maſter one lot or ſomewhat better of that ſaid *Mercury*, together with the way of turning it and fixing it into Gold. We ſet about the work and it ſucceeded to our deſires, and yielded us as much Gold as there was *Mercury* ſent us. This hoped for ſucceſs did ſo edge on my Maſter, that he could not reſt till he had obtained from him that knew it, the manner of making this Saturnine Spirit. But as often as ever we tried the operation according to the way preſcribed us, both our hopes and labour were in vain. And then my ſaid Maſter readily granted, that we could not effect it. Hereupon it was that he ſought all abroad with the greateſt diligence, and had got ſuch abundance of proceſſes and operations, that two years did ſcarce ſuffice me to try them all; though there was not ſo much as one amongſt them all that anſwered our wiſhes, but all our Labours were in vain. Upon this ſcore, I could believe neither *Baſilius* or *Paracelſus* when I read in them, that Gold and Silver might be reſolved into true and running *Mercury*, ſeeing that the bare turning of unripe Lead into *Mercury*, did coſt me and others ſo great Labour and Pains, and yet we could not obtain it neither. Whereupon I fell into this opinion, that the Philoſophers pointed

at ſome other thing, by their running *Mercury*: And I did ſo long adhere to this opinion of mine, untill I chanced to light on the making of a running *Mercury* out of Lead, and I have ſeveral times repeated the operation with the ſame ſucceſs.

I have likewiſe revealed it to others, who have alſo done the ſame, but onely in ſmall quantities hitherto. But ſome of them have beſtowed much pains about it, and to prepare it in a greater quantity; and that principally, becauſe 'tis certainly manifeſt that no ſmall benefit lies herein hidden. Nay if it were no otherwiſe profitable than barely thus, that it may be turned into Gold, and of this I am certain, ('twere worth while) For if the ſaid *Mercury* be but rubbed upon a piece of Gold, it makes it white, and being then put upon the Coals, it ſeparates indeed from it, but yet leaves it tinged of a higher and deeper Colour. If this Labour be ought repeated, the Gold will become weightier. And hence may eaſily be conjectured, that if it were adjoyned to a pure Golden Calx, it would in a ſhort ſpace of time eaſily paſs into good Gold. Neither is there any doubt, but that if any one did but know the manner of rightly handling ſuch a *Mercury*, he would obtain ſome notable thing out of it, becauſe all the Philoſophers do in their Writings promiſe ſo much good of *Saturn*. They generally affirm that Lead is (inwardly) far beyond Gold. How many Philoſophers are there that teach the preparation of the univerſal Work from thence? See the Univerſal Work of *Iſaac Holland*, *Paracelſus* his Heaven of Philoſophers, The great and ſmall Countryman, *&c.* Many do expreſly write, that all things which the Philoſophers do ſeek for, are to be found in Lead; Hereupon they called it Leaprous Gold. And ſome Philoſophers do write, that in *Mercury* are all things that are ſought for, haply they mean not the Common, but ſuch an one as is drawn out of Metals. But we'll even let paſs this *Mercury* of *Saturn*, and ſee whether or no we cannot find a better *Mercury*, and ſuch a one as is of greater moment. In the mean time the ſaid *Mercury* of *Saturn* will fly about, and bring good news to the Lovers of Truth, *viz.* that *GLAUBER* is now in the way, to triumph, by the help of God, over all his Enemies.

We will therefore go on to ſearch out, whether or no there is not another and better running *Mercury* than that to be found, which comes out of Lead. When I did ſomewhat more accurately ſearch into Nature's ſecrets, I clearly ſaw, that all things which live and doe in growing take an encreaſe, do proceed or come forth by the Sun's operation, inſomuch that ſuch fruits as are nearer hereunto are the more excellent, and by how much the farther off any are from it, by ſo much the vilder be they. As for example in Wine; by how much the nearer it is to the Sun, ſo much the nobler is it; and by how much the farther it is from it, ſo much the vilder is it.

The ſame may be obſerved in the generation of Metals, *viz.* that in the hotter regions there is a greater quantity of Gold, and of Silver, than in the colder Countries. This is well known, and out of all diſpute: So then when I ſaw that the hot beams of the Sun, together with the cold and refreſhing light of the Moon, did not onely ripen Gold, but alſo thoſe excellent Wines, and the beſt taſted Fruits, yea and the moſt contemptible Herbs, and that it gave to all things their moſt acceptable Savour; well did I conclude, that if a convenient Matrix, or ſuitable Magnet were expoſed to the hot Sun-beams, and to the cold light of the Moon, that might day and night receive their Operations; It could not poſſibly be, but that the Seeds of thoſe (*viz.* of *Sol* and *Lune*) inſinuating themſelves into ſuch a Magnet, will paſs into moſt excellent Fruit, and obtain a perfect maturation. I did once make trial to ſee whether it would be ſo or no, and having artificially prepared Gold and Silver, opened them, and brought them to a Magnetical attractive vertue; and being well mixed, I expoſed them to the *Sun* and *Moon*, to ſee and try what would proceed thencefrom. Then afterwards, ſuppoſing them to have ſtood long enough at the *Sun* and *Moon*, I put them into a ſmall Glaſs Retort, and placed it in Sand, and ſeparated (by diſtillation) all the moiſture from the Golden and Silver Magnet, that it had attracted from the Air. I got indeed a ſweet Water, but yet not without Vertues. But having adminiſtred a ſtronger fire to this Magnet, I drew therefrom an aſtringent Liquor, reſembling a golden yellow Colour, and like to Gold. I again expoſed the ſaid dried Magnet to the beams of the *Sun* and *Moon*, that it might by them be impregnated, and that I might ſee whether or no a Second, and more Births would be produced, anſwering in all reſpects to the former. I doe not doubt of them, I confeſs but that they will be of a like property and nature as their Father and Mother are, or indeed be more fair and excellent than they be: For that firſt-begotten off ſpring brought with it ſelf into the World a far more excellent fairneſs than its Father had.

Farther, bringing this Birth of *Sol* and *Lune* to a more accurate trial, that ſo I might find out its vertues and efficacy, I firſt of all perceived, that there lay hidden therein (though as yet ſo Volatile) a Medicine of great moment. And dealing with it upon a certain time, and putting a little of it by chance upon Gold, I found that it made the Gold white; and rubbing the ſaid Liquor many times upon the Gold, it did at length produce (or ſhow forth) the live *Mercury* that lay hidden therein, which ſaid *Mercury* thus living and viſible, I extracted out of this ſame Liquor; but it is better not to vivifie it, but to take it as 'tis born, and ſo fix it and make it conſtant. And now, I ſuppoſe, that ſuch a *Mercury* as is extracted out of the Air, by Gold and Silver, being not ſo much corporeal as ſpiritual, is to be accounted of as the true *Mercury* of the Philoſophers.

But if now any will object and ſay, that this *Mercury* doth not proceed forth from the Air, or that it is not extracted out of the beams of *Sol* or *Lune* by the Magnetick Gold and Silver; ſuch a one may even ſay what he pleaſeth, but in the mean time he will not get the things he fiſheth for. Beſides, I do not matter it ſo much, *viz.* whence it ariſeth, provided I can obtain the ſame; If it did proceed out of the Gold and Silver, it were not therefore to be rejected, but it would be altogether better than that which is made out of groſs Lead, nay haply it might become a Tincture, did but any one know how rightly to handle it.

It is a uſual Proverb, that *the Apple falls not far from the Tree*, and each thing follows the Seeds of its proper and peculiar nature. *By how much the nobler the Tree is, by ſo much the more worthy is the Wood thereof. The younger ſort ſing over the ſame Song as the old ones doe.* Now theſe Proverbs do declare, that the Fruits are ſo much the more excellent, by how much a better nature the Tree is of, and this is a ſure rule: And therefore it neceſſarily follows, that ſuch a *Mercury* as is drawn by Gold and Silver out of the Air,

Air, or doth proceed barely from Gold and Silver, muſt needs be far better than that which hath its riſe from Lead: And herein I acquieſce. Let every one take from thence what beſt likes him, I was willing to leave to ſuch as come after me, thoſe things which I met withall of ſo great moment.

And as concerning the Medicinal Vertues of this Golden *Mercury*, I doe give this caution about it, that if it be uſed as it came over at firſt in the diſtillation in Medicine, becauſe 'tis as yet immature, and but newly born, it may work too ſtrongly upon the Body of Man. It is therefore better that it be fixed with ſome corporal well-opened Gold, and ſo 'twill effect thoſe things which a Univerſal Medicine is onely able to perform. I confeſs that hitherto I have not brought it to any conſtancy or fixity, becauſe I have not had time of rightly handling it: In the mean while there are others that will ſet about this labour, and will in due time manifeſt more things concerning it. Let every one be content therefore with this preſent diſcovery, *viz.* that a truely live and running *Mercury* may be extracted, not onely out of the ſoft and volatile Metals, and conſequently unripe ones, but alſo out of the ripe Metals. And ſeeing that moſt Men doubt much of the truth of ſuch a thing, I could not omit the affirmation of the ſame, as being a moſt true thing: He that liſteth may make trial of the ſame. 'Tis enough for me to have ſhown you the way. Let others likewiſe publiſh ſomething, that ſo the truth which hath been ſo long ſuppreſt hitherto, may at length ſpring forth out of the darkneſs into light.

And now, at laſt, let's come to treat of Wine, and examine what an harmony and familiarity there is in it with Gold and Man.

CHAP. XII.

Sheweth how great harmony, familiarity, and love, there is in Wine, with Mankind and Gold.

IT is evident, even from the Writings of all the Philoſophers, that Wine and Gold is a wholſome remedy for Mankind, but yet not in ſuch a groſs ſtate, and without any preparation, as they come forth out of the Earth, but they are to be deſtroyed, and their moſt pure parts to be extracted, and again conjoyned. To obtain this knack, there have been uſed many *Menſtruums*, and one more excellent than another. The common Spirit of Wine hath no familiarity at all with Gold, becauſe of its unripe and combuſtible Sulphur, from which Gold is wholly averſe, as being its enemy. This thing I have in ſeveral places of my Writings made mention of, and have alſo taught it in this very Treatiſe, that Gold being diſſolved in *Aq. Regia*, and precipitated with the Water of Tartar, yields moſt curious fine Atoms, which cannot be done any other kind of way. For the common groſs Wine, and the common ſulphureous and unripe Tartar are enemies to the Gold, the which is evidently manifeſt by this preparation of the moſt ſubtile Calx of Gold, cauſed by the pouring of the Water of Tartar thereunto, whereby 'tis precipitated unto the bottom.

The certainty of the truth of this thing may be thus tried, if a little Gold being diſſolved in *Aq. Regis* be put into a glaſs full of Rheniſh, or any other ſharpiſh Wine: The Gold will be preſently precipitated, by the Tartar which is in the Wine, into a tender and ſhining Powder, but it will not in a moment of time ſettle to the bottom, but by little and little. And yet if you put the Wine in a Veſſel over a fire of Coals, and boil it, then will it be ſpeedily precipitated. From whence 'tis evidently apparent, that Wine being as yet not at all ſeparated from its impurities, doth as it were differ from Gold, with a deadly hatred, and yet carries hidden in its bowels a ſubſtance moſt friendly to the Gold, the which will, in the end, manifeſt it ſelf ſo to be, when the more groſs parts are ſeparated from the more ſubtile.

Baſilius teacheth its preparation by a peculiar proper inſtrument, wherein (as I judge) the Spirit of Wine is to be kindled and burnt, that ſo by the burning up of the Sulphureity, the Mercurial Salt may be ſeparated and caught in a cold Receiver. And with this very Salt (ſaith he) may a Tincture be extracted out of Gold, which ſeems very probable to be ſo, if one could but get or catch that ſaid Mercurial Salt. Many indeed have attempted this labour, but perhaps not a man hath found an anſwer to his expectation, where the defect lies, God knows.

Others have mixed Gold with *Alkalies*, and have taught the extracting of a Tincture by an Alkalizated Spirit of Wine, which way, though they may doe ſomewhat, yet it is not the genuine way.

Alſo ſome have by diſtillation gotten a certain fiery Spirit out of Tartar, and therewith endeavoured to conquer Gold. Here indeed is an appearance of ſome kind of poſſibility, but yet this Spirit is not to be attempted for that, which unlocketh all the bowels of the Gold; and that for this reaſon, becauſe it doth as yet abound with combuſtible Sulphur, to which Gold is a bitter enemy. But now if you would duely joyn Gold with Wine, then muſt all the combuſtible Sulphur (of the Wine) be firſt ſeparated from its Mercurial part, and the Mercury of the Wine is to be brought by diſtillation into a notable fiery Spirit; if this be not done, there will be no great matters effected with it.

CHAP. XIII.

By what means ſuch a Spirit of Wine as doth aſſociate it ſelf to the Gold may be prepared.

WIthout doubt many ſuch as perceive that there is a poſſibility of preparing ſuch a Spirit will be moſt vehemently deſirous to know the operation, how 'tis to be done. But it is even a wickedneſs to caſt ſuch a great Secret before the unworthy and impure Swine. It therefore will be ſufficient to ſhew both that it may be done, and after what manner; the reſt to be left to God.

But that the ſtudious Artiſt may not be wholly affrighted or kept back, I will here declare, ſo much as may be ſufficient to any one that is verſed in the Labours of the Fire, for the acquiſition of ſo great a Spirit: But yet with this proviſo, that he make uſe of Patience in his operation, for this work is not to be diſpatched in a day, like as that labour which in one days diſtillation affords a Spirit out of the Lees of Wine, or out of Tartar. No! But the manner of the work is thus:

Take white or red Tartar (for both of them being well mundified, are as good one as the other) diſſolve it in Water, and ſeparate all its groſs Sulphur by

by a certain precipitating matter. This impurity abiding in the Water, is to be ſeparated from the precipitated Tartar, by pouring out the Water, the which (Tartar) remains in the bottom like a ſnowy Sand, and is to be well purged by reiterated waſhings with Water, ſo long untill (all the impurities being well ſeparated) the Powder it ſelf becomes like to the white Snow. Now although that this Tartar be moſt exceeding white, yet doth it contain as yet many Sulphureous Fæces; which being black, do never ſuffer themſelves to be ſeparated by any Solutions and Coagulations, but it is neceſſary that they be precipitated by a certain precipitating matter. Therefore let that Tartar be again diſſolved in pure Water, and be precipitated, the which Solutions and Precipitations let be ſo often and ſo long repeated, untill there appear no more black Fæces. This moſt pure and moſt acceptable Tartar melteth in the mouth, and doth almoſt in the manner of other Salts eaſily admit of Solution in cold water. Being brought to this paſs, it is rendred fit to be dealt withall in the following manner.

Diſſolve ſome pounds of this pure Tartar in cold water, ſo as to make it ſufficiently acid. Put this Solution in ſome warm place, or rather in Horſedung, or in a warm Balneo, that the Tartar may begin to putrefie and loſe its acidity, and get a kind of ſweetiſhneſs, which before it will come to be, there is required the time of ſome months. After it hath thus putrefied, and loſt its acidity, all the unprofitable Water is to be evaporated by a Balneum, untill it become a thick and black Juice like Honey; the which being ſet in the Glaſs in Sand, and being urged with a ſtronger fire than was made in the Balneo, will yield a fiery Spirit, and ſuch an one as will mix it ſelf with Gold diſſolved in Spirit of Salt, and will ſeparate the purer parts by digeſtion, and draw them to it ſelf, from the more groſs parts, and ſo will perform its office in Medicine even to moſt high admiration. For any one may eaſily conjecture that the moſt pure parts of Wine, Salt, and Gold will operate no evil effect.

What it will perform in Metalline affairs, I doe not as yet know; But, without queſtion, if it be rightly adminiſtred, and duely made uſe of, it will play its part very notably.

This operation before ſet down, ſeems eaſie to be done, if barely looked on outwardly, but there's more labour and trouble in it than one would imagine. Such as have not the gift of patience, and knows not what belongs to patient working, may forbear this labour. For the putrefaction proceeds on very ſlowly, and there is required the knowledge of a matter precipitating Tartar, without which it will never ſuffer it ſelf to be precipitated and purged, 'tis an hard thing to find, but he that knows it, it renders him all his labour facile and eaſie. Any impure Tartar, whether it be white or red, may be ſo waſhed in one or two hours ſpace, and ſo purged, that (loſing nothing ſave its Fæces) it will become moſt white, and much more apt for many operations. But my time will not admit of treating farther of theſe affairs, it may (God willing) be done afterwards in another place.

However, thus much I will yet add more; That if Spirit of Wine brought to the higheſt purity, ſo as to retain no filthy ſavour or odour, be in a due quantity conjoyned by the help of common Water with this excellently well depurated Tartar, there will reſult from them two a drink of a moſt excellent ſavour, like to natural Wine, and may be uſed inſtead of wholſome Wine. This would be a moſt profitable thing for thoſe that travel, had they but that Spirit of Wine, and that ſo excellently well prepared Tartar. For there is Water to be had in all places, and ſo they may at all times and every where make themſelves good Wine, yea ſo good and ſo ſtrong as they pleaſe, according as they add more or leſs of that Spirit and Tartar.

N. B. This Art would be very profitable for the cold Countries, in which Countries, in the want of Spirit of Wine, becauſe no Wine grows there, the Spirit of Corn will perform the ſame. The chiefeſt knack is, to be furniſhed with that Tartar, which by an eaſie Solution enters into (or is diſſolved in) the Water. But this is a buſineſs of a greater moment than to be divulged. I have already opened to ſome the manner of preparing ſuch a Tartar, who make it in plenty, and ſo any one may eaſily get from them as much as they ſhall need.

Beſides the uſe of that kind of Tartar, conduceth to the accompliſhing of many other things, but not to be ſpoken of, leſt it ſhould prove a detriment to ſuch as know it. But I doe here truely and ſincerely affirm, that whoſoever he be that can without waſt and coſt ſo prepare the common vulgar Tartar, he will be hereby able to get his food and rayment, and other neceſſaries for life, whereſoever and in what Country ſoever he ſhall abide. This thing will in proceſs of time have a farther progreſs, and many will by the benefit thereof live more happily, and perform things incredible. I have made a beginning, and the Mice ſhall never gnaw off what I have here written, but contrarily my Succeſſors ſhall enjoy the ſame to God's glory, even to the Worlds end, and will in the firſt place thank God, and next him, me, as being the Authour and Revealer of the ſame. I could reveal many moſt profitable things that might be done by ſuch a Tartar, were it not for injuring ſuch as get their living by it, and which for certain cauſes are not at preſent to be mentioned. I have ſaid enough to Wiſe men, and as for deriders and mockers, I have ſaid too much, for they will ſay all are Lies, becauſe they know not how to doe thus.

As to what appertains to the uſe of this here deſcribed Liquor, conjoyned of Gold, Tartar, and Salt, it may ſerve inſtead of *Aurum Potabile*, in all Sickneſſes, and may be profitably adminiſtred, in corroborating the vital Spirits; for it doth not diſcover its Vertues by a remarkable and viſible operation, but it ſtrengthens the Body, and doth very gently drive out Urine and Sweat, and ſeldom is it that it provokes to ſtool, unleſs it be given in a ſtrong Doſe. The Doſe is from one, two, three, ſix, nine Drops, even to a Scruple, according as the Sick is, in Water, Wine, or Ale, or other Liquors, in a Morning upon a faſting Stomach, and at Evening after Supper, for ſome days together. It keeps the Body open, and ſtrengthens the Brain, and all the Members. But principally (before the uſe of this Liquor) the Body be well purged with good purging Remedies, ſuch as are my purging Gold, and purging *Lune*, becauſe then this Medicine of the ſaid Golden Liquor operates far better, and more profitably. In uſing it, you are to obſerve whether or no the Excrements become black, if not, the Doſe is ſo long to be augmented or continued untill the Excrements that come away be of a black Colour. Moreover, the Diſeaſe decreaſing, the

Doſe

Doſe is to be leſſened by little and little, according as neceſſity or the diſeaſe requires.

Theſe things I thought good, at this time, to publiſh in the Fourth Part of my *Spagyrical Pharmacopæa*. I entreat that every one would take in good part theſe few Medicinal Secrets, but of very wide and large extent. And, God willing, my Third Century will ſhortly come abroad and preſent you with a Manifeſtation of more excellent Medicines, and other profitable Secrets.

The End of the Fourth Part.

THE FIFTH PART OF THE Spagyrical Diſpenſatory.

Diſcourſing of the true Univerſal Medicine, and of thoſe moſt Eminent *Arcana's*, as well Univerſal as Particular, which are hitherto unknown unto the World; by the help of which unheard-of and almoſt incredible Operations may be effected, not onely in Medicine, but alſo in Alchymy. Propoſed by way of *Queſtion* and *Anſwer*.

Queſtion 1.

WHether or no it is a thing poſſible in nature for ſuch a Tincture, or ſo Univerſal a Medicament to be prepared, as by the help of which, both the Bodies of Men and Metals may be promoted unto an higher, better, and more noble Degree or Eſſence?

Anſwer.

It is not at all to be doubted of, for, as well the Authority of ſo many and ſo great Men (who confeſs by their Writings which they have publiſhed that they have made the ſame) as daily experience demonſtrates the ſame to be a truth, void of any doubt.

Queſtion 2.

If thoſe things which ſo many illuminated Philoſophers have written of this Univerſal Medicine be true; how comes it to paſs, that though almoſt the whole World ſearch after the ſame, yet ſcarce one of ſo many thouſands is maſter of the ſame, and that the greateſt part of the inquiſitors after it, waſt their Eſtates in the ſearch to no purpoſe?

Anſwer.

The Art is not to be blamed, becauſe of the fruitleſs endeavours of ſo very many men that ſo greedily gape after ſo great a treaſure; but the fault is to be imputed to their own ſelves, for they are hereto driven and ſtirred up by their inſatiable covetouſneſs and unjuſt intentions, to make their ſearch after ſo divine a gift, and their deſign is to ſcrape up to themſelves, by the help thereof, great Riches and Honours, little thinking that God always hath and ſtill doth beſtow his gifts upon ſuch as are upright and ſincere, and who doe not onely daily pray unto him for the ſame, but do alſo ſearch after them with unceſſant Labours. This the Apoſtle himſelf doth witneſs in expreſs words, ſaying, *It is not of him that wills, nor of him that runs, but of God that ſhews mercy*. And yet the extreamly blinded World believes it not, nor propoſeth unto it ſelf any other Scope than the ſcraping together of Gold and Silver right or wrong, and fain would as it were wreſt this ſo great a treaſure out of the hands of God; and having gotten it, add fewel to their malice, pride, and impiety; And ſo by this means, more nearly approach (even in this life) to the Devil the Father of all wickedneſs, and be at laſt plainly like him. And this now is the primary and principal cauſe, why ſo very many as are

buſied about the ſearch of ſo great a treaſure, do loſe both their labour and expence.

Queſtion 3.

But are there no other impediments that preſent themſelves, and which may be an hindrance and bar even againſt pious men too, and ſuch as lead a blameleſs life before God and Man, whereby they cannot have admiſſion to the knowledge of ſo great a Medicament?

Anſwer.

Yes verily, there are exceeding many, or almoſt innumerable impediments that lie in the way, and ſhut up the paſſage even againſt the approaches of pious men to ſo great a work, though they attempt the ſame too with a good intention, and do ſue unto God by their daily prayers, and make their ſearch with a moſt diligent meditation, and continual Labours thereabout.

Queſtion 4.

What are thoſe impediments, I pray?

Anſwer.

To reckon up all thoſe impediments apart, and to ſet down each of them ſo clearly as for every one to underſtand and apprehend the ſame, cannot at preſent be done; neither is it neceſſary to mention all, for it would not onely amount to a great Volume, but would alſo be a burthen to the Reader, and be rather an hindrance than an imitation and encouragement unto him concerning the attainment of the knowledge of ſo great a work.

But yet that I may ſatisfie in ſome ſort, the deſires of ſome or other, I will recount ſome of the chiefeſt of thoſe impediments, by the knowledge of which, every one may know the reaſons that are wont to ſtave off even pious men from ſo great a Secret.

N. B. Firſt of all therefore, there are a many that have not means neceſſary or requiſite to begin and perfect the Work withall, though they have a good Judgment, and are inflamed with an ardent deſire of ſearching after nature and its miraculous effects, and doe not at all fear, nor are diſcouraged at the hard labours that are neceſſarily requiſite to Chymical Operations. Such men therefore as theſe are (being ſtirr'd up by a ſingular candour and ſincerity of mind to a love of honeſty) doe not thruſt themſelves forward after the manner of impious and deceitfull Impoſtors and ſlanderous Vagrants that thirſt after nothing but Gold, and pretend to ſome greedy Miſer, that they will teach him the making of the Philoſopher's Stone (the knowledge of which themſelves are clearly deſtitute of.) No! but they even loath ſuch vain acquaintance, and diſdain that deſpicable name of Gold makers, and content themſelves rather to ſet at home, and enjoy thoſe few things which God hath vouchſafed to beſtow upon them, than to turn Paraſytes, and live in the Courts of Princes and great Men, where they muſt ſtrive by a Fox-like ſubtilty to pleaſe every one, and to bow the head to each ſhoulder, and to ſcrape with his feet. This now is the firſt impediment, which keeps off not a few good Men from the poſſeſſion of ſo great a Secret.

Beſides, there are not a few of this ſort, that briefly and curſorily running over the Writings of the Philoſophers without any ſerious meditation upon the thing they read, or without underſtanding of the ſame, do think themſelves maſters of a great deal of Wiſedom, and firmly perſwade themſelves, that if they have a little ſmatch of Learning, and have but the knowledge of a Tongue or two, and have but by ſome Anagrams pleaſantly tingling in the Ears of ſome great Men, ſooth'd their minds a little, and wip'd them of ſome of their Silver, the finding out of ſo great a myſtery cannot poſſibly eſcape their profound Scholarſhip, but they muſt needs catch it. But yet (by their leave) they are quite out, and full well are they known unto God, who with-holds from thoſe proud deriders, and envious contemners of the truth, his benediction, and leaves them wallowing in their courtly paſtimes ſo long, untill at length (after their turning and applying themſelves from one fooliſh deceived man to another, and ſo on) they doe themſelves lay open their own groſs ignorance and moſt filthy ſhifts, which they have wrapt over with ſuch a deteſtable babling, and by the fruitleſneſs of the event ſhew that their large promiſes of golden Mountains are moſt vain and idle. And hereupon their hopes of having the Philoſopher's Stone (which they ſeek for meerly to advance their pride, and the more eaſily to ſuppreſs the truth) vaniſhing away with the ſmoak, they loſe all their credit and their good report, and can find no more ſuch credulous perſons that will ſuffer themſelves to be ſoothed by their moſt vain promiſes. And this is another kind of thoſe that beſtow their labour in vain about this ſo great a work, who doe thereby add a great load to their wickedneſs, by waſting other mens goods, and deceiving the too credulous, and ruining others as well as themſelves. There are yet a third kind of erroneous ſearchers, and who deceive themſelves with their vain labour, and they are ſuch as being a little too credulous and ſimple when they have lighted upon ſome of the Philoſophers Writings, and read what vaſt treaſures are to be gotten by Chymical Labours, doe preſently feel an itching deſire after Gold, and being inflamed with the covetous deſire of ſuch hungry treaſures, doe apply themſelves with unwaſhen hands (as we may ſo ſay) to the reading of the ſame, and then follow the bare letter in their operations. From whence it comes to paſs, that (all things being obſcure and dark to them, being ignorant and unskilfull, and the light of nature not ſhining upon them) they wander from the right path, and immerſe themſelves in the fruitleſs attempts of vain Labours. Some there are that have indeed ſome kind of knowledge of managing the Fire, and who doe very diligently read over the Writings of the Philoſophers, but yet are quite confounded by their reading them, ſeeing that they cannot find out the true Fire, and true matter of the Stone, which the Philoſophers have ſo obſcurely and ſo variouſly written of. For ſome of them teach the making of the Stone out of fixt Gold and Silver, and not out of the other immature and volatile Minerals, becauſe what a Man ſowes, that he reaps; others tell us the quite contrary, and ſay that there cannot be any better thing made of fixt Gold and Silver, ſeeing they are already brought by nature unto that perfection as not to be reduceable into their firſt matter, out of which (ſaid firſt matter) they affirm that their Univerſal Medicine is to be made, and not of fixt Gold and Silver: And therefore rejecting fixt Gold and Silver, they ſay that the firſt Entities (of the ſaid *Sol* and *Lune*) being yet Volatile,

latile, are the true firſt matter of the Philoſophers Stone, becauſe they are as yet immature (as they phraſe it) and tender, and fit for the making of thoſe things which we are deſirous to accompliſh, which (they tell us) cannot be poſſibly made out of thoſe two fixed bodies. And to help forward yet more confuſion, the multiplicity and variety of names, which the matter of the Philoſophers is ſtiled, is no mean impediment to the underſtanding. One bids us ſeek it in Vitriol, another in *Mercury*, ſome in *Saturn*, others in *Magneſia:* And thus is that matter deciphered by various and innumerable names, inſomuch that it is impoſſible but that he who is ignorant, and not well verſed in theſe affairs ſhould be hurried into various doubts and perplexities, being clearly ignorant whether or no the Philoſophers mean the common Vitriol, or a Vitriol extracted out of the fixed Metals, eſpecially ſeeing they too and agen affirm, that their Vitriol *Mercury* and *Saturn* are not thoſe vulgar Metals of Gold, Quickſilver, and Lead. Who therefore I pray could be ſo wiſe and prudent as to rid himſelf out of the ſo many confuſed and intricate windings of this Labyrinth? Even hence it is that the moſt learned and diligent ſearchers have been wound into ſo many erroneous Labours, nor could by any means get clear of thoſe hedg'd up turnings.

Nay yet more, the inconſtancy of ſuch as labour is no ſmall impediment, who (ſhould they have the matter) would not perfect the ſame by reaſon of their fickle inconſtantneſs. For if the Stone does not preſently come forth, and make them maſters of what they deſire, away they throw their Books and tread upon them, and load the Authours with curſes and imprecations, accuſing them of wicked deceit, in that they have not written clear enough for every one to underſtand ſo great an Art at the very firſt daſh, and to become a maſter of ſuch a notable treaſure with ut any labour at all.

You ſhall likewiſe meet with ſome that are ſo very wiſe as that it ſeems no ways likely unto them, that ſo divine a gift can be prepared out of ſo vile abject, and contemptible things, whenas though (by their leave) every good thing (for the moſt part) is wont to be abject and mean, and not precious, witneſs *Sandivow*, who tells us that he had declared the whole Work to not a few, even from the beginning to the end, but (by reaſon of the meanneſs of the ſame) they judged it to be but of ſmall moment, believing that no good could poſſibly proceed thencefrom.

Beſides too, it oft times happens that even many of thoſe who by their reading and diligent ſcrutiny have attained the knowledge of the true matter, are notwithſtanding that ignorant of the true Fire that gives Tincture unto that true matter, and therefore cannot be maſters of their wiſhes and deſires. Infinite is the number of theſe and ſuch like obſtacles which impead, and retard the deſirous ſearchers after ſo great a Work. For many there be that ſeek, but few are they that find.

Queſtion 5.

Whether or no the Philoſophers do ſo much differ amongſt each other, as that one hath prepared that Univerſal Medicament of this matter, and another of that?

Anſwer.

Yea, verily they ſeem much to differ amongſt themſelves, not onely as to the external Letter, but their Opinions alſo that concern the very matter it ſelf are very various and diſcrepant, but yet as to the Baſis and Fundamentals of the truth, there they are of one mind, though one hath prepared his univerſal Medicament of one matter, and another of another matter, and have each (after the finiſhing of their Work) deſcribed the operation agreeable to their own way of proceeding.

Queſtion 6.

Whether or no there are more univerſal matters than one, out of which the univerſal Tincture is prepared?

Anſwer.

As far forth as we can gather from the Writings, both of the Ancient and Modern Philoſophers, they have not onely uſed divers matters, but alſo different ways of operation, in the preparing of their Tinctures: But the Tincture being acquired, each had an univerſal Medicine, and was therewithall content, though (I confeſs) one Medicine was more virtuous and efficacious than another.

Queſtion 7.

Which of the Metals and Minerals are to be accounted of as the true matter of the Stone?

Anſwer.

If you ſhould onely mind the literal ſence, the Philoſophers then ſeem to know a way of preparing their Tincture, not onely out of all the Metals, but even out of the Minerals too: For they have impoſed ſo many names upon their matter, calling it one while Gold, another while Silver, or *Mars*, or *Saturn*, yea and *Magneſia*, Arſenick, Sulphur, Soot, Urine, Blood, Sperm, *Menſtruum*, and I know not how many abſurd names, which have ſeduced the unskilfull Searchers into various errours, whereby they have beſtowed their Labours, and ſpent their Eſtates upon unprofitable matters, and ſo loſt both their Pains and Charges.

Queſtion 8.

Whether or not the Tincture may not be extracted as well out of fixt Gold and Silver as out of the other imperfect Metals, and immature and volatile Minerals, ſeeing that the Philoſophers ſay, that all the Minerals and Metals have their original out of one and the ſame root, and do agree as to their inward Eſſence, the difference that is between them conſiſting onely in the purity or impurity, and in the fixity or volatility of them. If therefore the pure be but ſeparated from the impure, and Shell from the Kernel, that ſeparated purity of the imperfect Metals will give the ſame that the moſt pure Gold and Silver will. Nay more, if it were neceſſary it mought eaſily be demonſtrated, that a true Tincture, and wholſome for both the bodies of Men and Metals, may not onely be prepared out of any Metal and Mineral, but even out of the Vegetables and Animals themſelves too, and and that by reaſon of their included Sulphur, which is the Father and Original of all the Metals?

Anſwer.

But what need is there of ſeeking that in far remote

mote places, which offers it ſelf nearer at hand? wiſely therefore did the Philoſophers reject all the Vegetables and Animals, and other the like unprofitable things, as to the making the univerſal Tincture, they expreſly adviſed us, that ſuch things as you deſire to reap, you muſt ſow; and that he that thinks with himſelf of beſtowing his labours about ſuch operations, muſt begin with thoſe things that nature hath left off at, and could not advance to a farther perfection. And what elſe I pray do Artiſts ſeek for but Gold and Silver? if ſo, then (as the Philoſophers do ſeriouſly admoniſh us) we muſt take their Seeds and Sow them, if we would Reap a much augmented and exalted Crop of Gold and Silver.

Queſtion 9.

If the caſe ſtands thus with theſe labours, as that thoſe things which are ſown, are again reaped in a multiplied encreaſe, why is not the moſt noble Seed of Gold onely ſown? What need is there of adding Silver thereunto which there's no appearance (as to the outſide view) of any colour.

Anſwer.

Although there be not any apparent colour in the Silver, yet is it certain that there lies abundance of colour therein hidden, which notwithſtanding does not diſſolve it ſelf before it is unlockt and inverted by the labour and help of the true Chymick Art, and that its external whiteneſs be hidden, and its internal redneſs be brought forth to light. For verily a true Tincture neceſſary for the tranſmutation of the Metals can never be prepared out of bare ſimple Gold, without an addition of Silver thereunto: For Silver is the Matrix of Gold, in which, this (as being the maſculine Seed) germinates, grows and multiplies its colour.

Queſtion 10.

This ſeems to every body a wonder that a red colour ſhould alſo lie hidden in white Silver, ſeeing that there are not a few who think that even Gold it ſelf does not contain more of colour than it needs for its own ſelf. How therefore muſt this be underſtood?

Anſwer.

As to this, you muſt not at all mind the external ſhape, but that which lies occultly hidden. The internal parts of any Seed are not viſible to the ſight, as for example. A Vegetable Seed preſents you not with the ſight of any various colours, but when it is committed to the Earth as to its Matrix, it then ſends forth firſt green Sprouts, then Stalks, then Leaves, after which ſucceed moſt curiouſly painted colours, that at laſt the Seed comes forth with an incredible augmentation, all which were not viſible in the bare Seed.

Conſider alſo the Egg of any Bird, in which no body can diſcern any Bird, conſiſting of ſuch divers and various Members, and adorned with ſuch delicate Feathers afore the ſaid Bird is hatcht, the Egg being ripened by an external cheriſhing heat.

Queſtion 11.

This ſimilitude of the Seed of a Vegetable, and of a Bird, doth not a little enlighten my mind and give me encouragement to believe: I do therefore firmly believe that there is hidden an abundance of colour not onely in yellow Gold, but alſo in white Silver it ſelf too, inſomuch that I do aſſuredly perſwade my ſelf, that a conſtant and moſt high Tincture may eaſily be prepared out of Gold and Silver, and that it is a very difficult matter to prepare a permanent Fire-brooking Tincture out of the imperfect Metals and immature Minerals (though they alſo hide within their inſide bowels moſt exquiſite colours) by reaſon of that imperfection and unripeneſs which they lie under.

Anſwer.

Your judgment and opinion is true. For although the leſſer Metals, as alſo the Minerals themſelves too do hide within their bowels, the moſt high colours, and though thoſe very colours may eaſily be ſeparated from their unprofitable bodies, yet notwithſtanding there is requiſite to ſuch operations a long ſpace of time, great expence, and hard labour, *viz.* to make ſuch Tinctures conſtant, permanent, and fixt by the common Fire of Wood and Coals. But yet he that knows the ſecret Fire of the Philoſophers, will eaſily give unto ſuch Tinctures that conſtancy in the Fire that is requiſite, which otherwiſe, and by the common Fire, will very difficultly and hardly ever be effected. For example, common water will always remain water, and therefore will never be brought into a ſtony or metallick nature by the Fire of Wood or Coals. But a thing may be eaſily reduced unto that which it was before: If an hard Stone be turned into pure water, it may be reduced (even by the help of the common Fire) out of that ſame Water into a more pure Stone, and ſo is it likewiſe with a Metal, if treated with the ſame operation.

But yet I do not deny but that even any common water, or any Stone may be changed into a Metal, but then I ſay, it muſt be done by the help, not of the common Fire, but of the Fire of the Wiſe Men, by which Fire, even the Waters are wont to be changed into Metals in the Earth: For all Metals and all Stones have their riſe out of the Water, and were at firſt Water. Whoſoever therefore doth well and throughly know this ſecret Fire, which the Philoſophers have always with their utmoſt diligence and care concealed, he may work upon all the firſt beings of Gold and Silver, as common Sulphur, Mercury, Antimony, Arſenick, Auripigment, Cobolt, and others of that kind, and tranſmute them into red and white Tinctures. But if he has no knowledge at all of the ſame, let him in God's name apply himſelf onely to fixt Gold and Silver, and having volatilized them, turn them into Water, and again turn this ſame Water into a fixed Stone, which if he brings but to paſs, he enters upon the neareſt way, and will be a maſter of that which he beſtows his labour in the ſearch of.

Queſtion 12.

If this be the moſt compendious way of getting the Philoſophers Tincture, viz. *out of thoſe known Metals, as fixt Gold and Silver; Why do ſome of the Philoſophers write that their* Sol *and* Lune *is not that common and well known Gold and Silver, and that as well the Poor as the Rich have that* Sol *and* Lune *as is theirs, and may eaſily prepare the Tincture it ſelf there out of; ſo that (it ſeems) all ſuch as buſie themſelves in the ſearching after that moſt eminent Medicine in the common Gold and Silver, do extreamly err?*

Anſwer.

Anſwer.

Theſe Philoſophers that reject the common and well known Gold and Silver, were clearly ignorant of the knowledge of making of the Tincture out of them, which had they but known and well underſtood, they would not ſo confidently have affirmed ſuch a thing in their Writings. But foraſmuch as they knew but that one way of making the Tincture out of the volatile Minerals, and that that way of making it with fixt Gold and Silver was unkown unto them, they could not mention unto us any other way than their own ; whereas though there are not a few of the Philoſophers, that on the other hand commend unto us the common Gold and Silver, and reject all the other Metals. Nor is the number too very ſmall, of ſuch as do confeſs, that the Tincture may be made of the more imperfect Metals, and volatile Minerals, but yet with this caution, that one ſubject is much eaſier, ſpeedier, and better to operate upon than another is.

No Man can all at once clearly know and apprehend every thing, and therefore it would be much better for a man to judge onely of the things he knows, and not cenſure the things he is ignorant of, that ſo the World may not by this means be ſtuft with ſo many Writings which thwart one another. Some there are who perſwade themſelves, that (when they do at long run arrive by many turnings and windings unto the wiſht for place) there is no certainer, nor more compendious way than that which they took in making their Journey. Hence it is, that the Writings of the Philoſophers are ſo involved with intricate opinions, out of which no body can well free himſelf, unleſs the whole knowledge of nature be opened unto him : But ſeeing the number of ſuch is very ſmall, therefore it muſt of neceſſity follow, that they who err are very many, and that they who become maſters of the truth, are but a very few.

Queſtion 13.

What therefore is it that is neceſſary for us to know, or what things muſt we be furniſhed withall, when we apply our minds to the ſearch of ſo great a ſecret ?

Anſwer.

Foraſmuch as the univerſal Medicine is the gift of God, and not of Man, it is but juſt, that the ſame be ſought for at the hands of God, and not of Men, who (in one night and by a Dream) can reveal thoſe things, which a Man will not get all his life long by his reading of the many intricate Books extant; And thus much doth *David* teach us, ſaying, *In vain do you riſe up early, and go to Bed loaden with cares, for God beſtows his gifts upon thoſe that love him, even whilſt they Sleep.*

Queſtion 14.

By what means may a gift ſo divine be obtained from God ?

Anſwer.

By daily praying unto him, and by accompanying your Prayers with daily and diligent Labour. For Prayers alone wont ſerve turn, unleſs the reading of good Authours, and continued Labour be alſo adjoyned thereunto. God reveals his good things to mortal Men, by their ſerious Prayers, and and continual Labours.

Queſtion 15.

Are all Men fit to beg ſo great a gift at God's hands, without any difference at all, or doth ſo great a ſecret require onely ſome particular Men's Supplications, and not admit every one, as if all were fitted thereunto ?

Anſwer.

Verily every body is not fit or worthy to be a maſter of the ſame. For ſhould it be granted every one, this ſo exquiſite an Art, and of ſo great a concernment, would become as common as the baking of Bread, and brewing of Ale, but this is contrary to the command of God, who wills not, that the Goat ſhould have ſo long a Tail as the Cow, for ſo in Pride ſhe may ſmite out her own Eyes. God well knows when, and where to give, and who it is that merits ſuch great favours. But however this is an undoubted truth that the proud ſhall never obtain any good thing at the hands of God.

Whoſoever therefore has a deſire after great things, let him throughly ſearch his heart, and ſee if it be upright and ſincere towards God, or no, and it is neceſſarily expedient for him well to examine himſelf, (before he ſets about the Labours of ſo great an *Arcanum*) for this reaſon, leſt it ſhould happen to him, as it did to that ambitious and proud Gueſt, who (as Chriſt teacheth) ſate himſelf down in the chiefeſt place of the Feaſt, which he was not worthy of, and was afterwards conſtrained (to his great ſhame and reproach) to yield the ſame to a worthier and honeſter Man than himſelf.

Queſtion 16.

How muſt ſuch a Man be qualified, that deſires to obtain from God by his Prayers, ſo great a ſecret, and by his Labours to bring it to a final end ?

Anſwer.

Firſt of all an *Arcanum* of ſo great an importance requires a free Man, and ſuch an one as is not bound to any other, nor intangled with any other humane affairs, that ſo being in a quiet and ſilent poſſiture, he may by his daily Prayers ſue unto God for his Bleſſing, and may be at leiſure continually to read good Authours, and to let no time ſlip wherein his Labours are required. Then farther, ſuch a Man muſt likewiſe be pious and liberal, and forward in helping of the Poor : he muſt alſo be no Tatler, he muſt have a good and ſound mind, and be given to temperance and ſobriety. He muſt not do as the *roving Mountebank* doth, inſinuating himſelf one while into this Man's Acquaintance, another while into that Mans : He muſt not be over credulous, preſently to believe every ones pretenſion : He muſt not mind his ſole benefit nor be prone to covetouſneſs, and aim at graſping all unto himſelf. He muſt not be of an unconſtant mind, but expect and wait for (with a patient and conſtant Reſolution) the end of that which his deſire inclines him to, and therefore he muſt not be preſently enraged, or be affected with a wearieſomneſs if it ſhould ſo happen unto him as not

to have every thing presently answering his expectation. He does not propose unto himself the getting of great honours in the World, and of having in his hands power and authority, but rather aims at the honour of God, and the helping and succouring the poor sick and distressed ones. Farther yet, he must be furnished with necessary means, lest he be constrained through the want of Coals, Materials, and other necessaries, to leave off the Work he has begun. But he must especially have God always before his Eyes, and expect the happy event from him alone, and attribute nothing at all to his own peculiar Wisedom, and be daily at his Prayers, and labour without ceasing, and with a patient mind wait on the Lord for a successfull end.

Briefly he that is studious after such a secret, must so lead his life, as to walk unblamably both before God and Man.

Question. 17.

Which of these two ways is most safe and most easie for the attainment of this divine gift, that which makes use of the common Gold and Silver, or that which useth the unknown, and as yet volatile Gold of the Philosophers?

Answer.

You must know that both ways are good, and lead you on to your wished end, if they be but rightly and orderly according to Art proceeded withall.

Question 18.

By what means shall an unskilfull beginner, and one who is ignorant of so great an Art, enter upon the right way, and not err, whenas he hath not any one to guide him as it were along by the hand?

Answer.

Who shewed the way unto the other Philosophers that were before us? were not all of them (some few excepted who confess that they learned the Art from good Friends) constrained to learn the same out of the Books of the Ancients, and by the divine Revelation?

Question 19.

Where may a Man find such good and well disposed Friends who will shew the way to him that is unskilfull?

Answer.

Such men are wondrous rare, and indeed good reason have they so to be, and to deal warily and wisely in revealing such notable secrets. It is not engraven on each Man's Forehead, whether he be good or evil; we rarely meet with any example, whereby it hath appeared, that even a Father hath disclosed to his Son so great a secret before his death. Nay more, if Parents have left ought written for their Children at their death; yet hath it been so intricate as that they could not do any good on it without divine Revelation. And upon this very account have divers such desisted from the work, finding that the Writings which their Parents left them were fully as hard to be understood as those written by other Authours, and which were not penned and published for the sake of their Children, but for the sake of all others in general.

Question 20.

What use are such intricate and obscure Writings of? would it not have been better that they had not Written at all? If they had but onely disclosed the true matter, it would have afforded the searching inquirers more light, and they would have been able more easily to have apprehended the truth?

Answer.

No surely, it would not have been better, if they had passed over so weighty a thing in silence. Whence I pray should we their Successours have known, that there is such an excellent Medicament in nature? The Books they have written do remove from us even every Scruple of doubt, and cause us to believe, that there hath been, is, and may be made such an universal Medicament, if God permits. The reason why they have not jumpt together in disclosing the matter of the Stone with one unanimous consent, is this, because one used this matter, another that, for the making of their universal Tincture, and so each of them have described the way of making the same after his own way. Hence it is, that one hath delivered this manner, but another that hath proceeded another way could not give us the self same accompt of making it just as the other did, but hath hinted unto us onely, the way which he himself used.

The greatest difference is about the matter onely of the Stone; one part of them saith that the common and fixt *Sol* and *Luna* is the matter of the Stone, and lays by or rejects all other Subjects. Another part affirms that a volatile and an unripe Gold is the Master of the same, and that the common *Sol* and *Luna* are to be wholly waved as being unprofitable for the matter of the Stone. Moreover the Philosophers in their description of making the Stone mention a dry way and a moist way, a long way and a short way, a common Fire and a secret Fire, which they used in the ripening of their Tinctures. And now (on this accompt) it could not otherwise be; but that they should publish such unlike, dubious, and thwarting Writings, which have rendred the way of finding out the truth so difficult and intricate, and have led the Lovers of the Art into such abundance of Errours, and fruitless Labours. The common Fire I wish, is destitute of the power of ripening volatile Gold, and reducing it into a Tincture, which that secret Fire, continually burning with its flame in the glass upon the matter of the Stone, is able to effect. Now besides the common Fire, there must necessarily be the assistance of the moist Fire, which being kindled by the Fire of Coals and made efficacious, doth radically conjoin the fixt Gold and Silver, brings them unto a volatility, and makes them again constant in the Fire. This way (in my judgment) is the shortest, easiest and safest of all; for it makes the fixt *Sol* and *Luna* spiritual and volatile in three days time, and turns them into the *Mercury* of the Philosophers, which white *Mercury* of the Philosophers doth afterwards pass in one days space, into the black Lead of the wise men, if a small Fire be administred thereunto. This Lead being

ing put into its requiſite glaſs, may (by the help of common Fire) be reduced (after its changing of Colours) into a conſtant Tincture.

And now though the ripe and fixt Gold coſt and be far dearer than the immature *Sol* is, yet that's no matter, for there needs not a pound of Gold to be uſed about the compleating of this work, but haif a pound onely, or elſe but two or three ounces, that ſo the operation may be the ſooner ended. Nor will he that ſhall once have brought one half Ounce unto a due perfection, need ſuch a deal of Gold, for he wants not Gold any more, wherewith to begin the operation a new. And although on the other hand the maturation of the immature Gold by the ſecret Fire doth not require ſo much expence as the common Gold doth, yet it requires more time for its perfection. Beſides too, the moiſt way is always ſubject to more Caſualty and Hazard, and requires a much longer time to bring it to the deſired perfection. It is therefore at every man's pleaſure, to chooſe which of theſe two ways pleaſeth him, onely he muſt proceed warily and prudently. And if he ſhould chance to commit ſome Errour once or twice, yet will not ſuch Errours be of any great derriment unto him, if he can but at laſt arrive unto the wiſht for end, and reap the multiplied and manifold Fruits of his Crop. Thus much was I willing (and indeed ought) to communicate of my opinion (concerning the univerſal Medicine) unto the Diſciples of *Hermes*, but yet without preſcribing (or obtruding my thoughts) upon any one, but leaving every one to his own Conceptions

Mean while I would adviſe every one not to attempt a thing of ſo great a moment, raſhly and inconſiderately, but in the firſt place accurately to weigh all things in his mind, as to what may be done, and what may not, leſt he repent him at laſt and be quite tired with his fruitleſs Labours. For it is no mean ſlight buſineſs to prepare the true Tincture of the Philoſophers, neither is it given unto every man to have the knowledge and poſſeſſion of ſo great a Work.

Queſtion 21.

Would it not be a very convenient thing for two or three Friends to joyn their hands together, and help each other by their mutual Labour and Expences, and ſo eaſe that trouble which otherwiſe one alone muſt undergo? Or if any one be ſo minded as to attempt the work alone, would it not be better for him to get him ſome faithfull and diligent Operatour, whoſe help he might make uſe of, in the promoting and forwarding of his Operations.

Anſwer.

For my part, I would not adviſe any one to do thus. For when a work of ſo great a moment is to be undertaken, and to be accompliſhed by the common mutual Expence and Labour of others, the Affairs are then obnoxious to no ſmall hazard, and for the moſt part come ſhort of the hop'd for event, by reaſon of the moſt different Opinions amongſt men, concerning which the Comœdian ſaid very right, ſo many heads ſo many opinions, every one hath a peculiar fancy.

Now then, from one deſiring this thing another that, there can't ariſe ought elſe but confuſed actions and operations, which are ſo far from forwarding the work, as that they retard and obſtruct the ſame. Many Work-men diſagreeing amongſt themſelves, can never build an Houſe agreeable to the right dimenſions of building. And therefore it is far better for every one to apply himſelf ſingle and alone to the performing of ſo great a work, and quietly to attend upon the ſame, and invoke God's help alone, and leave off his expectations from man, amongſt whom fidelity and love, are like the rare Bird in the Earth, and as ſcarce as a black Swan! Nay even the friendſhip of brethren is wondrous rare, and (which is worſt of all) the bond of friendſhip is too often broken aſunder betwixt Parents and Children. The golden Alphabet doth likewiſe in its beginning teach us the very ſame, ſaying, truſt in God onely, and in him place thy hope, give not any credit to the promiſes of man, God onely is faithfull, fidelity is baniſhed out of the World.

'Tis ſufficiently evident, what kind of doings there is in the Courts of great men, you'l there find 2, 3, 4, or more Chymical Operatours buſily imployed about making the Philoſophers Stone, for they ſeek after nothing leſs, but yet by reaſon of their ignorance, they effect but very little or nothing at all, for the main thing that they mind is to ſtrut it bravely out in their Silks and gay Apparel, and to have their Tables furniſhed with plenty of various Diſhes, and generous Wines and Drinks, whereby they may ſtuff their Bellies; and this is clearly teſtified by daily experience: and as for taking to ones ſelf an Operatour, that is more hazardous than the other, where the work is attempted by a confederacy, at their common mutual Expences and Labour. For ſeeing you cannot make an inſpection into any man's heart, whereby to know what Monſter he there cheriſheth, and what good or evil he has hidden in the inſide of his heart, you cannot poſſibly promiſe your ſelf any certainty of his taciturnity or fidelity, and therefore plainly ignorant muſt you needs be whether the man you would take to aſſiſt you be faithfull and no tatler. Verily even the common Labour cannot be committed to ſuch men without hurt and damage, but great Arcana's cannot be left to their care without aſſured loſs of all. 'Tis wondrous rare to find a Servant ſo faithfull, who (after he hath ſlily gotten the knowledge of one or two Secrets though but trifling ones too) does not preſently perſwade himſelf, that now he's a skilfull Artiſt enough, and no longer needs the inſtructions and manuductions of any other. Theſe kind of perverſe men being by thus (evilly perſwading themſelves) ſeduced, are preſently wont ſecretly to withdraw themſelves, or if haply they do ſtay yet longer with their Maſter, they behave themſelves ſo malepertly and unmannerly, as that they ſpoil the things committed to their Charge merely to accompliſh this end that their Maſter may diſmiſs them. If therefore you will not wink at and ſuffer them to ſpoil and deſtroy, by their ſaucy regardleſs Labours the things they have under their hands, but are conſtrained to put away theſe moſt ungratefull and plainly unmindfull men of the benefits they have received, yet will they not acquieſce here with an honeſt diſmiſſion and parting, but will every where gnaw and wound thy good name by abundance of reproachfull Stories, as being now thus opiniated that they far excel you, their Maſter in Wiſdom, Skill and Knowledge. But yet I except in this place thoſe Servants that are honeſt, pious and diligent, and that love vertue, and make a conſcience of their ways. For the Devil has not got the poſſeſſion of all

all men's hearts, for there are ſome Chymical Operatours to be found who are ſo faithfull unto their Maſters, as that could they of a farthing make a Florin for their Maſters, they would moſt cheerfully do it. But yet theſe men are ſo very rare, that ſcarce one in ten can be found that you may give credit to, and truſt. And my own thirty years experience hath taught me, and therefore I tell you no more than what my ſelf have to my own detriment experienced. Read but what *Paracelſus* hath written of theſe perfidious Knaves, amongſt other things he confeſſeth, that thirteen of his Servants came under the Hangman's laſh, and that of them all he found but one faithfull, (and that was *Operinus*) and yet he (after *Paracelſus* his death) did manifeſtly enough bewray his diſſimulation and unfaithfulneſs; for he did not onely load him with reproaches, but alſo publiſhed ſlanderous Writings of him. This is the thankfulneſs the World is wont to repay for the good that is done it, ſhun therefore ſuch as theſe the moſt you can, for they neither fearing God nor reverencing men, make no matter at all of either oppoſing the moſt apparent truths, or of defending it by moſt manifeſt and evident Lies. And although the malicious wickedneſs of a man, be not preſently known, yet notwithſtanding it bewrays it ſelf by the ſlanderous reproachfull lies, with which it requites the good turns done him by his Neighbour.

Thus much I judg'd worth while to communicate to all the Diſciples of the Hermetick Art, that ſo they may learn to beware of theſe kind of Harpies.

Queſtion 22.

Seeing it is not good to enter into friendſhip or conſortſhip with others, in order to the attempting ſo great a work: And ſeeing a man runs a greater hazard in taking to himſelf an unknown Operatour, haply it would be the beſt way to ſeek after ſome particular Medicament which may be ſerviceable for the benefit of both high and low, and which may not onely prove helpfull unto the poor, but alſo by which a neceſſary Suſtenance may be found even amongſt the rich, and ſo by this means may a man lead a quiet life.

Anſwer.

This advice or determination I confeſs ſeems far better and more ſafe than the two former, but even this too needs a provident warineſs, *viz.* if a man ſhould haply (by his ſedulous ſearch) acquire the knowledge of ſome eminent and excellent Medicaments, he muſt take heed leſt by preſently making every one partaker of the ſame, he pulls damage on his own head. For 'tis an uſual cuſtom amongſt wicked men to endeavour (aſſoon as they find any one gifted by God with ſuch a bleſſing) to get it out of the breaſt of the Poſſeſſour of the ſame, by moſt cunning Subtilties, and promiſe even golden Mountains, and ſuch as they are never able to perform. And if once thou let'ſt the Art paſs but out of thy hands and come within the Clutches of other men, thou may'ſt well fear in the firſt place leſt it ſhould be made publick, and ſo thy ſelf be deprived of the benefit of the ſame, though they whom thou haſt truſted with the ſame have bound their credit with the firmeſt obligations imaginable, and this now is to be underſtood of ſuch men from whom ſuch bonds as they call them may be demanded. But as for the great ones that are wont to give onely their words (and ſtand upon that) when they have got any *Arcanum*, they are wont to deliver it to their Chymical Operatours to make, for themſelves are partly ignorant of Chymical Operations, and partly ſet not their own hands to work; if their Operatours be skilfull in Chymical Operations and bring the ſame to the expected end, you ſhall be preſented with ſome ſmall reward, and even of this too will he (whoſe charge the preſenting of it is committed unto) keep to himſelf the better half. This now is done unwittingly to their Maſters, and who dares inform them of ſuch deceitfull Servants, and purchaſe to himſelf the envy and hatred of the Courtiers? And ſo thoſe who are commanded to bring thee good ſweet Milk, do themſelves firſt take away the ſweet fat Cream, and then bring thee the ſour Whey. But if for the more ſurety, thou ſendeſt any Servant that may be there at the perfecting of the Operations, he will (if faithfull ſatisfie thee; if not, he will preſent thee with as much of the reward as himſelf pleaſeth. Thus hath it hapned unto me, for 'mongſt other Servants I have had ſuch, that in their Cups have impudently boaſted of ſuch kind of theft, and have prevented me of a preſent or two that belonged unto me, and have made themſelves merry therewithall.

Theſe and other ſuch like inconvencies are wont to happen upon the revealing of *Arcanums*, though they ſhould fully anſwer the expectation of thoſe whom they are revealed unto. But if it ſhould happen that thoſe Chymical Operatours ſhould by reaſon of their ignorance commit ſome Errour in their Labour, or ſhould have no mind to the work as being a little more troubleſome than ordinary, fearing leſt the Sparks of the Coals ſhould light upon their Silken Garments, and that their hands ſhould be defiled with the blackneſs of the Coals, they preſently perſwade their Lords, that the *Arcanum* which was thus revealed is falſe, and that you are a cheat and a mere vapour, and ſo they do not onely rob thee of thy good name, but do likewiſe by their fraudulent and lying tricks deceive their Maſters affirming thoſe things to be falſe, which notwithſtanding are moſt certainly true. Several Letters I have by me, written unto me from ſuch Court Operatours, in which they confeſs that they have wrought up (or made) thoſe *Arcanums* (which were ſent them) not without good Succeſs, and that therefore they would deſire yet greater ones than thoſe: but yet they have afterwards ſpread obroad a falſe report, and ſaid that they never could receive any benefit by them at all. And that fruit or reward which was due unto me for my diſcovery, themſelves intercepted, ſome got them fat Offices, others were gifted with Nobility and Money. And ſo indeed is it an uſual thing for thoſe that dreſs the Vines, and preſs the Grapes and make the Wine, to be (by a forc't put) content with the Husks, whilſt the idle and ſuch as work not, drink up the Wine. Far better is it therefore, for every one to preſs out his own Grapes. By this means will a man know what is his, what he has, and what he does, whereby he may uſe his own things as beſt likes him. Now then well may the man that knows many Secrets be deterred by the ſo many and ſuch adverſe Chances, from making others partakers alſo of the ſame, and well may he eſteem it much better to enjoy the few things God hath beſtowed on him, with a quiet mind, than to expect many things (but with a great deal of danger) from others.

And

And thus much ſhall ſuffice to have been premiſed by way of *Queſtions* and *Anſwers*. Now follows the uſe of ſome eminent *Arcanums* and incomparable Medicaments, which have been mentioned in the Books I laſt publiſhed, one of which treats of occult Fires, and the other contains three Dialogues.

Of the Lyon, or of the Bloud of the Lyon, or Gold, how it is to be prepared, and to be moſt profitably uſed as well in Medicine as in other Arts.

AS concerning the way of preparing this Bloud of Gold, it is already deſcribed in the firſt Dialogue, and its adjoyned Corollary, inſomuch that there needs no fuller declaration in this place. But yet you are to know that I have met with (ſince the writing the firſt Dialogue) a far eaſier and more compendious way of converting or turning any Gold, even in a moment, into Bloud, by the help of our occult *Sal Armoniack*. But this Bloud is not to be uſed in Medicine, as it is *per ſe*, becauſe of the *Sal Armoniack*, which tranſmutes the Gold and changeth it into Bloud. For theſe ſharp Saline and Corroſive Spirits are unprofitable, and hurtfull in Medicine, and are therefore to be ſeparated from the Gold, which is done by the pouring on of common Water or Rain-water, which imbibes the Spirits of the Salts, and precipitates the moſt red Powder of the Gold to the bottom of the Veſſel. This Powder muſt be well waſh't by ſeveral waters, and be well freed from all its ſaltiſhneſs; which being ſo freed, may (by the addition of ſome Cordial Water) be reduced to the conſiſtence of a Syrup, and ſo kept; the Doſe whereof may be augmented or diminiſhed according to the condition of the ſick, and the diſeaſe. But commonly ſo much of this Golden Bloud is ſufficient as ſerves to tinge a ſpoonfull of Wine, Ale, or other Vehicle, with a red Colour. It is uſefull in all diſeaſes in which the Heart needs ſtrengthening. But eſpecially it allays the immoderate Flux of Bloud both in Men and Women, and cures the Gonorrhea, Leproſie, and French Pox, if the Body ſhall be purged with due Purging and Sudorifick Medicaments. It heals thoſe Puſtules in the Skin, the Noſe, and other places of the Face if outwardly anointed with a Feather ſeveral times a day. For it drys vehemently, and makes the Skin it ſelf fair and ſmooth. And therefore upon this account it is exceeding profitable for Women that have naturally pale Faces and Lips, for being laid on, it changeth the paleneſs into a comely and natural Colour, eſpecially if a little white Oil made of Talk be thereto admixed, to temper and allay that moſt red Colour of the Gold, and it likewiſe is a moſt delicate Fucus for ſuch Women whoſe Faces are not onely pale, but alſo dyed with a duskyiſh or yellow Colour, and by means of this Coſmetick or Fucus may they paint their Faces of a natural Colour. For no Fucus may compare with this, for it is ſo commodious and durable that it cannot be diſtinguiſhed or known, nor be corrupted as others are, which being done with Vinegar, ſowre Wine, Lemon-juyce and ſuch like things do preſently, by a breathing on them, turn into a filthy Colour, and bewray a painted Face. For this Golden Bloud is ſo very conſtant, and doth ſo keep its moſt curious Colour, as that it remains ſafe from all injury of the Elements.

Furthermore, this Bloud (before it is freed from its Saline Spirits) tingeth the Hair, Skin, Wool, Bones of Beaſts, and Feathers of Birds, with a moſt delicate purple Colour; which paſſing into a redneſs, is ſo conſtant, as that no ſharp Waters can corrupt it, and therefore it is far beyond all other purple Colours, what name ſoever called by, and worthily may it be accounted for a kingly Colour.

It would be too long to reckon up in this place its various other uſes: It ſerves in Medicine for the tinging of divers Confections and Cordial Waters, which Colour is much nobler, and more profitable than thoſe wherewith Confectio Alkermes and Cordial Waters are wont to be tinged. 'Tis evident that the Colour of Gold doth rather benefit than hurt the Sick, which if the ſaid Confections or Cordial Waters are coloured withall, they become the fairer, and they are rendred yet more delicate, if the Atoms of Gold, being thereunto adjoyned, fly about in the Wine or Water like ſo many very ſmall Stars. For if to an *Aq. Vitæ*, which is already tinged with the Bloud of Gold, a little of the ſaid Atoms be admixt, they will ſhine out of that delicate purple Colour, like the moſt bright *Aurora* (or day-break) in the Heavens. This is a moſt excellent way of making *Aq. Vitæ's*, for the Atoms of the Gold are ſo very ſubtile, as that they eaſily admit of concoction and digeſtion by the heat of the Stomach, and emit their Virtues, which thoſe common Gold leaves which are mixt with *Confectio Alkermes*, *Aq. Vitæ*, and ſuch like compoſitions onely for ornaments ſake, doe not doe: And therefore they are no ways comparable to thoſe Atoms of ours. 'Tis no ſmall trivial matter that I diſcloſe unto you, and verily it would be well worth the while for the Apothecaries ſhops of noble men to eſteem highly of the ſame: And as for what and how great things may farther be done with this ſame Tincture of Gold, as to the Metallick matter, may be found in the firſt Dialogue.

An eaſie way of making and preparing the Atoms of Gold.

DIſſolve an Ounce and an half of Gold in ſtrong Spirit of Salt, or if you are not furniſhed with this Spirit, then diſſolve the ſame in common *Aq. Reg.* and pour upon the Solution one pound or two of Rain water, whereto is admixt about one pound of Rheniſh Wine, mix them altogether in a glaſs, and ſhake them well, and ſhut the glaſs cloſe that no duſt fall therein, ſet it by for ſome days in a warm place that ſo the Gold may precipitate out of the Water, and ſettle to the bottom of the Veſſel in the likeneſs of moſt curious ſmall Stars. But if all the Gold ſhall not be precipitated in this time, ſet then the Glaſs in a B, and let the Solution boil a while; then when it is again cool, ſet by the Veſſel ſome-where that the Gold may ſettle, which being diſſolved into Atoms, (and the Water and Wine poured neatly off) is to be taken out of the Glaſs, and to be often waſh't with pure water: So ſhall you have the Atoms of Gold, which you may ſafely make uſe of in Medicine.

N. B. But you are to note, that it is impoſſible for the Gold to be by thus proceeding ſo diſſolved as for nothing at all thereof to remain in the diſſolving water. And therefore 'tis neceſſary that you ſeparate the reſidue of the Gold out of the water by precipitation. And in my other Writings will you meet with ſeveral ways of ſeparating the ſame. Theſe moſt fine and ſubtile Atoms of Gold may you alſo make uſe of with moſt notable profit even in o-

ther Chymical operations, concerning which you will find clear inſtructions in other places of my Writings.

And foraſmuch as I here make mention of a moſt excellent *Aq. Vitæ*, it ſeems in my Judgment neceſſary and profitable to add here a full deſcription of the ſame, together with the uſe thereof.

The way of making a Golden Aq. Vitæ, *and ſuch as never as yet hath been deſcribed and publiſhed unto us by any Phyſician.*

TAke of the beſt and pureſt Salt-petre, and of white and pure Tartar, each one pound, of yellow Sulphur half a pound, make theſe matters into Powder, and having well mixt them, put them into a Cruſible, and by putting thereunto a live Wood-coal, kindle them, that they may take fire and burn up, and leave a yellow maſs behind in the Cruſible; which being molten in the fire, and turned forth into a Mortar, will give you a fiery ſulphureous Stone, biting the tongue by reaſon of its ſharpneſs. Now whilſt it is yet warm, powder it, for it preſently attracts (when cool) humidity out of the Air, and admits not of pulverization. Being powdered, pour thereupon two or three pounds of the beſt Spirit of Wine, and ſet it by in a cold place for ſome days, but with this proviſo, that you daily ſhake or ſtir your matter in the Veſſel with the Spirit of Wine: By this means will the Spirit of Wine attract a red Tincture out of the Sulphur, and will withall acuate it ſelf with the Salt, by the Calcined Tartar, then filter this Spirit of Wine by Cap-paper or a Filter, as they call it, and draw off two third parts by diſtillation in a B, that ſo you may have your Spirit again, but of a very pleaſing taſt and ſmell, which it gets out of the Sulphur, as out of the Center of all odour.

This Spirit of Wine, having the following Spices and Flowers ſteeped therein, and being again diſtilled off in a B, will give thee an efficacious Cordial Spirit of Wine, which ſaid Spirit you may colour red, with the Tincture of the Gold, and by the appoſition of as much of the Atoms of the Gold as is ſufficient, make it Aureous. Now as much as there ſhall be in quantity of this ſame Spirit, you may thereto afterwards add ſo much ſweet volatile Spirit of Gold, as will allay the overmuch heat of the ſaid Vinous Spirit. But that this yet overmuch heat may be yet more allayed, and that the ſtrong odour it ſelf of the Aureous Spirit may be corrected, you may therein diſſolve about ſome four ounces of Sugar-candy beaten into fine Powder, and this will make this truely Aureous *Aq. Vitæ* moſt ſweet. This moſt incomparable *Aq. Vitæ* may be uſed in all the Sickneſſes of the Body moſt ſafely and moſt profitably where the Vital Spirits the Heart and Brain need ſtrengthening. For the Aromatical Spirit of Wine doth even *per ſe* corroborate the Vital Spirits, and now the Spirit of Gold makes it more potent and effectual, and the Atoms of the Gold too, doth render it yet more vertuous, inſomuch that this *Aq. Vitæ* bears away the Bell from all others, nor can a better and more powerfull be prepared. For not onely the red Tincture of the Gold, but likewiſe even the Gold it ſelf being thus turned into Atoms, is conſtrained to undergo the concoction and digeſtion of the Stomach of Mankind: And therefore where 'tis uſed, the Excrements are generally black, which could not be if the Gold paſt forth again undigeſted. Seeing therefore it is an undoubted truth, that it is thus overcome and ſubdued by the Stomach's digeſtion, it cannot be but that by its moſt wholſome operation it muſt needs prove helpfull to the ſick body. Beſides too, I think it not amiſs to tell you, that the very Excrements (ſave your preſence) of thoſe ſick Patients that daily make uſe of this *Aq. Vitæ*, are not to be thrown away, for they will even yet afford ſome ſmall benefit, if they are laid to the roots of Vines to dung them with, for it will make the Vines produce ſuch Grapes as have their Stones ſpeckled with little Golden Stars, as my ſelf have tried. And perhaps ſomething of greater moment may be effected in the Metallick trade by ſuch kind of Excrements, though I confeſs 'tis needleſs, ſeeing good may be done upon them by other ways.

The Spices and Flowers which are to be extracted by the aforeſatd Alcolizated Spirit of Wine, and to be uſed in the *Aqua Vitæ*.

TAke the Flowers of the Lilly of the Valley three ounces, Of Red Roſes, Cinamon, Mace, Cardamoms, Borage, Roſemary, Sage, Lavender, two ounces, of Ambergreaſe, Muſk, a ſcruple. All theſe Flowers freſh gathered are to be put, with the dry Spices, into the Spirit of Wine, and are to be therein macerated, and then diſtilled. If you can't get freſh Flowers, you muſt even content your ſelf with dried ones, but yet the freſh-gathered are better if they can be had.

The Uſe of the Univerſal Medicament deſcribed in my ſecond Dialogue.

THE vertue and efficacy of this Medicament is of ſuch a large extent, as cannot be comprehended nor apprehended by humane underſtanding. It is prepared of the immature, and as yet volatile, and not fire-brooking Mineral, called by the Philoſophers the *Magneſia* of *Saturn*.

When this black Mineral is purged from all groſs impurity, and reduced into a moſt white and delicate Colour, and is in the form of a moſt delicate, fine, bright, and very ponderous Powder, it may be uſed with notable benefit about the curing of the moſt grievous diſeaſes. It caſts forth out of the Body of Man all hurtfull things, and that both by a viſible and inviſible operation, freeing and purging it of all hurtfull and ill humours, beyond all other Medicaments, what name ſoever diſtinguiſh't by. It ſhews incredible Vertues in a very little Doſe, inſomuch that there hath not been found hitherto any Medicament, which being exhibited in ſo ſmall a quantity, hath ſhown ſuch incredible efficacy. And although Antimonial Medicines are notably vertuous, and cauſe every one to wonder at them, as appears by my Golden *Panacæa*, and my *Panacæa* of Antimony, which for this twenty years ſpace have been famous all over *Europe*, yet can they not be in any caſe compared to this Univerſal Medicament.

1. For firſt of all, they are far inferiour in virtues to this, for one grain of this will do more than two, three, or four grains of the other can effect.

2. Secondly, this is heavier and more ponderous than the others, for one ounce of this will lie in leſs room than three, four, or five times as much of my Antimonial, or of my golden *Panacæa*, and therefore is it much eaſier and more commodious to be taken by the Sick.

3. Thirdly, this is alſo to be preferred before the others if you conſider them as to taſt and ſmell, for this hath neither odour nor taſt, whereas that Antimonial and the golden *Panacæa* have always ſome odour and taſt of the Salts, and for that reaſon do breed a nauſeate and loathing in the Sick if often uſed.

Therefore I have determined with my ſelf to ſubſtitute this univerſal Medicament, in the room of my *Panacæa* made of Antimony, and the rather for this reaſon, becauſe Deceivers and Cheaters have made a red Powder of Antimony, and perfidiouſly ſold the ſame for my *Panacæa*; but now this deceit of theirs muſt end, for they will never be able by all their deceitfull imitations to counterfeit this ponderous Medicament void both of ſmell and taſt.

As for the Doſe of this Medicament, there muſt care be had that ſcarce one quarter part ſo much of it, be adminiſtred as is wont to be of my *Panacæa* of Antimony. There muſt ſcarce be given the tenth or twelfth part of one grain at one time, to ſuch Infants as are under ſix Months old, and which are afflicted with the Epilepſie or Convulſions, the Small Pox or Meaſels, the Feavers or ſuch like Diſeaſes. To ſuch as are upwards of ſix Months, even to 12, 13, or 24 Months old, an 8th. 6th. or 4th. part of a grain may be adminiſtred, to ſuch as are 2, 3, 6, 8, or 10 Years old, $\frac{1}{4}$ or $\frac{1}{3}$ part of a grain may be given. To ſuch as are upwards of 10, even to 20 years old, $\frac{1}{2}$ a grain, or $\frac{3}{4}$ or at utmoſt but 1 whole grain may be adminiſtred. Thoſe that are between the 20th. or 50th. Years of their age, may uſe 1 grain or 1 gr. and $\frac{1}{2}$, nor muſt they exceed 2 grains at moſt. From the 50th year, all the reſt of their age even to their lives end, the Doſe of this univerſal Medicament is to be again leſſened, for old age is not able to brook ſo much as youth, and as a Man in the prime of his years can. But however you may adminiſter this ſo notable an univerſal Medicament to every age, pleaſantly, ſafely, and without any danger at all, if a due Doſe be but obſerved: Inſomuch that you need not fear to adminiſter the ſame even to Women with Child. But yet the leſſer half part of the Doſe which other Men uſe is enough for them. In Feavers it muſt be given afore the Fit, in the Plague as ſoon as it's felt and afterwards too, in the Dropſie once (or if that one Doſe be not ſufficient) twice every month; in the Gout and Stone twice a Week; in the Leproſie, French Pox, and ſuch like Diſeaſes as ariſe from the impurity of the Bloud, thrice a Week, in obſtructions of the Milt, Liver, Meſentery, once a Week; in the Epilepſie, Madneſs, and other preternatural affects of the Head, let it be given twice a Week, and this ſo long till the evil be quite removed. The affects of the Chollick will need a Doſe every day before they ceaſe. This is the manner of curing the aforeſaid Diſeaſes of the Body and all others, by the help of this univerſal Medicament. Which being uſed inwardly performs things incredible, and doth likewiſe work admirably in all dangerous wounds, open or running Sores, as well old as new, the Cancer, Fiſtula, and the like.

Being inwardly taken once in eight days it conſumes all untoward Salt Humours, and hinders them from running to the Wounds or Sores, and making them by that means worſe and more dangerous. But yet you muſt likewiſe apply externally excellent Balſams and Emplaiſters, ſuch as are mentioned in my third Century, that ſo the Wounds and Ulcers being duely purged, may admit of help by the applied Remedies and be the more eaſily cured.

This alſo is to be conſidered in the uſing of this Medicament, the Sick is to lie in his Bed four or five hours at leaſt after he hath taken it, nor muſt he either eat or drink all that time, and he muſt abide all that day in Bed, or at leaſt in his Chamber, for the avoiding of the Air, nor muſt he ſleep afore the Medicament hath finiſht its operation.

The Vehicles which it is to be mixt with, and to be taken in, are Wine, Ale, the warm Broath of Fleſh, Syrups, Conſerves of Roſes, freſh Butter, roaſted Apples, and ſuch like. Neither is it amiſs to make a light Supper, and feed upon eaſily digeſtable Food, and which may make the Stomach more apt and fit for purging, the night afore you are to take the Medicine the next morning: And thoſe are Prunes, Rayſons, and other ſuch like Food, as by their laxative property make the tough and viſcous humours ſlippery and ſofter; when the operation is over, the ſick Patient is to avoid hard meats and ſtrong drinks, nor muſt he preſently ſtuff his Stomach therewithall, but rather uſe much temperance the next day after his purgation, and feed onely upon the Broaths of Herbs, as Chervil, Fennel, Spinach, and the like, whereby the Medicament may operate the more eaſily, but it will yet more readily perform its operation, if juſt at your adminiſtring it you add a Drachm of pure white powdered Tartar, and boil it with a Drachm of Sugar, or (which is better) ſome Manna, in ſome pure clean Water, and ſo drink it warm, which ſaid potion following after your Medicament firſt taken, is wont well to purge and cleanſe the Stomach and Inteſtines.

And this is the uſe of our Mineral Medicament, which if you do but accurately regard, there will no errour be committed, and the ſaid Medicament will (by its laudable operation) abundantly ſatisfie every ones deſires. But we have now ſaid enough of this incomparable Medicament in the form of a Powder. But if this Powder be reduced, by melting it into ſmall Stones of the colour of Milk, it then requires another way of uſing it. If therefore you would uſe one of the ſaid Stones, inſtead of the aforeſaid Powder, and purge and free the Body hereby from all hurtfull humours, you muſt then put it for ſome hours in a ſpoonfull of Wine, and ſo drink off the Wine, and it will effect the ſame operation, that the Powder is wont to do. But yet you muſt be wary in the uſe of theſe Stones, that you do not waſt and ſpend the ſtrength of the Sick ſo much, but that there may be but juſt as much as is requiſite for them, and as they can bear. But when their ſtrength is ſpent, you muſt put in a greater or leſſer Stone into the Wine to be imbibed; but an Infant is not ſo ſtrong, nor can bear ſo much as a ſtrong Man can, whoſe ſtrength is far greater. It is therefore neceſſary that thoſe, who deſire happily to cure the Diſeaſes of mankind by the help of theſe Stones do (for the firſt time) leave one of theſe Stones one, two, or three

hours

hours in the Wine, and then heedfully mind the operation of the ſaid Wine when drunk off. If the operation be to his mind, he may always obſerve that length of time, as it lay in the ſaid Wine. If the operation be leſs than what you would have it be, it may lie longer; if ſtronger and greater than what you would have it, it muſt lie leſs while in the Wine, and thus by this provident forecaſt may you ſo order it, as to have it juſt to your mind.

Now, although the uſe of this Medicament in the form of a Stone be far better than uſing it in the form of a Powder as being more pleaſant, and more gratefull, yet notwithſtanding it is better for him that cannot ſo accurately obſerve the uſe of the ſame, to make uſe of the Powder it ſelf, that ſo they may be the ſurer of what they do. But they that do know the way of uſing the ſaid Stones, they need not uſe the body of the Powder, foraſmuch as they who drink that Wine wherein the Stones are macerated, may have the fruition of the virtues alone, without the corporeity. Thoſe very Stones too, though they are ſeveral times ſteeped in the Wine, do not (I confeſs) loſe their virtues, but yet they grow leſs eſpecially if (for the ſtronger purgations ſake) they are boiled in the Wine which is poured upon them, for the boiling diminiſheth its little body, and leſſens the Stone. And theſe are the directions which concerns the uſe both of the Stones, and of the Powder it ſelf, in the taking away and purging out all the hurtfull and evil humours in Man's Body, both in young and old.

The body therefore being ſufficiently purged by our ſaid univerſal Medicament, it will be expedient (for the prevention of a relapſe) to obſerve a due Dyet, and to hold ſuch a Stone in their mouths a quarter or half an hour every day, which will attract unto it ſelf not a little vicious tough moiſture, out of the Brain and Stomach, which you are to ſpit out ſo often, and ſo long, untill there flows no more plenty of wateriſhneſs into the mouth. This attraction will much eaſe the Brain and Stomach, and free it from noxious obſtructions, and will take away the preternatural Appetite and Thirſt, and ſo may a Man expect his Dinner without any preternatural Appetite. For when the internal Veſſels of the Body of Man, as the Spleen, the Liver, the Meſentery, are obſtructed with tough humours, and the Stomach it ſelf is ſtuft with theſe obſtructions, inſomuch that for ſome hours after his riſing out of his Bed, he is uſually troubled with a preternatural Hunger and Thirſt, and with a debility and faintneſs of his Members; many think that theſe inconveniencies can be averted by Food and Drink, but they are out. For experience teacheth that the weakneſs of ſuch Men is increaſed by eating and drinking a little, ſo far is it from being capable of being removed and taken away by ſuch means.

From whence it is clearly manifeſt that that weakneſs is not to be imputed to the want of meat and drink, but rather to the obſtructions of thoſe inward Veſſels, which hindring the paſſage of the Vital Spirit to the Nerves, which it ought to ſtrengthen, doth of neceſſity cauſe ſuch a debility and weakning of the Members, and begets in the Stomach a preternatural Appetite. If therefore ſuch obſtructions be by little and little taken away by the daily uſe of theſe Stones, ſo that thoſe tough humours cannot encreaſe, it muſt neceſſarily follow, that the Diſeaſe muſt give place by little and little too, and be diminiſhed and conſequently the former good health muſt follow with a prolongation of the Life.

The Stomach therefore being beſet with ſuch tough and Melancholy humours, it cannot poſſibly be that they ſhould ſo very eaſily be expelled, but 'tis behoovefull, that the Wine wherein the Stone hath been boiled be drunk, and ſo caſt them forth: And that Stone may be afterwards held in the mouth (according to the aforementioned way) for conſervation ſake of health. But if it ſhould happen that thoſe tough humours of the nauſeate and weak Stomach, and thoſe clammy obſtructions of the Veſſels, and that preternatural Hunger and Thirſt ſhould not be taken away by this way of healing; 'tis a ſign that all theſe inconveniencies have a deeper rooting and cannot be thoroughly removed by the ſaid Medicaments. And therefore ſuch Remedies as are ſtronger and more powerfull are to be made uſe of, which may ſoften thoſe tenacious humours of the Stomach, may incide them, and caſt them out, and may unlock all the obſtructions of the body, and open the paſſages of the Vital Spirit, to enter unto all the Members, and may ſtrengthen the weakned Stomach, whereby it may be capable of concocting the meats it takes, with a laudable digeſtion, and generate good and laudable bloud.

Foraſmuch therefore as ſuch an efficacious Medicament as is fit to take away all the obſtructions of the inward Bowels, and Veſſels, and to corroborate a weak Stomach, is to be found but with a very few, it hath ſeemed good unto me, to reveal at preſent ſuch a Medicament (for the ſake of mankind) and which is ſo efficacious a Remedy, as I dare boldly affirm the like thereof hath not for above theſe hundred years laſt paſt been in the hands of any Phyſician, but was found out by my ſelf by divine inſtinct, and which I here publiſh with a willing mind.

The Preparation thereof is as follows.

TAKE of new and ſtrong ſmelling *Myrrh*, and of the pureſt and cleareſt *Aloes*, and of the beſt Engliſh *Saffron*, of each one, two, or three ounces. Beat them all into Powder, and pour thereupon the ſtrong, operative, and *volatile Spirit of* Mars, (of which I have made mention in my Book of Fires) and diſſolve as much thereof as will diſſolve, to the Solution add a little of my *ſecret Ferment*, which will preſently cauſe it to ferment. Now before the putting your ferment thereunto, you muſt have an Alembeck or Head ready at hand, and Paper and Paſt wherewith the Alembeck being put upon the Body, may be well luted, and ſuffer nothing to paſs out.

For aſſoon as ever the Ferment, ſhall be added to the Solution, it preſently begins to ferment, and the glaſs being placed in Bal. and feeling the heat, that volatile Spirit of the Iron will aſcend readily and nimbly like the Spirit of Wine, much inferiour thereunto as to its heat I confeſs, but yet of a far more penetrating efficacy. The Spirit being all aſcended the remaining humidity is to be drawn off even to the conſiſtence of honey, but yet ſo gently, that the remaining Juice may not at all ſmell of burning. This done, take out the glaſs and let it cool, and pour on upon the Juice after its refrigeration the ſame volatile Spirit of *Mars* which you ſeparated from the matter by diſtillation; which Spirit will diſſolve that thick Juice, which being

ing diſſolved will become a Balſam of a ſtrong Odour, a penetrating Efficacy, and a red Colour like bloud; which (by reaſon of its penetrative Efficacy) is to be kept well ſhut, and may be accompted of as a Balſam of Life; for it takes away the obſtructions of the whole body, and doth mightily corroborate and ſtrengthen all the internal Veſſels and Members, and preſerves them ſafe from all corruptions. Nor is there any Balſam whatever, being brought whenceſoever it will, that is comparable unto this. For it does not onely defend the living bodies of men from all Diſeaſes, but likewiſe performs the ſame effects in the preſervation of the dead bodies from putrefaction, as other Balſams do, but far more efficaciouſly: For it penetrates all things, and by its ſo admirable vertue keeps them from putrifying, inſomuch that no body can enough admire theſe ſo great and wonderfull works of God. Now to try the truth of this, any man may make proof thereof with a Frog, Mouſe, or ſuch like ſmall Creature.

The uſe of this ſame Balſam as to the taking away of all the obſtructions of the internal Veſſels, and corroborating the weak Stomach, is this, *viz.* The body is firſt of all to be well purged, and then 1, 2, 3, 4, even to 10 or 12 drops thereof (according to the Age of the Patient) is to be adminiſtred to a faſting Stomach, in that Water, which was drawn over after the volatile Spirit was all come, as aforeſaid.

After the taking of the Medicament, you muſt faſt an hour or two, this Balſam penetrates all the Members of the whole Body, and ſtrengthens the Stomach, Brain, Heart, and all the internal Veſſels, takes away all obſtructions, makes good blood, excites a good appetite to meat and drink, and augments the radical humidity, and ſo conſerves the body of man (by God's Grace and Bleſſing) even unto old Age.

But let it not ſeem to any one a ſtrange thing, nor let them ſuffer any ſuch thoughts to come into their minds, as if others have already had this Balſam, becauſe *Paracelſus* made his *Elixir Proprietatis* of Myrrh, Aloes, and Saffron, and ſo others too inſiſting on or tracing his footſteps have made the ſame, and which hitherto hath been in great eſteem amongſt all skilfull Phyſicians; no, no. That *Elixir* of *Paracelſus*, being as yet in its corporeal form, and being nothing elſe but the meer body, is far ſhort of the Vertues of my Balſam; for my Balſam of Life excels, by reaſon of its moſt efficacious Spirits, which penetrate the whole body of man, and fills all his Spirits, and even the whole body it ſelf with its moſt pure vertues, corroborating the ſame, and driving away all corruption and rottenneſs.

Farther, if any one be minded to make this Balſam of Life yet far more efficacious and powerfull, he may inſtead of the aperitive Spirit of *Mars*, uſe the Spirit of Gold, which queſtionleſs will enrich the ſaid Balſam with far greater vertues, but then the coſt will be the more, ſo that this Medicament will be fit for the rich onely. A man may alſo in the preparation of this Medicament, preſerve the volatile Spirit apart, and uſe the ſame as a ſpiritual Balſam, or *Elixir* of Subtilty, for the conſerving of the inward parts of the body, and ſo thou wilt moſt potently diſſolve (by its more penetrative, more potent, and more efficacious vertues, all hurtfull obſtructions, and all the moſt clammy and tenacious humours. And after the ſame manner may you reſerve the ſimple Balſam apart for its proper uſe.

Now by this way which I have here delivered, may be made likewiſe other efficacious and penetrating Spirits and Balſams of great worth, out of other Animals, Vegetables, and Minerals, wherewith a man may perform wonderfull effects in Medicine. I have here laid a foundation, whereupon every one may as he thinks good build a ſtrong Edifice. Nothing verily would be more deſirable, and more to be wiſht for, than to ſubſtitute, and introduce ſuch ſubtil and penetrating Medicaments, in the room of ſo many unprofitable compoſitions made by their boilings and ſtewings, *&c.* It would be far better for the health of mankind, nor would ſo many men die, remedileſs, of ſuch ſmall and contemptible Diſeaſes as ariſe meerly from the tenacious and pituitous humours of the Stomach: What vertues I pray can there be in the common diſtilled waters of herbs? Verily ſcarce any at all. But if they be prepared according to the way by me preſcribed, they would be (both in odour, taſt, and vertues) much better and more profitable.

If to ſome common Wine, which hath already undergone its natural and accuſtomed fermentation, there be another fermentation given it by the help of my ſecret ferment, and then the Spirit thence extracted, it will be of ſo ſtrong and efficacious a ſavour and odour (eſpecially if ſome Spices, and other ſweet ſmelling fragrant Herbs, be fermented together therewith) as that other Wines may be thereby rendered ſavoury and well taſted, and odoriferous too. Upon this account I dare boldly and conſtantly aver, that the Spirits of Metals deſerve the chiefeſt place in Medicine above all other things whatſoever: But I do not as yet know what may be done with them in metallick matters, onely thus much, *viz.* they are wont to coagulate the common and running Quickſilver. Did we but know the Art of fixing them (Spirits) and making them conſtant, without queſtion we ſhould not onely obtain an excellent univerſal Medicament in medicine for the conſervation of the health of mankind, but alſo a moſt abſolute Tincture for the tinging of the bodies of the metals. That this is poſſible, the Writings of the Ancient Philoſophers do too and again hint ſo much, but yet I have not as hitherto effected the ſame. However I am content, and moſt heartily thank my God, in that he hath honoured me with ſo excellent a Medicament, which haply no body for this hundred years laſt paſt hath been rendered a partaker of: For had it ſo been, it would long ſince have been revealed and diſcloſed. 'Tis not a Boys play nor ſo very mean a thing, to bring not onely Vegetables and Minerals, but even the moſt fixed metals themſelves, in (as it were) a moments time, to ſuch a paſs, as to undergo a fermentation, and to yield (by diſtillation and rectification) ſo ſtrong and penetrative a Spirit; believe it or not believe it, all's a caſe. 'Tis enough for me that I can perform the ſame whenſoever I pleaſe; which thing the incredulous ſhall very ſhortly, (God willing) find to be moſt true, and ſee it with their Eyes, and feel it with their hands. But however, by the ſame way, as the aforeſaid Balſam is ordered to be prepared, may various and unknown effectual Medicaments be made out of other matters.

A Preparation of *Opium* would yield ſuch a Spirit, as (by its odour) would procure reſt, and lay the exteriour Senſes aſleep.

The like would Tobacco, or Henbane, and other ſuch like Herbs effect, and ſo would the other inebriating Herbs, whoſe Spirit being mixt (even in the leaſt Doſe) with Wine, or Ale, and ſo drunk off, would preſently make a Man drunk. By the help of ſuch kind of Spirits might many waggiſh tricks be done, as for example, If Barley, Peaſe, Beans, or other Seed and dry Fruits were moiſtened or ſteeped in the ſame, and thrown to Fiſhs, Birds, and other wild Animals, and they eat of the ſame, they would be made ſo drunk, as that you may take them with your hands. In like manner, by ſuch kind of Spirits emitting ſuch a ſtrong odour, may all miſchievous wild Beaſts, as Bears, Wolves, Foxes, and other ſuch ravenous Creatures be driven away; and on the contrary, may Fiſhes diſperſt in the Waters be gathered together into one place. For they (*viz.* the Beaſts) ſhun all ſtrong odours and ſtinks, but theſe (*viz.* the Fiſhes) are wont to follow after them in the Water.

Briefly, and in a word, thoſe aforeſaid Spirits would be fit for the effecting of ſuch wonderfull concluſions, as is no ways fit ſo much as once to mention, much leſs to reveal and make known the ſame. And for this reaſon I have determined with my ſelf to bury this ſo great a Secret of Fermentation with me in my Grave, and not to diſcloſe it to any one. In the mean while I will take care to provide a ſufficient plenty of the beſt Medicaments, whereby I may be ſerviceable unto my Neighbour. And I will omit taking care about other needleſs affairs, unleſs it ſhould chance to happen, that that Turkiſh Tyrant thirſting after nothing but Bloud, ſhould approach too near unto us (which God forbid) againſt whom my wonderfull and hitherto unknown Artificial Fires, and other new inventions of mine, ariſing from my unwearied Labours, will be of ſuch reſiſtance, as that I am confident his numerous hoſt will be rid of the care of again returning back. For it is beyond all kind of doubt, that ſuch fiery Globes [or Granadoes] may be made, as for one pound thereof to exceed the violence even of twenty pounds of Gunpowder. And who knows for what cauſe God hath vouchſafed the revealment of ſuch great Secrets, at this nick of time? Perhaps to ſhew his Omnipotency, he will effect ſome ſingular and admirable work for the freeing of the Chriſtian World by this ultimate and extream defenſive way, out of the moſt preſent and imminent dangers: And though it (*viz.* the Chriſtian World) be immerſt and even drowned in the Labyrinths of various Errors, and is gone greatly aſtray from a true Chriſtian-like life, yet notwithſtanding it doth yet contain many a pious Soul. Never did God make, or vouchſafe ought without a cauſe; And therefore it is altogether credible, that theſe new inventions did not light into the hands of men in vain, the which time will manifeſt.

The Explication of the two Circular Figures of the Quinteſſence at the beginning of this Fifth Part of the Pharm. Spagyr.

ABout the Circle of the firſt Figure. *The Quinteſſence of the Minerals, is a Univerſal Medicine.*
Without ſide the Square in the Circle. *Separate the pure from the impure.*
Within ſide the ſame Square. *The four Elements.*
In the four Angles of the Square. *Fire, Air, Water, Earth.*
Without ſide the Triangle. *The three Principles.*
Within the three Angles. *Salt, Sulphur, Mercury. Make the fixt Volatile.*
Within the Circle, in the Triangle. *Two Contraries.*
Within the Central Circle. *The firſt Ens.*
Which if you begin to read in the Center, the ſenſe will be thus. *From the firſt Ens, proceed two Contraries; from thence the three Principles; from them the four Elements; from which, if you ſeparate the pure from the impure, you obtain the Quinteſſence, which is an Univerſal Medicine.*
About the Circle of the ſecond Figure. *The Salt of Metals, is the Stone of the Philoſophers.*
Without ſide the Square in the Circle. *And bring it unto Maturity.*
Within ſide the ſame Square. *The four Elements.*
In the four Angles of the Square. *Fire, Air, Water, Earth.*
Without ſide the Triangle. *The three Principles.*
Within the three Angles. *Salt, Sulphur, Mercury. And the Volatile, make fixt.*
Within the Circle of the Triangle. *Diſſolve, Coagulate.*
Within the Central Circle. *The primum Mobile.*

To underſtand the Scope of thoſe two Figures, you are to begin with the firſt, in the Center, and next read the Center of the ſecond, for they anſwer one another in all their Parts. As in the Center of the firſt Figure are theſe words: *The firſt Ens.* Which in the Center of the ſecond is, *The primum Mobile.* And ſo on to all the other parts.

The End of the Fifth Part.

Quinta Essentia in die Pharmacopoea Spagirica.

THE SIXTH PART OF THE Spagyrical Pharmacopœa.

Or a Light lately riſen, and a ſtrong Key for opening Philoſophick Verity, treating of the moſt ſecret Fire of Philoſophers, *viz.* How it is to be uſed profitably and commodiouſly for the preparation of many Royal Medicaments; and how, by the benefit of it, *Vegetables*, *Animals*, and *Minerals*; venemous, fœtid, noxious, and wholly adverſe to Humane Nature, may be converted into a gratefull and moſt ſalubrious Medicine, Mineral-Salts, and the Corroſive Spirits of them dulcified; and fixed Metallick; Bodies tranſmuted into Volatile Spirits. As alſo how theſe Volatile Spirits may again be changed into Bodies fixed, tinging, and penetrating through every Metal and Glaſs, and other rare things of that kind may be performed.

READER,

I did ſome time ſince, ſincerely diſcover to certain of my Friends, ſome of the beſt of the Arcanums *(deſcribed now publickly) in this Treatiſe, with ſuch condition as they themſelves ſhould prepare the ſame: but they have not as yet ſet about the Work, and perhaps for no other reaſon, than becauſe they thought it a matter not of great but of ſmall moment. Hence it was, that they could not believe ſo great a Medicine could be prepared in ſo few days. It is manifeſt by the Writings of Philoſophers, that* Maria *the Propheteſs, Siſter of* Moſes, *could ripen the Stone of Philoſophers in three Days. Likewiſe, ſome Philoſophers have abſolved their Work in a Week. Others have conſumed ſome Months labour upon the ſame. But now, thoſe erroneous Fellows (who run from one to another, and although themſelves be rude and ignorant of all things, proffer their labour for reward to make the Stone of Philoſophers) require to themſelves for digeſtion the ſpace of one, two or three whole years. But what a vaſt difference is there between three days and three years. As for my ſelf, I indeed as yet have never elaborated ſo great a Work, but have ſeen with my Eyes ſo great a poſſibility thereof, and with my hands handled things ſo, as (if time and place be given, and God grant ſucceſs) I am confident I ſhall prepare this ſupream Medicine in a very ſhort ſpace of time. But I can truly affirm, that in all my life I never aſpired to things ſo high; yet what hath been conferred on me by God, I now make common. Wherefore, he (whom God ſhall favour) may there begin, where I have ended, and happily conſummate the Work: but if he (whom God favours not) ſhall attempt any thing therein, let him not diſquiet me with troubleſome Interrogatories; for I know not how to anſwer more, than are here diſcovered by me. Yet (if God pleaſe) after ſome ſhort ſpace of time, I will clearly expoſe to publick view, whatſoever I have found and ſeen in the particular Melioration of Metals. Which indeed will contribute great Light to this later Age of the darkened World.*

CHAP.

CHAP. I.

Describing that artificial Philosophick Distillatory Furnace (of which the little Book of Fires treats) by the help of which in the space of one hour, all Chymical Operations at one time, the secret Fire mediating, may be demonstrated so, as was never yet described by any Man.

GET a Furnace made of good Earth (which in burning will be rendred as compact and solid as Glass; such you may find about *Colen*, *Sibburg*, *Freichiem*, or *Waltenburg*) in its Diameter, at least two Foot broad, but rather (if that well may be) three. Prepare a Vessel like the Hemisphere or half-Globe, having three or four handles, to be hanged up by, fill that with cold Water, and your Recipient or Blind-head will be perfect. Then fit to it a plain Pan of good Earth, the breadth of three or four Thumbs, and a Thumbs breadth high. This Pan fill with common Sulphur, mixt with some other Mineral Subject, as *Mercury*, *Auripigment*, *Arsenick*, or *Antimony*; which you desire to fix, either particularly into *Sol*, or universally into Medicine. Kindle the Sulphur that it may burn, then this Sulphur will calcine and fix that subject (in the Fire continually burning,) which was put in to be fixed. If in burning the Sulphur be deficient, it must be supplied with other Sulphur. If the Sulphur should happen to be extinguished, you must kindle it again, that it may constantly burn and never go out. It will not easily go out, if you prevent the extinction, by putting a little Cotton in the midst of the Pan. When the burning Sulphur, with its penetrating and ripening Fire, penetrates the subject added, then the volatile Mineral at first cannot bear patiently the vehemency of the Fire, but a part of the same is elevated upwards with the fiery Oil (fixing all Mineral subjects) which concretes round about to the Vessel, and again distills down upon the burning Sulphur into the Pan, so as it excites no small admiration in the Beholders. The motion of this Oil, which is so often and long driven upwards and downwards; Philosophers have named their Distillation, Ascent, and Descent, also Cohobation and Circulation: but the Sulphur continually burning, they called Calcination and Solution. For, in this operation, two very potent Fires act. The flame of Sulphur is a strong fixing Fire, but stronger yet is that fiery Oil continually distilling. By the help of both which *Stygian Fires*, the volatile subject in the Pan, is in a short space of time (unless it was very impure before) without any diminution of its weight fixed into a fixed Medicine. It is to be admired, with how great virtue, either Fire is endewed, for fixing volatile Metals; also it is pleasant to behold, how (when any drop of that Oil of Sulphur driven upwards distills down again upon the burning Sulphur) the flame that ascends then, will be red as bloud, which otherwise from Sulphur onely ascends yellowish. The repeated Distillation of that into the under set Vessel was by Philosophers called Inceration: But when the whole resided in the bottom without any ascending fume, that was by them called Fixation.

These operations I have performed with my own Hands, and seen with my own Eyes. More at this time I dare not publish; for more than enough is already spoken to impious Men. Which indeed I should not have done, if this excellent Philosophick Work had not been made too common already, or (to express my meaning more plainly) if it had not fallen into the hands of unworthy Persons, to me most ungratefull. For indeed I permitted onely some few of my Friends to see this Philosophick fixing Furnace; yet the knowledge of it was by them so far divulged, as I repented I had ever communicated it. Nevertheless, instead of that, not long after by God was given to me a certain other, far better and more elegant gift, for he shewed me such an Instrument, as would far more commodiously than the former, receive the ascending sulphureous fume, so as none of it should be lost. Therefore this divine gift shall by me be more warily kept than the former.

THE

The Explanation of the CUT.

A *Is the ſtanding part of the Furnace.*
B *The lower Hemiſphere or half Globe, which is to contain the Sulphur, or what you intend to make into Oils or Spirits.*
C. *The upper Hemiſphere with its Pipe to draw the Oils or Spirits by.*
D. *The body that holds the Water.*
E. *The Cavity or top of the body to put in the Water.*
FFF. *The handles by which it is hanged up, which are made of the ſame Earth that the Body is made of.*

CHAP. II.

The way of preparing another Medicine of Sulphur onely.

FILL an earthen Pan full of Sulphur, and ſet it under the Blind-head. Kindle the Sulphur and keep it continually burning for eight or fourteen days. And when the burning Sulphur cauſeth its Oil to aſcend, and the ſame again deſcends upon it, and this aſcent and deſcent hath ſo long been made, as untill the Oil is fixed, and no more aſcent is perceived, then let the Fire go out, and that which you find in the bottom, looking black as a Coal, take out, pour clear Water upon it, and make them boil together. In this boiling the Water extracts the fixed Oil of Sulphur, which paſſed into Salt, from the black Fæces. This extracted Salt diſtill through a Filter, and permit the Water to exhale in *Balneo*; ſo the Reſidue will remain in the bottom ſweet, in the form of a ſoweriſh gratefull yellow Salt. Which take out, and put into a clean Crucible, where keep it hot, but not red hot; then the Salt will wax red. This diſſolve again and Filter, and it will leave ſome Fæces. You may reiterate this operation if you will, and the Salt will be ſo much the more pure. This Salt is of a middle taſt between ſower and ſweet: Of which five or ſix grains being taken inwardly will penetrate the body and ſtrongly provoke ſweat. But a larger Doſe will provoke gentle Seidges, eſpecially if the operation be made in ſome Iron Pan, yet it contracts from the Iron a ſweetiſh taſt, but that is not at all to be feared, becauſe the Salt plainly depoſits this taſt, eſpecially if you heat it hot and diſſolve it, coagulate and heat it hot again, unto the third time. For then it loſeth that taſt, and becomes a ſweet red Salt, which is a ſafe remedy againſt all Diſeaſes, where there is need of ſweating and purging.

Note, here is need of caution, that in making it hot, your Fire be not too ſtrong, and ſo the virtues of your Salt diminiſhed, which is a thing accurately to be minded. Ancient Philoſophers likened this operation to ſuch a Fire-vomiting Dragon, as devours his own Tail, and converts it into a ſalutary Medicine. The Dragon is burning Sulphur, his Tail is its fiery Oil, which ſlides down upon the burning Sulphur, and in it converts it ſelf into an efficacious Medicine.

Note, I would have you give credit to me, in theſe Works, which I here have opened in few words, are many things of great worth contained. Therefore, if you be wiſe, you will more diligently ſearch into

the matter, and find out much more than is here diſcloſed by me.

CHAP. III.

Another ſecret Fire of Philoſophers, by which all venemous and fœtid Vegetable, Animal, and Mineral Subjects, may be changed and prepared into a moſt efficacious Medicine.

REctifie Spirit of Wine ſo perfectly well from all Phlegm, as it will all burn away. For this way you will have a ſecret Fire, by help of which you will be able to effect wonders in Medicine.

CHAP. IV.

Where firſt is exhibited an efficacious Medicine from this Vegetable Fire it ſelf.

PRepare you of ſtony Earth poliſhable in Fire, or of Metal, a Furnace in ſuch wiſe, as under it a flaming Fire may burn, and yet none of the fume fly away, but in it condenſe either into Water or Oil, and thence deſcend into ſome fit Receiver. Under ſuch a Furnace, in ſome earthen Pan kindle an ounce or two of this ſubtile Fire, and let it burn. The Spirit of Wine being burnt, the volatile Salt as incombuſtible (yet the volatile Mercury of the Wine) comes forth, is cooled in the Receiver, and ſo preſerved.

Note, when the firſt Spirit of Wine is burned, more muſt be put in. Of how great profit it will be in Medicine, you may eaſily judge, becauſe it is the immortal and incombuſtible Soul of Wine. How much it is able to effect in Alchymy, is not very well known to me, I not having laboured much in it as yet. *Baſilius* touching this Mercury, thus Writes: Whoſoever can obtain it, will be a principal Maſter in Chymiſtry. He, as I judge, well knew how from Gold its Tincture was to be extracted by the help of this. But of theſe enough at this time.

CHAP. V.

How by the benefit of this ſecret Vegetable Fire, the Microcoſmick Mercury may be corrected, freed from its nauſeous ſtink, and converted into a ſweet Medicine.

REctifie Spirit of Urine as highly as you can, according to my Preſcripts, largely deſcribed in the Book of Furnaces. To this Animal Mercury add five fold or ſix fold its weight of our Vegetable Fire, with which fill a Pan, and kindle this Fire under our Philoſophick Alembick; then will our Fire burn up all the nauſeous ſtink of the Animal Mercury, ſo as it will aſcend with a gratefull odour and taſt. If it be not to your mind the firſt time, commit the ſame to this purgation a ſecond time, and make it paſs over; then you will find your Animal Mercury ſweet, by virtue of which you will be able to do great things in Medicine, becauſe it forcibly penetrates. Therefore a diligent Phyſician ſhould not be ignorant of the uſe of this. It is known that Spirit of Urine doth much good in Medicine, yet it is commonly abhorred by reaſon of its unpleaſant taſt. But when it hath ſuſtained the trial of our Philoſophick purgation, then it aſcends into its Heaven, that is, into the Alembick without ſtink. Alſo by help of this purgation, all other fœtid, bitter and unſavoury Vegetable, Mineral, and Animal Subjects, may be purged, rendred ſweet, pleaſant, and gratefull, as the following examples will prove.

CHAP. VI.

R*Ecipe* of common Sulphur, Tartar, and Niter, of each one pound, pulveriſe, mix and decrepitate them in a Crucible, kindling them on the top, otherwiſe they will fulminate. When decrepitated, melt and pour out the mixture, reduce it to Powder, and extract thence the Tincture with Spirit of Wine. Burn away the Spirit of Wine under the Philoſophick Alembick, and what aſcends reſerve for your uſe in Medicine. What remains in the bottom will be ſweet and void of all evil ſavour, becauſe the Spirit of Wine hath burnt up all the ſtink. This Medicine is a moſt excellent Diaphoretick.

CHAP. VII.

How the Tincture or Soul of Antimony may be purified by the benefit of this Vegetable Fire.

R*Ecipe* of Antimony, Tartar, and Niter, of each alike; decrepitate, melt, pulveriſe, and extract the Tincture, which cauſe to paſs through this Purgatory Fire, and you will have a ſafe Medicine againſt all Diſeaſes. But if you would render it yet more excellent, to this Antimony (which hath already once ſuſtained that Purgation) again add its own weight of Tartar and Niter; decrepitate, melt, extract, and cauſe it to burn as before, and you will have your Medicine more excellent. And if you ſhall repeat this labour the third time, you will have it far more excellent, for every time there are ſome Fæces depoſited, whence the Medicine becomes more efficacious.

As is ſaid of Sulphur and Antimony, ſo alſo all other ſtinking and bitter Subjects; yea the ſtinking Dungs of Animals may be ſo purified as to become ſweet. But there is no neceſſity to ſpeak hereabout in this place. For whoſoever ſtudiouſly ſearcheth for ſome famous Medicine, will eaſily find ſome excellent thing, ſo as he may attain both Riches and Honour according to his wiſh.

CHAP. VIII.

How by help of the Vegetable Fire, Mineral Fires may be extinguiſhed, and the corroſive fiery diſpoſition of them converted into ſweetneſs.

IT is very well known, that the greater common Fire doth always (as often as one is ſet near the other) either extinguiſh the leſſer, or cauſe it to languiſh, the ſame alſo happens to Philoſophick Fires. As for example, Put into a Stone diſh or Pan, Spirit of Salt, Vitriol, Niter, or Sulphur, or ſome other acid Spirit, and three, four, or ſix parts of the beſt Spirit of Wine which kindle, and the Spirit of Wine will burn away, but the acid Spirit through the ſubtilty of the flame becomes ſweet. Which ſweet Spirits, eſpecially that of Sulphur and Salt,

manifeſt

manifeſt great Vertues in Medicine. *Baſil Valentine* ſpeaks of the dulcified Spirit of Salt, that it extracts from Gold its Tincture; and that he, who knows how to dulcifie it, will be honoured by Philoſophers. He in like manner teacheth, that Spirit of Wine is ſeven times to be abſtracted thence: Yet undoubtedly he intended not the vulgar Abſtraction, but this ſecret Abſtraction rather, of which we now ſpeak. Becauſe ſuch Spirits are not dulcified at one time, but Spirit of Wine is often to be abſtracted thence by the help of Fire, before they will be ſufficiently dulcified.

CHAP. IX.

Another way, by help of other Fires, to cleanſe and ſweeten Vegetable, Animal and Mineral Subjects.

EVery man knows, that the Nature and Property of common Fire is, to abſume every ſtinking Sulphur, to drive away *Mercury*, and leave nothing but dead Aſhes, with a little fixed Salt; which is no Correction, but a violent Deſtruction and Corruption of good things. Therefore, in preparing famous medicines, we ſhould uſe a better Fire, *viz.* ſuch, as neither conſumes Sulphur, nor drives away *Mercury*, but onely ripens, cleanſeth and ſweetens them; as will be proved by theſe following Examples.

Firſt let us make trial with the (to us abominable) Dung of men, and ſee, whether its Stink can be totally taken away, and of it an Univerſal medicine be prepared.

It is very manifeſt, that the Dungs of Animals crude and not prepared, are of ſome uſe in medicine, and we know they have been long in uſe with Galeniſts and Apothecaries: For they preſume to cure the Jaundies with Gooſe-dung; Feavers with Horſe-dung; Inflammations of the Bowels with the diſtilled Water of Cow-dung, which they call the Water of all Flowers; and the Quinſey, with the white Dung of a Dog, which they call *Album Græcum*. Pertinent to the purpoſe, Hiſtory makes mention of a certain Countryman labouring with a Quinſey. To this man a Phyſician gives a Bill, by which he was to go to an Apothecaries Shop, and buy *Album Græcum*. The Bill he gave to a Boy in the Shop, who having read it, looked into the Box in which *Album Græcum* was wont to be kept; and finding the Box empty, bid the Countryman ſtay a little, and he would ſerve him preſently. But the Boy not wiſe enough to conceal the Secret, runs preſently into the Church Yard, where he gathered ſome of the white Dung of Dogs, which he brought home, and put into his Mortar to pulveriſe. The Countryman ſeeing this, ſpake to the Boy thus: I pray thee lay aſide thoſe things, and give me what I have need of; for I can ſtay no longer. To which the Boy anſwered: This is that the Phyſician preſcribed you; therefore ſtay but a little while, for it will be beat enough preſently. Then the Countryman angerly ſaid: What do you ſay, you Whelp? Muſt I buy Dogs-turd of you for Silver? I have enough of that at home: Therefore you and your Doctour ſhall eat it your ſelves for me. And having ſpoken thus, he went out of the Apothecaries Shop in a great rage. Many ſuch Hiſtories are variouſly commemorated: by which you may clearly ſee, that the Dungs of Animals, although crude and not at all prepared, have been uſed by Apothecaries. All which had they not been uſefull in Medicine, would long ſinc have been abrogated. But humane Dung, which deſervedly is to be preferred before all other, is not uſed medicinally; and that onely becauſe of its evil ſmell. Yet I have known ſome old Women give that to be taken inwardly by ſuch as laboured with Feavers (but without their knowledge) and ſo have expelled thoſe Feavers. There are ſome Chirurgeons ſo skilfull as to know, that the Salt of humane Dung onely generates Putrefaction, but on the contrary all other Salts preſerve from it. Wherefore they uſe that for putrifying ſuch excreſcent Caruncles, as they fear to cut off, by reaſon of the intermixed Veins. Yet, that humane Dung (if inwardly taken) wants not its effects, no man doubts: but becauſe of its great Stink, its uſe is to be abſtained from, and not to be admitted in medicine. Nevertheleſs, if it can be freed from its abominable Odour, it may be uſed in medicine, otherwiſe not. Wherefore, *Paracelſus* ſo highly eſteemed it, as he ſaid: From him Heaven and Earth is hid, to whom humane Dung is not known. An Hiſtory, which ſhews what happened in *Cæſar*'s Court, between him and the Court Phyſicians, plainly ſheweth this. For when thoſe Phyſicians asked him to leave behind him ſome medicinal Experiment unto them, *Paracelſus* ordered humane Dung to be brought and laid before them. They ſeeing that, went away in a rage and reviled him. But *Paracelſus* anſwered. You indeed run away, thereby proving your ſelves unworthy of the Secret I purpoſed to have diſcovered to you. Whence it is very manifeſt, that *Paracelſus* knew how to render ſtinking Excrements fit for uſe. For undoubtedly, he never adminiſtred them to any man, before they were prepared; becauſe he had other Medicaments always in readineſs. Now, that it may be known to be poſſible to take away the Stink of Dungs, I will prove the ſame by the following.

To a ſound and healthfull Man for two days together give nothing to eat, but a little well baked Wheat-bread; or to drink, but good Wine. His Excrements for theſe two days caſt away. On the third day let him eat a peculiar Bread, with which is mixed before it is baked about an Ounce and half, or one Ounce of my Blood of *Sol*; alſo let him have an Ounce and half, or one Ounce of the ſame Blood of *Sol* mixed with his Drink, that it may thereby be tinged with a red Colour. And all the third day let him eat nothing but this Bread, in which the Blood of *Sol*, or Gold rendered irreducible hath been baked, and uſe that Wine onely, which the Tincture of Gold hath coloured. Then on the fourth day, let his Excrements (which will be tinged with blackneſs like a Coal) be put into a glazed Pan or Diſh, yet with this Caution, that no Urine be mixed therewith; becauſe that will be injurious. Indeed theſe Excrements will have a very evil Odour, but that you may take away their ſtink, and convert them into an Univerſal Medicine, proceed thus.

If theſe Excrements be in weight one pound, or ſomewhat above, pour on them two Ounces of well dephlegmated Oil of Sulphur, or in defect of that, as much ſtrong and well rectified Oil of Vitriol; mix the whole well ſtirring it with a wooden *Spatula*, that the Oil may act upon the Excrements: Expoſe the whole to the Air for one Night; and that mineral Fire will calcine the Dung Philoſophically, and deprive it of all its ſtink, without any diminution of its Weight; which is very ſtrange. And if any part

of

of the evil Odour ſhould be left remaining, add to it again one Ounce and half of the Mineral Fire, and ſuffer them to ſtand together for one Day and Night. Then muſt you alſo have in readineſs the Animal Fire, *viz.* Spirit of Urine exactly rectified, of which pour leiſurely and by degrees upon the Dung, ſo much, as until both thoſe contrary Spirits ceaſe to act each upon other, and are ſtill: For then thoſe two contending Fires have mortified each other, whence a middle Salt is generated. Upon this mixture put into a Glaſs do you alſo pour ſo much of the Vegetable Fire, (that is, of the beſt Spirit of Wine) as may riſe in height above it two fingers breadth. Set this glaſs in *Balneo*, and digeſt the whole for twenty four hours: For in that time the Spirit of Wine diſſolveth that Salt, which proceeded from both the contrary Fires, together with the Microcoſmick Salt, Sulphur and Mercury; and from that Gold, now the ſecond time inverted, extracts the Tincture, which it hath, and is thereby tinged red as Blood. This Tincture pour off, and re-pour on other Spirit of Wine, and let that alſo ſtand twenty four hours in *Balneo* for extracting what remains: but this will have but little Tincture, becauſe the firſt extraction drew forth almoſt all. Add both extractions together, and in *Balneo*, with very gentle heat, by Alembick abſtract the Spirit of Wine from the Tincture; then will remain in the bottom of the Veſſel a very red and pleaſant Salt; upon which muſt be poured ſo much Aromatick Spirit of Wine, as will ſuffice to diſſolve all the Salt. Which Solution pour out from the Glaſs it was diſſolved in, into a ſtrong and very clean Glaſs-bottle, and keep it by you as a moſt pretious Treaſure.

The Doſe of it is very ſmall: for if you give, at one time, 1, 2, 3, 4, 5, or 6 drops, it will provoke Urine, expel Sweat, and the Stone alſo powerfully. But if the doſe be augmented, it purgeth the Belly, and that without any moleſtation. In a word, this Univerſal Medicine may ſafely be uſed in all Diſeaſes. Yet becauſe I intend brevity, I forbear to write more touching this Medicine.

The Excrements or Fæces, from which this Tincture is extracted, are not to be caſt away, but muſt be calcined with Fire till they are red hot, and (after a ſtrong *Aqua Regia* hath been poured upon them) the remaining Gold, which was not before extracted, muſt be diſſolved. Yet you ſhall have very little of that; becauſe the Man's Stomach did a ſecond time invert that Gold, (which was once before inverted) and made it reducible, ſo as it could be extracted with Spirit of Wine by help of the Mineral and Animal Mercury. It is hard for me to believe, that a more excellent Diuretick and Diaphoretick Medicine can be found, than this Microcoſmick Salt, which is tinged with *Sol.* For you will know of how great vertue this Diuretick and Diaphoretick Salt is, when you ſhall precipitate the acid Oil of Sulphur (or in defect of that, rectified Oil of Vitriol) with good Spirit of Urine, and reduce it into Salt. And will not ſuch a Salt as this be far more excellent, when Sulphur the (Philoſophically calcined) Salt and Mercury of the humane Body, together with the Tincture of Gold have Acceſs?

I have not writ any thing here of this Univerſal Medicine, to the end it ſhould be preferred before others, becauſe I very well know, we can of other Subjects prepare famous Medicines, and eaſily be without humane Dung; but whatſoever I delivered here, I did it for the good of all. For my part, I ſay, if any one hath no mind to proceed in this Operation, let him forbear. It ſufficeth me, that I have ſignified to the World, how by the help of Art, all venomous and ſtinking Subjects may be amended and cleanſed.

Thus may the induſtrious Phyſician, by the benefit of the three Principal Fires prepare many excellent Medicines, and before all ſluggiſh and careleſs Phyſicians be had in great honour by the Sick, and obtain the favour of GOD and Men. For he may invert the Venom of Vipers, Serpents and Scorpions, and convert the ſame into an Antidote powerfull againſt the Peſtilence, and other Venoms. He alſo underſtands how to prepare a Medicament of Toads ſafe to be given to dropſical Perſons: of Spiders a Medicine healing the Leprous; of Cantharides and May-Woms, a certain Salt good againſt the Stone of the Reins and Bladder; of Earth-Worms, or Rain-Worms, a venereal Experiment; of Opium, Tobacco and Henbane, a famous Somniferous Medicine; of Wormwood a Stomachal and Antifebrile; of Hellebore, Agarick, Spurge, Aſarabacca, Squill, and the like, an Univerſal Purging Salt; of Pearch-Stones, and Crabs-Eyes, a Nephritick Medicine againſt the Stone of the Reins and Bladder; and of Napellus, Staveſacre, and Wake Robbin, a famous Antipodagrick. Theſe, and other ſuch moſt excellent and preſently medicinal Salts may after the ſame manner be prepared: Theſe, for the health of infirm Mankind I could not content my ſelf to conceal. Indeed I could have writ more at large touching this matter; but brevity, which I now ſtudy, forbids a more ample Declaration.

CHAP. X.

Of the Nature and Property of that Fire, which lies hid in Tartar, or the Stony Fæces of Wine.

TArtar is a Salt, which in Fermentation ſeparating it ſelf from the Wine, adheres partly to the ſides of Wine-Cask, and partly reſides with the Dregs in the Bottom. This Salt or Tartar, although it is numbred among Salts, yet it is of another diſpoſition than all other Salts; becauſe they may be diſſolved in cold Water, but this Tartar cannot be diſſolved, except in boiling Water onely. No Man hitherto was willing to open the Cauſe of this hard Tye. But I, ſeeing Death daily approaching nearer and nearer, was not willing to carry it with me to my long Home, therefore I choſe rather to leave it behind me for Mankinds ſake. And thus it is with Tartar. Tartar contains in it ſelfa peculiar Sulphur by which the Salt is ſo bound or fixed, as it cannot like other Salt be diſſolved in cold Water. For if the Sulphur be ſeparated from it, it is eaſily diſſolved in cold Water, like other Salts. Yet ſo ſoon as ſuch Sulphur is taken from it, the ſecret Fire which lay hid in it, is alſo taken away: and thenceforth it can no more ſerve inſtead of a ſecret Fire, by which Metals are ripened into Tinctures; but is rendred onely fit to perform its Office in medicine. Touching which, for brevity ſake we ſhall here make no mention.

The method of depriving Tartar of its tinging Sulphur, that it may be diſſolved in cold, is thus: By burning two Pound of Tartar, reduce it into a white Salt, upon which, if you pour Water to diſſolve it, it will become a *Lixivium*. Which *Lixivium* pour upon one Pound of Tartar, and boil them together

together in an Earthen glazed Pot: Then the *Lixivium* diſſolves the Tartar, and ſeparates the binding or fixing Sulphur from the Salt. Then pour on one part of common Tartar, boil them together yet once, filter the boiled Liquour through Paper; then in the bottom will remain the Sulphureous Fæces, and the Water of Tartar paſs through yellowiſh; upon which Water pour diſtilled Vinegar to mortifie the *Lixivium*. This being done, the Vinegar will alſo be coagulated with both Salts, and be changed into one Salt; which Salt in Medicine and Alchymy is of great uſe and benefit; touching which if I ſhould here write more I ſhould be too tedious: but (GOD willing) the manifold uſe of it ſhall be ſhewed in my Third Century. For here my purpoſe is not more at large to ſpeak of the matter. [*vide Helm.* Fol. 183. and *Baſilius* p. 240.]

That feculent Slime, which adheres to the ſides of the Filter you ſhould not caſt away, but endeavour to fix. For then you will find ſome admirable thing, and more than here I dare diſcover. Becauſe that is the genuine Coagulator of running Waters, which it hardens, and is joined in a ſingular familiarity with metals, and eſpecially with *Sol*; as I with admiration have experienced. For in a few hours it tinged *Sol* with whiteneſs, and turned it into brittle Glaſs; whereas otherwiſe *Sol* is an Enemy to every volatile Sulphur. I do not believe there is any other thing in Nature ſecond to this wonderfull Sulphur; which is endewed with a potency coagulating and hardning running Subjects. For nothing, except Sulphur onely, can be found, which coagulates and tingeth. *Mercury* and Salt tinge not: but Sulphur doth that. Conſider I pray, how great power common Sulphur hath over *Mercury*, ſince four Ounces of it can coagulate a Pound of running *Mercury* into hard and red Cinnabar. Alſo four Ounces of common Sulphur can coagulate two or three Pounds of Oil into a Liver-like Maſs: and one Pound of Oil reduce ten Pounds of *Lixivium* into hard Soap. Likewiſe one or two half Ounces of the volatile Vapour of Sulphur in ſubterranean Veins, can coagulate ſerene Water into hard Rocks and Stones, as alſo all ſorts of minerals and metals. So, that little Sulphur which is found in Tartar, can render much ſower Wine or Water hard as a Liver; as is known to thoſe that labour in Wine and Vinegar.

I once purpoſed and endeavoured to extract from Gold its Tincture by the benefit of Salts, among which Salts Tartar alſo was; whence my Gold came out white and altogether brittle as Glaſs. But I, being willing to prove whether my Gold was conſtantly white or no, cupellated that with *Saturn*; and then I found my God not to remain white, but to have received its priſtine yellow Colour. That whiteneſs proceeded from nothing elſe, than the tinging Sulphur of Tartar, and becauſe the Colour was not fixed, therefore in cupellating it vaniſhed away:

Note: Hence, when I had broken ſmall a little of this tinged white and brittle *Sol*, and caſt it upon a little vulgar *Mercury* made hot in a Crucible, it preſently had ingreſs, and coagulated the *Mercury* into an heavy white Body, which when I expoſed to a cineritious *Examen*, all the *Mercury* vaniſhed, and the *Sol* onely remained in its Colour. The Reaſon hereof was becauſe the aforeſaid Sulphur of Tartar was not fixed. Yet thence I obſerved, that it might be fixed with *Sol* into a conſtant Redneſs. If any one hath convenient time and place, he may more profoundly ſearch into this Work, becauſe in it lies a great *Arcanum*. But how otherwiſe from Gold its Tincture is to be extracted, ſhall afterward be taught. Enough of that at this time.

But there remains this one thing to be ſpoken, *viz.* that whoſoever knows how to conjoin the Sulphur of Tartar with the Sulphur of Metals, and to fix it with them, may certainly obtain the Tincture: As *Ripley* clearly intimated, when he ſaid, He ſaw a red Toad ſo long and ſo often drinking of the Juice of Grapes, as until his Bowels burſt. If you do more ſeriouſly think of this (and GOD judge you worthy of his Grace) you will experience wonderous things; if not, then conclude thou waſt not worthy of thoſe Secrets. So much may ſuffice for this time to be ſpoken touching the admirable Sulphur of Tartar. More elſewhere of it, if GOD will.

CHAP. XI.

Proceeding now to Metallick fixed Salts, Mercurial volatile and moſt ſubtil Spirits, let us ſee what they are able to effect in Medicine. And firſt let us ſpeak of Antimony, as the Radical Juice of all Metals.

RECIPE of the *Minera* of Antimony finely pulveriſed one Pound, of our ſecret *Sal Armoniack* ſix or eight half Ounces; which diligently mixed put into a coated Glaſs Retort, which ſet into a Diſtillatory Furnace, and apply a Receiver thereto, miniſtring Fire leiſurely according to Art, that the Glaſs be not broken. In diſtilling firſt of all aſcends a little ſowriſh Water, then (the Retort being hot) a thick Oil fat and yellow, in which is contained the moſt excellent *Mercury* of Antimony, which you may thence thus ſeparate.

Upon the yellow Oil diſtilled, pour common Water, which Water will draw to it ſelf the Salts, and precipitate the *Mercury*, like a yellow ponderous and ſhining *Calx*, which being edulcorated and dried, will be an Univerſal Purger. Its doſe is very ſmall. I uſe no more than a quarter of a Grain, which (ſaving your Reverence) gives me 3, 4, or 5 Stools: but to a robuſt man I give half a Grain, a whole Grain, and ſometimes two Grains. *Note:* If a larger doſe be given, this *Mercury* excites vomiting alſo, though very gently. If you would render it Diaphoretick, you muſt thence abſtract rectified Oil of Vitriol. Then this *Mercury* of Antimony, which before was liquable as Wax, becomes altogether fixed and unmeltable; and then you may give of it from 1, 2, 3, to 8, or 10 Grains, which indeed move not Seidges, but provoke Sweat without wearineſs to the Patient, and performs the Office of a bleſſed Medicine againſt all Diſeaſes, where Sweat is needfull. Reduce the *Caput Mortuum* taken out of the Retort to Powder (the finer the Powder is the better your Work will ſucceed) and having put it into a Phial pour Spirit of Wine upon it, mix them by a continued ſtirring and ſhaking of the Glaſs (for otherwiſe it turns it ſelf into an hard ſtony Maſs) and in *Balneo* digeſt it for a natural Day. Thence the Spirit of Wine will acquire a red Colour, which pour off, and repour on freſh Spirit, which alſo permit to extract as much as it can. Then with gentle heat of *Balneo*, abſtract the Spirit of Wine from the Tincture, which will reſide in the bottom like a red Salt. Which Salt is

ſo great a Treaſure in Medicine, as exceeds all eſtimation. For it paſſeth through the whole Body like Fire, and conſumes Diſeaſes, as Fire burns up Wood. For according as it finds any defect in the Body ſo it operates, expelling Sweat and Urine, purging out all malignant and noxious Humours of the whole Body, and highly purifying the Blood, ſo as I believe no more noble Tincture and Salt than this can be extracted out of Antimony. Its doſe indeed is very ſmall, but of great efficacy, inſomuch as uſing but half a Grain of it you will find a moſt evident Operation. Therefore, if a Maſter of a Family provide for himſelf but one Drachm of this Medicine, he may by the help of that for the ſpace of one whole year not onely preſerve himſelf and family from many Diſeaſes, but alſo defend himſelf and them from all other Affects every where prevailing. Therefore let GOD have the Praiſe of it.

CHAP. XII.

That this way alſo may be prepared from Auripigment and Arſenick a Mercurial Oil, and a fixed Tincture.

Recipe of Auripigment one Pound of our ſecret *Sal Armoniack* four Ounces, which reduced to Powder mix, and diſtil in a Retort by degrees a volatile yellow corroſive Oil. At laſt, in the neck of the Retort will aſcend a ſublimate Red as Blood, tranſparent and as beautifull as an Oriental Ruby; the external uſe of which is famouſly medicinal againſt Ulcers and gangrenous Affects. And the yellow Oil is a moſt preſent Remedy for mortifying all gangrenous Ulcers, and laying a ſolid Foundation for their Cure, if the part affected be onely anointed with a Feather dipt therein. If any one pour Water upon the aforeſaid Oil, that corroſive, which aſcended with the Auripigment, will be ſeparated and precipited into a yellow *Calx*, which edulcorated and dried, becomes ſo ſtrong and vomitive, as it cannot ſafely be given inwardly: but outwardly ſprinkled upon Wounds, it lays a good foundation for healing. But if from the aforeſaid yellow Powder, Oil of Vitriol be abſtracted, it then becomes ſo fixed, as it will bear the force of a moſt violent Fire, without any exhalation of fume; and then loſeth all its venome, and may be moſt ſafely uſed from 1, 2, 3, 4, to 6, or 8 Grains, againſt the Peſtilence, all Feavers, and ſuch Diſeaſes where Sweat is needfull. It is to be admired, that this Subject ſo very volatile and venomous, ſhould by one onely abſtraction of Oil of Vitriol, become ſo fixed and conſtant in Fire. Alſo it is no leſs admirable, that this Oil like any other Oil of Minerals, doth not aſcend in the form of a Liquor, but like and in the form of ſome fat Vegetable Oil, whereas in it is not any fatneſs at all, becauſe all proceeds from the Auripigment.

Moreover, it will be profitable alſo to teach, that the aforeſaid fixed Auripigment (whenſoever unto it, by the help of *Mercury* of *Luna*, ingreſs is procured) projected upon a Red-hot Plate of Copper, renders the ſame totally white and as tractable as Silver. Which things being known, although of little uſe, do notwithſtanding ſavour of a pleaſing Curioſity, by which you will find, that of red Copper, white Silver may be made Alſo, after the ſame manner of white and red Arſenick, ſuch a medicinal Oil and Tincture may be prepared for *Venus*. *Note:* Whoſoever is deſirous to labour herein, muſt ſtudiouſly avoid the venomous fume: For Arſenick cannot well be handled without peril.

I might here alſo ſay ſomething of the running *Mercuries* of Metals; but ſince they rather appertain to the Tranſmutation of Metals, than unto Medicine, I thought it beſt to paſs over the mentioning of theſe in this ſmall Treatiſe, and to publiſh them in the following Centuries.

CHAP. XIII.

Of the ſubtil and moſt penetrating Medicinal Spirits of Metals.

IN my little Book of Fires, and alſo in my fifth Part of the *Spagyrick Pharmacopœa*, I have indeed made ſome mention of volatile Spirits, but for brevity ſake concealed the method of preparing. When I conſidered, that ſuch Works were judged by many impoſſible, I thought it would be worth while here to inſert the Preparation of them; and that onely from one Metal, that every Man may ſee the Verity of all the other. For whoſoever is deſirous to operate in Metals, he may be able by this one Proceſs ſufficiently to learn ſo much Skill, as it will not be difficult for him to extract ſuch volatile Spirits from other Metals alſo.

The way of preparing the volatile Spirits of Metals.

Recipe of the Steel Wyars, which the Needlemakers cannot uſe, one Pound, which ſo heat in the Fire, as all ſquallidneſs and filth may be burned away. Afterward put them into a glaſs Body, and pour on them of the hereafter deſcribed diſſolving Water 4, or 5, Pound. Place the Veſſel in *Balneo* or in Sand, and adminiſter Fire ſo to it, as the Water in the Glaſs ſurrounding the Steel may wax hot and not boil; then the Water preys upon the Iron to be diſſolved. For in this Operation the Steel is diſſolved, and fermented like new Beer or Wine. In this Fermentation a certain moſt ſubtil Spirit of *Mars* aſcends, without any corroſive, breathing a very ſtrong Odour, and endued with a Taſte vehemently penetrating. For ſuch a Spirit ſo penetrates the Tongue, as the taſte long remains, although a Man waſh his mouth, yet this taſte is not unpleaſant. By penetrating the Body of him that takes it down, it provokes Sweat copiouſly, opens obſtructions of the Liver, Spleen and Lungs, and comforts the vital Spirits and Stomach. Alſo it is admirably conducent to the Health of thoſe, who are accuſtomed to drink Wine mixt with Water; becauſe it gives the Wine a grateſull Taſte, and that far better, than the beſt of ſowriſh Springs are able to perform. If any one knows how to fortifie, or concentrate this Spirit by Rectification, he will be able to effect wonders by the benefit of it; which indeed yields not to be ſo readily concentrated, as Spirit of Wine: as you ſhall hear anon, yet it is poſſible.

The Water is prepared in this manner.

Recipe of common Salt one Pound, which diſſolve in 4, or 5 Pound of common Water, and pour upon it half a Pound of Oil of Vitriol, to which ſuperadd ſome Steel-wyar, and thence by diſtilling ſeparate the VVater; then no ſharp Spirits will aſcend with the VVater, but all the corroſive will remain

remain with the *Mars*, and nothing aſcend but a ſubtil Spirit void of Corroſion. This moveth admiration, that of ſuch an hard and fixed Metal, with the help of ſo gentle heat, ſhould aſcend ſuch a flying and penetrating Spirit. But it is more to be admired, that this white, volatile and penetrating Spirit, in a few hours ſpace, is able to turn it ſelf into a fixed red Tincture: yet you will find this incredible Miracle verified, thus.

Fill a glaſs Body above half full with our Spirit of *Mars*, yet take no more of it than 5 or 6 Pound, becauſe that would be more than is needfull for Probation. Place the Body, with its Head luted well in Sand, and diſtil off almoſt the VVater by Aſcent, ſo as onely half a Pound may be left remaining in the bottom. Take what aſcends out of the Receiver, and you will find it endewed with little more taſte than Rain-water; and that becauſe the volatile Spirit in this Abſtraction or Decoction is ſeparated from the VVater, and again converted into a fixed Body, *viz.* A moſt red Powder. VVhich red Powder is indeed a true Tincture, yet it hath no ingreſs into Metals, unleſs that be procured to it by the help of Gold. Hence is fulfilled the Precept of Philoſophers thus teaching: Make the fixed volatile, and render the volatile fixed. VVhat, I pray, is more fixed than Iron? VVhat more volatile than its Spirit? And laſtly, what more conſtant in Fire, than the Spirit again fixed into a red Tincture?

Note: VVhenſoever the Glaſs with the remaining Water, in which the red Powder is, ſhall by motion be diſturbed, the Water will ſeem to be blew, which blew colour ariſeth onely from the Tincture, which by that agitation is diſſipated into moſt ſmall Atoms. For when the Tincture red as Blood is again ſetled in the bottom, the Water ſtands above it white as before. Touching this flaming Sulphur *Coſmopolita* thus ſpeaks: *When Philoſophers have freed their Sulphur from his tenebrous Priſon, and ſee him ſwimming in his own Sea, they adore him, that is, are delighted with his Beauty.* But whoſoever would operate any thing to purpoſe, it will be expedient for him to provide in readineſs a good quantity of this Water, becauſe from ten pound of this Water, there is no more than one Scruple of our Sulphur to be expected. Which *Avicen*, in his advice to his Son obſerved, ſaying, he had need to procure to himſelf ſixty pounds of that Water before he began his Work. Touching which alſo *Braceſcus* hath excellently diſcourſed, although he was [ſeemingly] refuted by *Tauladanus*, who (by reaſon of the great ſubtilty of his Wit) could not conceive, that any good could lie hid in deſpicable groſs Iron. But that good Man *Tauladanus* no more underſtood the meaning of *Braceſcus* than he knew the nature of Iron. If any one be ſeiſed with the deſire of operating in this Subject, let him reade *Braceſcus*, by whom he will be ſufficiently informed. But many by his Writings have erred, through their miſtake of what he mentions in the latter end of his Book, *viz.* that he ſpake not of vulgar Iron, which by ſtrong Fire might be again reduced into Iron; but that ſuch Iron was to be choſen, as by the force of ſtrong Fire, could turn it ſelf into a green or blewiſh Glaſs. Where the ſimple Readers following the bare letter, ſought their Tincture in common Scales of Iron, but to no purpoſe. Here I ſpeak of a blew or green *Scoria*, which can no more be reduced into Iron. For whenſoever any one ſhall melt our fixed Sulphur mixt with *Borax*, although with moſt vehement Fire, yet he ſhall never reduce it into Iron, but into a greeniſh Glaſs. This *Crocus Martis* cannot do, nor any other deſtroyed Iron; but in Reduction it will always yield ſome ſmall Grains of Iron, wherefore thence no Tincture can be made. For whatſoever is endewed with a tinging Vertue muſt not be Metal, according to the Univerſal Conſent of all Philoſophers. If any one would find out ſome excellent thing, let him learn the Art of concentrating that, by which Concentration it will be multiplied in vertue.

Theſe few things I was willing at this time to communicate touching the volatile Spirit, and fixed Sulphur of *Mars*, for publick good. The whole work is neither difficult nor chargeable, becauſe we may uſe one and the ſame *Menſtruum* always again and again, nor is there need of new Expences, which are now eaſily acquirable. Theſe are things accurately to be noted, according as that moſt ingenious Poet *Virgil* hath perſpicuouſly hinted in theſe Verſes.

Conſider firſt, what here is to be done:
A Golden Branch, *with Leaves of Gold thereon,*
Upon a Tree concealed groweth: This
To the Infernal Juno *ſacred is.*
But the whole Grove, with diſmal ſhades of Night,
Obſcure and keep this Tree *from humane Sight;*
And till ſome one ſhall take down from the Tree
This Golden Branch, *there can no Entrance be*
Into Earths Caverns. Beauteous Proſerpine
Ordained hath that this rare Gift divine
Shall brought be unto her. No ſooner is
The firſt Branch *cropt, but in the place of this*
A ſecond ſprouts; and that moſt pure and fine,
As did the firſt, with golden Leaves will ſhine.
Therefore diſtinguiſh Right; when rightly known
This Branch *is unto thee, then with thy own*
Hands crop the ſame: for it will follow Thee,
If thou, by Fates, *for this Work choſen be;*
If otherwiſe, no humane Violence,
Nor ſtrength of Iron force it can from thence.

By theſe it evidently appears, that when one golden Bough is cropped off that Tree, another follows; and not onely one and another, but as often as you will crop one, another follows: Provided the Heavens favour our Enterprize; otherwiſe all endeavour will be vain. Yea, it will be impoſſible with hard Iron, or from hard Iron (as the Gold-bearing Tree) to acquire or crop one Branch. Conſider theſe things in your Mind. For here are words plain and clear enough to every man, whoſe Ears and Eyes GOD ſhall open.

CHAP. XIV.

Of the Preparation of the volatile and ſubtil Spirits of other Metals, and of their Uſe.

NOTE: This labour of preparing ſubtil Spirits of fixed Metals, and of reducing volatile Spirits, into fixed Bodies, ſo fully explains the Table of *Hermes*, as even Children may underſtand it. Alſo it proves the verity of that Aphoriſm unanimouſly uſed by all Philoſophers: The fixed make volatile, and the volatile fixed. He, whom GOD favours, will eaſily underſtand this; but to all others it will remain moſt firmly locked, although it be deſcribed to them with great clearneſs. I doubt not, but that this

Work

Work (when theſe my Writings in time to come ſhall fall into the hands of moſt diligent Searchers) will be more throughly ſought into, and a nearer way found, than this here deſcribed by me, by the benefit of which, the Sulphur of Philoſophers may be releaſed out of that dark Priſon, in which he is kept bound with moſt ſtrong Iron Chains. It would amaze a man to think, that from ſuch a tenebrous and ſhadowed black Tree, ſuch fair golden Branches ſhould be cropped. Although they (who are not Philoſophers, but would be accounted ſuch, whilſt they walk magnificently adorned with ſplendid cloathing) by reaſon of their blind Pride cannot ſee what I have here clearly written; yet thoſe Artificers, who wearing Linnen Frocks, labour in their ſimplicity, will ſee; becauſe to their Endeavours GOD gives his Benediction.

As I have here taught the way of extracting penetrating volatile Spirits from contemptible old Iron, and of reducing thoſe Spirits into fixed tinging Bodies; ſo alſo from other Metals the ſame may be prepared. Indeed one Metal is more apt for ſuch an Operation than another, and one gives forth its Spirits more readily than another: yet ſuch Spirits may be extracted from all Metals, but with the help of divers Solutions. For that Water which diſſolves Gold, leaves Silver undiſſolved, and what will diſſolve Silver, diſſolves not Gold. Common Salt, and Salt Niter, with the Water and Oil of Vitriol, (but rather of Sulphur) diſſolve *Sol*, *Mars*, *Venus* and *Jupiter*. Niter the Water and Oil of Sulphur diſſolve *Lune* and *Venus*. Moſt ſharp VVine Vinegar diſſolveth *Saturn*. The Spirit of Gold coagulates *Mercury* into *Sol*, the Spirit of Silver coagulates it into *Lune*. Both theſe Spirits are Medicinal. The Spirits of *Venus* and *Jupiter* are of a loathſome Taſte and Odour, and therefore unfit for Medicine. Spirit of *Saturn* is a mere penetrating Venome, or a VVater, which by its Odour ſuffocates the vital Spirit, wherefore every man ſhould ſtudiouſly avoid it, ſince its uſe cannot be without Peril; otherwiſe that Spirit in metallick VVorks excels all. Nor do I believe we can eaſily prepare a Tincture, whereby to coagulate *Mercury*, unleſs by the help of *Saturn* cold and killing all living things, yet it muſt be warily handled.

VVith theſe I cloſe up my diſcourſe of theſe Spirits; becauſe, although of them much more might be ſpoken, yet it will not be the part of a conſiderate man to caſt Pearls before Swine. Beſides, I judge I have already divulged more than is fit. But it is worthy of all obſervation, that GOD is a faithfull Defender and Governour of all moſt ſubtil Arts and Things.

CHAP. XV.

How by the Benefit of a Magnet from the Air may be extracted an Univerſal Medicine.

IT is ſufficiently known, that the Life of all things is reconded in the Air, without which Spirit, or Soul of the VVorld, nothing in this Univerſality of things can live or grow. But the Ancient Philoſophers ſought out various ways, by which that Spirit might be brought from a far off nigh unto us, be received and exhibited palpable, and at length they found the way, and by the benefit of it performed great things both in Medicine and in Alchymy, and that more or leſs, according as one knew better than another how to intercept and concentrate it. For the whole Art conſiſts in this Concentration. Therefore, ſince by the Grace of GOD, unto me alſo is ſomething known touching a like Concentration of the Univerſal Macrocoſmick Spirit of Life, I was not willing (like ſome envious or covetous man) to keep ſo great a Gift of GOD to my ſelf onely, and ſuffer the ſame to be buried with me; but choſe rather (for the health of mankind, for the profit of my Neighbour, and for the Honour and Glory of GOD) to impart ſomething thereabout; yet no more than is fit or convenient.

If any one deſireth to extract ſome good thing from the Air, he muſt firſt well underſtand what will be a good Magner, and how to make choice of an oportune place and time. For in a moiſt Seaſon, you ſhall extract nothing but an unprofitable Water from the Air. Wherefore no man ſhould undertake this labour of extracting, unleſs in the height or midſt of Summer, when the Air is very ſerene, void of Clouds, and hot with the Solar Rays. Becauſe, at ſuch a time, the Magnet, which you ſhall hang up in the Sun, immediately (from the hot Rays of the Sun) extracts a medicinal Water, which every one may uſe acccording to his Capacity. Alſo, I would have you to know, that various Magnets are found, by help of which Water may be extracted from the hot Air, but all ſuch Waters make not for our Univerſal Medicine. Yet I am willing here to ſubjoin ſome of thoſe vulgar Magnets.

The Firſt Magnet.

With 3, 4, or 6 Pound of *Mercury*, or more or leſs fill ſmall Stone Jugs, or ſtrong Glaſſes, which Glaſſes firmly cloſed let down into a deep cold Well, where the *Mercury* in it ſelf will concentrate the Cold. Now, if you would extract Water from the Air, hang up ſuch a cold Glaſs or Jug full of *Mercury* in the Air, where it will preſently draw Water to it ſelf. Therefore under the Glaſs or Jug muſt be ſet a Glaſs Tunnel with a long Pipe; by which the diſtilling Water may be received, and conveighed through the Pipe, from the hot Sun into a cold Cellar. If this be not done, the Sun will again draw to it ſelf the diſtilled Spirit. You may leave the Magnet hanging as long as it remains cold and Water diſtils from it: But aſſoon as no more water will diſtil, you muſt immerge it again in a Cold VVell, that it may recover its Coldneſs. In the mean while, inſtead of it hang up another; and repeat the labour ſo often as until you have gathered water enough.

Another Magnet.

Hang up in the hot Sun Jugs or Glaſſes full of ſuch water; which of their own accord will their contract ſo great Coldneſs, as you can ſcarcely endure to touch them with your hand. To them, as is aboveſaid, water will adhere, and diſtil into the Tunnels ſet under them.

A Cold water is thus prepared. In common water, or Spirit of Vitriol, diſſolve of *Sal. Armoniack* and Salt-peter equal parts, as much as can be diſſolved. VVith this water fill your Glaſſes, and with them, as is above ſhewed, extract water from the Air; and that will be equal in vertue to the former. If you be deſirous to extract ſomething more excellent from the Air, you muſt alſo expoſe to it more excellent Magnets. For as is the Magnet ſo it extracts.

CHAP.

CHAP. XVI.

Proceed in your Work thus.
